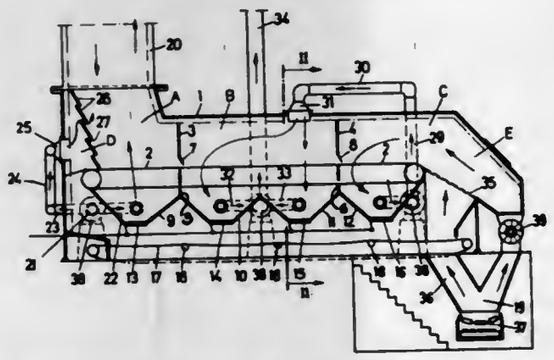
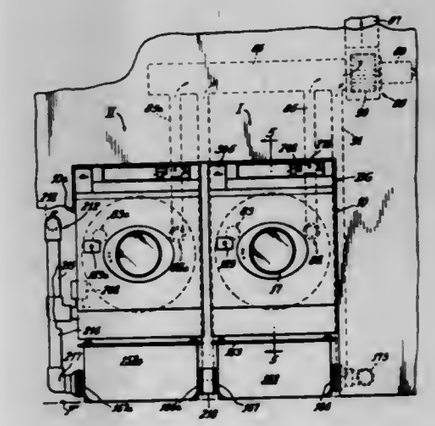
1. A device for setting one of a plurality of tangential thread cutting chasers with respect to a second chaser, each chaser having a multi-grooved side surface and a cutting edge on one end thereof and being adjustably mounted for movement parallel to its multi-grooved surface in a die head having a flat front surface, said device comprising support means having a locating surface engageable with said flat front surface, a datum surface carried by said support means and extending essentially perpendicular to said locating surface for engagement with the multi-grooved surface of said second chaser when said locating surface engages said flat front surface, a gaging arm, means mounting said gaging arm on said support means for limited swinging movement toward and away from said datum surface, said gaging arm havnig a gaging surface engageable with the cutting edge of said one chaser, and micrometric means carried by said support means for registering the location of said gaging arm.

3,273,254
ELECTROMAGNETIC MEANS OF GUIDANCE
Urho Leander Wertanen, 7281 Freda, Dearborn, Mich.
Filed Dec. 9, 1963, Ser. No. 331,078
4 Claims. (Cl. 33—222)



1. In a structure of the character described and comprising, in combination, a mounting base having a centrally vertical pivot member attached thereto and a calibrated dial on said base concentric relative to said pivot, a vertically positioned and centrally swivelled U-yoke member about said pivot and having an index in register with said dial, an adjustable locking means engaging said U-yoke to said pivot, a horizontally positioned cross-yoke member having its end shafts extending through journals at the side members of said U-yoke, another adjustable locking means engaging one end shaft of said cross-yoke to one side member of said U-yoke, another

calibrated dial at the other end shaft of said cross-yoke and said dial being in register with an index at the same side member of said U-yoke, a drive unit and brackets attached at opposite sides of said cross-yoke and having the drive shaft of said drive unit extending centrally through said cross-yoke, a group of three similar A.-C. sine wave signal generators having their rotation shafts at diverging coplanar angles and mounted with bearings and means of support attached to said brackets and wherein the rotation axis of the central coplanar generator shaft bisects the angle between the rotation axes of the remaining coplanar generator shafts at equal complementary angles, a bevel gear on each generator shaft,

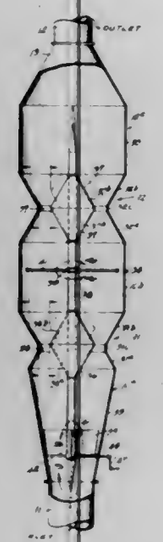


the gears on adjacent shafts being in mesh and the central generator shaft being directly coupled to the shaft of said drive, a current collector ring insulated on each generator shaft and each ring connected with a lead to one end of its respective generator winding, a brush operating means at each collector ring and each ring and brush having electrical means of connection to a respective terminal at a terminal block, a lead and means electrically connecting the remaining end of each generator winding to its respective shaft, a brush operating directly at the surface of each generator shaft and having electrical means of connections to a common electrical terminal at said block, and, two separate terminals at said block for leads of said drive.

3,273,255
METHOD AND APPARATUS FOR COOLING BURNED MATERIALS DISCHARGED BY A FURNACE FOR BURNING CEMENT, MAGNESITE, LIME OR THE LIKE
Walter Kramer, Hamburger Allee 62, Frankfurt am Main, Germany
Filed June 2, 1965, Ser. No. 460,676
Claims priority, application Germany, June 2, 1964, F 43,039
3 Claims. (Cl. 34—20)

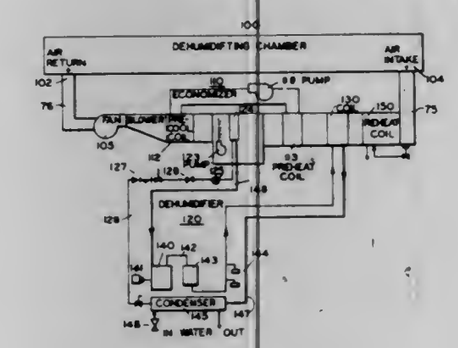
3. Method for cooling the burned material discharged by a furnace, kiln or the like for burning such materials as cement, magnesite and lime, comprising the steps of feeding the burned material over a slotted slide into the first chamber of a cooler and onto a permeable conveyor, blowing fresh air upwardly through said slide and through said conveyor and through the material on said slide and on the conveyor, continuously moving said conveyor and the burned material thereon, conducting air from the discharge opening of the cooler into the third chamber of said cooler downwardly through the layer of material on the conveyor portion therein and through said conveyor portion, conducting said air from said third chamber to the second chamber of said cooler, downwardly onto the burned material on and through the conveyor portion therein and thence into and through an air discharge duct for use other than as secondary air in the burning or calcinating process.

3,273,256
DRY CLEANING MACHINE
Curtis E. Behrens, Effingham, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Continuation of application Ser. No. 142,606, Oct. 3, 1961. This application Nov. 2, 1964, Ser. No. 407,959
17 Claims. (Cl. 34—45)



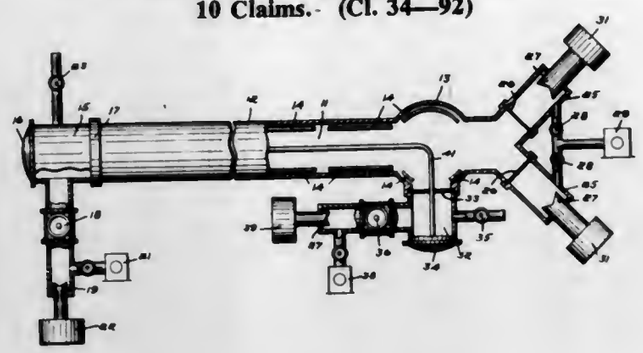
11. In a fabric drying machine, a container; a basket rotatably mounted in said container; an access door for said container; a latch for holding said door in closed position; means for operating said latch to release said latch; means for heating air and for circulating heated air in said container to vaporize liquid in the fabric; a condenser; means for supplying and circulating fluid to and through said condenser to cool and thereby condense the vapors into liquid form; and means controlling operation of said latch-releasing means and dependent on a predetermined condition of the fluid supplied to and circulated through said condenser by said fluid supply and circulating means.

3,273,257
AIR LIFT DRIER
Frank E. Johnson and Thomas E. Lewis, Anaheim, Calif., assignors to Rietz Manufacturing Co., Santa Rosa, Calif., a corporation of California
Filed July 9, 1963, Ser. No. 293,795
3 Claims. (Cl. 34—57)



1. In a drier, an upright drying chamber or tower formed to provide at least two drying sections, one being disposed above the other, a throat section connecting the drying sections, the throat section being formed by oppositely sloped aligned frustoconical walls and a substantially cylindrical portion connecting said walls, the lower end of the lowermost section being adapted to receive material to be dried together with a stream of drying gas, a discharge conduit connected with the upper-

most end of the upper section for discharge of drying air and dried material, and means disposed within said throat section for adjusting the cross-sectional flow area through the same, said means comprising a body formed substantially of two connected frustoconical walls whereby said body is tapered toward both its ends, the greatest diam-

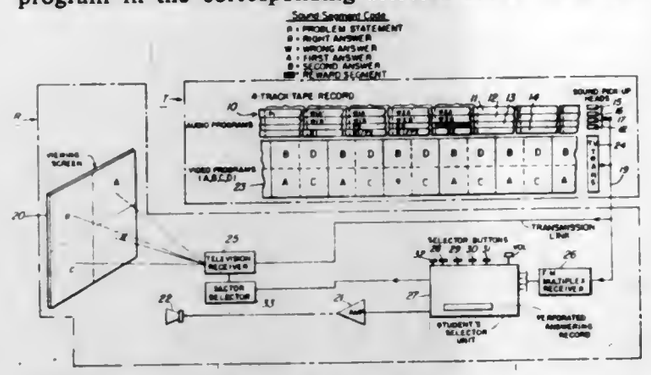


eter of said body being less than the diameter of the substantially cylindrical portion, said body being disposed axially within the substantially cylindrical portion of said throat section thereby providing together with said throat section an annular orifice through which the drying gas and material is caused to pass.

3,273,258
EGG DRYER
Ralph C. Liebert, 580 Keyes Lane, Worthington, Ohio
Filed Jan. 16, 1964, Ser. No. 338,154
16 Claims. (Cl. 34—62)

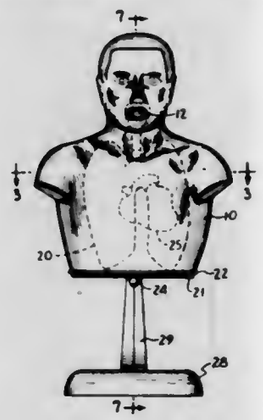
1. An industrial material dehumidifying system for the warm air drying of materials comprising, a closed chamber in which materials are to be dried and having a material entry and an exit, means for moving said material to be dried from said entry through said chamber and to said exit, an air intake and an air exhaust connecting to said chamber, means creating an air stream between said intake and said exhaust, said means for moving said material being intermediate said air streams; and an air conditioning unit for recycling the air between said air intake and said exhaust and including air heating means and air cooling means connected to a refrigeration cycle for maintaining said air stream at a constant warm temperature and low relative humidity being supplied from said air intake.

3,273,259
FREEZE DRYING APPARATUS
Ulrich Hackenberg, Alter Trassweg 9, Bensberg-Refrath, Germany
Filed May 29, 1964, Ser. No. 371,217
Claims priority, application Germany, June 6, 1963, L 45,038
10 Claims. (Cl. 34—92)



1. A freeze drying apparatus comprising;
(a) an elongated evacuable drying chamber having inlet, outlet and intermediate portions,
conveyor means adapted to transport a material to be dried through said drying chamber,
heating means positioned within said drying chamber and adapted to heat the material to be dried;
(b) an avacuable inlet lock chamber connected to said drying chamber inlet portion,
inlet lock valve means for isolating said inlet lock chamber from said drying chamber,
an inlet door means adapted to provide access into said inlet lock chamber,
inlet lock evacuation means adapted to provide evacation of said inlet lock chamber;
(c) an evacuable outlet lock chamber connected to said drying machine outlet portion,
outlet lock valve means for isolating said outlet lock chamber from said drying chamber,
an outlet door means adapted to provide access into said outlet lock chamber,
outlet lock evacuation means adapted to provide evacuation of said outlet lock chamber; and
(d) drying chamber evacuation means directly connected to and adapted to provide evacuation of the entire said drying chamber,
said drying chamber evacuation means being connected to the outlet end of said drying chamber thereby providing a gas evacuation path along the entire length of said drying chamber and wherein no additional evacuation devices are directly connected to either said drying chamber inlet or intermediate portions.

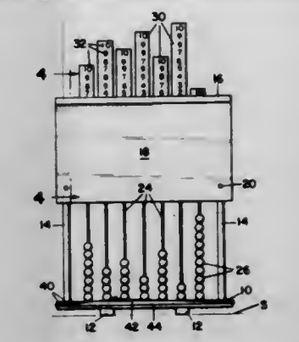
3,273,260
AUDIO-VISUAL COMMUNICATION SYSTEMS AND METHODS
Harold R. Walker, Metuchen, N.J., assignor to Tutortape Laboratories, Inc., New York, N.Y., a corporation of New York
Filed Oct. 6, 1964, Ser. No. 401,787
13 Claims. (Cl. 35—9)



1. In a system for enabling a listener to receive and respond to transmitted programmed aural and visual programs, the combination of a plurality of sound program playback means each allotted to a corresponding recorded aural program, a plurality of manually operable members to select any playback means, a web carrying a series of sound tracks one for each of said aural programs, each of said tracks having a series of segments, with certain segments containing playback recordings for providing the listener with a choice of operation of one out of said plurality of manually operable members, said

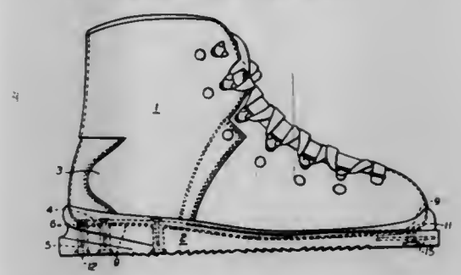
web also including a series of motion picture frames with each frame divided into sectors so that the similar sectors in successive frames constitute a visual record of a visual program to accompany a corresponding aural program in a particular corresponding one of said sound tracks, control circuits responsive to the operation of any one of said members to automatically reproduce the aural program in the corresponding selected sound track and

simultaneously to select the proper sector in said motion picture frames to visually display the same on its allotted sector area of said screen, said control circuits further including means for blanking the other sector areas of said screen to which the remaining motion picture frame sectors are allotted, and means including other track segments having recorded information therein for confirming to the listener the correctness or incorrectness of the choice he has made.



3,273,261
ANATOMICAL DEVICE
Corrie L. Lovercheck, Deaver Wyo., assignor, by mesne assignments, to Ideal School Supply Company, Oak Lawn, Ill., a corporation of Illinois
Filed Apr. 3, 1964, Ser. No. 357,032
5 Claims. (Cl. 35—17)

1. An anatomical device comprising a transparent shell-like simulated human head and integral downwardly open chest, a pair of flexible, transparent, inflatable simulated lungs disposed in the chest cavity, an aperture formed in the mouth of said head, a conduit leading from and connected to said mouth at one end and at its other to a tube disposed medially of said lungs, and a flexible resilient diaphragm extending across and closing said chest cavity.

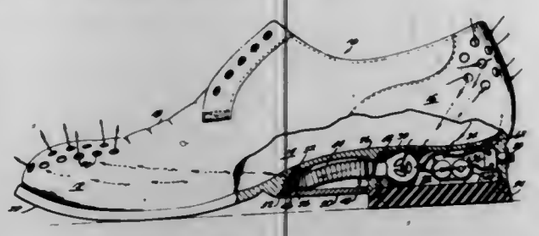


3,273,262
TEACHING DEVICE
Luke J. Smith, Jr., East Longmeadow, Mass., assignor to Milton Bradley Company, Springfield, Mass.
Filed July 27, 1964, Ser. No. 385,305
11 Claims. (Cl. 35—33)

1. A teaching device comprising in combination, a frame, a plurality of vertically-disposed denominationally-ordered flexible metal rods carried by said frame and forming spaced rows, a group of beads strung on each said rod for sliding movement relative thereto, a signal means slideably disposed on each said rod and resting on the uppermost bead of each group thereof, said signal means each carrying numerical indicia indicating the num-

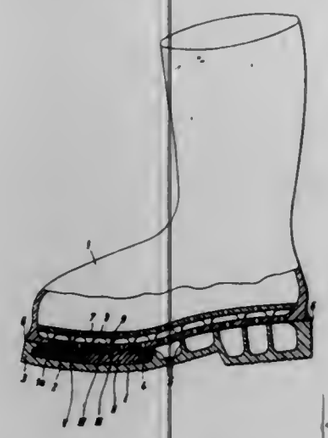
ber of beads in each group, and a horizontal support on said frame intermediate the length thereof for supporting all bead groups in such manner that flexing of any said rod releases and drops a selected number of beads from said support to form a sequence supported by the bottom of said frame and corresponding to a selected number readable on said signal means.

3,273,263
SHOE, IN PARTICULAR, SKI-BOOT
Robert Klima, Linz (Danube), Austria, assignor to Firma Robert Klima, Lederbekleidung, Linz (Danube), Austria, a corporation of Austria
Filed Nov. 13, 1964, Ser. No. 410,944
Claims priority, application Austria, Nov. 15, 1963, A 9,148/63
17 Claims. (Cl. 36—2.5)



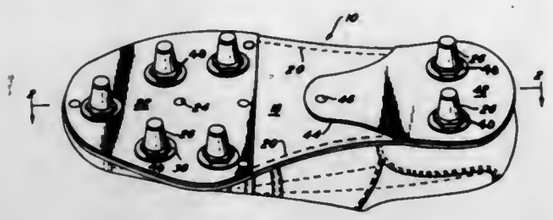
1. A shoe, in particular a ski-boot, comprising
an upper part and
a sole,
said upper part comprising a leg portion having a wedged-up fold and an inner sole in form of a wedged-up structure,
said sole consisting of homogenous flexible material, an adhesion connection and securing elemeans comprising two parts for connection of said sole with said upper part,
said two-part securing elements comprising a sleeve, and a pin-shaped part received by said sleeve and having a head portion disposed above said inner sole, as well as extending through said inner sole and said wedged-up fold, and
said sole having bores receiving said sleeves.

3,273,264
AIR CONDITIONED SHOE
Anthony S. Farinello, Jr., 2007 Ebbtide Lane, Dallas 24, Tex.
Filed Jan. 10, 1964, Ser. No. 336,994
9 Claims. (Cl. 36—3)



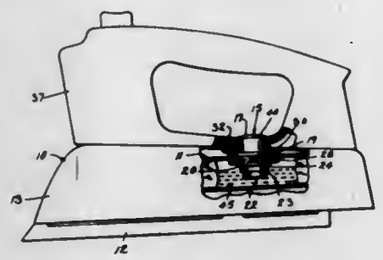
1. In a shoe including a heel, a shank, and a toe portion, an air conditioning mechanism comprising in

combination, a hollow chamber in the heel portion, a fan disposed in said chamber, means for motivation of said fan, means for controlling the motivation means of said fan disposed in said chamber, a second chamber connected by a flexible tube in series with said heel chamber



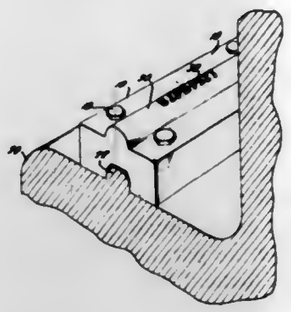
and disposed in the shank portion and in supporting relationship therewith, a tube connected to said fan and disposed in said second chamber, and a fluid path extending from the heel portion, through said fan and tube, to the toe portion.

3,273,265
WATER-TIGHT BOOTS
Ernst Reinert, Hannover, and Herbert Funck, Munich-Pasing, Germany, assignors to Dr. Ing. Funck K.G., Munich-Pasing, Germany
Filed Mar. 24, 1964, Ser. No. 354,286
Claims priority, application Germany, Mar. 27, 1963, R 34,801
1 Claim. (Cl. 36—3)



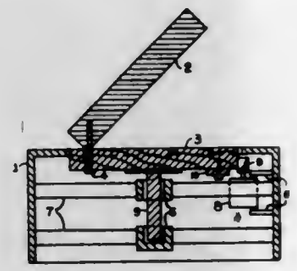
Water-tight boot of thermoplastic elastomer having a boot shaft and a boot base, the shaft comprising: an apertured insole formed integrally with the shaft, an apertured liner sole layer located above and distanced from the insole, projections attached to the liner sole and extending between it and the insole to define resiliently compressible chambers between adjacent projections, a walking sole layer located below and distanced from the insole, sponge rubber material positioned between the walking sole layer and the insole in the forward region of the boot base, projection located in the rearward region of the boot base and attached to the walking sole layer and extending between it and the insole so as to be in abutting contact with the insole, resiliently compressible chambers each formed between an adjacent pair of these projections; the arrangement being such that during walking air is forced from the second-mentioned chambers and the foam rubber material through the apertures in the insole and into the shaft of the boot by way of the first-mentioned chambers and the apertures in the liner sole layer, while fresh air from outside the boot shaft follows the reverse route into the second-mentioned chambers and the foam rubber material.

3,273,266
FOOTBALL SHOE
Michael Goldenberg, Hanover, Pa.
Continuation of application Ser. No. 265,977, Mar. 18, 1963. This application Sept. 10, 1965, Ser. No. 486,369
3 Claims. (Cl. 36—2.5)



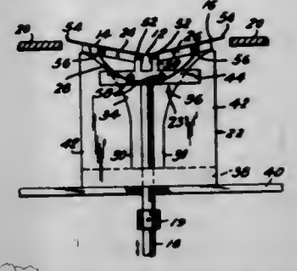
2. A football shoe comprising a shoe upper, an outsole, a pair of spaced, rigid, nylon, cleat-retaining plates positioned on the exterior surface of said outsole, with one of said plates being positioned in the tap area of said outsole and the other of said plates being positioned in the heel area of said outsole, means adhesively securing said plates to said outsole, rivets additionally securing said plates to said outsole, said plate in the heel area including an integral shank which extends into the arch area of said outsole and is positioned on the exterior of said outsole, whereby said shank serves as an arch support, and each of said plates having a plurality of cleats secured thereto.

3,273,267
WATER LEVEL INDICATOR FOR ELECTRIC IRON
Philip E. Willman, St. Charles, Ill., assignor to McGraw-Edison Company, Milwaukee, Wis., a corporation of Delaware
Filed Oct. 22, 1965, Ser. No. 501,438
1 Claim. (Cl. 38—77)



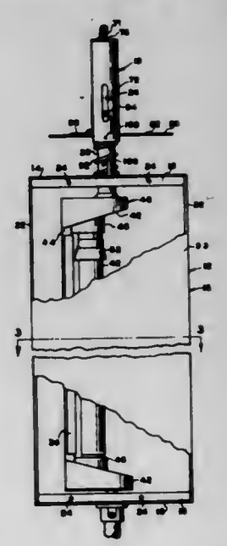
An electric iron comprising a liquid reservoir including top and bottom wall portions; a shell structure defining a housing for said reservoir concealing the reservoir from the user; an opening in said reservoir top wall; an opening in said housing substantially aligned with said reservoir top wall opening; a visual type liquid level indicator having a body member of solid transparent light transmitting material mounted at said reservoir opening and extending into said reservoir with a lower surface disposed in a lower portion of said reservoir, a plurality of ledge surfaces respectively vertically spaced intermediate said lower surface and said reservoir top wall; legends formed in relief on said lower surface and said ledge surfaces; a darkened surface on said reservoir bottom wall confronting said body member, and a convex upper surface on said body member through which said lower surface and said ledge surfaces are viewed enlarged, whereby each of said legends are readily visible through said body member upper surface and said housing opening when said liquid level is below the surface of said body with which each legend is respectively associated and said legends are respectively not readily visible when the respective surface with which each is associated is below the surface of the liquid in said reesrvoir.

3,273,268
TAMPERPROOF IDENTIFICATION DEVICE
Herbert Steen Blandford, Elmira, N.Y., assignor of one-half percent to Mordecai Casson, Elmira, N.Y.
Filed Apr. 1, 1964, Ser. No. 356,429
3 Claims. (Cl. 40—2.2)



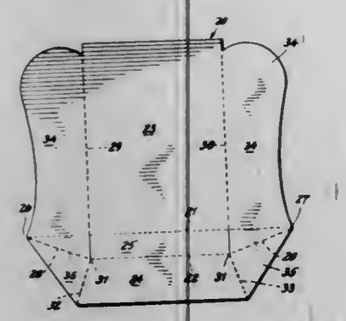
1. In combination, a machine having a longitudinal rib thereon with a convex surface, an identifying block having a groove in the bottom surface thereof fitting over and receiving said rib on the machine, said groove having a concave surface, indicia on said concave surface, a longitudinal rib on the top surface of said block and having a convex surface, indicia on the convex surface of the rib on said block thereby forming identifying indicia in triplicate, and means for securing said block to the machine.

3,273,269
ADVERTISING MECHANISM
Aubrey Braswell, Pensacola, Fla., assignor of twenty-five percent to Rex O. Williams, Lake Worth, Fla.
Filed Feb. 28, 1964, Ser. No. 348,111
5 Claims. (Cl. 40—34)



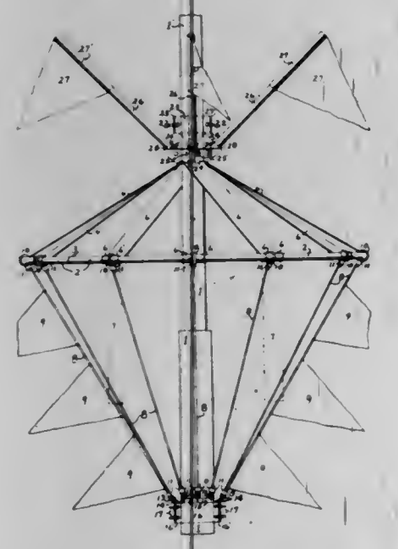
1. An advertising mechanism comprising a base, said base including a substantially flat top, said top defining an enlarged central aperture spaced inwardly from the periphery thereof, a member positioned within and generally filling said aperture, said member including a flat upper surface positioned coplanar with the flat top of the base, said member being rotatable within the aperture with the coplanar nature of the upper surface and flat top being maintained during the rotation of the member, means within said base for selectively effecting a continuous rotation of said member, and a display device, said display device having at least one circular portion, mounting means rigidly affixing a point on the circumference of the circular portion to the upper surface of the member adjacent the periphery thereof for rotation of the display device with the member, said point on the circumference of the circular portion constituting the only area of engagement of the display device, said display device projecting outwardly at an acute angle from the member at the point at which it is rigidly affixed to said member.

3,273,270
SEGMENTED EXHIBITOR
Alfred Skrobisch, Huntington Station, N.Y., assignor to Allard Instrument Corp., Westbury, N.Y., a corporation of New York
Filed Sept. 23, 1965, Ser. No. 493,613
21 Claims. (Cl. 40—52)



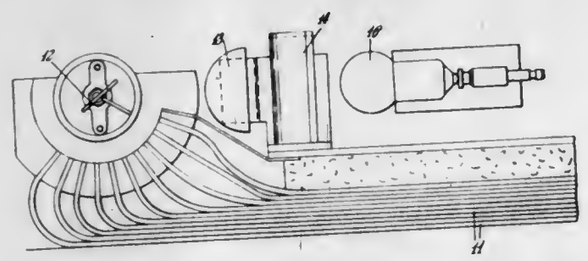
1. A segmented exhibitor comprising an extensive character display area having an array of elongated segment spaces and elongated segments for making up characters, each segment being longitudinally divided into two narrow vanes pivoted at their adjoining long edges to fold in face-to-face relation, an actuator operatively connected to the pivoted edges, a stationary guide block fixed behind the segment space and having spaced supports, and means so operatively connecting the vanes at points spaced outward from the inner edges of the vanes to the spaced supports of the block that retraction of the vanes by the actuator into the guide block folds the vanes in face-to-face relation between the spaced supports in order to conceal the faces of the vanes, and advance of the vanes out of the guide block by the actuator opens the vanes in edge-to-edge spread relation in order to expose their faces.

3,273,271
ILLUMINATED REVOLVING SIGN
Willy T. Werner, 12326 E. McNichols Road, Detroit, Mich.
Filed Apr. 22, 1964, Ser. No. 361,789
19 Claims. (Cl. 40—77)



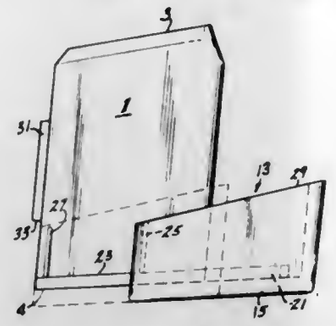
1. An illuminated display device comprising,
(a) a support structure,
(b) an illuminating assembly having one end pivotably suspended from said support structure,
(c) a display assembly enclosing and rotatable with respect to said illuminating assembly,
(d) said display assembly being rotatably carried by said support structure and said illuminating assembly.

3,273,272
ARTICLES SUCH AS DISPLAYS FORMED OF FLEXIBLE CREASABLE SHEETS
Richard E. Paige, New York, N.Y., assignor to Paper Products Development Corporation, New York, N.Y., a corporation of New Jersey
Filed July 15, 1964, Ser. No. 382,712
13 Claims. (Cl. 40—124.1)



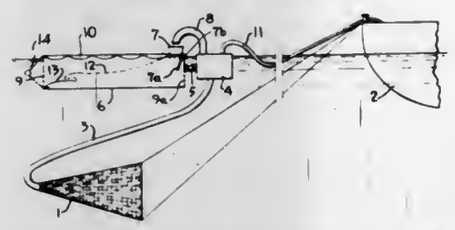
1. In a self-sustaining display made of a flexible creasable sheet, a pair of adjacent crease lines dividing the sheet into two main areas and an intermediate area between the crease lines, said crease lines converging to points of intersection at opposite ends of the intermediate area, said sheet being folded on one of said crease lines so that said intermediate area overlies the adjacent part of one of said main areas, said sheet being folded in the opposite direction along the other of said crease lines, the opposite end regions of said overlying parts being deflected into angular dispositions which bring their pointed ends nearer together, said deflection constraining said overlying parts to remain so and compelling said main areas to lie in transverse relationship to each other.

3,273,273
PENNANT AND STREAMER DISPLAY ASSEMBLIES
Frank W. McLarty, Tarrant County, Tex. (6767 Church St., Fort Worth 12, Tex.)
Filed May 29, 1961, Ser. No. 113,554
8 Claims. (Cl. 40—128)



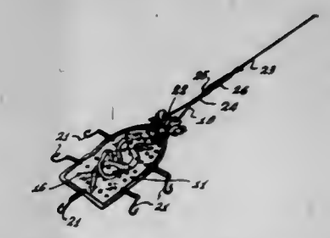
1. A vertical post standard, at least two bolts and corresponding threaded nuts wherewith are joined two bands around the post, and a complete pennant display assembly assembled and connected at the factory and subsequently installed on the post of a customer from the side thereof without disassembling the components of the said assembly comprising: a horizontally disposed parted band enveloping a high segment of the post; a second such band enveloping a much lower segment of the post; at least three pliant ropes having rather abruptly limited elasticity, such as those made of jute, each of which is connected at each end to the widely spaced bands at approximately equally spaced intervals around each of the bands, which conform to the dimensions of the post at their respective levels and therefore need not be of exactly the same length; a horizontally disposed and circular tubular hoop, cloven in at least one place and thereby permitting its placement around the post at a horizontal plane intermediate of the parallel bands, where it is disposed between the multiple pliant ropes, which it distends at considerable equal distances from the post, and to which it is attached by suitable means such as a loop in each rope intermediate between the parallel bands, a place of cleavage of the hoop being located between the same two ropes as is a place of parting of each of the two bands, each of which is provided with outward projecting integral flanges at the place of parting with a suitable hole in each of the flanges through which is passed one of the above mentioned bolts, whose respective nut is screwed on the bolt passing through its pair of flanges to contract and hold the proper dimension of each of the bands around the pole; means keeping the said ropes equally disposed relative to each other at points around the circumference of the circular tubular hoop and keeping the hoop horizontally disposed at a chosen level between the two bands, such as a strong cord of material like cotton fiber, sufficiently pliant to tie in hard immovable knots, tied in such an immovable knot forming a very tight loop in the cord around two strands of each rope loop immediately adjacent the tubular hoop, said knots in the cord being joined to each other by approximately equal segments thereof, which thus keep the ropes somewhat equally spaced around the tubular hoop; a dowel inserted and keyed in one of the cloven tips of the circular tubular hoop and thereafter inserted and keyed into the other tip, after disposition around the pole, thereby forming a splice and creating a complete circular rope-distending frame supported by the ropes attached to the upper band, which ropes also have pennants sewn to them in tandem at intervals, in a conventional manner, between the hoop and the bands at each end of the ropes.

3,273,274
SELECTIVELY ILLUMINATED INDICATING DEVICES
John Philip Pearce, Hillingdon, Middlesex, England, assignor to K.G.M. Electronics Limited, Richmond, Surrey, England
Filed June 3, 1964, Ser. No. 372,171
2 Claims. (Cl. 40—130)



1. A selectively illuminated indicating device comprising a light source, at least two light transmitting plates with indicia on their faces and disposed in stacked relation, and an independently moveable mirror which reflects the light from the source onto the edge of the desired plate to illuminate the entire plate and make its indicia visible.

3,273,275
PLASTIC BOX MAGAZINE
Joseph A. Badali, Branford, Conn., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Filed Dec. 1, 1964, Ser. No. 415,034
3 Claims. (Cl. 42—50)



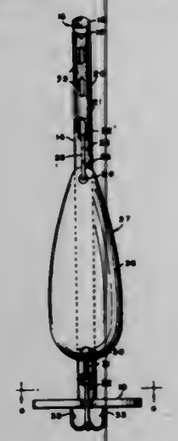
1. A plastic box magazine including a generally rectangular hollow body open at both ends, feed lips formed integral with one end of said body, an end cap closing the other end of said body, said end cap being slidably received on said other end, means on said end cap and said body to interlock said end cap and body, said means to interlock including a pair of laterally spaced longitudinal guide rails and corresponding longitudinal grooves in said body and said cap which are slidably engageable, at least one interlocking vertical ridge and groove on said body and end cap engageable when said end cap and body are in assembled condition, a follower slidably mounted in said body, spring means in said body normally urging said follower toward said feed lips, and cooperating guide means in said body and on said follower guiding the movement of said follower in said body.

3,273,276
LIVE FISH STORAGE AND TRANSPORT DEVICE
Sixten Englesson, Djursholm, Sweden, assignor of one-half to AB Flygts Pumpar, Solna, Sweden
Filed Jan. 14, 1965, Ser. No. 425,506
1 Claim. (Cl. 43—6.5)

A live fish storage and transport device, for use in connection with a fishing implement having means for catching fish and pumping them in a water stream to said device and adapted to be detachably connected to said device, said device comprising an elongated container including floating means and composed of flexible material and due said floating means floating at the sea surface and having an inlet adapted to receive the pumped stream of fish, and having front and rear walls defining restricted openings being sufficiently large to pass water and sufficiently narrow to block the passage of fish, enabling a restricted flow of sea water through said container, and valve means disposed adjacent said inlet opening and operable to restrain releasably the passage of fish into and out of said container, a flexible sheet disposed inside said container and having perforated portions adapted to pass water but to reject fish and near the rear wall a rear portion corresponding to the rear wall of the container and being substantially impervious to the passage of water, said sheet being connected to the interior of the container and disposed diagonally therein to the rear of said inlet, said sheet in the empty container normally remaining in an inactive slackened position and being operable to be moved upwardly and rearwardly into an active position by the fish entering into said container below said sheet, said rear portion in the active position lining the rear wall of the container, said sheet thereby substantially blocking the openings thereof to the passage of water, whereby the flow of sea water through the rear end of said container will be substantially prevented.

3,273,277
FISH LURE
Gustav E. Valentine, 2162 N. Holliston Ave., Altadena, Calif.
Filed Aug. 7, 1964, Ser. No. 388,141
8 Claims. (Cl. 43—41)

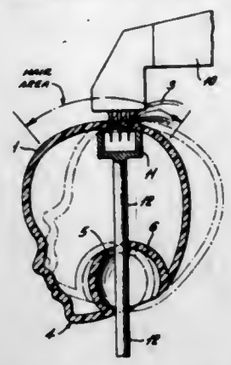
1. A fishing lure comprising: a transparent, water pervious bait bag having an open top for the reception of bait materials to be placed in the bag; a leader secured to said bag and extending around the side and bottom edges thereof, said leader being completely embedded in the side edges of said bag; means on said leader for attachment of a fish line; and means on at least one embedded leg of said leader for the securement of a fish hook to the leader whereby the strain of a fish caught on the hook is applied to the line through the leader without substantial strain on the bait bag.



3,273,278
FISH LINE SINKERS AND FLOATS
Edward F. Lynch, 6429 Plunkett St., West Hollywood, Fla.
Filed Aug. 14, 1964, Ser. No. 389,754
3 Claims. (Cl. 43—44.87)

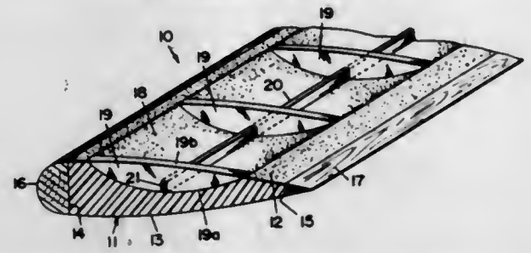
1. A fish line sinker comprising a sinker of ellipsoidal configuration and having a slot extending from a longitudinal axis thereof to a point on the surface of the sinker, a cylindrically disposed opening extending along the longitudinal axis and coaxial therewith, a hollow resilient plastic tube having an outside diameter substantially equal with the diameter of the cylindrical opening and having a head at one end thereof larger than the cylindrical open-

ing, said hollow plastic tube having a slot extending from end to end thereof and a length slightly greater than the length of the cylindrical opening along the longitudinal axis, and said hollow plastic tube being rotatably positioned within said cylindrical opening, a beveled surface at each polar zone of the sinker about the longitudinal axis at opposite ends of said cylindrical opening, each beveled surface being inclined with respect to the center of the sinker toward a common point, and end means on the free end of the hollow plastic tube together with said head at said one end being molded to conform to the inclined attitude of the beveled surface when the slots of the tube and the sinker are in alignment, and providing thereby means for substantially locking the tube and sinker when the slots are in maximum non-aligned position.



3,273,279
FISH LURE HOLDER
Desmond H. Norton, 1122 Patterson St., Ogden, Utah, and Martin A. Hardin, Ogden, Utah (1790 South 50 West, Bountiful, Utah)
Filed Dec. 3, 1964, Ser. No. 415,606
2 Claims. (Cl. 43—54.5)

1. A fish lure holder comprising a base having a slot extending inwardly from a peripheral edge thereof, through which slot the shank of a fish lure hook is passed to permit engagement of the hook barbs with the underface of the base, a supporting member extending upwardly from said base, and resilient means engaged with the upper extremity of said supporting member and depending downwardly for tensioned engagement with the upper end of the lure to maintain the lure hook in engagement with the underface of said base, wherein said resilient means includes an elastic member having a plurality of longitudinally spaced perforations, the perforations being adapted for selective engagement over the upper extremity of said supporting member to adapt the lure holder for use with lures of various sizes.

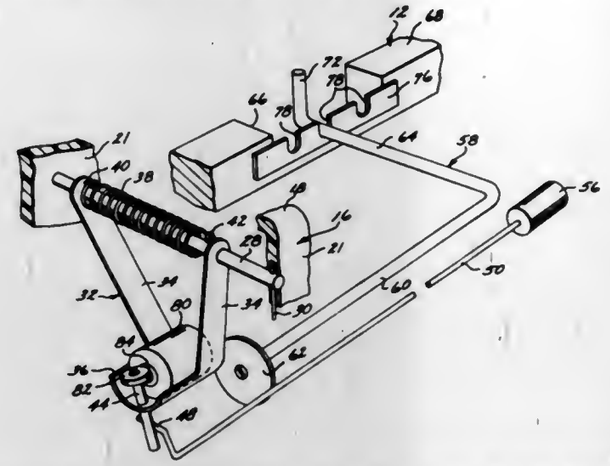


3,273,280
DOLL JOINT CONSTRUCTION FOR COOPERATION WITH HAIR ROOTING MACHINE
Joseph Karton, Newark, N.J., assignor to Deluxe Reading Corporation, Elizabeth, N.J., a corporation of New Jersey
Filed Feb. 27, 1964, Ser. No. 347,942
1 Claim. (Cl. 46—16)

A doll comprising a resilient head member having rooted hair secured therein, a torso member, and means securing said members together for universal movement, said means comprising a hollow ball element integral with one of said members, a hollow socket element receiving the ball element integral with the other of said members, and aperture means in the element integral with the head for allowing access of a support post for a hair rooting device into the head, the element integral with the head being of resilient material and the other element being of relatively rigid material, the ball fitting snugly into the

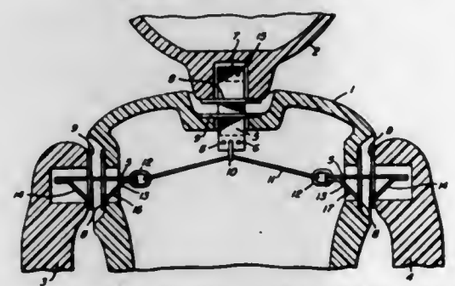
socket element to provide a rotatable locking fit of the head member on the torso member and the socket element being formed in the head.

3,273,281
MODEL AIRCRAFT WING CONSTRUCTION
Lawrence V. Harrison, Portage La Prairie, Manitoba, Canada (P.O. Box 1291, Sackville, New Brunswick, Canada)
Filed Oct. 4, 1965, Ser. No. 492,514
3 Claims. (Cl. 46—76)



1. In a model aircraft wing, the combination of a wing body of low density homogeneous solidified plastic foam material, said wing body having an airfoil cross-section with upper and lower airfoil surfaces terminating at a flat vertical front edge and a flat vertical rear edge, a wooden leading edge member having a flat vertical rear edge contiguous with and secured to said flat vertical front edge of said wing body, a wooden trailing edge member having a flat vertical front edge contiguous with and secured to said flat vertical rear edge of said wing body, one of said airfoil surfaces of the wing body being provided with a concave longitudinally extending recess, and a set of wooden ribs complementally fitted in said recess, said ribs having convex edges in contact with and secured to the concavity of said recess and also having other convex edges flush with said one of said airfoil surfaces of the wing body.

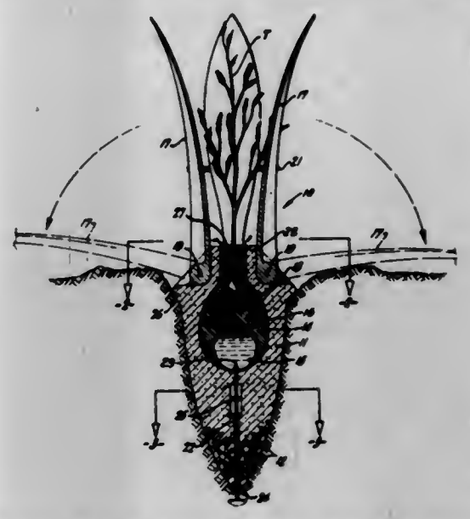
3,273,282
FOOTBALL PASSING TOY
Harold F. Berry, 17448 Hemmingway St., Northridge, Calif.
Filed Aug. 17, 1964, Ser. No. 390,120
12 Claims. (Cl. 46—241)



8. A toy comprising in combination:
a supporting base,
an action figure mounted on said base including a simulated human body with arm means mounted for movement in the fore and aft direction of the body, and a spring operatively connected between said body and arm means constantly operative to urge said arm means in one of said directions relative to the body,
actuating means on said base releasably engageable with said arm means both to move said arm means in the direction opposing the bias of said spring and to release said arm means to the bias of said spring for

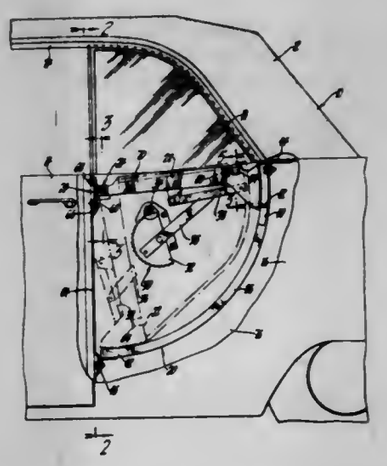
propulsion thereof in said one direction by said spring,
stop means for abruptly arresting movement of said arm means in said one direction,
a member simulating a ball, and

means on said arm means for releasably holding said simulated ball member in such manner that the latter is hurled from said arm means when movement of the arm means in said one direction is arrested by said stop means, thereby to simulate a person throwing a ball.



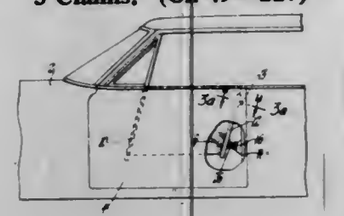
3,273,283
ARTICULATED HEAD AND LIMBS FOR DOLLS AND TOY ANIMALS
Tobin Wolf, 447 Essex Ave., Bloomfield, N.J.
Filed Dec. 20, 1963, Ser. No. 332,070
7 Claims. (Cl. 46—161)

6. A toy including a body member defining an aperture, tensioning means secured within said body member and an articulation comprising a first generally planar mounting plate defining a cut out opening therein, a cut out member integral with said mounting plate, a portion of said cut out member being substantially normal to the plane of said mounting plate and a leaf spring secured to said portion of said cut out member, said leaf spring extending through said cut out opening of said mounting plate, said articulation further including a second generally planar mounting plate defining a second cut out opening therein, a second cut out member integral with said second mounting plate, a portion of said second cut out member being substantially coplanar with said first mentioned cut out member portion, said leaf spring extending through said second cut out opening, said leaf spring being secured to said portion of said second cut out member.



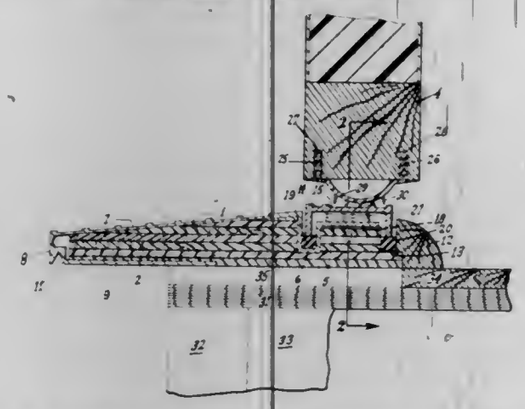
3,273,284
PLANTING CONTAINER
George N. Anagnostou, 203 Missouri St., San Francisco, Calif.
Filed Oct. 28, 1963, Ser. No. 319,345
12 Claims. (Cl. 47—34)

11. A planting container comprising an essentially enclosed receptacle having an elongated shape and a tapered lower end, said receptacle being formed with a riser defining an upper stem opening, said receptacle having an internal pocket filled with loam and being formed of material that disintegrates upon exposure to water, the lower end of said receptacle being weighted with metal embedded in said material, a set of protective



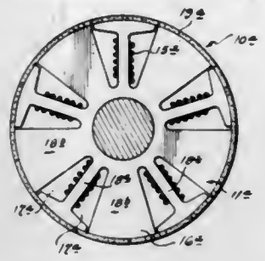
vanes spaced around said riser and pivotally mounted to said receptacle, and a frangible collar encircling said protective vanes to hold them in protective relationship to the limbs of a tree planted in said receptacle, said riser restricting movement of said vanes to prevent damage to the limbs of the tree.

3,273,285
WINDOW REGULATOR MECHANISM
Richard H. Champion, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Jan. 31, 1964, Ser. No. 341,504
5 Claims. (Cl. 49—40)



1. A window regulator mechanism for automotive vehicles, and comprising, a mounting frame receptive of the lower edge of a vertically curved and disposed window panel member, pivotal support means provided adjacent one end of said mounting frame and including means defining an axis extending transversely of said frame and supporting said frame for pivotal movement in the general plane of the window, guide track means formed and disposed for guiding engagement with said frame adjacent the other end thereof in the course of pivotal movement of said frame about said axis, and means shifting said frame axially along said axis in the course of pivotal movement of said frame about said axis.

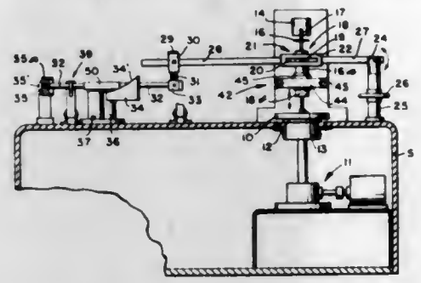
3,273,286
VEHICLE BODY
Lawrence P. Brissette, Utica, and James D. Leslie, Birmingham, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Mar. 25, 1964, Ser. No. 354,655
3 Claims. (Cl. 49—227)



1. In a vehicle body having a window opening therein and a window for closing said opening, the combination comprising, guide means mounted on said body for guiding one edge portion of said window along a predetermined path upon movement of said window between open and closed positions, a guide member for guiding an opposite edge portion of the window, means pivotally mounting said guide member adjacent one end thereof on said body, said pivot means permitting said window, upon movement thereof, to move said guide member relative to said pivot means longitudinally of the path of movement of the window, laterally of the path of movement of the window, or both longitudinally and laterally of the path of movement of the window as required to align said guide member with said window during movement thereof, and resilient means interconnecting said guide member adjacent an opposite end thereof and said body and providing a floating connection therebetween, said resilient means locating said guide member in a predetermined position both laterally and longitudinally of the path of movement of the window and resisting movement of said guide member from said position by said window during movement thereof.

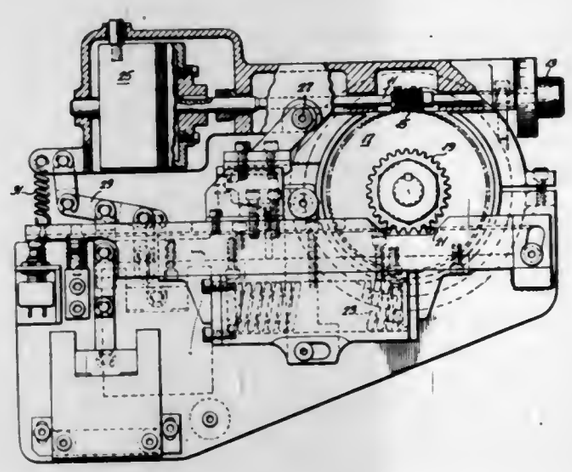
3,273,287
SILL AND THRESHOLD ASSEMBLY
David H. Pease, Jr., Cincinnati, Ohio, assignor to Pease Woodwork Company, Inc., Hamilton, Ohio, a corporation of Ohio
Filed June 29, 1964, Ser. No. 378,566
12 Claims. (Cl. 49—468)

1. A threshold and sill combination comprising a sill member and a threshold element affixed thereto, said sill member being elongated and having inner and outer edge portions, said sill member shaped to provide a surface sloping downwardly toward said outer edge and having at least one longitudinal groove positioned at said threshold on said sill, said threshold element having a horizontal body and a depending leg for entering said groove and for being sealed therein with a deformable substance, and means adjustable in height for affixing said threshold element to said sill member.



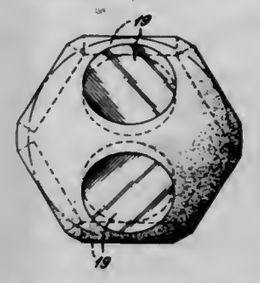
3,273,288
ULTRASONIC GRINDING AND HONING
Arthur Kuris, Bronx, and Lewis Balamuth, New York, N.Y., assignors to Cavitron Ultrasonics Inc., Long Island City, N.Y., a corporation of New York
Filed Apr. 25, 1962, Ser. No. 190,154
9 Claims. (Cl. 51—72)

1. An abrading device comprising
(A) at least one abrading element having an active surface adapted to be moved relative to a workpiece in contact with a surface of the latter for finishing the workpiece surface,
(1) said element having a relatively small thickness in the direction normal to said active surface; and
(B) means applying high frequency vibrations to said abrading element at the side of the latter opposed to said active surface and in said direction normal to the latter,
(1) said applying means including a generally circular, radially vibrated metal body having diametrically opposed sectors of relatively small mass and relatively large mass, respectively, so that the average radial velocity in each sector of relatively small mass is substantially greater than the average radial velocity in the diametrically opposed sector of relatively large mass, thereby to provide radial vibrations of magnified amplitude at the peripheries of said sectors of relatively small mass,
(2) said radially vibrated metal body being rotated with a peripheral speed equal to the speed of movement of said abrading element relative to the workpiece,
(3) said sectors of relatively small mass and of relatively large mass having abrading elements on the peripheries thereof which respectively include relatively fine and relatively course abrasive grains,
(4) said vibrations being applied to said abrading elements at least over the area of the latter in contact with the workpiece so that the vibrations are effectively transmitted through the thin abrading elements to act at said active surface for enhancing the abrading effect of the latter.



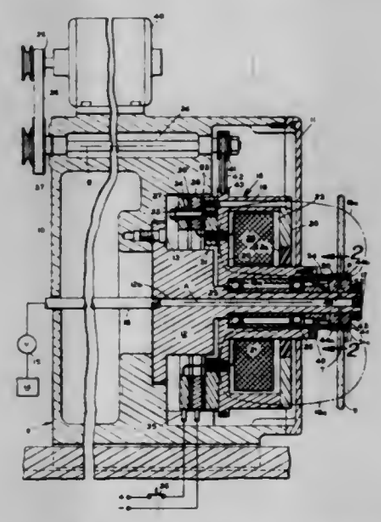
3,273,289
ASPHERIC SURFACE GENERATOR
Ralph W. Dietz, 106-B Bard, and Harold E. Bennett, 1501-B Smith Road, both of China Lake, Calif.
Filed Sept. 16, 1963, Ser. No. 309,356
5 Claims. (Cl. 51—127)

1. In a surface generator, the combination comprising:
a rotatable, horizontally disposed turntable for rotatably supporting a work blank;
a working bar transversely disposed above said turntable;
a fixed vertical pivot post for pivotally supporting a first end of said working bar in a manner such as to accommodate working bar pivotal displacement in both horizontal and vertical directions;
a vertically and horizontally movable working point;
means for operatively connecting said working point with said working bar in a manner such that the working bar serves to impart both a vertical and a horizontally transverse displacement to said working point relative to said turntable;
working point guide means for imposing a straight-line movement on said working point as it is caused to horizontally traverse said turntable;
a moveable pivot post for pivotally supporting a second end of said working bar in such a manner as to



accommodate working bar pivotal movements in both vertical and horizontal directions;
means for imposing both a vertical and a straight-line horizontal displacement to said moveable pivot post for imparting movement to said working point through said working bar; and
means for establishing and maintaining a state of parallelism between the straight-line horizontal movements imparted to said working point and said moveable pivot post.

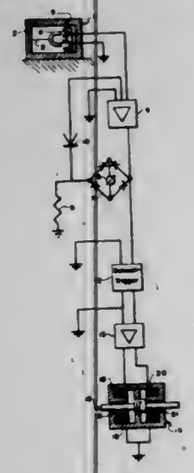
3,273,290
GRINDING
Richard J. Levi, 256 Irving Ave., Closter, N.J.
Filed Feb. 26, 1963, Ser. No. 261,026
5 Claims. (Cl. 51—165)



1. A mechanism for controlling relative motion between a machine tool and a workpiece comprising: a movable member for providing relative motion between a machine tool and a workpiece, a rotatable input shaft. drive means operable when engaged to drive said movable member from the rotation of said input shaft, biasing means to expose the motion of said movable member and bias said movable member back toward a starting position to thereby eliminate backlash from said driving means, means selectively operable to brake said input shaft, and means selectively operable to disengage said driving means so that said biasing means will drive said movable member back to said starting position moving the workpiece and the machine tool away from one another.

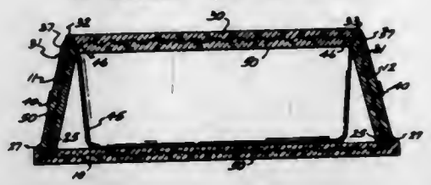
3,273,291
PITCH LENS BLOCKER BALL AND BLANKS
Patrick H. Reardon, Hagerstown, Md., assignor to The Lionel Corporation, a corporation of New York
Original application Dec. 7, 1960, Ser. No. 74,380, now Patent No. 3,114,992, dated Dec. 24, 1963. Divided and this application July 31, 1963, Ser. No. 304,712
2 Claims. (Cl. 51—216)

1. A spherical lens blocker ball consisting entirely of pitch, and a plurality of lens blanks inset radially therein with the outer face of each of said blanks being disposed at a depth to lie in a plane chordwise of the surface of said blocker ball whereby said blocker ball and said blanks may be ground as a unit to a smaller sphere with the convex outer faces of said blanks of the same curvature.



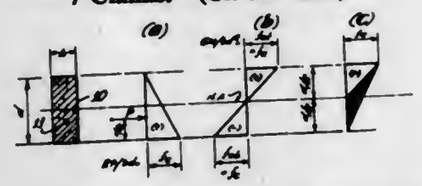
3,273,292
MACHINE TOOL HEADSTOCK
William B. Seidel, Cincinnati, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio
Filed Oct. 16, 1963, Ser. No. 316,643
4 Claims. (Cl. 51—237)

1. A headstock for a machine tool comprising:
(a) a housing,
(b) a fixed member tightly secured in said housing and having a fixed vent head positioned outside the housing on an axis to receive an annular workpiece, said vent head adapted for connection to a source of fluid under pressure and having a surface of circular cross section centric with respect to said axis for registration with the workpiece, said surface having a plurality of orifices equally angularly spaced around said axis and said vent head having a plurality of passages to connect said orifices to the source of fluid under pressure,
(c) a drive member surrounding said fixed member mounted in the housing for rotation on said axis, said drive member terminating in a magnetic annular end face outside the housing adjacent said vent head, said annular end face centric with respect to said axis and effective when magnetized to grip one end



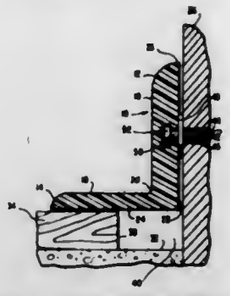
of the workpiece and rotate the workpiece relative to the vent head,
(d) means to magnetize said magnetic annular end face,
(e) and means to rotate said drive member.

3,273,293
DEVICE FOR BALANCING ROTATING BODIES DURING OPERATION
Hans Conrad Sonderegger, 26 Breitestrasse, and Hans U. Baumgartner, 90 Kurlstrasse, both of Winterthur, Switzerland
Filed June 13, 1963, Ser. No. 287,662
Claims priority, application Switzerland, June 18, 1962, 7,266/62; July 27, 1962, 9,076/62; Feb. 20, 1963, 2,232/63
15 Claims. (Cl. 51—262)



1. Device for dynamically balancing rotating bodies supported on a support structure, comprising:
sensing means responsive to imbalance of the rotating body and capable of generating electric impulses,
electromagnetic actuator means controlled by said electric impulses,
tool means actuated by said actuator means at a frequency proportional to the speed of said rotating body, said tool means being operable to remove material from a portion of the contour of said rotating body at each operating cycle of said actuator means,
said sensing means including a portable vibration feeler provided with adjustably tuned mechanical vibration means,
said feeler being removably mounted on said support structure in the vicinity of said rotating body,
said vibration means being tuned to the speed of said rotating body to produce by the imbalance a resonant condition and therewith generating said electric impulses as a periodic signal,
said electromagnetic actuator means including at least one solenoid coil, an armature substantially coaxial with said solenoid coil, and at least one stop means limiting the advance of said armature which is effected by said electromagnetic actuator means upon energization thereof,
and indicating and control means operatively connected with said feeler including recording means indicating said periodic signal with the amplitude thereof maximum upon tuning of said feeler, means for transforming said signal into a control signal of a substantially square wave characteristic, and means for adjusting the amplitude of said square wave signal to the operating characteristics of said solenoid coil and said armature in such a manner that said armature abuts against said stop means during the duration of said square wave signal.

3,273,294
BURIAL VAULT WITH SECTIONAL INCLINED SIDEWALLS
Joseph J. Trzesniewski, 1711 W. Lincoln Ave., Milwaukee, Wis.
Filed Sept. 17, 1963, Ser. No. 309,501
12 Claims. (Cl. 52—141)

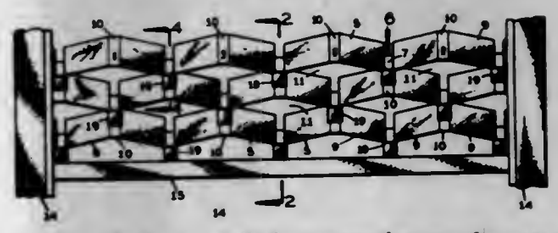


10. In a burial vault; a bottom plate having two ends and two sides; a pair of end pieces with one of said end pieces extending upwardly from the top surface at each end of said bottom plate; a pair of side pieces, one of said side pieces extending upwardly from the top surface at each side of said bottom plate with said side pieces in engagement with said end pieces to form an enclosure open at the top, the outer edges of said side and end pieces engaging the top surface of said bottom plate inside the perimeter of the top surface of said bottom plate to form a lip on said bottom plate about the perimeter of the enclosure, each of the junctures of said side pieces with said end pieces having adjacent surfaces of adjoining pieces tapered relative to each other so that they form a wedge shaped opening extending through the height of said side and end pieces and opening into the outer surface of the enclosure; means securing the bottom edges of said side and end pieces to said bottom plate; a strip of sealing material in each of the wedge shaped openings for sealing the joints; a strip of sealing material disposed on said lip and in contact with the adjacent surfaces of said side and end pieces to seal the juncture of said side and end pieces with said bottom plate; a V edge formed in the top edge of each of said side and end pieces; a cover plate having a V groove formed in its bottom surface and resting on the top edges of said side and end pieces with its V groove engaged by the V edges of said side and end pieces for closing the top of the enclosure and retaining said side and end pieces in position in the assembly; a liner located within the enclosure formed by said bottom plate with said side and end pieces, said liner being open at the top; and a flange extending outwardly from said liner about the periphery of the opening in said liner, said flange being clamped between the V groove of said cover plate and the V edges of said side and end pieces to secure the liner in position within the burial vault and seal its interior.

3,273,295
SPLIT-BEAM PRESTRESSING
Arsham Amirikian, 6526 Western Ave., Chevy Chase, Md.
Filed June 4, 1963, Ser. No. 285,535
7 Claims. (Cl. 52—223)

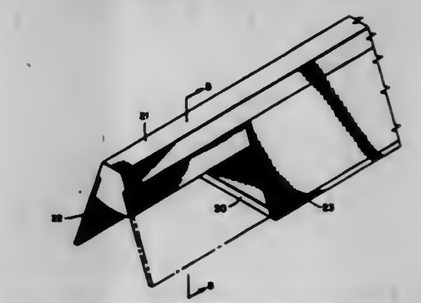
2. A composite structural concrete beam comprising:
a lower prestressed tension segment which includes all of the beam below its neutral axis;
an upper non-prestressed compression segment which includes all of the beam above its neutral axis; and
bonding means at the meeting interface of said segments to resist any shear forces developed during normal loading of said beam.

3,273,296
DETACHABLE BASEBOARD AND FLOORING TRIM ASSEMBLY
Glenn E. Soulon, New York, N.Y.
(43 Greenwich Ave., Greenwich, Conn.)
Filed June 17, 1963, Ser. No. 288,410
3 Claims. (Cl. 52—288)



2. In flooring trim construction the combination including;
a sub-floor,
a vertical wall abutting the edge of said sub-floor,
surface flooring overlying said sub-floor having a marginal edge spaced from said wall to define an expansion void,
a number of anchor members mounted on said wall, each anchor member including a neck portion extending from the wall, an enlarged head portion formed at the outer end of the neck portion and a spacer flange formed on the opposite end of said neck portion and engaging, on one side, said vertical wall,
an elongate trim member bridging said expansion void having upper and lower edges, an inner face extending between said edges and engaging the other side of said spacer flange to define an air space between said inner face and vertical wall, and a horizontal leg projecting from said trim member in overlying and spaced relationship with the upper surface of said surface flooring adjacent said marginal edge, and
a longitudinal substantially T-shaped groove formed in said inner face of said trim member, said groove having a reduced portion extending to the surface of said inner face and receiving the neck portion of said anchor member, and an enlarged portion receiving the head portion of said anchor member, said groove being dimensioned such that said head portion engages a shoulder defined by said reduced portion to prevent relative displacement between the trim member and anchor member.

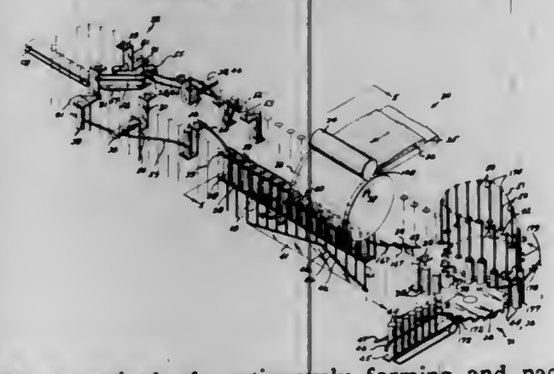
3,273,297
DOOR AND PANEL CONSTRUCTION
Herbert W. Wehe, Jr., Ligonier, Pa., assignor to Overly Manufacturing Company, Greensburg, Pa., a corporation of Pennsylvania
Filed June 7, 1963, Ser. No. 286,289
4 Claims. (Cl. 52—404)



1. In a sound attenuating metal panel construction in combination,
(a) a pair of laterally spaced vertically disposed metal sheet members providing outer faces of the panel and having connected vertical margins at each side thereof forming an open ended envelope,
(b) a limp septum member comprising a sheet of lead vinyl provided on one face thereof with a foam type backing layer disposed intermediate the inner faces of said spaced sheets for substantially the vertical height thereof and connected with the adjacent inner faces of said envelope side edges,
(c) a plurality of vertically disposed transversely spaced stiffening members secured to the inner face of each said vertically disposed metal sheet members and extending therefrom towards an adjacent face of said septum,
(d) a porous non-continuous material filling the spaces between said metal sheets, stiffening members and septum member, and
(e) top and bottom closure members secured to the opposite ends of said envelope.

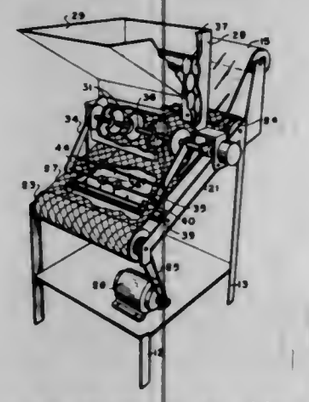
3,273,298
RETICULATED SUN SHADE OR GRILL
Robert L. Jordal, Fort Lauderdale, Fla., assignor to Al-Vent Inc., Fort Lauderdale, Fla., a corporation of Florida
Filed Apr. 2, 1964, Ser. No. 356,791
7 Claims. (Cl. 52—473)

1. A sun shade or grill for mounting to the exterior of a window or door comprising a multiplicity of elongated metallic strips having their ends anchored in a metallic frame, the several strips being shaped at equidistantly spaced points throughout their length to form channels and between each pair of channels the strip is inclined upwardly to form a flat apex that is intermediate each adjacent channel, each alternate strip being staggered whereby the flat apex underlies the bottom of a channel of the next adjacent strip, means in the bottoms of the channels and the apex to fixedly lock the strips together and to form transverse cells of like configuration that extend entirely through the grill, the channels being open throughout and ornamental cover plates for closing the ends of the channels, the several cells constituting air passages through the grills and to the window or door adjacent to the grill, the grill having a depth calculated to exclude the passage of sun light therethrough for the major number of hours of the day.



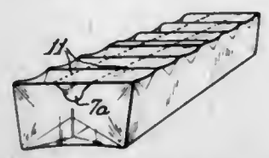
3,273,299
BIPOD COMPONENTS AND BUILDING UNITS CONTAINING SAME
Philip F. Hartung, Jr., 41 Fairfield Drive, New Shrewsbury, N.J.
Filed July 12, 1963, Ser. No. 294,473
6 Claims. (Cl. 52—648)

1. A triangular shaped beam comprising a trapezoidal timber base member having beveled edges, each of the edges having a recess at the upper portion thereof, said base member extending longitudinally of the beam, a



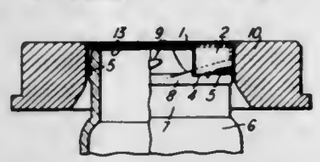
trapezoidal timber head member having beveled edges, each of the edges having a recess at the lower portion thereof, said head member being disposed in a plane spaced away from the base member and parallel to said base member, two plywood webs each being positioned between said base member and said head member, thus forming the opposite sides of the triangle circumscribing the configuration of said beam, and being disposed at angles corresponding to the angles of said beveled edges.

3,273,300
CONTINUOUS DOUGH CUTTING AND PACKAGING
Howard N. Watrous, Cincinnati, and Charles R. Hood, Springfield Township, Hamilton County, Ohio, assignors to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
Filed Aug. 7, 1963, Ser. No. 300,431
22 Claims. (Cl. 53—23)



20. A method of continuously forming and packing blanks of dough comprising the steps of feeding a sheet of dough continuously to a rotating cutter head, cutting dough blanks continuously from said sheet of dough by pressing the dough sheet against the cutter head, depositing the dough blanks so cut into a series of continuously moving hollow intermediate containers moving beneath said cutter head until each intermediate container is filled with a plurality of dough blanks, and transferring the dough blanks by gravity from each intermediate container into a commercial container.

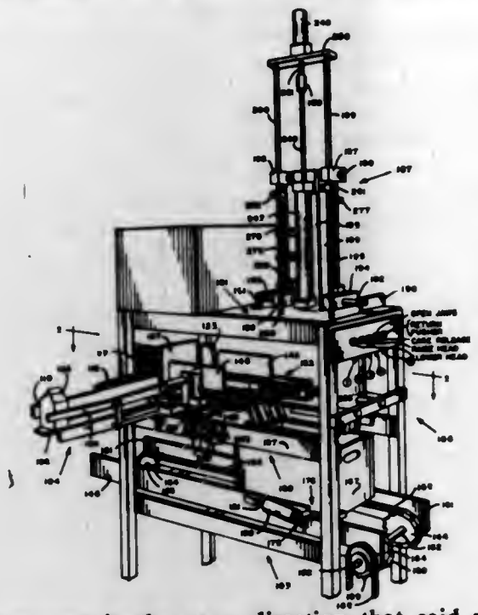
3,273,301
METHOD AND APPARATUS FOR WRAPPING AND PACKAGE PRODUCED
Kelvin G. Anderson, Greer, S.C., assignor to W. R. Grace & Co., Duncan, S.C., a corporation of Connecticut
Filed Aug. 28, 1963, Ser. No. 305,045
11 Claims. (Cl. 53—32)



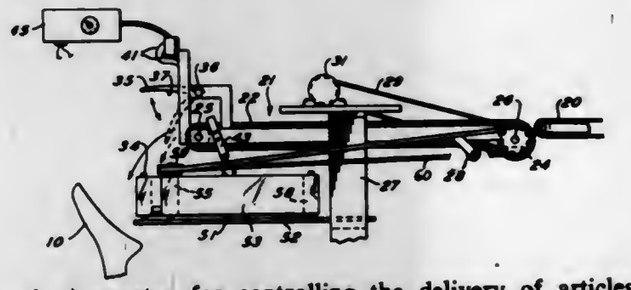
1. A method for wrapping an object in a sheet of organic thermoplastic film comprising:
(a) rotating the object between at least one pair of diametrically opposed electrodes,
(b) establishing a high voltage direct current potential between each of said electrode pairs,
(c) feeding the film sheet between the object and one of the electrodes, and
(d) continuing to rotate the object until the sheet is overlapped to form a tube around the object.

3,273,302
METHOD OF FORMING SHRINK FILM PACKAGE
Richard T. Walter, Norristown, Pa., assignor to Container Corporation of America, Chicago, Ill., a corporation of Delaware
Filed Dec. 16, 1963, Ser. No. 330,680
3 Claims. (Cl. 53—39)

1. A method for forming a package comprising a filled carton encased in a thermoplastic film element, which comprises:
(a) enclosing the filled carton relatively loosely within a thermoplastic film element;
(b) shrinking such film element to tighten it around the filled carton; and
(c) perforating the film element to provide tear strip openings.



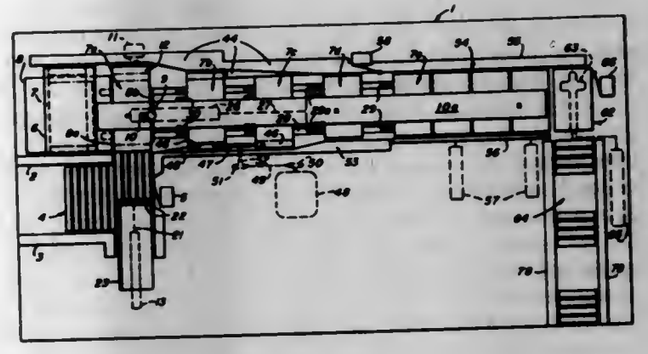
3,273,303
METHOD OF APPLYING CONTAINER CLOSURE
John Charles Hill, London, England, assignor to The Metal Box Company Limited, London, England, a British company
Original application May 6, 1959, Ser. No. 811,477, now Patent No. 3,086,672, dated Apr. 23, 1963. Divided and this application Oct. 1, 1962, Ser. No. 227,153
6 Claims. (Cl. 53—42)



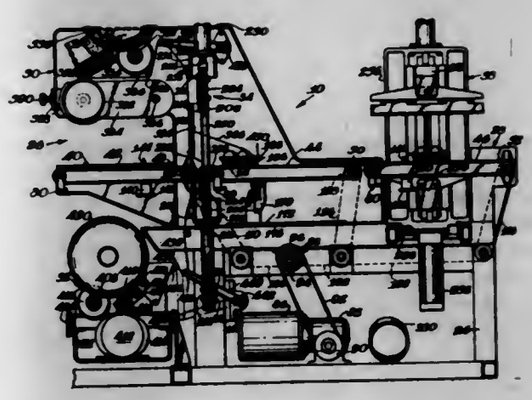
1. A method of securing a cap on a container having a neck provided with projecting multi-start screw-threads in a manner which permits removal and repositioning of the cap after securement thereof on the container, the method comprising the steps of providing a cap having a smooth skirt with a lower outwardly extending peripheral projection, telescoping the cap over the container neck, and then sliding a closing ring having a tapered opening over the cap to directly inwardly deform primarily the cap peripheral projection around the container neck and into meshing engagement with the screw-threads thereof.

3,273,304
CASING MACHINE
Alpheus Winter IV, Fairfield, Joseph F. Pane, Danbury, and Frederick R. Marindin, Woodbury, Conn., assignors to Windor, Incorporated, Danbury, Conn., a corporation of Connecticut
Filed Apr. 17, 1963, Ser. No. 273,595
31 Claims. (Cl. 53—61)

26. In apparatus for casing cartons within a case comprising in combination, a frame; a conveyor for feeding cartons into said frame; a first support within said frame for receiving cartons from said conveyor; a pusher mounted in said frame for successively pushing rows of a predetermined number of cartons from said first support in a direction angularly disposed relative to said conveyor; another support within said frame for receiving the cartons as they are pushed from said first support; transfer means at said another support activatable to move cartons in the same direction as they were pushed thereon by said pusher and independent thereof; and means responsive to a tier being formed on said other support of a predetermined number of rows of cartons for actuating said transfer means to cause said tier to be moved off said other support in the same direction that said rows are moved thereon by said pusher, while said conveyor is feeding the next tier of cartons, whereby said pusher can be continuously operated to reload said other support while a tier of cartons is being moved off said other support.



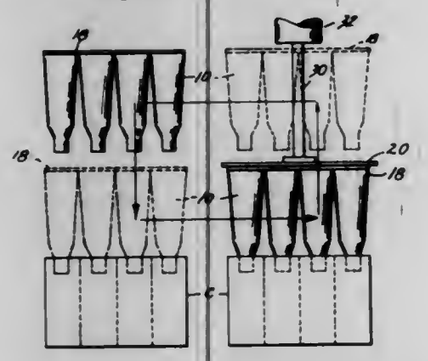
3,273,305
DELIVERY CONTROL APPARATUS
Jack Dreeben, Wyndmoor, Pa. (2601 N. Howard St., Philadelphia, Pa.)
Filed Oct. 9, 1963, Ser. No. 315,068
15 Claims. (Cl. 53—78)



1. Apparatus for controlling the delivery of articles to a packaging machine having reciprocable jaws for advancing packaging material to form a package comprising a linearly advancing article carrying means having a discharge end, a movable gate at said discharge end and having a plurality of positions for article delivery control, a member for receiving articles for delivery to the packaging machine, and a member for temporary reception of articles, said gate positions determining the selective delivery of articles to said members.

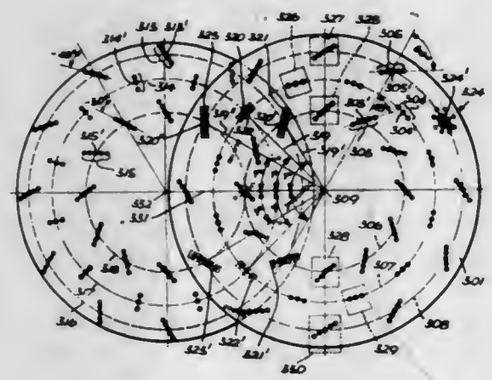
3,273,306
CIGAR PACKAGING MACHINE
Norman D. Maclennan, Dorval, Quebec, Canada, assignor to Imperial Tobacco Company of Canada Limited, Montreal, Quebec, Canada
Filed June 17, 1963, Ser. No. 288,161
5 Claims. (Cl. 53—186)

1. An automatic cigar packaging machine comprising a magazine for a supply of collapsed cartons, carton feed and erection means for feeding collapsed cartons from said magazine and erecting them at a filling station, means for filling an erected carton with cigars at said filling station, and means for closing said carton after it is filled, said carton feed and erection means comprising a bed plate along which a collapsed carton is fed to said filling station, a carton feeder member, means for moving said carton feeder member along the upper surface of said bed plate to push the collapsed carton into said filling station with a longitudinal edge of the carton leading and the diametrally opposed longitudinal edge being engaged by said carton feeder member, said longitudinal edges constituting the eventual upper right-hand and lower left-hand corners of the transverse cross-section of the erected carton, assuming that the carton is fed into the filling station from left to right, stop means engageable by the leading edge of the collapsed carton being fed, a carton hold-down plate spaced above said bed plate a distance approximately equal to the depth of an erected carton, said stop means and said hold-down plate defining the upper-right hand corner of the filling station, and leaf-spring means extending upwardly from said bed plate at an acute angle towards said corner of the filling station to guide the leading edge of the carton to said corner, whereby the carton is automatically erected upon continued movement of said carton feeder member.



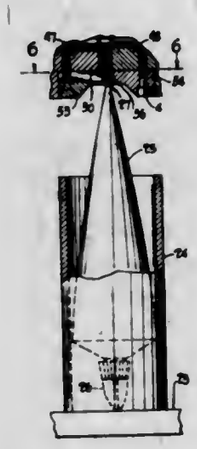
3,273,307
WRAPPING MACHINE
Donald E. Burt, Boston, Mass., assignor to Keyes Fibre Company, Waterville, Maine, a corporation of Maine
Filed Aug. 3, 1964, Ser. No. 386,822
21 Claims. (Cl. 53—228)

1. A wrapping machine comprising in combination a wrapping station, conveyor means connected to transport articles to be wrapped along a predetermined longitudinal



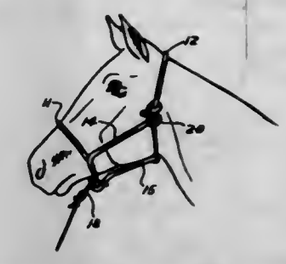
path past the wrapping station, the wrapping station including sheets of flexible wrapping material positioned transversely across the predetermined path whereby the mid-portions of the sheets will be engaged by articles transported by the conveyor means, the conveyor means including first and second longitudinally aligned belt conveyors arranged with their adjacent ends spaced sufficiently closely to transport articles thereacross in a continuous fashion but spaced sufficiently apart to permit transverse positioning of the sheets of flexible wrapping material therebetween, means connected to control the first and second belt conveyors for intermittent operation to transport articles to be wrapped with a step-by-step motion along the predetermined path, the control means including a stop bar mounted for shifting motion between operative and inoperative positions, the bar being extended in the operative position into the predetermined path to arrest motion of articles on the conveyors and the bar being retracted in the inoperative position from the predetermined path to permit passage of articles on the conveyors, power driven means at the wrapping station located on opposite sides of the predetermined path to feed wrapping material laterally toward articles to be wrapped at a predetermined rate coordinated with the rate of articles transported by the conveyor means whereby as articles engage the mid-portions of the transversely positioned sheets of wrapping material and move the mid-portions longitudinally the sheets are arranged in two layers on opposite sides of articles, and sealing means connected to attach the two layers of wrapping material together adjacent the articles to form packages which comprise articles wrapped in flexible material.

3,273,308
CASE PACKING MACHINE
Harald Hoette, West Hartford, Conn., assignor to Emhart Corporation, a corporation of Connecticut
Filed Aug. 14, 1963, Ser. No. 302,076
7 Claims. (Cl. 53—261)



1. A machine for packing cases that are open at the top to receive articles, comprising a generally horizontal open grid frame located at an elevated initial position at a drop station, a plurality of sleeves hanging on the frame, there being one such sleeve in each open grid having an open top end to receive an article inserted through the frame, the sleeve being adapted to retain the article therein and having expansible means associated with its bottom end, means for assembling a pack of articles over the frame and for inserting them substantially simultaneously through the frame into the sleeves, means for locating an open case below the frame, means for lowering said frame toward said case, means for then moving the case and frame substantially horizontally to a release station, a pressure pad movable over said frame at the release station to substantially seal the open tops of the sleeves, means for introducing air under pressure simultaneously to said sleeves to force articles therein through the associated expansible means into said case, means for elevating said frame and said pressure pad at said release station, and means for returning said frame to its initial position.

3,273,309
APPARATUS FOR FILLING AND SEALING TWO-PIECE CAPSULES AND THE LIKE
Otto Wolf, Kirchheim, Teck, and Theo Moser, Waiblingen, Wurttemberg, Germany, assignors to Höfliger & Karg, Waiblingen, Germany, a firm of Germany
Filed Oct. 1, 1962, Ser. No. 227,479
Claims priority, application Germany, Jan. 5, 1962, H 44,537; Jan. 22, 1962, H 44,680
6 Claims. (Cl. 53—281)

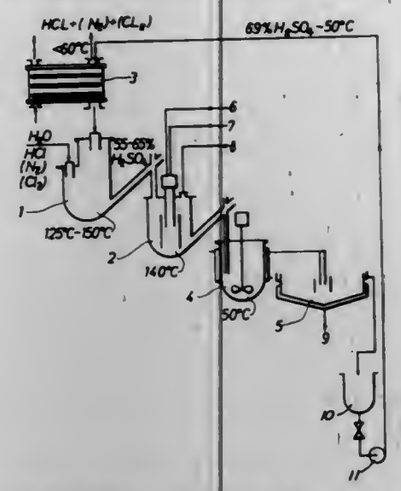


2. In an apparatus for filling and sealing two-part capsules, in combination, a pair of disks mounted for intermittent rotary movements at a certain step angle about spaced parallel axes at such a distance from each other that a portion of one disk overlaps a portion of the other disk, both of said disks having a plurality of apertures arranged in a plurality of groups forming several series radially spaced from each other, the apertures in one of said disks being adapted to receive the upper parts of said capsules and the apertures in the other disk being adapted to receive the lower parts of said capsules, the overlapping portions of said disks defining two spaced transfer stations for each series, all apertures of one group of one series of one disk being simultaneously in alignment at said stations with all apertures of one group of one corresponding series of the other disk during the intervals between the intermittent movements of said disks, all apertures and a central point of each of said aperture groups in each disk being located on at least one straight line, said central points of said groups of each series being located on one circle and being equally spaced from each other, the circles of different series having different diameters and being concentric to the axis of the respective disk, each aperture at one side of said central point on each straight line being associated with a corresponding aperture at the other side of and equally spaced from said central point, said circle of each series of one disk intersecting at said transfer stations at right angles with the circle of the corresponding series of the other disk, said straight lines of the aperture groups of at least some series of each disk forming equal angles other than 90° to the radii of the respective disk intersecting said central points, said angles of said straight lines of each group of each series of one disk differing by 90° from said angles of said straight lines of the groups of the corresponding series of the other disk, the size of the angle between two radii of each disk intersecting said centers of said two transfer stations of each of said series when divided by the size of the step angle of the respective disk resulting in an integral number and the angle of one complete revolution of each disk when divided by the half of said angle, between two radii of each disk intersecting said centers of said two transfer stations of at least one of said series resulting in an integral number.

3,273,310
COLLAPSIBLE-TUBE CLOSURE CRIMPING UNIT
Philip Freeman, 1391 E. 33rd St., Cleveland, Ohio
Filed Nov. 14, 1963, Ser. No. 323,759
1 Claim. (Cl. 53—371)

In a collapsible tube filling machine of the type having conveyor means for holding the tubes in a vertical, inverted, position and intermittently moving same along the base of the machine between tube filling and tube closing stations, a tube closure crimping unit, comprising in combination, an upright frame mounted on the mamounted on the frame, including means for moving the panel in a vertical plane between adjusted positions; a pneumatic cylinder mounted on the panel and extending laterally thereof in a horizontal plane, the cylinder having a stationary head at the free end thereof centered over the conveyor; a pair of spaced guide rails mounted on the end face of the stationary head, and extending therefrom over the conveyor and across its travel path; a movable head connected to the end of the pneumatic cylinder piston rod and slidably mounted on the guide rails for travel longitudinally thereof; a nylon spacer mounted on the guide rails between the stationary and movable heads; a toothed crimper jaw mounted on the bottom edge of the stationary head, said jaw having type slugs mounted therein with their impression faces extending beyond the plane of the forward edges of the jaw teeth; a second toothed crimper jaw mounted on the bottom edge of the movable head, with its teeth in opposition to the stationary crimper jaw teeth and movable toward and away from the first crimper jaw with its supporting movable head; the width of the nylon spacer being such that when it is contacted by both the stationary and movable heads, the teeth of the second crimper jaw will be spaced from the impression faces of the type slugs carried by the first crimper jaw; and cam means, activated by the cycling mechanism of the tube filling machine, for controlling the pneumatic cylinder, to move the cylinder piston rod between a first, extended, position wherein the movable head and its crimper jaw are made to travel away from the stationary head and its crimper jaw, and a second, retracted, position wherein the movable head and its crimper jaw are urged toward a position whereat the movable jaw acts to press the folded closed end of a filled tube, held by the conveyor between the two jaws, against the stationary crimper jaw to impress the crimp pattern, of the two jaw teeth and type indicia, on both faces of the so folded and sealed tube end.

3,273,311
ANIMAL HALTER
Gary G. Henry, 2119 S. Cleveland, Sioux City, Iowa
Filed Aug. 12, 1964, Ser. No. 389,059
3 Claims. (Cl. 54—24)



1. Halter means for livestock comprising a yoke, a nose loop portion, a head loop portion and a pair of side pieces connecting said nose loop portion to said head loop portion, said halter means being formed from a unitary and continuous length of hollow braided line having opposite respective terminal ends and adapted to receive and enclose another section of said line within itself, said nose loop portion being formed from a section of said line lying between a first point near one of the terminals ends of said line and a second point spaced from said first point by a distance equal to twice the length adequate to form said nose loop portion, said one terminal end of said line being inserted within said line at said second point and forced around within said line so that said nose loop portion is formed of a coaxial layer of said line, one of said side pieces being defined by a section of said line lying between said second point and a third point on said line, a loop and lock being formed in said line at said third point, said yoke being formed from a section of said line lying between said third point and a fourth point on said line, said yoke having a loop intermediately thereof, said loop being formed by insertion of the opposite free end of said line into the interior of said line near the midpoint of said yoke section forcing said opposite end back through said line a predetermined distance and withdrawing it from the interior of said line, said line being withdrawn until a relatively small loop remains at said midpoint, the other of said side pieces being formed from a section of said line lying between said fourth point and a fifth point on said line spaced from said fourth point by substantially twice the length of said other side piece, said other side piece being provided with a loop engaging said nose loop portion by threading the opposite free end of said line through said nose portion at a desired point thereon and thereafter threading said opposite free end of said line back into said line, passing it back to said fourth point and there withdrawing it and drawing said line through said other side piece until said loop is formed, the balance of said line forming said head loop portion and being secured to said loop at said third point to form the completed halter means.

3,273,312
PROCESS FOR DRYING GASES WHICH CONTAIN HYDROGEN CHLORIDE
Hans Zirngibl, Duisburg, and Jakob Rademachers, Krefeld, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation
Filed May 18, 1964, Ser. No. 367,994
Claims priority, application Germany, May 28, 1963, F 39,857
6 Claims. (Cl. 55—31)

1. Process for drying gases containing hydrogen chloride by contact with semi-concentrated sulfuric acid, which comprises conducting the hydrogen chloride containing gas in counter-current contact with semi-concentrated sulfuric acid in an absorption stage, in which the concentration of the sulfuric acid entering such absorption stage is

about 65 to 70% by weight H_2SO_4 and the concentration of the sulfuric acid discharging from such absorption stage is about 55 to 65% by weight H_2SO_4, dissipating the heat evolved during the absorption stage contact so that the

temperature of the unabsorbed gas at the end of the absorption stage contact amounts to about 15 to 60° C. while the temperature of the discharging sulfuric acid from such absorption stage is about 115 to 150° C.

3,273,313

MEANS AND METHOD FOR SEPARATING GASES FROM LIQUIDS

Robert M. Livesey, Burbank, and Mark H. Ettinger, North Hollywood, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.

Filed Feb. 13, 1963, Ser. No. 258,347
9 Claims. (Cl. 55—46)

1. A gas separator for removing gas from liquids comprising:

(a) means defining a gas extraction chamber;

(b) fluid inlet means and gas outlet means in said extraction chamber means spatially separated from one another for respectively admitting a fluid under a predetermined pressure and removing separated gas;

(c) depressurizing means in fluid communication with said extraction chamber for establishing a subatmospheric pressure therein;

(d) passage means in said extraction chamber means leading from said last-mentioned means through said depressurizing means and having a liquid outlet spatially separated from said gas outlet means; and

(e) a separator element mounted in said extraction chamber means, said element having an upstream side in fluid communication with said fluid inlet and a downstream side in fluid communication with said depressurizing means, said separator element being pervious to said fluid and impervious to gas bubbles entrained therein when said bubbles are expanded by being exposed to said subatmospheric pressure upon entering said extraction chamber.

3,273,314

REMOVAL OF ALKYNES FROM GASEOUS STREAMS WITH A SILVER CARBOXYLATE ION EXCHANGE RESIN

Harold W. Quinn, Sarnia, Ontario, Canada, assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

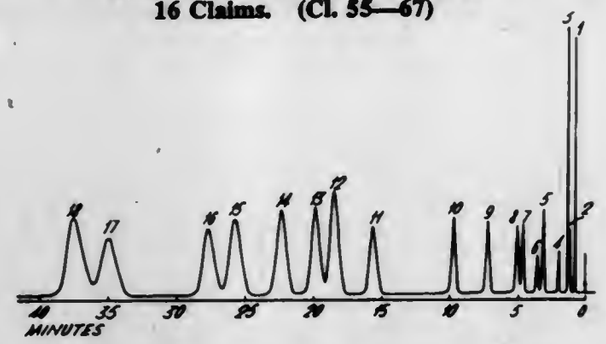
No Drawing. Filed June 29, 1964, Ser. No. 378,957
7 Claims. (Cl. 55—63)

1. A process for removing an alkyne of the formula:

$$RC{\equiv}CH$$

wherein R is one from the group consisting of H, methyl and ethyl, from a gaseous mixture containing up to 5000 p.p.m. of the alkyne which comprises:

(A) Contacting the gaseous mixture at a temperature in the range from about 0° to 120° C. with a silver carboxylate ion exchange resin in which at least 40 mole percent of the exchangeable cations are silver ions, whereby the alkyne is adsorbed by the silver carboxylate resin, and



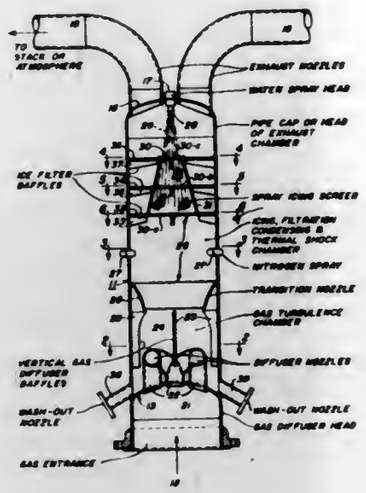
(B) Recovering therefrom a gas with a lower alkyne content.

3,273,315

SEPARATION OF ORGANIC COMPOUNDS

John Victor Mortimer, Sunbury-on-Thames, England, assignor to The British Petroleum Company Limited, London, England, a British joint-stock corporation

Filed Sept. 12, 1963, Ser. No. 308,397
Claims priority, application Great Britain, Sept. 25, 1962, 36,388/62; Dec. 3, 1962, 45,480/62
16 Claims. (Cl. 55—67)



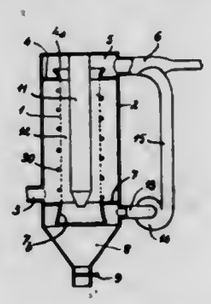
1. An active constituent for use in the resolution of a mixture of organic compounds by a gas chromatographic process, the constituent comprising a mixture supported on an inert solid, said mixture being (a) organo-clay compound in which at least some of the replaceable inorganic cations present in said clay compound capable of inter lamellar expansion are replaced by organic cations, the organo-clay compound being in particulate form, and (b) a modifying agent therefor, the modifying agent being a substance of low volatility which at process operating temperatures will be a liquid whereby no substantial amount of said liquid is volatilised in use at process operating temperatures, which is a solvent for at least one of the components of said mixture of organic compounds to be resolved and which does not react chemically with the organo-clay compound and with the components of the mixture to be resolved.

3,273,316

INDUSTRIAL WASTE GAS PURIFIER METHOD

Sigmund L. Ross, 2761 Sedgewick Ave., Bronx 68, N.Y.

Filed Feb. 3, 1964, Ser. No. 342,214
8 Claims. (Cl. 55—90)



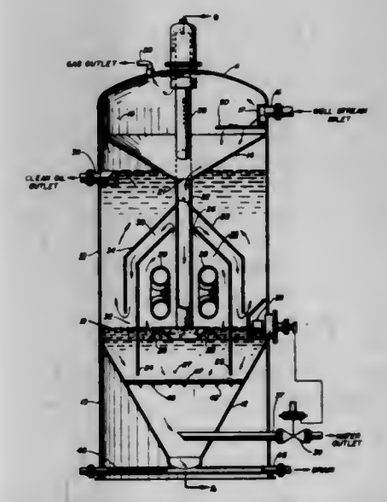
1. The method of purifying industrial waste gases which includes flowing such waste gases upwardly, spraying water downwardly, gasifying liquid nitrogen in contact with said water spray and expanding the so gasified nitrogen to form ice crystals from a portion of said water spray, separating said ice crystals from the ascending gases and moving the ascending gases in contact with masses of such separated ice crystals, draining and removing the melt from such ice crystals and the portion of said water spray which has not been converted into ice crystals, and exhausting the resultant gases.

3,273,317

SLEEVE FILTERS

Pierre Georges Vicard, 15 Cours Eugenie, Lyon, France

Filed Oct. 6, 1961, Ser. No. 143,408
Claims priority, application France, Oct. 12, 1960, 40,828, Patent 1,276,842
2 Claims. (Cl. 55—103)



2. A filter for a fluid containing particles in suspension comprising tubular filtering elements in the form of substantially cylindrical sleeves each having a first end, a second end and a filtering wall made of a highly insulating textile material capable of developing electrostatic charges by frictional effect, with said filtering wall having an inner side and an outer side; an inner substantially cylindrical core disposed in each one of said sleeves, substantially coaxially thereto, to limit the fluid passage through the sleeve to an annular space of reduced cross-section; fluid inlet means to supply the fluid to be filtered to the first ends of said sleeves; a collecting chamber communicating with the second ends of said sleeves; means to recycle a portion of the fluid to be filtered from said collecting chamber into said inlet means; means to collect the fluid filtered through the filtering walls of said sleeves; and a helical grounded wire-like electrode disposed closely adjacent to the outer side of the filtering wall of each sleeve, to retain by electrostatic action against the adjacent portion of the inner side of the filtering wall of each sleeve the particles which have been retained by said filtering wall, which have been entrained by said fluid to be filtered and which have been electrostatically charged by friction against said filtering wall.

3,273,318

DE-SANDING EMULSION TREATER

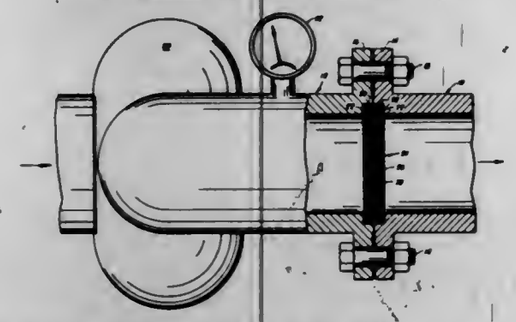
Paul E. Meyer, Tulsa, Okla., assignor to National Tank Company, Tulsa, Okla., a corporation of Nevada

Filed Feb. 10, 1964, Ser. No. 343,587
3 Claims. (Cl. 55—175)

1. An emulsion treater for petroleum well streams containing foreign matter such as sand including,

an emulsion treating vessel having an inlet for well streams,

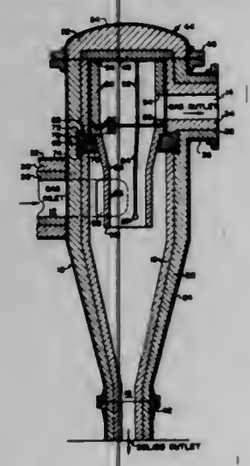
a compartment formed within the vessel by upright walls which provide openings at the top and bottom of the compartment, a conduit connected between the inlet and bottom of the compartment for direct conductance of the liquids of the well stream to horizontal distribution in the compartment,



heating means mounted within the compartment for initially raising the temperature of emulsion of the distributed liquids flowing upward through the compartment substantially more slowly than the liquids are conducted to the compartment so the viscosity of the emulsion will be lowered enough to allow substantial amounts of foreign matter in the emulsion to fall from the compartment and into the lower part of the vessel,

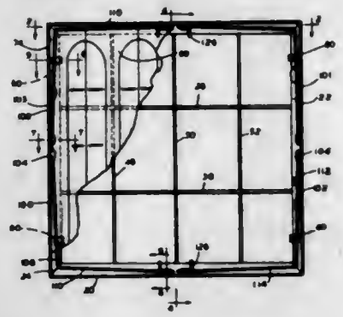
means for maintaining an interface of water and oil and emulsion in the lower part of the vessel,

a passageway formed by baffles on the outside of the compartment and closed in its connection to the opening at the top of the compartment to receive the upwardly flowing emulsion from the compartment and flow the emulsion downwardly at a velocity greater than the upward velocity within the compartment and release the emulsion within the vessel toward the interface,



a coalescing section within the vessel above the discharge end of the passage and which is sized to receive the emulsion released toward the interface, and water and gas and clean oil outlets from the vessel.

3,273,319
DEVICE FOR REMOVING ENTRAINED GASES FROM VISCOUS LIQUIDS
Wray H. Jones, Orwin G. Maxson, and Billy W. Terry, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma
Filed June 5, 1963, Ser. No. 285,718
3 Claims. (Cl. 55—199)

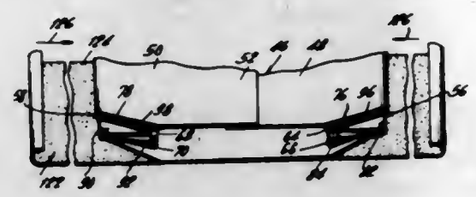


1. A device for removing entrained gases from a viscous fluid comprising:
(a) a first tubular member;
(b) a second tubular member connected to said first tubular member in coaxial alignment therewith and spaced therefrom to provide an unobstructed gap separating the adjacent ends of said first and second tubular members and
(c) a screen positioned between said members and extending substantially normal to the longitudinal axis of said members and entirely across the passage created by said tubular members for impeding fluid flow between said members, said screen terminating immediately adjacent said gap in the interior of said members whereby gas flows from said screen through said gap to the exterior of said tubular members.

3,273,320
CYCLONE SEPARATOR FOR HIGH TEMPERATURE OPERATIONS
Lawrence Joseph Delaune, Byron Victor Molstedt, and Robert Harry Waghorne, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware
Filed July 15, 1963, Ser. No. 294,987
11 Claims. (Cl. 55—267)

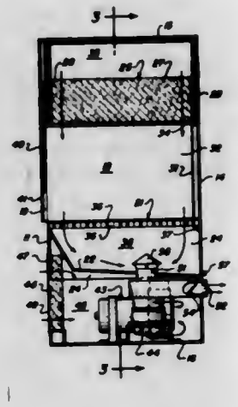
1. A cyclone separator particularly adapted for use in operations above 2000° F. which includes an enclosing metal wall with a tangential entry for solids-laden gases, separate outlets for gases and solids, refractory walls contiguous to and lining the metal wall, refractory linings for the said entry and outlets, a support shelf circumferentially mounted within and projecting inwardly from the side walls, a separate refractory cyclone tube located within the confines of the enclosing walls, said tube being provided with a plurality of longitudinal slits extending through the refractory wall, downwardly from the top and terminating short of the bottom of the tube, said tube having an outwardly projecting upper flange portion which provides a lip, the lower side of which impinges upon said shelf to position and space the tube away from the walls and within a space separating the entry and outlets, a refractory hold-down ring resting upon the top of the flange and located between the cyclone tube and the refractory lined metal wall enclosing the top of said cyclone separator by virtue of which arrangement excessive movement and vibrations of the cyclone tube by impingement thereupon of solids and gases is prevented.

3,273,321
AIR FILTER HAVING A REPLACEABLE CARTRIDGE
Carl J. Bauder, Charles G. Hart, and Douglas R. Cleminshaw, Syracuse, N.Y., assignors to Cambridge Filter Corporation, Syracuse, N.Y., a corporation of New York
Filed Aug. 26, 1963, Ser. No. 304,351
13 Claims. (Cl. 55—341)



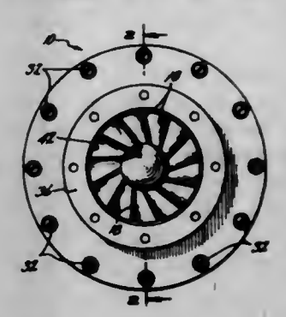
1. An air filter comprising a rectangular frame having an inwardly extending flange extending around the downstream side thereof, a pleat supporting wire grid secured to said flange, said grid having a rectangular wire frame affixed to the downstream side of said flange, and a plurality of wires lying in uniformly spaced vertical planes secured to the upper and lower sides of said wire frame, said wires having central portions thereof offset upstream into the frame, and pocket forming wires lying in generally horizontal planes affixed to the side portions of said wire frame, said pocket forming wires having downstream extending loop portions between the adjacent offset wires and the frame side portions, and upstream portions bent over the offset central portions of said offset wires, a filter cartridge having a plurality of pleats having folds disposed over the offset portions of said offset wires, and pocket forming portions extending into the loop portions of said pocket forming wires and a perimetral flange disposed downstream from the plane of said pleat folds and lying against the upstream side of said frame flange, and the inside faces of said frame, and displaceable resilient sealing rods bearing on said cartridge flange, and yieldingly sealing said cartridge flange against the upstream side of said frame flange and the inside faces of the frames.

3,273,322
DISPOSABLE VACUUM CLEANER BAG
John J. Fesco, Baldwin, N.Y., assignor to Studley Paper Company, Inc., a corporation of New York
Filed Dec. 4, 1962, Ser. No. 242,164
1 Claim. (Cl. 55—376)



An expendable vacuum cleaner bag formed of a substantially rectangular blank of air pervious sheet material, said blank having portions which define the opposing side walls of said bag and axially pleated portions which define opposing pleated end walls of said bag, said blank having notches defined at the upper marginal end thereof

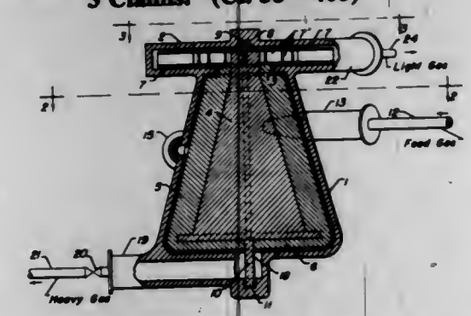
for projecting upper end portions of said pleated portions beyond adjacent marginal end portions of said side walls, an air impervious closure provided at the bottom of said bag, and a collar provided at the upper end of said bag, said collar being secured to said opposing side walls and to said projecting portions of said pleated portions, said notches being provided at the four junctures of said side and end walls, each end wall having a pair of inwardly directed pleats and each notch being defined between one pleat and the adjacent side wall, each pleat of said pair of inwardly directed pleats being defined by a first one of said axial pleat end wall portions and a



second one of said axial pleat end wall portions, each second axial pleat end wall portion being normally folded against an adjacent side wall portion, each notch being defined by an oblique cut at the upper marginal edge of each second axial pleat and its associated side wall portion so as to disclose at each said juncture above each side wall an upper end surface portion of each first one of said axial pleat end wall portions, and said collar encompassing the upper marginal end of said bag and being adhesively secured to each of said side walls and to said disclosed upper end surface portions of each first one of said axial pleat end wall portions.

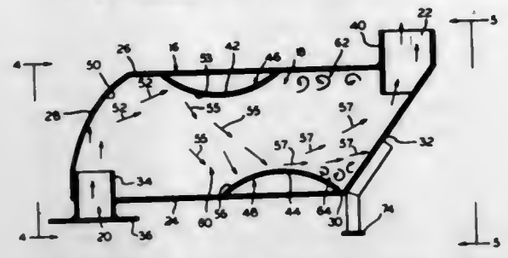
3,273,323
LAMINAR FLOW AIR HOOD APPARATUS
Willis J. Whitfield, Albuquerque, N. Mex., assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission
Filed Dec. 24, 1963, Ser. No. 333,235
5 Claims. (Cl. 55—385)

1. A laminar flow air hood apparatus comprising the combination of generally upright wall means substantially surrounding a space, a generally horizontally disposed submicron air filter substantially filling a cross-sectional space within confines of said wall means adjacent upper portions thereof, a top member spaced above the air filter and joined with said wall means forming with the latter and an uppermost surface of the air filter a plenum chamber, a platform below and spaced from the air filter, said wall means including portions forming an air inlet passageway communicating with the plenum chamber and portions spaced inwardly from and extending generally along outer portions and forming with the filter and platform a work chamber, at least part of the wall means below the air filter and adjacent the platform being displaceable to provide an opening for ingress and egress of the work chamber, a third chamber or compartment extending below said work chamber and platform, partition means forming a lower boundary of the third chamber extending generally between the wall means, a fourth chamber below said third chamber and partition, a lower end wall forming a bottom of the fourth chamber, a second air filter in the fourth chamber, first blower means in the fourth chamber for drawing air through the second air filter and discharging it to said inlet passageway and said plenum chamber to flow through said sub-micron air filter and downwardly as a body of air moving substantially parallel to said inwardly spaced portions of the wall means and with said body of air traversing the work chamber below the sub-micron filter in an essentially uniform manner and velocity throughout substantially all cross sections of the work chamber, passageway means providing communication between the work chamber and the third chamber, second blower means in the fourth chamber for drawing air through the passageway means and discharging it external of the assembly, means for selectively controlling the quantity of air discharged by the second blower means independently of the quantity of air supplied by the first blower means to provide a balanced air flow condition or an air inflow condition via said opening or an air outflow condition via said opening, and an outlet drain from said third chamber for discharging fluids from the third chamber.



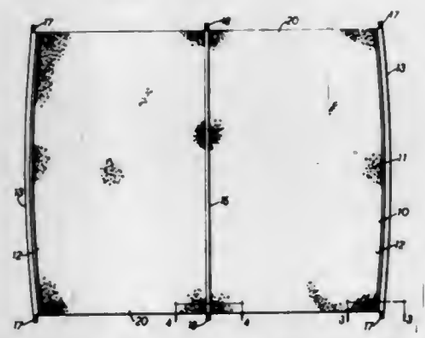
3,273,324
TURBINE DRIVEN ROTARY LIQUID-GAS SEPARATION SYSTEM
David C. Jennings, Windsor Locks, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Filed May 28, 1962, Ser. No. 198,364
1 Claim. (Cl. 55—404)

The combination of a duct having wall means defining an enlargement therein, said duct having a longitudinal axis, said enlargement containing a rotary centrifugal separator for removal of liquid entrained in gas flowing in said duct, said separator including an open ended hollow rotary frusto-conical element, said element being coaxially and rotatably mounted in said duct enlargement, an inwardly extending flange at the larger end of said element, said flange and said element defining an annular space within said element at the larger end of said element for the collection of liquid, a porous mass disposed within said element adjacent its smaller end, said mass peripherally engaging the interior surface of said element so that gas with entrained liquid flowing through said element must pass through said mass and so that the liquid in said gas is entrained in said mass to be carried by centrifugal force into the annular space as the element rotates, and means for removing liquid from the annular space including a fixed tube extending through said wall means defining an enlargement in said duct and terminating in an open end portion disposed in said annular space, said open end portion extending tangential to said annular



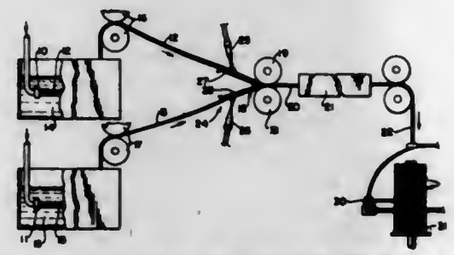
space and in a direction opposite to the direction of rotation of said frusto-conical element, and means to rotate said frusto-conical element comprising a hub rotatably mounted coaxial with said longitudinal axis and extending through said frusto-conical element and having an end adjacent the larger diameter end of said frusto-conical element, a plurality of radially extending turbine buckets extending from and attached to the end of the hub at the larger diameter end of said frusto-conical element, a core member coaxial with said longitudinal axis, said core member disposed adjacent to the end of said hub at the larger diameter end of said frusto-conical element, a plurality of whirl inducing vanes attached to and extending radially from said core members, the radial extremity of each of said whirl inducing vanes being attached to said duct, and means connecting said frusto-conical element to said hub for rotating said frusto-conical element.

3,273,325
ROTARY GAS SEPARATOR
Clarence G. Gerhold, Palatine, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware
Filed Jan. 9, 1963, Ser. No. 250,739
3 Claims. (Cl. 55—405)



1. A rotary gas separator comprising:
(a) a chamber defined by a frustoconical casing having a first circular endwall of minimum diameter and a second circular endwall of maximum diameter, and a central aperture through each of said endwalls;
(b) a frustoconical rotor member rotatably mounted within said chamber and having its major base adjacent said second endwall and defining with the chamber an annular space of uniform radial width but of varying average diameter with respect to distance along the axis of rotation of the rotor member;
(c) a plurality of circumferentially spaced radial vanes attached to and extending radially outwardly from the rotor member, each radial vane extending substantially the full longitudinal length of the rotor member;
(d) a number of circumferentially spaced blades attached to and extending across the major base of said rotor member and projecting longitudinally into close proximity to said second endwall;
(e) an enclosed volute housing of larger diameter than and spaced beyond said first endwall and communicating with said chamber through the central aperture in said first endwall;
(f) an impeller member rotatably mounted within said volute housing;
(g) rotary shaft means connecting said rotor member with said impeller member;
(h) a number of convergent feed nozzles tangentially connected to said casing and communicating with said chamber at points which are spaced apart from one another both radially and also along the longitudinal length of the casing;
(i) a light gas withdrawal duct tangentially connecting with said volute housing; and
(j) a heavy gas withdrawal duct connecting with the central aperture in said second endwall.

3,273,326
SPARK ARRESTOR FOR DIESEL LOCOMOTIVE ENGINES
Merle L. Benzer, 559 S. Oak Park Court, Milwaukee 14, Wis.
Filed Oct. 26, 1964, Ser. No. 406,329
6 Claims. (Cl. 55—434)

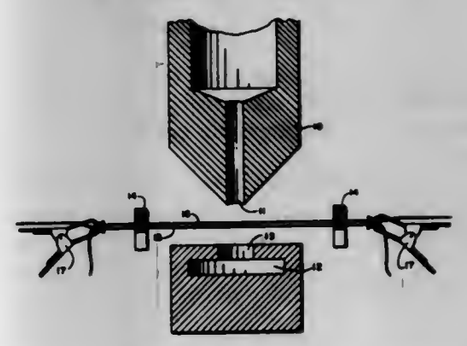


1. A spark arrestor for application to diesel engine exhaust stacks and the like comprising:
a chamber defining an open flow path for combustion exhaust gases,
said chamber including an inlet passage at one end of said chamber on one side thereof and an outlet passage at the other end of said chamber at the side of said chamber opposing said one side,
with said passages being directed substantially at right angles to said flow path,
said chamber defining a first deflecting surface in flow deflecting relation to said inlet passage and a second flow deflecting surface in flow deflecting relation to said outlet passage,
said second surface being oriented to deflect exhaust gases passing through said flow path into and out of said outlet passage,
said chamber defining a pair of turbulence inducing convexly curved protuberances extending into said flow path intermediate said passages,
one of said pair of protuberances being positioned at said one side of said chamber,
and the other of said protuberances being positioned at said opposing side of said chamber,
said first deflecting surface being oriented to deflect exhaust gases against said other protuberance,
and said other protuberance being positioned to deflect exhaust gases in the direction of said one protuberance.

3,273,327
PLASTIC AIR FILTERS
Donald E. Hoffman, West Seneca, N.Y., assignor to Fedders Corporation, Edison, N.J.
Filed June 18, 1964, Ser. No. 376,097
1 Claim. (Cl. 55—507)

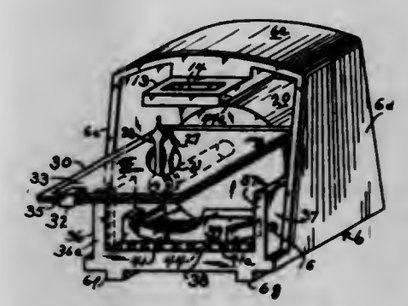
The combination with a rectilinear duct having spaced opposed mounting holes in its upper and lower walls, of a filter unit for installation in the duct, said unit having parallel upper and lower margins adapted to contact the side walls of the duct, and outwardly curved side margins adapted to tangentially contact the side walls of the duct, said unit being of resilient plastic foam material and having solid marginal plastic reinforcements on its curved sides and intermediate solid plastic reinforcements extending between the parallel margins of said unit opposed pintles at the ends of the marginal plastic reinforcements, the curvature of said reinforced sides being such when said unit is mounted in said duct by stretching to engage the pintles thereof in the mounting holes of the duct, the shape of said unit becomes rectilinear to completely cover the cross section of said duct.

3,273,328
PROCESS AND APPARATUS FOR MAKING BULKED FILAMENT YARNS
Godfrey Bloch, 38 E. 75th St., New York, N.Y.
Filed Feb. 4, 1965, Ser. No. 430,310
18 Claims. (Cl. 57—34)



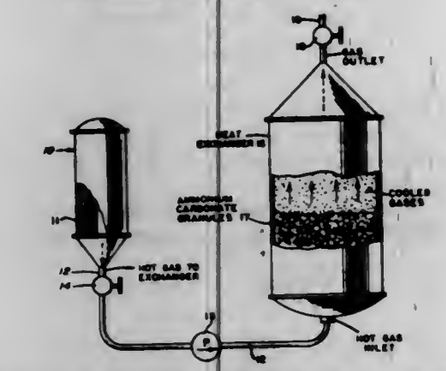
12. An apparatus for producing bulked filament yarns comprising means (1) for continuously advancing two groups of continuous synthetic filaments lengthwise towards a merging zone with the filaments in one group having the capability of being crimped to a substantially greater extent than are the filaments of another group, and (2) for causing said groups of filaments to form a bundle at said merging zone, means for causing the filaments in the two groups when combined into said bundle to be interleaved and intermixed sufficiently to cause the filaments from each group to be distributed substantially throughout the cross-section of the bundle and comprising means for subjecting the filaments from both groups to sufficient gas currents to open up the filaments from said groups, said advancing means being operable to advance the filaments from said groups with the filaments from each group sufficiently free from each other while being subjected to said gas currents to cause filaments from the two groups to open up and the filaments from the two groups to become interleaved and intermixed sufficiently when said opened filaments are in said bundle to cause the filaments from each group to be distributed substantially throughout the cross-section of the bundle, and means for forming said bundle into a singles yarn having the filaments still continuous and the filaments from said one group crimped to an extent substantially greater than are the filaments from the other group and having the filaments from each group distributed throughout substantially the cross-section of the yarn.

3,273,329
TEXTILE YARNS
Frederick Scragg, Mobberley, England, assignor to Ernest Scragg & Sons Limited, Macclesfield, England
Original application July 25, 1963, Ser. No. 297,510, now Patent No. 3,199,284, dated Aug. 10, 1965. Divided and this application Feb. 23, 1965, Ser. No. 434,257
Claims priority, application Great Britain, July 26, 1962, 28,710/62
5 Claims. (Cl. 57—140)



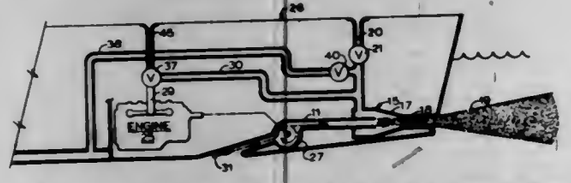
1. A textile yarn consisting of an elongated strip of plastic material which is twisted and formed with a plurality of relatively closely spaced elongated openings surrounded and defined by uniformly spaced narrow strip portions, said openings having adjacent opening portions at least some of which are connected by transverse slots so as to form between said adjacent openings portions a plurality of free projecting strip portions which are distributed along said strip in a regularly recurring pattern and at least some of which are located at the exterior of the yarn projecting from the surface thereof.

3,273,330
METHOD FOR FORMING A THREAD JOINT
Conrad J. Gonsalves, Arnhem, Netherlands, assignor to American Enka Corporation, Enka, N.C., a corporation of Delaware
Filed Nov. 4, 1963, Ser. No. 321,244
Claims priority, application Netherlands, Nov. 14, 1962, 285,518
5 Claims. (Cl. 57—159)



1. A method of uniting at least two ends of multifilament threads which comprises arranging at least two thread ends in substantially parallel overlapping relation, clamping the overlapped thread portions at at least two points, directing at least one jet of gas across the overlapped thread portion and between the clamped points while maintaining the overlapped thread portion under tension.

3,273,331
ELECTROLUMINESCENT DIAL CLOCK AND NIGHT LIGHT
Joseph G. Mosovsky, 249 E. 2nd St., New York, N.Y.
Filed Aug. 13, 1965, Ser. No. 479,479
11 Claims. (Cl. 58—50)



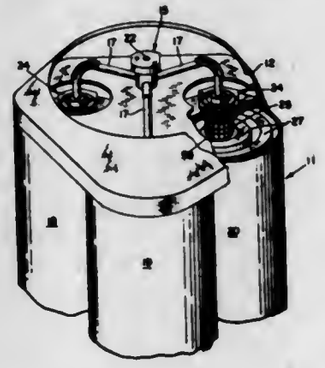
1. In a clock, a case comprising a housing and a cover having a transparent front part, a clock mechanism affixed in said housing, a minute and hour arbor extending from said clock mechanism, a pair of time indicating hands affixed at one end of said minute and hour arbors respectively, an electroluminescent cell having a central opening is affixed in said housing and being coaxially disposed on said minute and hour arbors between said clock mechanism and said time indicating hands, opaque time markers and said time indicating hands being disposed so as to be viewed against the background light of said electroluminescent cell, and electrical energizing means being provided.

3,273,332
PRODUCTION OF COOLED PROPELLANT GASES THROUGH ENDOTHERMIC REACTION
George L. Poudrier, Fredericksburg, Va., assignor to the United States of America as represented by the Secretary of the Navy
Filed Sept. 3, 1963, Ser. No. 306,395
2 Claims. (Cl. 60—35.4)

1. A method of cooling gases through an endothermic decomposable reaction, comprising:
producing a gas through the combustion of a propellant;
passing said gas through a mass of solid granules of a decomposable material, said decomposable material cooling said gas and producing additional gas through process of decomposition, which additional gas is non-condensible under normal conditions.

3,273,333
WATER JET PROPULSION DEVICE
Poul B. Roulund, Redondo Beach, Calif., assignor of twenty percent to Edward A. Sokolski
Filed Sept. 12, 1963, Ser. No. 308,513
9 Claims. (Cl. 60—35.5)

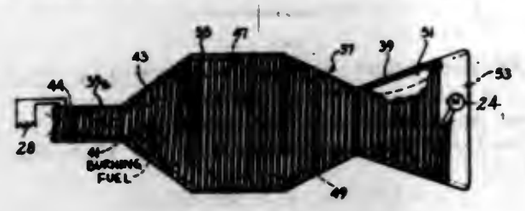
1. A water jet propulsion device for propelling an aquatic vehicle comprising
a pump mounted in said vehicle,
means for feeding water from the ambient water supply to said pump, said pump impelling said water in the form of a water jet,
means for ventilating said water jet with air from the ambient supply thereof, and
means for emitting said ventilated water jet out from the hull of said vehicle below the water line thereof into the ambient water as a propulsive jet for said vehicle.



3,273,334
RAMJET MISSILE
Frank I. Tanczos, Washington, D.C., Thomas Davis and Edward H. Smith, Silver Spring, Md., and James W. Mullen II, Richmond, Va., assignors, by direct and mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Sept. 10, 1959, Ser. No. 839,260
2 Claims. (Cl. 60—35.6)

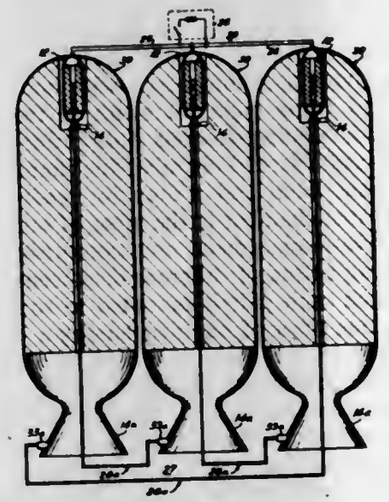
1. A reactive propulsion engine comprising a body suitable for supersonic flight having an ogival nose section and a convergent sheltered rear section with the maximum cross-sectional area of the body disposed at the junction of said nose and rear sections and normal to the longitudinal axis of the body, said body being defined on the underside thereof by a plurality of intersecting concave surfaces of revolution and on the upper side thereof by a convex surface of revolution intersecting said concave surfaces, and means disposed within said sheltered rear section for supplying combustible fuel into the airstream downstream from said maximum cross-

sectional area and within said sheltered rear section to introduce heat into the airstream in an amount sufficient to breakdown the supersonic airstream by normal shock and allow continuous combustion of fuel within the sheltered rear section under subsonic conditions.



3,273,335
MANIFOLD IGNITION SYSTEM FOR SOLID PROPELLANT ROCKETS
Edward S. Gravlin and Frederick L. Haake, both of Oxnard, Calif., assignors to the United States of America as represented by the Secretary of the Navy
Filed May 4, 1964, Ser. No. 364,866
9 Claims. (Cl. 60—35.6)

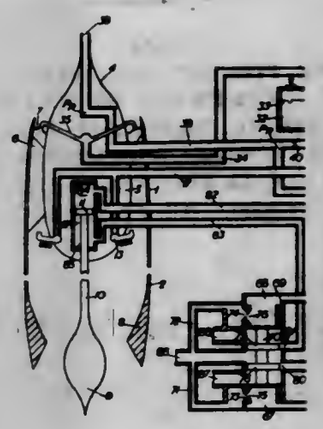
1. A manifold ignition system for igniting substantially simultaneously a cluster of rocket motors comprising:
a primary charge disposed in a central ignition chamber remotely positioned from said rocket motors for propagating high temperature combustion products to be communicated to each of the rocket motors;
a plurality of ignition means disposed one each adjacent to the propellant of each of the rocket motors;
conduit means for communicating said combustion products individually to each of the rocket motors; and
said means for communicating including a portion which has an area of diminished cross section at its end remote from said central ignition chamber so that said combustion products are communicated substantially simultaneously to the rocket motors by the delay occasioned by said area of diminished cross section in said conduit means.



3,273,336
APPARATUS FOR CONTROLLING CONDUCTIVE FLUIDS
Robert P. Kidwell, 2213 Calle de Suenos, Las Cruces, N. Mex.
Filed May 29, 1961, Ser. No. 113,443
11 Claims. (Cl. 60—35.6)

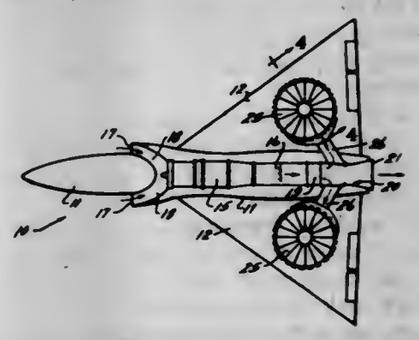
10. In combination with a rocket motor having a combustion chamber in which fuel in burned, a rear gas discharge orifice and a passageway connecting said combustion chamber with said discharge orifice, means for confining the flow of gases along a given path between said combustion chamber and said discharge orifice comprising means for providing a magnetic field pattern along

said path which comprises successive magnetic field sections which alternate in direction along said path.



3,273,337
LINEAR EXPLOSIVE TYPE IGNITER TRAIN FOR ROCKET MOTOR
Christopher W. Bolleau, Brigham City, Utah, assignor to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware
Filed Sept. 30, 1963, Ser. No. 312,531
11 Claims. (Cl. 60—35.6)

1. An ignition system for a cluster of rocket motors of the type containing a solid propellant grain comprising a primary igniting means for igniting the propellant grains in the plurality of motors simultaneously in response to a command signal, said primary igniting means including an element in each rocket motor adjacent its propellant grain which contains a pyrotechnic material and an electric igniter connected to the plurality of elements, a secondary igniting means including linear explosive type igniter trains for igniting one or more motors which fail to become ignited by the primary igniting means, and each of said igniter trains including an igniting portion adjacent the propellant grain in one of said motors and a heat operated primer located to respond to heat from another motor to initiate operation of the train.



3,273,338
JET ENGINE SHOCK WAVE CONTROL SYSTEM INCLUDING FUEL SUPPLY AND EXHAUST NOZZLE REGULATION
Ronald Rimmer, Bristol, England, assignor to Bristol Siddeley Engines Limited, Bristol, England, a British company
Filed Feb. 13, 1964, Ser. No. 344,722
Claims priority, application Great Britain, Feb. 19, 1963, 6,680/63
6 Claims. (Cl. 60—35.6)

1. An aircraft engine for flight at supersonic speeds, comprising an air intake passage with a throat, a subsonic combustion zone, means for supplying fluid fuel to the combustion zone, and an exhaust nozzle with adjustable throat area; and including a control system comprising:
(a) fuel flow control means responsive to the position of a normal shock wave in the air intake so as to tend to return the shock wave to a predetermined position on departure therefrom,
(b) means for producing a first signal which is a function of the supply of fuel to the engine,

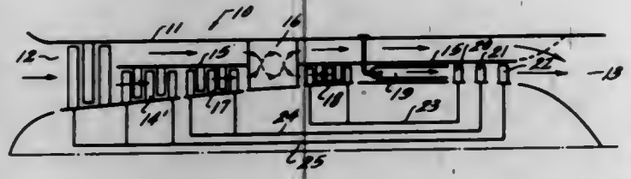
(c) means for producing a second signal which is a function of the mass flow of air through the engine,
(d) exhaust nozzle throat area varying means responsive to the ratio of the first and second signals to reduce nozzle throat area on increase of said ratio from a predetermined value, and vice versa, and
(e) means constituting a thrust selector, for modifying one or both of the said signals, or the response of the nozzle throat area varying means to their ratio.

3,273,339
PROPULSION SYSTEM FOR HIGH SPEED VTOL AIRCRAFT
Roman Borysthen-Tkacz, Beverly, Mass., assignor to General Electric Company, a corporation of New York
Filed July 1, 1964, Ser. No. 379,458
6 Claims. (Cl. 60—35.54)

4. A combination exhaust nozzle-diverter valve assembly for use in high speed VTOL aircraft, said assembly comprising:
(a) a housing having at least one port therein,
(b) a first wall downstream of said port with respect to the direction of fluid flow through said assembly, said first wall diverging outwardly in the downstream direction and defining a divergent passageway,
(c) a plurality of movable valve segments upstream of said first wall,
(d) and means to move said valve segments between first and second operative positions,

(e) said valve segments in said first position defining a second wall converging in the downstream direction to form with said first wall a converging-diverging nozzle, said port being formed in the convergent portion of said nozzle, said second wall blocking said port to prevent fluid flow therethrough,

(f) and said valve segments in said second position defining a third wall blocking the divergent passageway defined by said first wall to prevent flow therethrough and permitting fluid flow through said port.



3,273,340

GAS TURBINE POWERPLANT HAVING AN EXTREMELY HIGH PRESSURE RATIO CYCLE

Thomas Nell Hull, Jr., Marblehead, Mass., assignor to General Electric Company, a corporation of New York

Filed Nov. 22, 1963, Ser. No. 325,587

1 Claim. (Cl. 60—39.16)

A gas turbine powerplant comprising, in combination:

(a) an inlet for admitting motive fluid into said powerplant and an axially spaced outlet for exhausting the motive fluid from said powerplant;

(b) a first axial flow compressor connected to said inlet for receiving motive fluid therefrom;

(c) first and second ducting means defining independent concentric annular axially extending flow passageways connecting the outlet of said first axial flow compressor to said powerplant outlet, each of said ducting means arranged to receive a portion of the total flow of motive fluid from said first compressor, the passageway defined by said first ducting means surrounding the passageway defined by said second ducting means;

(d) second and third axial flow compressors;

(e) a heat exchanger having first and second sets of independent passages therein, said first set of passages forming a portion of said first ducting means and said second set of passages forming a portion of said second ducting means, said first and second sets of pasages being disposed in heat exchange relationship;

(f) a combustor;

(g) first, second, and third axial flow turbines;

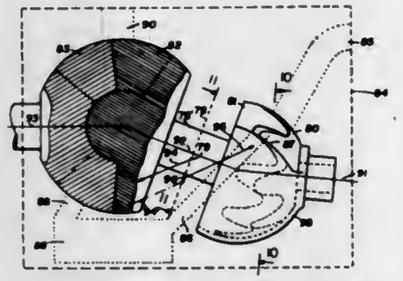
(h) an outer driveshaft, said first turbine and said third compressor mounted on said outer driveshaft for rotation therewith;

(i) an intermediate driveshaft concentrically mounted within said outer driveshaft, said second turbine and said second compressor mounted on said intermediate driveshaft for rotation therewith;

(j) an inner driveshaft concentrically mounted within said intermediate-driveshaft, said third turbine and said first compressor mounted on said inner driveshaft for rotation therewith;

(k) said first ducting means connecting said first compressor, said heat exchanger, and said powerplant outlet in serial flow arrangement, and said second ducting means connecting said first compressor, said second compressor, said heat exchanger, said third compressor, said combustor, said first turbine, said second turbine, said third turbine, and said powerplant outlet in serial flow arrangement;

(l) whereby the motive fluid in said first ducting means is heated and the motive fluid in said second ducting means is cooled as a result of heat transfer therebetween in the passages of said heat exchanger.



3,273,341

POSITIVE-DISPLACEMENT THERMAL UNIT

Ernest Wildhaber, 124 Summit Drive, Rochester, N.Y.

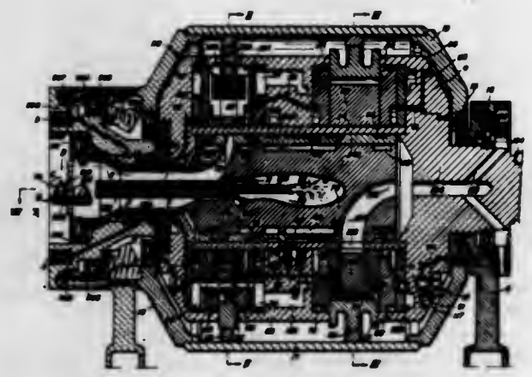
Original application Apr. 29, 1963, Ser. No. 276,285. Divided and this application Aug. 27, 1965, Ser. No. 483,121

6 Claims. (Cl. 60—39.61)

1. A positive-displacement unit comprising two pairs of intermeshing rotors, housing means in which each pair is mounted to rotate on intersecting axes, the number of teeth of the rotors of each pair differing by one, one rotor of one pair having a common axis with one rotor of the other pair and being rigid therewith, a thermal chamber, a duct for leading gaseous fluid from one of said rotor pairs to said thermal chamber for changing the temperature of said fluid, and a duct for leading said fluid from said thermal chamber to the other of said rotor pairs.

2. A positive-displacement unit comprising two pairs of intermeshing rotors of different displacement, housing means in which each pair is mounted to rotate on intersecting axes, one rotor of one pair having a common axis with one rotor of the other pair and being rigid therewith, a thermal chamber, a duct for leading gaseous fluid from one of said rotor pairs to the thermal chamber for changing the temperature of said fluid, a duct for leading said fluid from said thermal chamber to the other of said rotor pairs, the rotor pair of larger displacement having a larger angularity of the axes.

3,273,342



ROTARY VANE COMBUSTION ENGINE

Karl Eickmann, 2420 Isshiki Hayama-machi, Kanagawa-ken, Japan

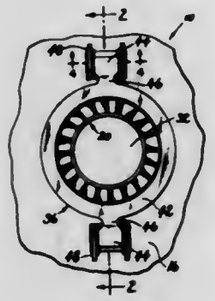
Filed July 22, 1963, Ser. No. 296,583

Claims priority, application Germany, July 23, 1962, E 23,244

19 Claims. (Cl. 60—39.63)

1. A rotary combustion engine comprising housing means, a rotor rotatable about an axis and having means

for forming working chambers between said rotor and said housing means so that at each revolution of said rotor said working chambers periodically increase in volume between an inner dead center and an outer dead center, the position of said dead centers determining a plane of eccentricity, channels in said rotor leading to said working chambers, at least one of said channels being adapted to supply a pressure medium to said working chambers, and at least another of said channels being adapted to discharge said pressure medium from said working chambers, control body means, means for mounting said control body means so as to permit them to be turned and sealed relative to said rotor, control ports in said control body means operatively associated with said channels in said rotor so that at each revolution of said rotor relative to said control body means said control ports in said control body means and said channels in said rotor are moved alternately to and out of communication with each other, and setting means for adjusting said control body means relative to said plane of eccentricity in the direction of rotation of said rotor and in the opposite direction.



3,273,343

COMBUSTION CHAMBER CONSTRUCTION IN GAS TURBINE POWER PLANT

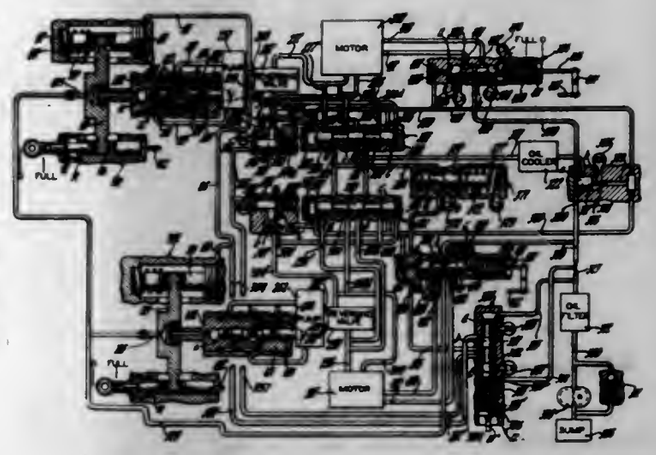
Salvatore J. Cretella, North Haven, Conn., assignor to Dickens Inc., New Haven, Conn., a corporation of Connecticut

Filed Mar. 8, 1965, Ser. No. 437,698

5 Claims. (Cl. 60—39.72)

5. A retaining ring for use with a swirl ring and a reinforcing ring assembly in a combustion chamber housing for a gas turbine power plant, said ring having a short annular flange which projects axially in one direction and a flat radially extending body portion, said body portion being at least twice as wide as it is thick and being provided at diametrically opposed locations with first and second similar ears, each of said ears extending angularly outwardly between radial and axial planes in a direction generally opposite said axial flange, and each of said ears being generally U-shaped in cross section when viewed along radii, the legs of the U-shaped ears extending from the ears in the general direction of said axial flange.

3,273,344



TRANSMISSION

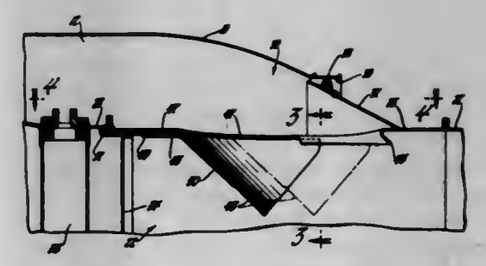
Howard W. Christenson and James J. Mooney, Jr., Indianapolis, and Robert H. Schaefer, Westfield, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed May 10, 1963, Ser. No. 279,372

43 Claims. (Cl. 60—53)

1. In a hydraulic transmission, an input driven variable displacement pump having a fluid inlet and a fluid outlet and fluid actuated displacement control means, an output driving variable displacement motor having a fluid inlet and a fluid outlet and fluid operated displacement control means, a supply passage connecting said pump outlet to said motor inlet, a return passage connecting said motor outlet to said pump inlet, bypass valve means connecting said supply and return passage normally closed and oper-

ative in response to a predetermined maximum pressure in either one of said supply and return passages to connect said passages, and speed responsive means acting on said bypass valve means to vary said predetermined maximum pressure.



3,273,345

GAS TURBINE ENGINE

Esten W. Spears, Jr., Indianapolis, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Sept. 10, 1963, Ser. No. 307,904

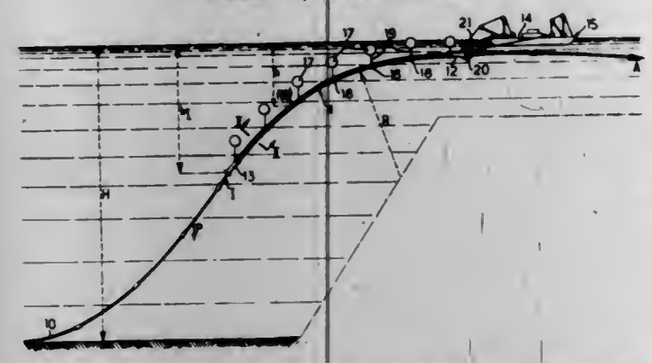
4 Claims. (Cl. 60—35.6)

1. A by-pass gas turbine engine comprising, in combination, first and second compressors, combustion apparatus, and first and second turbines, each turbine being connected to drive one of the compressors, an exhaust pipe from the second turbine, a by-pass duct extending from the first compressor to the exhaust duct, the duct terminating in an annulus extending around the pipe,

and a variable mixer connecting the said duct to the said pipe including

means defining a plurality of openings from the annulus into the pipe,

a chute ring disposed around the pipe and having apertures registerable with the said openings,



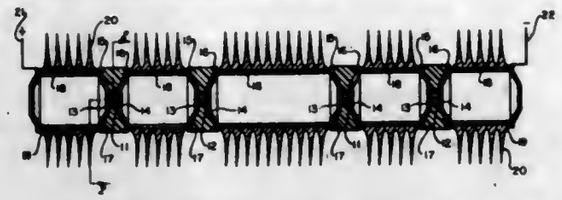
mixing chutes extending from the chute ring into the duct disposed so that the apertures are in the lee of the chutes,

and means to shift the chute ring so as to variably obstruct the passages defined by cooperation of the said openings and apertures and thus variably throttle the by-pass duct.

3,273,346
POSITIONING OF SUBMARINE TUBES

Jacques Delaruelle, Paris, and Léon Constantin, Villecresnes, France, assignors to Electricite de France (Service National), Paris, France, a French National Service and Gaz de France (Service National), Paris, France, a French National Service

Filed Dec. 18, 1961, Ser. No. 160,191
Claims priority, application France, Mar. 21, 1961, 856,278
1 Claim. (Cl. 61—72.3)



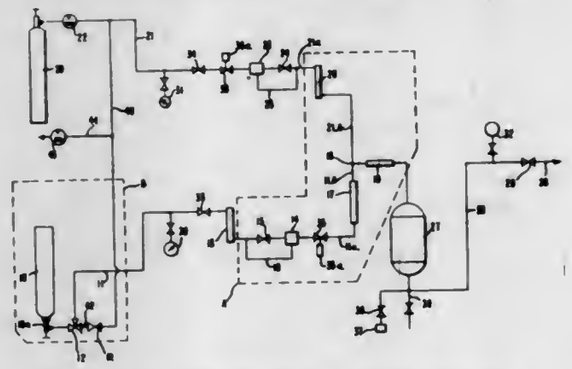
In a method for laying a hollow steel pipe to be used as a pipeline on an immersed bottom from one shore to another shore by imparting to said pipe a resilient deformation in an immersed section thereof that joins a pipe portion already laid to a pipe portion awaiting to be laid with the latter portion adjacent the vicinity of but below the surface of the water and in a position substantially parallel to the surface of the water, said deformation being such that said pipe section has a lower branch tangential to the bottom and in an upper branch having a horiozntal terminus and an S-curve between the bottom and said horizontal terminus, the S-curve having an inflection point between said branches, said section progressively sinking to the bottom during laying of the pipe so that the S-curve advances toward said another shore with said horizontal terminus moving above and in advance of said inflection point and said inflection point moving above and in advance of the point at which said lower branch is tangential to the bottom, with said horizontal terminus and said inflection point and said tangential point all advancing in that order lengthwise along the pipe, said pipe further having by itself when immersed a negative buoyancy; the improvement comprising imparting to said upper branch a positive buoyancy by supporting said upper branch on and for sliding movement relative to an elongated guide which extends from adjacent said inflection point to adjacent said horizontal terminus and which is flexible in all transverse directions while applying upward buoyant forces to said guide simultaneously at a plurality of points distributed lengthwise of the guide, the sum of said buoyant forces being greater than the sum of the submerged weights of said guide and said upper branch, moving said guide relative to said pipe while maintaining the positions of said forces fixed relative to each other along the length of the guide, in the direction of said another shore, at a speed equal to the speed of laying said pipe, while exerting on said pipe adjacent the surface of the water a horizontal traction in the direction of said another shore.

3,273,347
THERMOELECTRIC HEAT PUMP ASSEMBLY

Thore M. Elfving, 433 Fairfax Ave., San Mateo, Calif.

Filed June 14, 1965, Ser. No. 463,713
21 Claims. (Cl. 62—3)

1. In a thermoelectric assembly, pairs of semiconductive bodies of dissimilar type with similar ends contacting hot and cold junction bridges to form a linear array of thermocouples in series, at least one of said junction bridges being formed from a tubing section, metal disc elements in contact with the ends of said tubing section and joined to said semiconductive bodies, and fin means



extending outwardly from said tubing section for heat exchange to air.

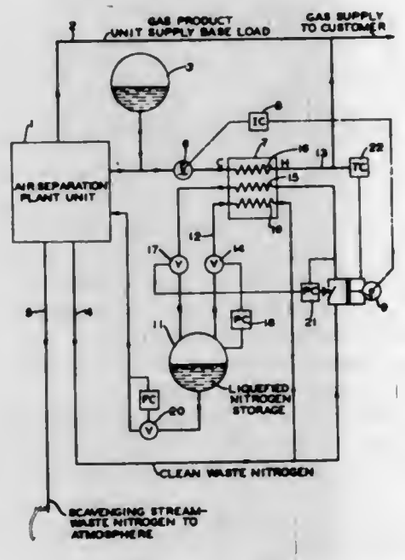
3,273,348
PROCESS AND APPARATUS FOR PREPARING GASEOUS MIXTURES

John W. De Hart, Jr., Salem, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

Filed Mar. 28, 1963, Ser. No. 268,788
5 Claims. (Cl. 62—49)

1. Apparatus for preparing a gaseous mixture of (1) a fluid having a normal boiling point in the range of —45° C. to +60° C. and a vapor pressure at 70° F. in the range of 4.4 to 140 p.s.i.a. and (2) a gas having a normal boiling point below —75° C. and a vapor pressure of at least about 200 p.s.i.a. at 70° F., in preselected proportions under a pressure in the range of 1 to about 2000 p.s.i.g., which apparatus comprises

(A) a fluid supply vessel in which said fluid is maintained in liquid state under a pressure which initially is in the range of 11 to 2200 p.s.i.g.,
- (a) said fluid supply vessel being connected in series, through fluid conducting conduits and valves carrying a stream of said fluid from said supply vessel, to
- (b) a liquid flow measuring means,
- (c) differential pressure flow control means for controlling the rate of flow of the liquid fluid and for decreasing the pressure on the fluid by a predetermined amount,
- (d) a vaporizer for completely vaporizing the fluid,
- (e) a mixer for intimately mixing the vaporized fluid with said gas, and
- (f) a reservoir for the product mixture; and



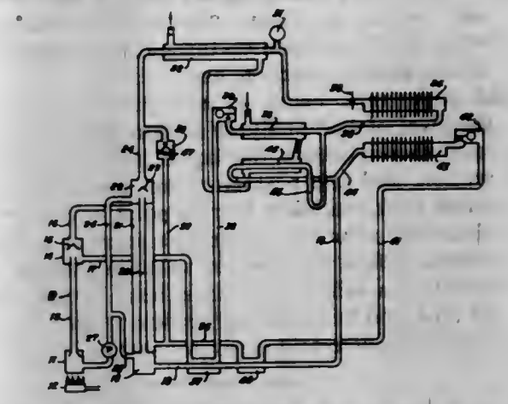
(B) a gas supply vessel in which said gas is maintained under a pressure of from about 200 to about 2400 p.s.i.g. which is at least as high as the initial pressure in the supply vessel for said fluid,
- (a) said gas supply vessel being connected in series, through gas conducting conduits and valves carrying a stream of said gas from said gas supply vessel, to
- (b) differential pressure gas flow control means for controlling the rate of flow of the gas and for decreasing the pressure on the gas by a predetermined amount,
- (c) a gas flow measuring means, and

- (d) a junction with a conduit for the completely vaporized fluid positioned between said vaporizer and said mixer.

3,273,349
VARIABLE DEMAND AIR RECTIFICATION PLANT WITH RECYCLE

Milton Litvin, New York, N.Y., and Allen V. Muska, Berkeley Heights, N.J., assignors to Air Reduction Company, Incorporated, New York, N.Y., a corporation of New York

Filed Feb. 15, 1965, Ser. No. 432,722
3 Claims. (Cl. 62—50)



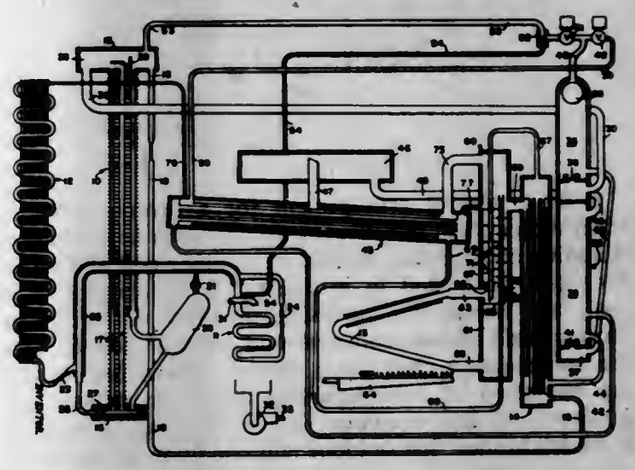
1. A process for supply of gaseous oxygen from an air separation plant so as to meet varying demands comprising the steps of passing gaseous oxygen product at a substantially steady state from the plant to a source of demand, storing liquid oxygen product from said plant, vaporizing said liquid product in a vaporizer in response to demand, compressing waste nitrogen from said plant, cooling substantially all of said compressed waste nitrogen by heat exchange with said liquid oxygen product being vaporized, throttling said compressed and cooled waste nitrogen to liquefy it, controllably applying said liquefied waste nitrogen to said plant to provide refrigeration therefor, and passing vapors from said liquified nitrogen in heat exchange with the compressed nitrogen stream and then into mixture with the waste nitrogen before said waste nitrogen is compressed.

3,273,350
REFRIGERATION SYSTEMS AND METHODS OF REFRIGERATION

Robert S. Taylor, 2906 Cedarview Drive, Austin, Tex.

Filed Sept. 14, 1964, Ser. No. 409,339
20 Claims. (Cl. 62—101)

1. A refrigeration system including,
- a generator for receiving a dilute solution of a refrigerant and an absorbent,
- means for heating the generator to drive off refrigerant from the dilute solution to form a concentrated absorption solution,
- means for condensing the driven off refrigerant,
- a low temperature evaporator,
- means for flowing the condensed refrigerant into the low temperature evaporator while restricting such flow,
- a low pressure absorber,
- means for flowing refrigerant vapor from the low temperature evaporator to the low pressure absorber,
- means for flowing the concentrated absorption solution from the generator to the low pressure absorber to absorb refrigerant vapor therein,
- a high temperature evaporator,
- means for flowing a condensed refrigerant from the generator to the high temperature evaporator,
- a high pressure absorber,
- means for flowing the refrigerant from the high temperature evaporator to the high pressure absorber,



- means for flowing the absorption solution from the low pressure absorber to the high pressure absorber to absorb the refrigerant from the high temperature evaporator and reconstitute the dilute solution of the refrigerant and the absorbent,
- and means for flowing the reconstituted dilute solution from the high pressure absorber to the generator.

3,273,351
ABSORPTION REFRIGERATION

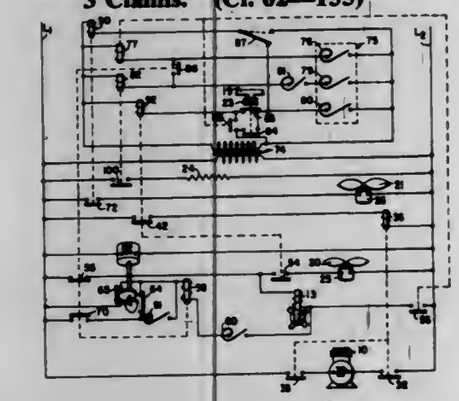
Richard H. Merrick, Indianapolis, Ind., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware

Filed May 20, 1964, Ser. No. 368,775
6 Claims. (Cl. 62—103)

2. An absorption refrigeration machine containing an absorbent solution, and arranged to provide refrigeration, said machine comprising:
- an absorber section for absorbing refrigerant vapor in said absorbent solution;
- a generator section for concentrating absorbent solution and forming vapor;
- an analyzer section comprising a vertically extending vessel for containing a quantity of absorbent solution in a vertically extending column above said generation section, and for increasing the refrigerant concentration of vapor passed thereto;
- means to pass vapor formed in said generator section upwardly through said vertically extending column of absorbent solution in said analyzer section;
- a heat exchanger section;
- passage means to pass strong solution from said gener-

ator section through said heat exchanger section, in heat exchange relation with weak solution, to said absorber section, said passage means being continuously open during operation of said machine for continuous transfer of strong solution from said generator to said absorber;

passage means to pass weak solution from said analyzer section to said generator section;



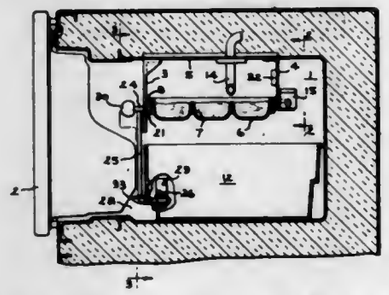
an outlet tank connected to receive only weak absorbent solution from said absorber section and having passage means associated therewith to discharge said weak absorbent solution through said heat exchanger to said analyzer section; and

said outlet tank being at least partly disposed above the level of said analyzer section and having a liquid level therein above the liquid level in said analyzer section, and said passage means associated with said outlet tank extending from a point below the level of absorbent solution therein to a point at said analyzer section below the level of solution therein, so as to maintain a sufficient solution head between said outlet tank and said analyzer section to provide a desired solution flow to said generator section.

3,273,352
REFRIGERATION SYSTEM DEFROST CONTROL

Raymond G. McCready, Marshalltown, Iowa, assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware

Filed June 14, 1965, Ser. No. 463,570
3 Claims. (Cl. 62—155)



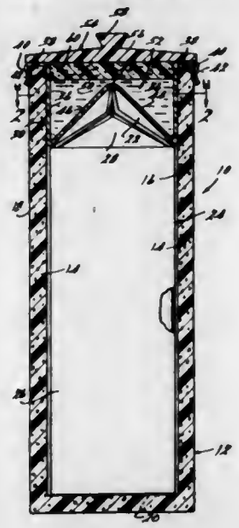
1. In a control arrangement for a reverse cycle refrigeration system selectively energizable to heat and cool including compression means, an outdoor coil and an indoor coil connected in refrigerant flow relationship to cool, and means for reversing the flow of refrigerant through said indoor coil and said outdoor coil to heat, the combination comprising control means for regulating operation of said reversing means to defrost said outdoor coil; first condition responsive means adapted at a predetermined first outdoor coil condition to ready said control means for energization; first timing means adapted periodically to ready said control means for energization, said control means being energized upon simultaneous actuation of said first condition responsive means and said first timing means to defrost said outdoor coil; and means for regulating the duration of said outdoor coil defrosting to insure restoration of said outdoor coil to at least a predetermined second condition including second condition responsive means adapted at said predetermined second outdoor coil condition to ready said control means for deenergization, and second timing means adapted upon the expiration of a predetermined timed interval to ready said control for deenergization, said control means being deenergized upon simultaneous actuation of said second condition responsive means and said second timing means, said first condition responsive means being effective at the occurrence of a predetermined third outdoor coil condition during said timed interval to intervene and deenergize said control means to terminate outdoor coil defrosting.

3,273,353
FLEXIBLE TRAY TYPE ICE MAKER

Julius B. Horvay and Bernard J. Grimm, Louisville, Ky., assignors to General Electric Company, a corporation of New York

Filed Mar. 4, 1965, Ser. No. 437,236
4 Claims. (Cl. 62—353)

1. An ice maker comprising a flexible ice tray, said tray including a front portion having a transverse slot therein, support means for supporting said tray for rotation from a normal position about its longitudinal axis to a partially inverted discharge position,



said support means having an arcuate slot therein registering with said transverse slot,

pivoted operating means for manually effecting rotation of said tray to its discharge position comprising a pivoted lever, including a movable portion extending through both of said slots whereby movement of said movable portion along said arcuate slot effects rotation of said tray.

3,273,354
THERMAL INSULATING AND COOLING RECEPTACLE FOR DISPOSABLE FLUID CONTAINERS

Bruce Wellington Gibson, 44904 Gratiot Ave., Mount Clemens, Mich.

Filed Aug. 10, 1965, Ser. No. 478,687
1 Claim. (Cl. 62—457)

In a combination thermal insulating and cooling receptacle for disposable fluid containers,

a substantially rectangular cross section housing comprising upwardly extending side wall sections which include inner surface portions defining a fluid container receiving cavity substantially co-extensive of said housing,

said housing also comprising a bottom section closing the lower end of said cavity,

said side wall sections and said bottom section being integral and constructed of a thermal insulating material,

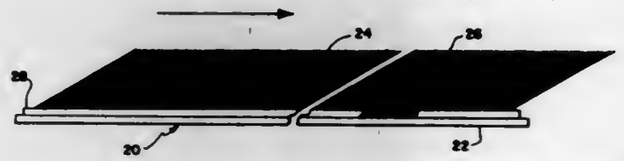
a liner member disposed in the upper end of said cavity and having side wall portions contiguously engaged with the top of said inner surface portions,

the upper ends of said side wall portions terminating in outwardly and downwardly projecting flange sections adapted to nestingly receive the upper ends of said side wall sections,

the lower ends of said side wall portions terminating in a bottom portion of a complementary shape with respect to the upper end of the fluid container disposed within said cavity and together with said side wall portions defining a fluid reservoir within the upper end of said cavity above the container,

said reservoir containing a freezable substance which when frozen provides means for reducing the temperature of said cavity, whereby to cool the fluid container disposed therewithin, and

a cover member removably mounted on the top of said housing,



said cover member comprising an upper cover section secured to the top of said outwardly projecting flange portions of said lining member and having gripping handle means integrally formed thereon,

said cover member also comprising an insulating layer constructed of a thermal insulating material which is secured to the lower side of said upper cover section and is disposed within the upper end of said reservoir tightly engaging the inner surfaces of said side wall portions of said lining member.

3,273,355
HEAT PROTECTION APPARATUS

Paul R. Hill and Otto F. Trout, Jr., Hampton, Va., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration

Filed Dec. 19, 1962, Ser. No. 245,941
6 Claims. (Cl. 62—467)

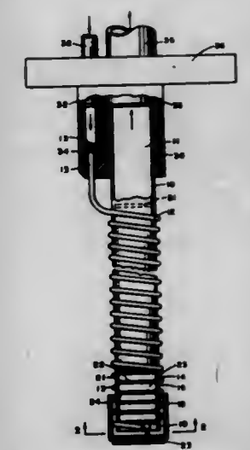
1. A thermal protection device for cooling the external surfaces of hypersonic aircraft and other flight and re-entry vehicles during hypersonic flight comprising: a lower heat shield consisting of a supporting substructure element adaptable as an integral part of the external surfaces of hypersonic aircraft and other flight and re-entry vehicles; a plurality of low thermal conductive fibers cast within the upper surface of the substructure element at the inner, root ends thereof and at an angle thereto insuring orientation of the upper fiber ends thereof in the direction of the air-flow and constituting an upper heat shield; and root cooling means incorporated as an integral part of the lower heat shield to provide additional cooling thereto.

3,273,356
HEAT EXCHANGER-EXPANDER ADAPTED TO DELIVER REFRIGERATION

Thomas E. Hoffman, Marblehead, Mass., assignor to Arthur D. Little, Inc., Cambridge, Mass., a corporation of Massachusetts

Filed Sept. 28, 1964, Ser. No. 399,530
7 Claims. (Cl. 62—514)

1. An apparatus suitable for providing refrigeration to a localized area, comprising in combination



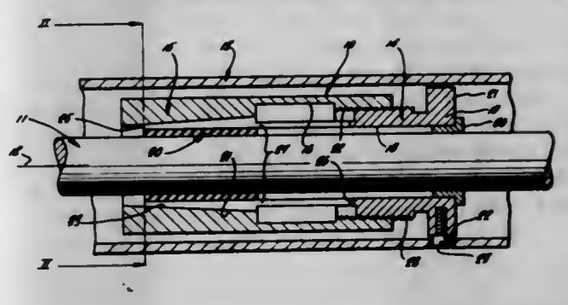
(a) a hollow cylinder defining a fluid channel therein;

(b) spaced foraminous discs within said channel affixed to the internal wall thereof and positioned normal to the direction of fluid flow;

(c) tubing helically wound around the external surface of said cylinder along substantially its entire length and permanently affixed thereto, the external surface of said tubing being in direct heat transfer contact with said external surface of said cylinder;

(d) means associated with one end of said tubing for introducing a fluid at pressure P_1 and temperature T_1 thereto;

(e) means associated with the other end of said tubing for conducting said fluid leaving said tubing into said channel to be returned in out-of-contact heat exchange with said fluid flowing through said tubing wherein the external path for said heat exchange comprises said foraminous discs, the wall of said hollow cylinder and the wall of said tubing; the hydraulic radius r_h and length L of said tubing being of such dimensions that said high-pressure fluid in its passage therethrough is expanded and cooled to a predetermined pressure P_2 and temperature T_2 whereby refrigeration is available; said hydraulic radius and said length being determinable from the relationship

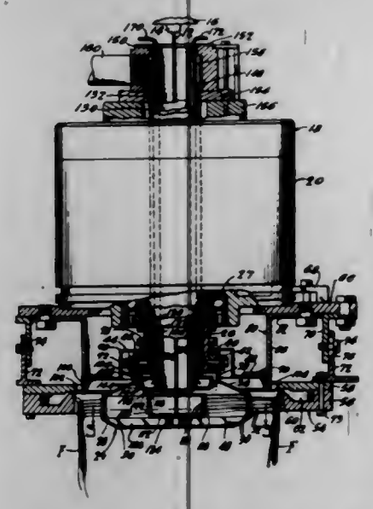


$$L=\frac{P_1^2-P_2^2}{fRT}\frac{\pi^2(r_h)^5g}{64w^2}$$

wherein f is the friction factor characteristic of said tubing, R is the universal gas content, T is a mean temperature between T_1 and T_2, g is the gravity constant, and w is the mass flow of said fluid.

3,273,357
CLUTCH

Howard Lyon, La Canada, Calif., assignor to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California



Filed Jan. 27, 1964, Ser. No. 340,204
5 Claims. (Cl. 64—30)

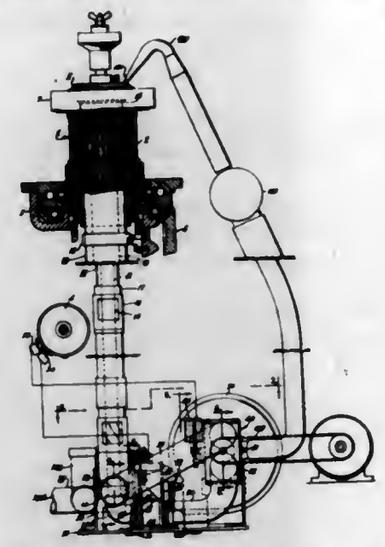
1. A clutch for coupling a rotatable drive shaft to a driven member disposed axially thereof comprising a col-

let sleeve disposed circumferentially of the shaft between the shaft and the driven member, means coupling one end of the collet sleeve and the driven member for securing the collet sleeve from angular motion relative to the driven member about the axis of the shaft and for accommodating movement of the collet radially relative to the driven member, a plurality of slots formed through the collet sleeve at and adjacent to the other end of the collet sleeve to define a corresponding plurality of cantilevered fingers, friction means engaged with the shaft about its circumference and captive to the cantilevered ends of the fingers, and selectively operable means coupled to the collet sleeve operable to move the cantilevered ends of the fingers toward and away from the shaft for varying the radial forces of engagement of the friction means with the shaft.

3,273,358
METHOD OF AND APPARATUS FOR FORMING FIBERS
Dale Kleist, Sur Lausanne, Switzerland, and Henry J. Snow and Carl S. Buchanan, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio, a corporation of Delaware
Continuation of application Ser. No. 738,692, May 29, 1958. This application June 2, 1961, Ser. No. 114,376
9 Claims. (Cl. 65—6)

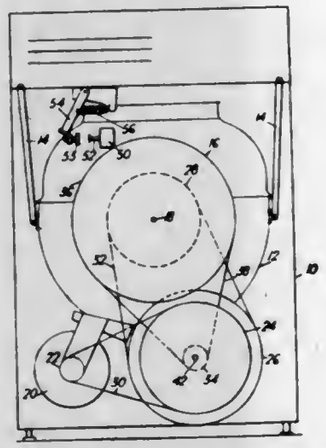
1. In the process of producing glass fibers by centrifugal force cooperating with a gaseous attenuating blast, the improvement which comprises flowing molten glass into a first rotating receptacle having openings to project the glass as streams onto the inner surface of a second rotating receptacle spaced from the first receptacle, projecting the glass on the inner surface of the second receptacle through openings therein in the form of molten glass streams, engaging the molten glass streams outside of the second receptacle with a gaseous blast moving transversely to the direction of movement of the streams from the second receptacle at such velocity as to draw out the molten glass into fibers and at a temperature below the temperature at which the molten glass is drawn out into fibers, applying to the molten glass by burning a gaseous medium within the second receptacle all of the heat needed to maintain the glass in the condition in which it is adapted to be drawn out into fibers until it is engaged by the attenuating blast.

5. Apparatus for forming fibers from heat-softenable mineral material including, in combination, a support, a hollow shaft journaled on the support, a hollow rotor carried by the shaft and having a peripheral wall formed with a plurality of orifices, an annularly shaped manifold surrounding the rotor and spaced therefrom and adapted to contain steam under pressure, said manifold having an annular orifice through which steam in the manifold is discharged as a generally cylindrical high velocity blast, a material distributing cup in said rotor adapted to be rotated with the rotor, means for feeding heat-softened material from a supply into the distributing cup, means for rotating the hollow shaft, rotor and distributing cup whereby the material is projected by centrifugal forces from the distributing cup to the peripheral wall and through the orifices, annularly shaped burner means within the rotor adapted to receive combustible mixture from a supply, said burner means having concentric circular wall regions, each circular wall being formed with a group of circumferentially spaced passages wherein the passages of one group are arranged to direct combustible mixture toward the distributing cup and the passages of the other group arranged to direct combustible mixture toward the interior region of the peripheral wall of the rotor whereby the mixture is burned adjacent the distributing cup and adjacent the peripheral wall for applying heat to the distributing cup, the rotor wall and the mineral material.



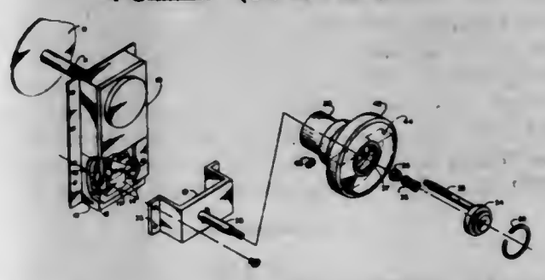
3,273,359
SINKER CAP MECHANISM FOR CIRCULAR KNITTING MACHINES
Oscar Fregeolle, Lincoln, R.I., assignor to The Banner Company, Central Falls, R.I., a corporation of Rhode Island
Filed Jan. 11, 1963, Ser. No. 250,863
6 Claims. (Cl. 66—8)

1. In a circular knitting machine, a needle cylinder, a sinker head encompassing the upper end of said cylinder and fastened to rotate therewith, a sinker cap overlying said sinker head, an annular sinker head bearing of angular formation being secured to the outer periphery of said sinker head comprising a vertical portion and a horizontal portion being adapted to support said cap, and an annular sinker cap bearing adapted to overlie said sinker head bearing.



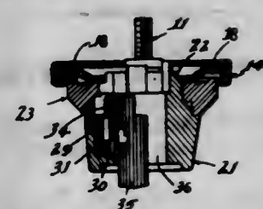
3,273,360
PNEUMATIC TENSIONING, EVERTING, AND DISCHARGING DEVICE AND METHOD FOR CIRCULAR KNITTING MACHINES
Peter A. Mahler, High Point, N.C., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Oct. 8, 1963, Ser. No. 314,705
14 Claims. (Cl. 66—149)

8. A device for everting, tensioning, and discharging tubular fabric fed from a circular knitting machine, comprising first and second hollow coaxial conduits, said conduits positioned so as to receive inside the first of said conduits and outside the second of said conduits the tubular fabric as it is knitted, said conduits terminating in a position remote from their fabric receiving end, air supply means having an air intake and air discharge, valve means interposed between said air intake and said conduits and operable to selectively connect said air intake to said first conduit to thereby tension said fabric being knitted, and to said second conduit at the termination of knitting to thereby evert the knitted fabric and draw the fabric through the second conduit, said device having a fabric receiving element operable to allow air flow therethrough, said element displaceable between a first and second position, in the first of said positions said element being in registry with



the second conduit and the air intake for receiving said fabric, and in the second position in registry with the air discharge for discharging the fabric.

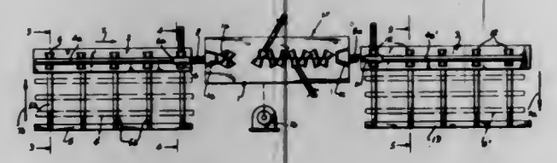
3,273,361
CLOTHES WASHER MACHINE WITH A PROGRAMMED REBALANCING CYCLE
Bernard G. Smith, Saint-Cloud, France, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 9, 1964, Ser. No. 395,264
Claims priority, application Great Britain, Sept. 19, 1963, 36,901/63
1 Claim. (Cl. 68—12)



A clothes washer machine comprising a frame, a container and tub assembly mounted on said frame so as to be oscillatable within limits relative thereto, said tub being rotatable for the washing and the spin-drying of clothes therein, a reversible motor for rotating said tub in wash and spin operations, electric control devices for effecting sequential wash and spin operations of said tub, and an unbalance detector system responsive to oscillations of said assembly beyond a predeteremined limit due to clothes unbalance during said spin operation to actuate said electric control devices in a programmed rebalancing cycle so as to stop tub rotation, and then in sequence effect wash rotation in the direction of spin, wash rotation in the direction opposite to spin, wash rotation in the direction of spin, and finally a re-initiation of spin, said system including clutch means operable for selecting the wash or spin operation of said tub by controlling the speed at which said motor rotates said tub, timer motor means connected to said electric control devices for actuating same and an unbalance switch responsive to oscillations of said assembly beyond a predetermined limit due to clothes unbalance, said unbalance switch having a normal position in power supply relationship to said motor and an unbalance position interrupting power supply to said motor and in power supply relationship to said clutch means and said timer motor means to initiate said programmed rebalancing cycle.

3,273,362
SAFETY EXIT ATTACHMENT FOR COMBINATION LOCK
Edward G. Becke, 6006 Napoli Road, Camp Springs, Md. 20031
Filed Sept. 2, 1964, Ser. No. 394,988
4 Claims. (Cl. 70—320)

1. A combination lock-safety deadbolt extension combination which comprises an improved safety attachment therefor for withdrawing the deadbolt which comprises:
a mounting means,
a shaft means rigidly secured to said mounting means,
a door handle means rotatably secured about said shaft,
an arcuate slot in said mounting means adjacent to said shaft,
a spring loaded thumb button secured in said door handle means,
a deadbolt retrieving plunger secured to said thumb button,
said deadbolt retrieving plunger extending through a passage in said door handle means parallel to said shaft and extending through said arcuate slot in said mounting means,
said spring loaded button securing said deadbolt retrieving plunger normally in an outermost position relative to said mounting means for axial movement,
said deadbolt retrieving plunger adapted to release said safety deadbolt extension and to permit withdrawal of said deadbolt extension by rotation of said door handle means.

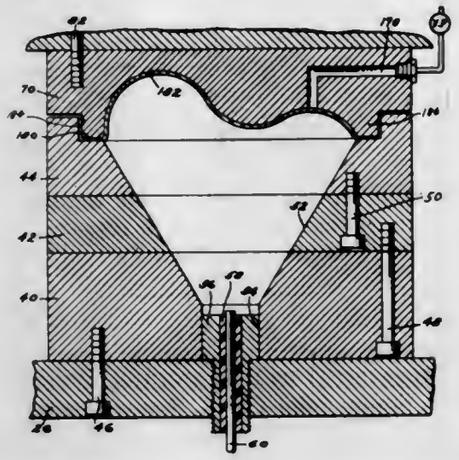


3,273,363
COMBINATION CHANGING DIAL, KNOB AND ESCUTCHEON ASSEMBLY
Edwin W. North and Robert L. Dauenbaugh, Rockford, Ill., assignors to National Lock Co., Rockford, Ill., a corporation of Delaware
Filed May 27, 1964, Ser. No. 370,591
4 Claims. (Cl. 70—330)

3. In a combination changing dial, knob and escutcheon assembly adapted to be mounted on the exterior free edge of a locker door to operate a permutation lock mounted on the interior of the door, a hollow knob mounted at

the exterior of the escutcheon and having a hub projecting through said escutcheon and a central longitudinal opening therethrough, a separate dial rotatably mounted on said hub at the exterior of the escutcheon, the hub having a portion cut away and a cylindrical groove formed adjacent and parallel to the central longitudinal opening of the knob, said groove communicating with the inner circumference of said dial, said dial having plural spaced grooves on the inner circumference adapted to be aligned with the cylindrical groove of the knob at the cut-away portion thereof, a pin in said cylindrical groove of the knob and spring-biased toward said dial to project in one of said plural notches, and a change key having a free end insertable from the front of the escutcheon into the central opening in the knob, the free end having a lateral and then rearward projection extending into the cut-away portion of the knob with the rearward projection extending into the cylindrical groove to engage the end of the pin and retract the pin from engagement with the groove in the dial upon rearward movement of the change key to allow relative movement between the knob and the dial so that the pin may be projected into a succeeding notch of the dial to lock the dial to the knob and effect a new combination for the lock.

3,273,364
STRAIGHTENING MACHINE
Carl Ludwig Pohler, Solingen, and Rudolf Breuer, Solingen-Ohligs, Germany, assignors to Th. Kieserling & Albrecht Werkzeug-maschinenfabrik, Solingen, Rhineland, Germany
Filed Oct. 26, 1964, Ser. No. 406,436
Claims priority, application Germany, Oct. 24, 1963, K 51,169
14 Claims. (Cl. 72—12)

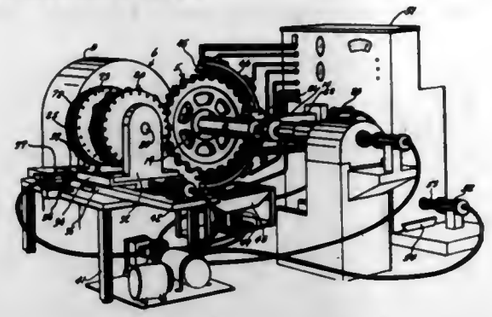


1. A straightening machine for bars, tubes and similar elongated workpieces, comprising a plurality of cooperating straightening rolls; a first conveyor for advancing untreated workpieces seriatim to said straightening rolls; a second conveyor for receiving treated workpieces from said straightening rolls; first transfer means operative to feed workpieces to said first conveyor; second transfer means operative to remove workpieces from said second conveyor; and control means for operating said transfer means in a predetermined sequence, said control means comprising a pair of induction coils respectively disposed intermediate said rolls and said first and second conveyors, each of said coils defining a passage for a workpiece respectively advancing toward and away from said rolls to produce impulses which are utilized to operate said transfer means.

3,273,365
METHOD AND APPARATUS FOR FORMING METAL
Robert Felts, Union Lake, Mich., assignor to The Cincinnati Shaper Company, Cincinnati, Ohio, a corporation of Ohio
Filed May 14, 1963, Ser. No. 280,265
9 Claims. (Cl. 72—56)

1. In a device for forming material of the type utilizing a liquid chamber, a confined forming cavity and an electrode in said chamber for carrying a charge of high potential to said chamber and a high capacitance circuit adapted to be discharged to said electrode, an improved switch for controlling the charge and discharge of a high potential capacitance which comprises:

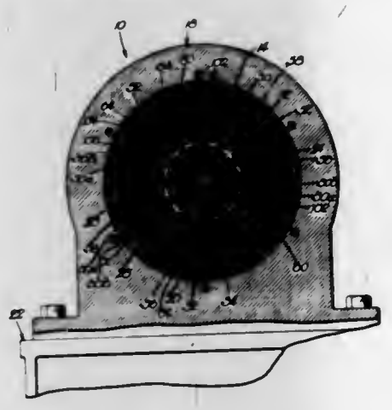
(a) spaced first contact members for a charging switch,
(b) means for supporting said spaced contact members in spaced relation,
(c) spaced second contact members for a discharge switch,
(d) means for mounting said second contact in spaced relation to each other and to said first contact members,
(e) a first conductive bar mounted to contact simultaneously said first contact members and span the distance therebetween to provide a conductive connection,
(f) a second conductive bar movable into proximity to said second contact members without contacting



either member to provide a capacitance discharge path,
(g) means for mounting said conductive bars comprising:
(h) a plurality of arms on spaced mounting means having said conductive bar mounted respectively thereon,
(i) an actuator arm associated with each of said arms wherein movement of said actuator shifts said arms relative to said contact members, said arms being so positioned relative to said contact members that movement of one of said conductive bars to a position adjacent its respective contact members shifts the other of said bars a material distance away from its respective contact members wherein only one pair of said contact members may be electrically associated at any one time, and
(j) means for operating said actuator bar.

3,273,366
APPARATUS FOR FINISH-SHAPING SPROCKETS
Leslie N. Schuman, Brecksville, Ohio, assignor, by mesne assignments, to Midland-Ross Corporation, Cleveland, Ohio, a corporation of Ohio
Filed July 17, 1962, Ser. No. 210,511
12 Claims. (Cl. 72—69)

1. Apparatus for finish-shaping a sprocket rim portion having incompletely shaped teeth and recessed areas therebetween comprising:

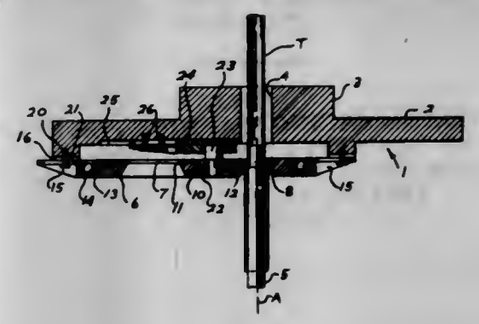


(A) a mandrel for supporting the sprocket with its axis of rotation merged with the axis of rotation of the mandrel;
(B) a plurality of rollers having cylindrical surfaces of uniform diameter adapted to be separately received between pairs of adjacent teeth of the sprocket;
(C) means for supporting said rollers with the axes of said cylindrical surfaces in serial uniformly-spaced relationship for meshing relation of the rollers with said teeth, said means movably arranged

to successively support each roller in radially non-yielding relation at the extremity of a fixed radius of the mandrel axis; and

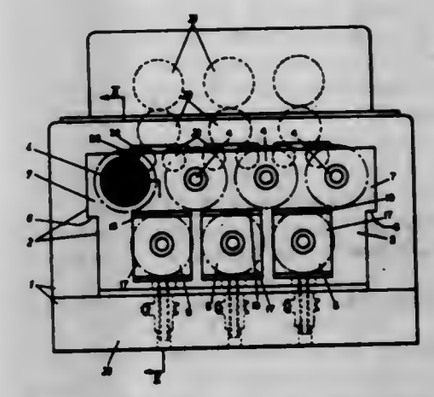
(D) means for rotating the mandrel and moving said supporting means to engage successive rollers with successive recessed areas to reform said areas at said fixed radius.

3,273,367
ROTARY SWAGER
Karl W. Hallden, Thomaston, Conn., assignor to The Hallden Machine Company, Thomaston, Conn., a corporation of Connecticut
Filed Mar. 4, 1964, Ser. No. 349,283
20 Claims. (Cl. 72—76)



1. In a rotary swager, the combination of a die unit having about a first axis inwardly and outwardly movable swaging dies with outer surfaces; a roller unit surrounding said die unit, said units being relatively turnable about said axis, and said roller unit having rollers with peripheral surfaces turnable about their own axes and spaced apart about said first axis for inward rebounding impact of said dies with said rollers at their respective outer and peripheral surfaces on relative rotation between said units; and means operative to cause simultaneous relative rotation between said units and rotation of said rollers about their own axes in directions and at relative speeds such that said rollers and dies have on impact substantially synchronous speed in the same direction at their impacting surfaces.

3,273,368
METAL WORKING
Claus L. Sporck, Cincinnati, Ohio, assignor to The Lodge & Shipley Company, Cincinnati, Ohio, a corporation of Ohio
Filed Oct. 3, 1963, Ser. No. 313,646
2 Claims. (Cl. 72—78)

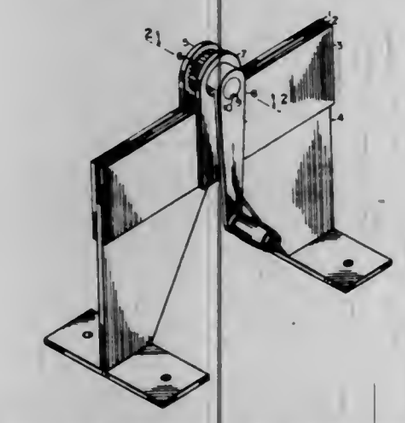


1. A roller head for a tube forming machine comprising:

a frame formed with a central bore to accommodate a tube to be worked;
means on said frame for mounting the frame for rotation about an axis extending through said bore, said rotational axis being coaxial with the axis of the tube to be worked;
a first roller in the form of a ring having an interior, annular working surface surrounding said axis, the roller working surface being engageable with a tube to be worked;
a slide surrounding said first roller;
bearing means connected between said slide and said first roller and providing for the roller to be rotatable relative to the slide;
means connecting said slide with said frame for movement in a direction to adjust the working surface of said first roller toward and away from said rotational axis;

a second roller in the form of a disc and having an exterior working surface for engaging a tube to be worked, the working surfaces of the first and second rollers being respectively disposed on diametrically opposite sides of said rotational axis so that the working force of one surface radially balances the working force of the other;
a second slide and means rotatably mounting said second roller on said second slide; and
means connecting said second slide with said frame for movement in a direction to adjust the working surface of said second roller toward and away from said rotational axis, said roller adjustments maintaining said diametrically opposed positions.

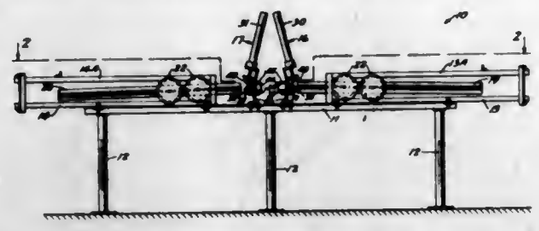
3,273,369
STRAIGHTENING MACHINE
Otto Mödder, Dahlbruch, Kreis Siegen, Germany, assignor to Siegener Maschinenbau G.m.b.H., a corporation of Germany
Filed Sept. 9, 1963, Ser. No. 307,604
Claims priority, application Germany, Sept. 13, 1962, S 81,440
7 Claims. (Cl. 72—164)



1. A straightening machine for materials such as, sheets and rails, comprising,

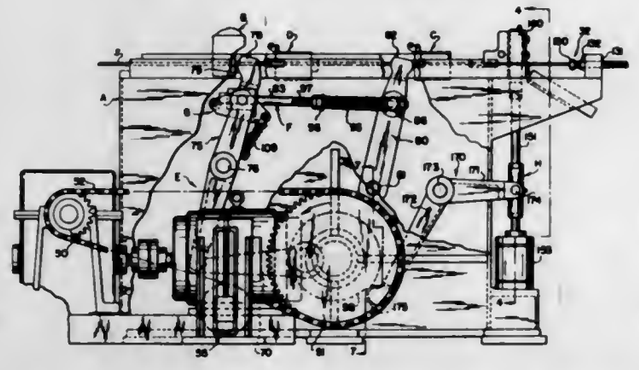
a relatively rigid heavy outer housing having a window,
a relatively light portable intermediate frame received in the window of said outer housing and engageable

with said outer housing on a first side of a pass opening between which the material is fed,
two groups of straightening rolls received in said intermediate frame and forming said pass opening, said rolls of one group being positioned in a staggered relationship to the rolls of the other group wherein the rolls act upon the opposite sides of the material,
guide boxes rotatably receiving the rolls of at least one group of rolls, displaceable toward and away from the rolls of the other group, and
means carried by said outer housing projectable from a side opposite said first side of said pass opening with respect to said rolls, and engaging said guide boxes for supporting the rolls of said one group independent of said intermediate frame.



3,273,370
HAND FACING MACHINE FOR RULE, TYPE AND BORDER
James M. Owens, 1413 Coberg Road, Columbus, Ohio
Filed July 15, 1963, Ser. No. 295,252
3 Claims. (Cl. 72—199)

1. An apparatus for facing line border material which comprises
a base;
a pair of hangers supported on said base;
means comprising a substantially stationary horizontal guide way supported on and fixedly secured against movement relative to said base, said guide way forming a material channel for the reception of said line border material and slidably supporting said line border material;
a facing wheel rotatably supported by said hangers in a position above but adjacent to said channel; and
means comprising a crank secured to said facing wheel for manually rotating said facing wheel, impressing uniformly spaced markings upon said line border material, and advancing said line border material through said channel as the markings are impressed thereon.

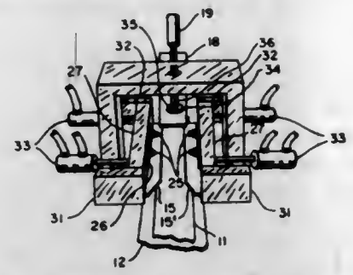


3,273,371
FABRICATING TABLE
Earl C. Peterson, Minneapolis, Minn., assignor to Permaduc, Inc., Minneapolis, Minn., a corporation of Minnesota
Filed Dec. 23, 1963, Ser. No. 332,553
8 Claims. (Cl. 72—218)

1. Apparatus for fabricating at least one elongated metallic member in substantially U configuration, said apparatus comprising a work supporting table, hold-down means arranged on said table for releasably retaining the elongated metallic member within the support table and providing support reaction for the upright legs during fabricating operations, and bending means mounted on said table including a forming head and a back-up plate, the back-up plate having a working surface, and the forming head being mounted for pivotal rotation about an axis spaced from said working surface, said work support table having a retractable loading carriage with a transverse support bed adapted for reciprocal to-and-fro move-

ment between first and second positions along said table, the loading carriage being arranged to support said elongated legs along said support bed when in said first position, and being disposed free of said work when in said second position.

3,273,372
COMBINED DRAWING AND CUT-OFF APPARATUS
William A. Ehlert, South Euclid, Ohio, assignor to The Ajax Manufacturing Company, Euclid, Ohio, a corporation of Ohio
Filed Feb. 24, 1964, Ser. No. 346,626
15 Claims. (Cl. 72—275)



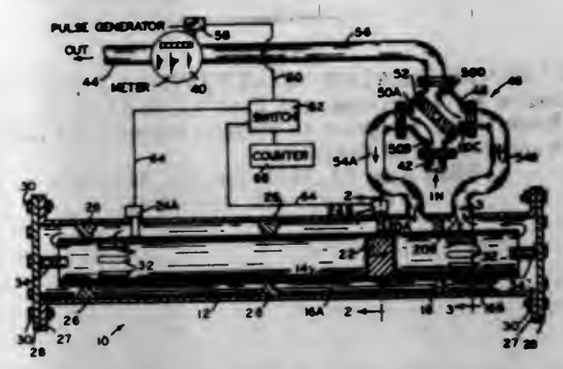
8. In combined stock drawing and cut-off apparatus, a frame, a cut-off mechanism, a reciprocable die slide carried by said frame, a drawing die carried by said die slide and adapted to perform a drawing operation on said stock during movement of said die slide away from said cut-off mechanism, a reciprocable feed slide carried by said frame, a stock gripping means carried by said feed slide and adapted to grip and advance the stock during movement of the feed slide toward said cut-off mechanism, first means operatively engaging said die slide for moving said die slide during the drawing operation, second means operatively interconnecting said first means with said feed slide and reciprocating the latter with the former, third means for actuating said cut-off mechanism to shear said stock at the end of said movement of said feed slide toward said cut-off mechanism, fourth means in said second means releasable upon said feed slide encountering a pre-determined resistance during movement of said feed slide toward said cut-off mechanism.

3,273,373
APPARATUS FOR APPLYING METAL CASES TO BRICKS
James D. Jenkins, San Jose, and Charles B. Reynolds, Saratoga, Calif., assignors to Kaiser Aluminum & Chemical Corporation, Oakland, Calif., a corporation of Delaware
Filed June 3, 1963, Ser. No. 285,093
7 Claims. (Cl. 72—316)

1. In an apparatus for applying a channel-shaped metal casing to a preformed brick having side faces and end

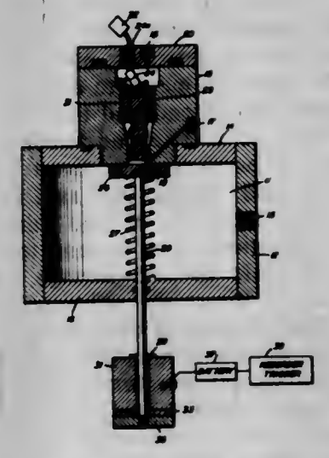
faces and at least one shallow, discontinuous depression in each of a pair of side faces, the combination of
(a) A support means,
(b) A conveying means for a brick and an associated casing,
(c) A plurality of punch means disposed adjacent to and directed inwardly toward a pair of said side faces of said brick on said conveying means,
(d) Means for simultaneously and limitedly moving

said punch means into contact with said casing at said pair of side faces to locally deform the casing into said depressions,
(e) Means for stopping said brick at a predetermined point relative to said punch means,
(f) Means for guiding said brick into alignment with said punch means, and
(g) Pressure means for holding said brick and said conveying means stationary against said support means.



3,273,374
FILTERS FOR LIQUIDS
John Frederick Annett, Hounslow, Middlesex, England, assignor to The Metafiltration Company Limited, Hounslow, England, a British company
Filed Nov. 26, 1963, Ser. No. 326,140
Claims priority, application Great Britain, Feb. 28, 1963, 8,118/63
1 Claim. (Cl. 72—340)

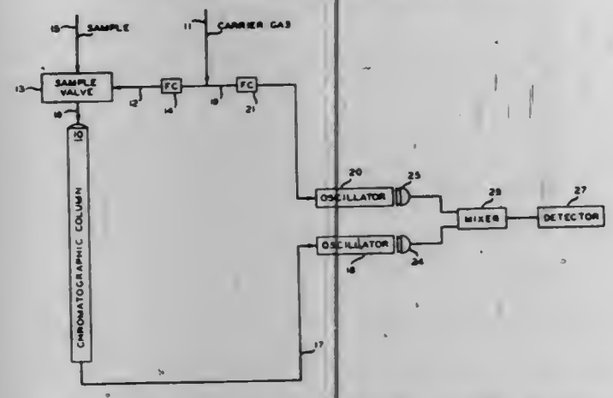
A method of making a disc for an edge filter, which comprises stamping out from sheet metal, an initial disc in the form of an annulus having one side which is substantially flat whilst the opposite side is formed with shallow projections to define, when pressed against the flat side of a like disc, radial passageways for liquid, machining the initial disc to make it substantially circular, the machining operation forming a bur on each side of the circular disc edge, and then removing the bur from one side whilst diminishing the bur on the other side.



3,273,375
FLOW METER CALIBRATING BARREL
Ralph W. Howe, Tulsa, Okla., assignor to Halmor Industries, Inc., Tulsa, Okla., a corporation of Oklahoma
Filed Nov. 24, 1964, Ser. No. 413,422
6 Claims. (Cl. 73—3)

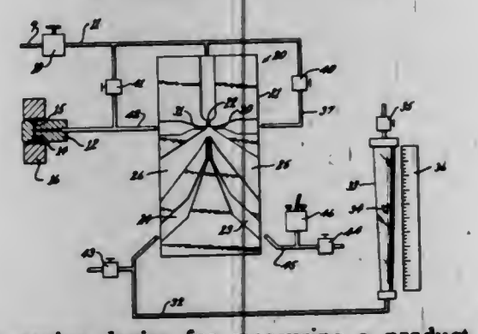
1. A calibrating barrel comprising:
an outer tubular housing closed at each end;
a reduced diameter and length inner tubular barrel supported within the housing providing an annulus between the exterior of the barrel and the interior of the housing;
a wall partitioning the annulus into two longitudinal portions, the housing having fluid ports therein communicating with each annulus portion wherein fluid flowing into one port flows within one annulus portion, through the barrel, through the other annulus portion and out the other port;
a free piston in the barrel; and

first and second spaced apart detector switches actuatable by the passage of the piston as it moves in the barrel.



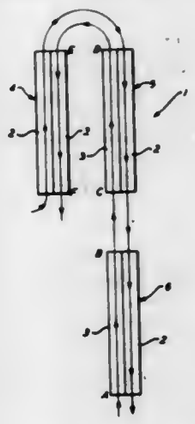
3,273,376
STATIC AND DYNAMIC CALIBRATION VESSEL FOR PRESSURE GAGES
Philip M. Aronson and Robert H. Waser, Silver Spring, Md., assignors to the United States of America as represented by the Secretary of the Navy
Filed Oct. 30, 1964, Ser. No. 407,936
5 Claims. (Cl. 73—4)

1. Apparatus for a static and dynamic calibration of pressure gages comprising:
a main pressure chamber having a cylindrical wall portion, a flat top portion and a flat bottom portion,
a cylindrical sleeve having a coaxial portion therein, said sleeve being mounted on said top flat portion such that the hole portion of said sleeve is in communication with the said main pressure chamber,
means within the hole portion of said cylindrical sleeve for mounting a test pressure gage therein,
port means in said main chamber, poppet valve means within said main chamber and abutting said cylindrical sleeve in the area of said hole portion such that a second chamber is provided between a test pressure gage and said poppet valve and a seal is provided between said main pressure chamber and said second chamber,
a cover portion on said sleeve forming a chamber between said cover portion and a pressure gage,
a second port means pneumatically connected to said second chamber,
third port means pneumatically connected to said third chamber,
means resistively urging said poppet valve against said cylindrical sleeve,
means for moving said poppet valve away from said



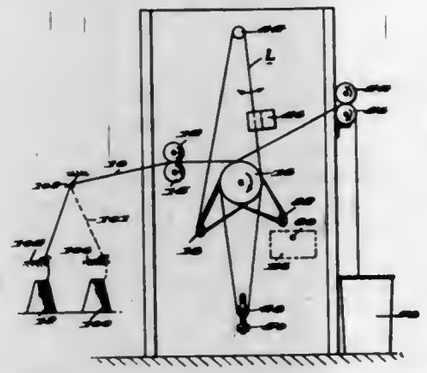
cylindrical sleeve whereby the pressure from said main chamber may be applied to said test pressure gage and said test pressure gage may be calibrated.

3,273,377
FLUID OSCILLATOR ANALYZER AND METHOD
Maurice K. Testerman and Paul C. McLeod, Jr., Little Rock, Ark., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Aug. 12, 1963, Ser. No. 301,418
5 Claims. (Cl. 73—23.1)



4. In a chromatographic analysis system wherein a fluid sample to be analyzed is introduced into a chromatographic column, and a carrier gas is directed through the column to elute the constituents of the fluid sample; apparatus for detecting the eluted constituents comprising first and second detectors, each comprising means forming a fluid passage, means to divert fluid at the outlet of said passage into second and third streams, means to return a portion of said second stream to said passage in a direction so as to tend to divert a greater portion of the fluid in said passage into said third stream, and means to return a portion of said third stream to said passage in a direction so as to tend to divert a greater portion of the fluid in said passage into said second stream; means to direct the effluent from the column through the fluid passage of said first detector; means to direct a stream of reference carrier gas through the fluid passage of said second detector; a first vibration sensing means positioned adjacent said first detector; a second vibration sensing means positioned adjacent said second detector; and means connected to said first and second sensing means to measure the difference between the frequencies of the vibrations received by said first and second sensing means.

3,273,378
GAGING DEVICE
William F. Gesell, Fairborn, Ohio, assignor to The Sheffield Corporation, Dayton, Ohio, a corporation of Delaware
Filed Nov. 29, 1963, Ser. No. 326,828
6 Claims. (Cl. 73—37.9)

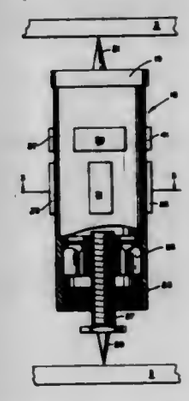


1. A gaging device for measuring a product characteristic comprising,
fluid pressure supply means providing a source of fluid through a common duct,
gaging means for operative association with a product to be gaged and controlling fluid flow to atmosphere which varies in accordance with the characteristic gaged,
gaging passage means operatively connecting said common duct to said gaging means,
a restrictor in said gaging passage means,
a fluid control device having no moving operating parts comprising,
a power jet of high energy flow operatively connected to said common duct,
first and second discharge passages arranged opposite said power jet to receive flow therefrom,
and first and second control jets of relatively low energy flow opposing one another transverse said power jet for proportioned diversion of the flow therefrom into said discharge passages in accordance with the relative flow through said control jets,
passage means connecting said first control jet to said common duct,
passage means connecting said second control jet to said gaging passage means downstream of said restrictor and upstream of said gaging means for control of flow through said second control jet in accordance with the flow through said gaging means and proportionate diversion of flow from said power jet into said discharge passages in accordance with the characteristic gaged, whereby flow conditions are obtained in said discharge passages as determined by the flow to atmosphere through said gaging means and amplified relative thereto,
control means for said restrictor for changing the basic flow level in said gaging passage means and to said second control jet providing amplification adjustment for said gaging device,
and signal means operatively connected to one of said discharge passages responsive to the flow therethrough to ambient atmosphere and to the gaged product characteristic.

3,273,379
METHOD OF LOCATING LEAKS
John J. Rendos, Millington, and Robert R. Banks, Berkeley Heights, N.J., assignors to Air Reduction Company, Incorporated, New York, N.Y., a corporation of New York
Filed Sept. 17, 1963, Ser. No. 309,503
10 Claims. (Cl. 73—40.7)

1. A method for determining the existence and approximate location of a point of leak between adjacent passes of heat exchange apparatus, each having a direction of flow, comprising the steps of introducing condensible tracer materials having respectively different freezing points along the path of one pass of the heat exchange apparatus, said path being one of decreasing temperature along the direction of flow, conducting a stream through the adjacent pass, and analyzing said stream for traces of said condensible tracer materials.

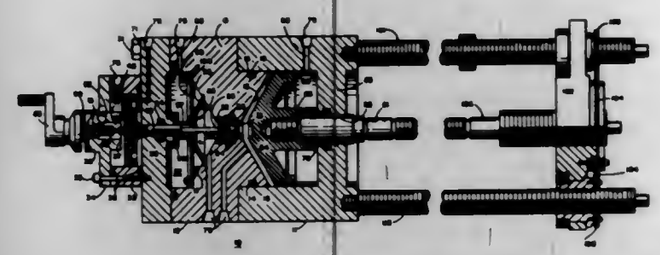
3,273,380
APPARATUS FOR DETERMINING MASS PER UNIT LENGTH
John S. Seney, Seaford, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed June 14, 1963, Ser. No. 287,815
3 Claims. (Cl. 73—67.2)



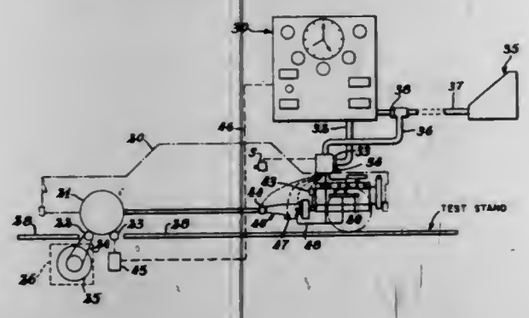
1. An apparatus for determining mass per unit length of a filamentary structure, said apparatus comprising: a driven shaft; an input feed roll rotatably mounted on said shaft; an output feed roll mounted on said shaft for rotation therewith; an idler roll mounted in spaced relationship to said shaft; a motor mounted on said shaft for rotation therewith and coupled to said input feed roll, said rolls being adapted to advance said structure axially over the input feed roll, around the idler roll, in rolling contact with the input feed roll to the output feed roll; a weight rotatably carried by the advancing structure in a loop between said input and output feed rolls; position detection means associated with said weight, said detection means including components for forwarding a control signal to said motor whereby to maintain the position of said weight and therefore the amount of tension on said structure substantially constant in the length advancing from said idler roll to the input roll; means associated with said structure in said length for vibrating the latter at its natural frequency, in a plane substantially perpendicular to the rotational axes of said feed rolls; and circuitry for detecting that frequency, converting the detected frequency to an indication of mass per unit length and recording the mass indication.

3,273,381
MEANS AND METHOD OF MEASURING VISCOELASTIC STRAIN
James E. Webb, Administrator of the National Aeronautics and Space Administration, with respect to an invention of Anthony San Miguel and Robert H. Silver
Filed Jan. 8, 1964, Ser. No. 336,608
8 Claims. (Cl. 73—88)

1. A method of testing a viscoelastic tubular solid propellant member, characterized by:
(a) coating at least one end of a tubular solid propellant member with a birefringent resin;
(b) sealing the ends of said propellant member internally of said birefringent resin whereby said resin is exposed;
(c) subjecting the tubular propellant member to internal pressures;
(d) exposing the coating to polarized light
(e) and photographing the strain pattern produced by said coating.

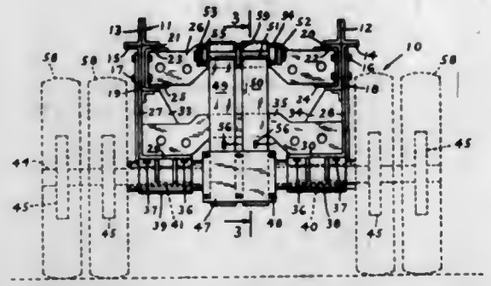


3,273,382
APPARATUS TO DETERMINE HORIZONTAL AND VERTICAL LOADS IN LANDING GEAR OF AIRCRAFT
Raymond L. Fonash, Haverford, Pa., assignor to the United States of America as represented by the Secretary of the Navy
Filed Aug. 20, 1963, Ser. No. 303,452
1 Claim. (Cl. 73—88.5)



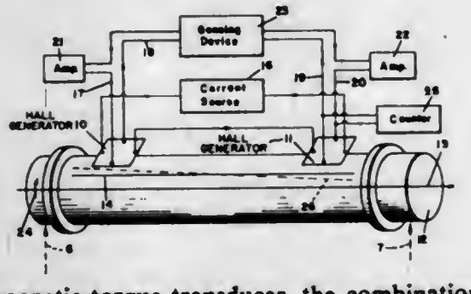
In aircraft landing gear having a tubular axle apparatus for continuously detecting ground loads applied to said landing gear, said apparatus comprising:
(a) a tubular proving rod constructed of material having a coefficient of thermal expansion similar to that of the said axle of the landing gear;
(b) four strain gages which are secured in quadrature on the exterior peripheral surface of the proving rod and which are calibrated after having been secured thereto;
(c) an end cap which is secured over one end of the tubular proving rod and which includes a pointed exterior projection centered on the longitudinal axis of the proving rod;
(d) an end plate which is secured in the other end of the proving rod and has a threaded aperture aligned with the longitudinal axis of the proving rod;
(e) a stud which is threadedly disposed in the aperture in the end plate and which includes a pointed exterior extremity that together with the pointed projection of the end cap engage opposite internal peripheral portions of the axle and support the proving rod on a predetermined axis therewithin;
(f) and means for detecting stress developed in the strain gages.

3,273,383
TENSION-COMPRESSION TESTING MACHINE
Joseph M. Krafft, 1709 Oakcrest Drive, and Walter A. Stolz, 4511 S. 34th St., both of Arlington, Va.
Filed Nov. 4, 1963, Ser. No. 321,375
4 Claims. (Cl. 73—93)



1. An improved tensile-compression testing machine which comprises a pressure chamber and a piston chamber separated from said pressure chamber by a wall structure including an axially aligned valve in the wall structure with the valve controlled from outside said pressure chamber by a valve stem that passes through the pressure chamber, said pressure chamber including hydraulic fluid and a gas fluid, the improvement comprising
(a) fluid separating means secured within said pressure chamber to separate said hydraulic fluid from said gas fluid,
(b) said valve stem passing axially through said fluid separating means and secured thereto,
(c) said fluid separating means being secured within said pressure chamber to prevent any fluid leakage between said fluid separating means, said valve stem, and the wall of said pressure chamber.

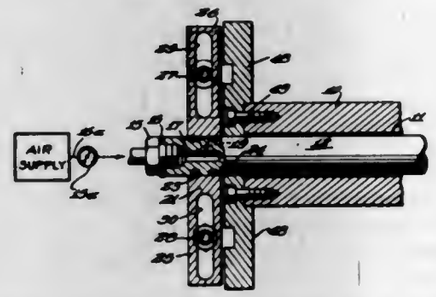
3,273,384
MACHINE AND METHOD FOR TESTING AUTOMATIC TRANSMISSIONS
Lawrence L. Flaugher, Pewaukee, Wis., assignor to Applied Power Industries, Inc., Milwaukee, Wis., a corporation of Wisconsin
Filed Mar. 7, 1963, Ser. No. 263,547
8 Claims. (Cl. 73—118)



1. Apparatus connectable to automotive vehicle parts for in situ testing of a hydraulic fluid automatic transmission while said transmission is being operated through predetermined cycles of operation:
(a) said transmission having input and output shafts;
(b) said testing apparatus comprising first means for measuring the speed of said input and the speed of said output shaft;
(c) second means for measuring hydraulic fluid pressure; and,
(d) recording means connectable to said first and second measuring means for producing continuous line graphs, representative of said speeds and of said hydraulic fluid pressure, plotted against time for said predetermined cycles of operation of said transmission.

3,273,385
BRAKE TESTING APPARATUS
Leo F. Donnelly, Alvin M. Fischer, and Franklin R. Nall, Allentown, Pa., assignors to Mack Trucks, Inc., Plainfield, N.J., a corporation of New York
Filed Mar. 10, 1964, Ser. No. 350,758
6 Claims. (Cl. 73—129)

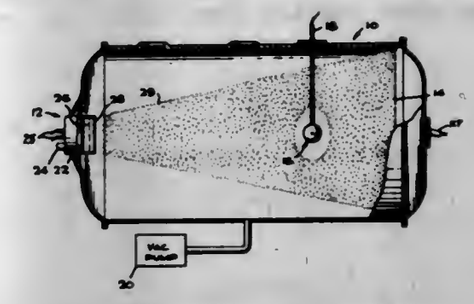
1. A device for measuring the horespower rating of vehicle brakes comprising a frame, an axle, means for rotatably supporting said axle on said frame wheels rotatably mounted on said axle for rotation thereon, brake means operatively fixed to said axle for selective engagement with said wheels to resist the rotation thereof, at least one torque arm operatively fixed to said transverse axle and secured to said frame to oppose axle rotation, and means for measuring stresses developed in said torque arm to measure the horsepower absorbed by the brake means when said brake means are engaged with the wheels.



3,273,386
TORQUE TRANSDUCER UTILIZING A MAGNETIZED SHAFT HAVING A SURFACE DISCONTINUITY REFERENCE MARK
Harry Sipler, Philadephia, Pa., assignor to the United States of America as represented by the Secretary of the Army
Filed Nov. 14, 1962, Ser. No. 237,776
1 Claim. (Cl. 73—136)

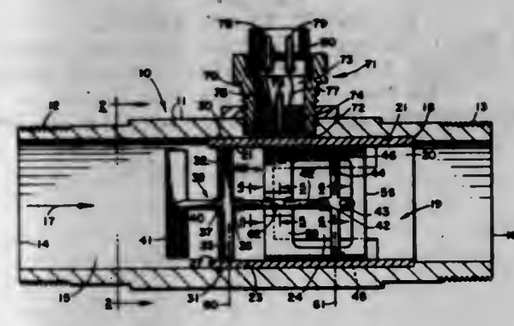
In a magnetic torque transducer, the combination with a round circularly-magnetized rotary shaft for torque transmission under variable load, of
means providing a reference mark extending longitudinally in a straight line along the peripheral surface of said shaft substantially from end to end and defining a linearly-extending surface discontinuity and magnetic leakage field transversely thereacross,
said last named means being thereby subject to deformation in opposite directions at its ends in response to torsional deformation of the shaft under load and proportional to the magnitude thereof,
a pair of Hall generators of the rectangular-crystal Indium compound type having a relatively high degree of sensitivity to magnetic field change located in fixed spaced relation along said leakage field and aligned therewith to be traversed across the crystal thickness dimension by said field and to produce simultaneous voltage output pulses from said Hall generators for each revolution of the shaft without load and consecutive pulses under load having a relation in elapsed time proportional to the torque transmitted through said shaft,

means connected with said generators for indicating the time relation betwen the pulses for each revolution as a measure for determining the torque load applied to the shaft, and
means for applying magnetizing current to the shaft at rest between test operations to periodically restore the circular magnetization thereof, thereby to eliminate current conducting contact therewith in operation.



3,273,387
TORQUE METER
Carl M. Westbrook and Loyal H. Hess, Beloit, Wis., assignors to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin
Filed May 25, 1964, Ser. No. 369,794
4 Claims. (Cl. 73—136)

1. A device for measuring torsion in a shaft comprising,
first and second fluid flow units each having a nozzle member positioned to direct a flow of fluid in a direction circumferentially of the shaft axis and a surface member facing said nozzle member for impeding flow therefrom, and mounting means for supporting the members on the shaft with the nozzle member being supported from one location at the shaft and the surface member being supported from another location axially spaced from said one location so that relative rotational movement occurs with torsion in the shaft,
means for continuously delivering fluid under constant pressure to the nozzle members, and pressure responsive means indicating variation in pressure occurring within said delivering means by back pressure caused by change in distance between said nozzle members and said surface members,
said first and second units spaced diametrically opposite relative to the shaft axis so that lateral bending of the shaft will simultaneously increase flow in one nozzle member and decrease flow in the other nozzle member thereby avoiding error in torsion measuring due to lateral bending.

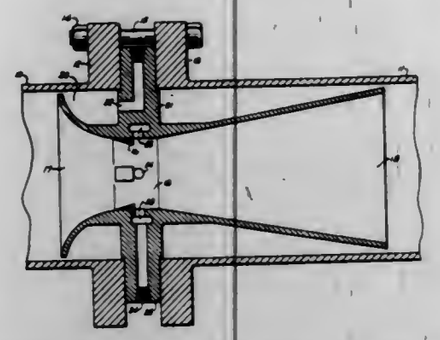


3,273,388
APPARATUS FOR MEASURING ELECTRIC FIELD STRENGTH ON THE SURFACE OF A MODEL VEHICLE
James E. Webb, Administrator of the National Aeronautics and Space Administration, with respect to an invention of John M. Sellen, Jr. and David F. Hall
Filed Mar. 5, 1964, Ser. No. 349,782
8 Claims. (Cl. 73—147)

1. An apparatus for simulating the condition of a space vehicle moving rapidly through space and determining the electrical interaction between the space vehicle and the resident plasma in space; said apparatus comprising:
(a) a cylindrical vacuum chamber,
(b) a plasma source mounted in one end of said vacuum chamber for directing a pulsed plasma beam toward the other end of said vacuum chamber,
(c) a model space vehicle positioned within said vacuum chamber in the path of the pulsed plasma beam,
(d) means supporting said model vehicle within said vacuum chamber,

(e) sensor means mounted in said model vehicle, and
(f) means for measuring the momentary flow of electrical current induced in the sensor means during the interval of time when each of the plasma pulses from the plasma source is engulfing the model vehicle.

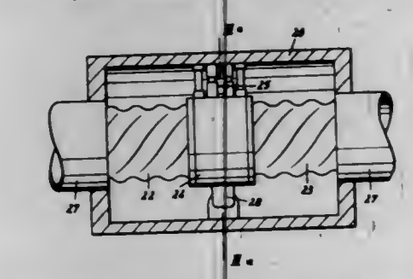
3,273,389
OSCILLATING VANE FLOWMETER
Charles C. Waugh, 5211 Beckford Ave., Tarzana, Calif.
Filed Dec. 9, 1963, Ser. No. 328,949
10 Claims. (Cl. 73—194)



1. In a flowmeter for measuring the rate of flow of a fluid through a conduit, flow rate sensing means comprising,
an elongated support member within and extending along said conduit,
first pivot means pivotally mounting said support member on said conduit for turning about a first pivotal axis extending transversely of said conduit,
first vane means connected with said support means upstream of said first pivotal axis,
second vane means located downstream of said first pivotal axis,
second pivot means pivotally supporting said second vane means on said support member for turning about a second pivotal axis generally parallel to said first pivotal axis and located downstream of the center of lift of said second vane means, and
stop means for limiting the angular motion of said second vane means relative to said support member.

3,273,390
VENTURI TUBE
William R. Brown, St. Paul, Minn., assignor to Pfaudler Permutit Inc., Rochester, N.Y., a corporation of New York
Filed Oct. 6, 1965, Ser. No. 505,089
10 Claims. (Cl. 73—213)

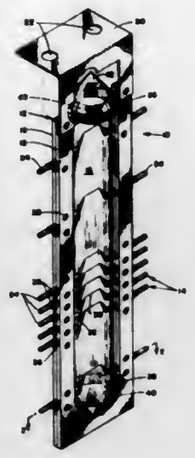
1. A venturi tube adapted for fluid flow, said tube comprising:
(a) a converging section;
(b) a throat section;



(c) at least one low pressure piezometer opening in said throat; and

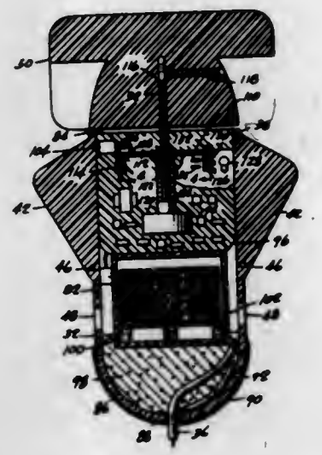
(d) an element attached to said throat section immediately upstream of each of said low pressure piezometer openings for creating a quiescent region over and about said low pressure openings, only, said

elements having a width about the square root of three time the diameter of said low pressure openings and a height sufficient to pierce the boundary layer of fluid flowing through said throat section; the remainder of said tube being free of obstructions.



3,273,391
DYNAMIC FLOW METER
Horst Bader, Stuttgart-Sillenbuch, Germany, assignor to J. C. Eckardt A.G., Stuttgart-Bad Cannstatt, Germany
Filed Nov. 29, 1963, Ser. No. 326,962
Claims priority, application Germany, Mar. 20, 1963, E 24,522; Apr. 26, 1963, E 24,741
11 Claims. (Cl. 73—228)

2. A flow meter comprising a pipe section adapted to be inserted between two adjacent parts of a pipe line, means for connecting said pipe section to said adjacent parts so as to be rotatable relative thereto about a common axis, means for producing in said pipe section a helical twisting motion of a fluid medium flowing through said pipe line and said pipe section, and means outside of said pipe line and pipe section for measuring the torque exerted by said twisting motion upon said pipe section, a housing connected to said adjacent parts of said pipe line and enclosing said pipe section, said twist producing means comprising at least one guide wheel similar to a turbine wheel within said housing and connected to said pipe section, and pivot means connecting said guide wheel and said housing for pivotably suspending said guide wheel in said housing.



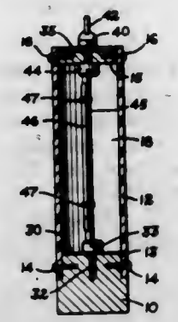
3,273,392
HOT WIRE LIQUID LEVEL DETECTOR FOR CRYOGENIC FLUIDS
William A. Olsen, Lakewood, Ohio, assignor to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed July 17, 1963, Ser. No. 295,855
10 Claims. (Cl. 73—295)

1. A liquid level sensor to be utilized for measuring the level of cryogenic fluids including a supporting structure; at least a pair of electrically-conductive probes supported on said structure, resistance wires spanning the probes and in electrical connection therewith, and a

stillwell comprising a thin shell of low heat capacitance material disposed within the supporting structure and surrounding said probes for isolating the said probes from the structure.

3,273,393
BATHYTHERMOGRAPH
Wallace R. Spark, Santa Monica, Calif., assignor to Douglas Aircraft Company, Inc., Santa Monica, Calif.
Filed Mar. 24, 1964, Ser. No. 354,325
20 Claims. (Cl. 73—344)

1. A bathythermograph comprising:



a transmitting system including

a bathythermosphere having means for sensing temperature of a surrounding fluid, means responsive to descent motion of said bathythermosphere for establishing its depth as it sinks in the surrounding fluid, and means for producing an electromagnetic signal carrying both the sensed temperature and established depth information in a correlated relationship through the surrounding fluid; and

a receiving system including

means for receiving the electromagnetic signal produced in the surrounding fluid, and means for converting the information carried in the received electromagnetic signal into visual information.

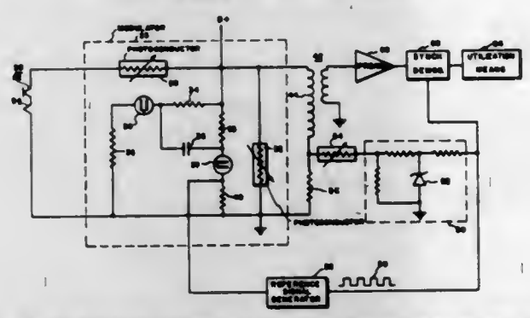
3,273,394
DEPTH THERMOMETER
John L. Chaney, Lake Geneva, Wis.
Filed Aug. 23, 1963, Ser. No. 304,046
4 Claims. (Cl. 73—354)

1. A depth thermometer for measuring the temperature of a body of liquid at a distance below the surface thereof comprising:

a weighted base member,

a transparent tubular member mounted on said base and forming a chamber for receiving and retaining a quantity of liquid,

said base member having port means extending therethrough and communicating with the lower part of said chamber,



a closure member mounted at the upper end of said chamber and fastened to said tubular member in liquid sealing relation therewith,

said upper closure member also having port means therethrough communicating with the upper part of said chamber,

studs mounted on said base and upper closure members respectively and having slotted heads extending into said chamber,

and a thermometer mounted in the slots of said studs in position centrally of and readable through said tubular member.

3,273,395
AUTOMATIC AMBIENT TEMPERATURE COMPENSATION FOR A MEDICAL THERMOMETER
Frank Schwarz, Stamford, Conn., assignor to Barnes Engineering Company, Stamford, Conn., a corporation of Delaware
Filed Aug. 5, 1963, Ser. No. 299,841
7 Claims. (Cl. 73—355)

1. A radiometer for measuring temperature which includes automatic compensation for ambient temperature changes comprising

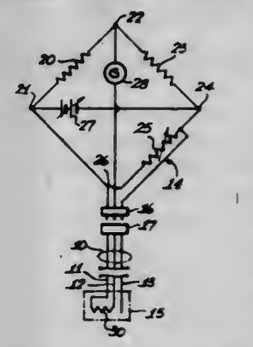
(a) an infrared detector,

(b) means for applying radiation from an object whose temperature is to be measured on said detector,

(c) an amplitude stable alternating voltage source,

(d) a voltage divider connected to said amplitude stable alternating voltage source which divider includes a temperature responsive resistor located in the proximity of said detector,

(e) modulator means for modulating the output of said detector,



(f) means for mixing the outputs of said modulator means and said voltage divider,

(g) amplifying means for amplifying the mixed modulated outputs,

(h) demodulator means for synchronously demodulating the output of said amplifying means in synchronism with said modulator means, and

(i) utilization means coupled to said demodulator means for providing an indication of the temperature of the object being measured.

3,273,396
APPARATUS FOR MEASURING RESISTANCE AT THE END OF A LONG CABLE
Alan E. Beck, London, Ontario, Canada, assignor to Canadian Patents and Development Limited, Ontario, Canada, a corporation of Canada
Filed Sept. 3, 1963, Ser. No. 306,063
6 Claims. (Cl. 73—362)

3. Apparatus for remotely measuring resistance comprising,

a cable having first, second and third conductors with distributed shunt resistance therebetween,

a first resistance having an unknown value connected between said first and second conductors at one end of the cable,

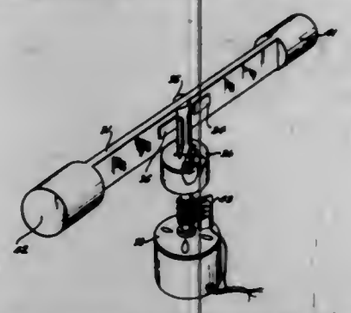
said third conductor having an open circuit termination at said one end of said cable,

an electric circuit comprising a second resistance connected between a first and second junction point, a third resistance connected between said second and a third junction point, and a fourth resistance connected between said third and a fourth junction point,

a current indicating means connected between said second and fourth junction points,

a source of direct current connected between said first and third junction points, and

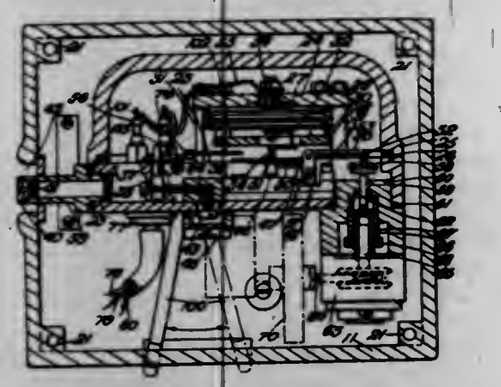
connecting means on the other end of said cable connecting said first conductor to said first junction point and said second conductor to said fourth junction point forming with said electric circuit a Wheatstone bridge,



said cable introducing an undesired cable shunt resistance in an arm of said bridge including said first and second conductors and said first resistance,

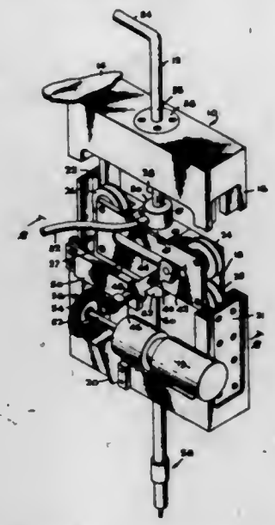
said connecting means also connecting said third conductor to said third junction point introducing a compensating cable shunt resistance in an arm of said bridge including said fourth resistance.

3,273,397
MEASUREMENT OF STATIC FORCE FIELD GRADIENTS
Robert L. Forward, Oxnard, Calif., assignor to Hughes Aircraft Company, Culver City, Calif., a corporation of Delaware
Filed June 5, 1964, Ser. No. 372,866
14 Claims. (Cl. 73—382)



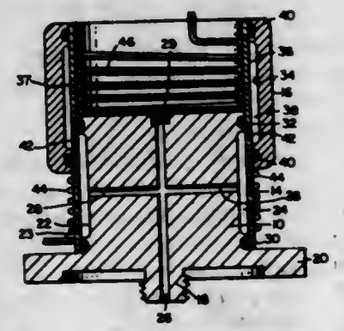
1. A system for measurement of static force field gradients, comprising: a resonant energy storage device

including a plurality of spaced sensing elements responsive to a particular type of force field coupled thereto; means for imparting equally to said sensing elements a periodic motion through the force field being measured to induce in said sensing elements energy in the form of periodically varying signals; means for combining said signals from each of the plurality of sensing elements in said resonant energy storage device to form a resultant complex signal, said spacing of said plurality of sensing elements causing said complex signal to have gradient connoting components at various harmonic frequencies



related to the frequency of the periodic motion of said sensing elements through the force field being measured, said storage device being resonant at a selected component frequency corresponding to a selected force gradient and excited thereby to provide a large amplitude response to the selected signal component; and output means coupled to said energy storage device and responsive to the large amplitude response for providing an output signal the magnitude of which is proportional to the magnitude of the selected gradient and the phase of which is indicative of the directional sense of the selected gradient.

3,273,398
ANEROID BAROMETERS
Douglas Cecil William Thomas Sharp, Basingstoke, England, assignor to Appleby & Ireland Limited, Hampshire, England, a British company
Filed Aug. 26, 1963, Ser. No. 304,461
Claims priority, application Great Britain, Nov. 6, 1962, 41,974/62
9 Claims. (Cl. 73—386)



1. An aneroid barometer comprising in combination a pressure-responsive capsule, a pivotally mounted lever, a movable member carried by said capsule to move in accordance with pressure changes, a first electrical contact on the lever, a co-operating adjustable electrical contact member, means for adjusting the position of said adjustable electrical contact member towards and away from said first electrical contact, means for indicating the position of adjustment of said adjustable electrical contact member, a second pair of co-operating electrical contacts on said lever and said movable member respectively, means urging said lever about its pivot in a direction to close said second pair of contacts, said lever being arranged so that movement of the lever due to the adjustable electrical contact bearing against said first electrical contact causes the said second pair of electrical contacts to open and electric circuit means including indicating means for indicating when both pairs of electrical contacts are closed.

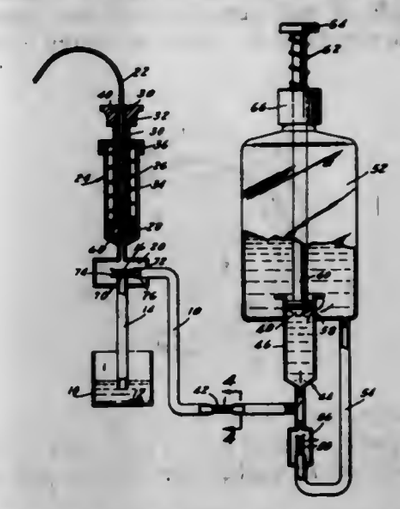
3,273,399
TRAVERSING PROBE
Edwin J. Saltzman, Kern County, and Meryl D. De Geer, Stanley C. Plamowski, and Robert Grant Green, Los Angeles County, Calif., assignors to the United States of America as represented by the National Aeronautics and Space Administration
Filed June 25, 1964, Ser. No. 378,080
9 Claims. (Cl. 73—389)

1. An instrument for examining and recording conditions existing in a flowing fluid comprising:
(a) a probe adapted for immersion in the flowing fluid to sense the conditions existing therein;
(b) a traversing mechanism coupled to said probe for extending and retracting said probe in a predetermined cyclic manner;
(c) a first means connected to said traversing mechanism for monitoring and recording the position of said probe, and
(d) a second means connected to said probe for recording the conditions sensed by said probe, whereby a record is obtained which indicates the exact conditions encountered by said probe at every position thereof.

3,273,400
PRESSURE CELL
Harvey L. Pastan, Brookline, Mass., assignor to Dynisco, Division of American Brake Shoe Company, Cambridge, Mass., a corporation of Delaware
Filed Sept. 8, 1964, Ser. No. 394,910
10 Claims. (Cl. 73—398)

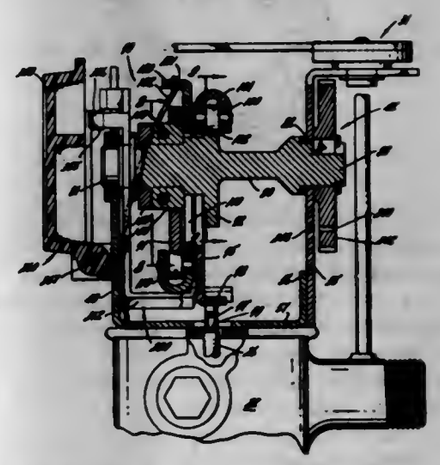
7. A pressure transducer comprising
a deformable cylindrical wall,

means disposed within and about the wall cooperating with it to form two axially displaced chambers, said means being of substantially greater mass than the wall and being nondeformable within the contemplated pressure range of the transducer,
one of said chambers being defined by the inner surface and the other by the outer surface of said wall,
means for impressing the pressure of the fluid being measured upon the walls of the chambers,
and means for measuring the deformation of the deformable wall in response to the impressed pressure.



3,273,401
PROBE SAMPLER
Henry H. Kaufmann, St. Louis Park, and Douglas E. Fiscus, Burnsville, Minn., assignors to Cargill, Incorporated, Minneapolis, Minn., a corporation of Delaware
Filed May 14, 1964, Ser. No. 367,432
8 Claims. (Cl. 73—421)

1. A cotton seed sample collecting device comprising: a hollow probe means for packing cotton seed into a solid duct about and spaced from said probe, means for isolating cotton seeds from the mass, means for collecting cotton seeds isolated from the solid mass of stored cotton seed, means for conveying said collected cotton seed to a sample container, means for inserting and removing said probe into a mass of cotton seed.

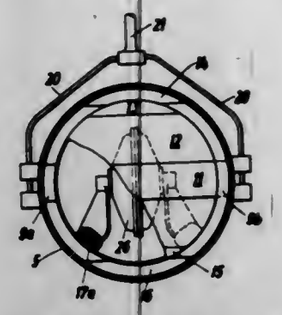


3,273,402
SPECIMEN SAMPLING AND DILUTING APPARATUS
Andrew F. Farr, 8620 San Antonio Ave., South Gate, Calif.
Filed Apr. 27, 1964, Ser. No. 362,830
7 Claims. (Cl. 73—425.6)

1. Specimen sampling apparatus comprising:
a container having a quantity of specimen liquid therein,
a sampling tube of predetermined capacity,
pump means for drawing liquid from said container into said tube and for removing excess liquid overflowing said tube,
said pump means including a sampling valve chamber,
a pressure responsive sampling valve within said chamber at one end of said tube,
a barrel communicating with said chamber,
a plunger movable in one direction within said barrel for reducing pressure within said chamber, and
coverable passage means through said plunger closed to reduce pressure in said chamber upon plunger movement in said one direction within said barrel

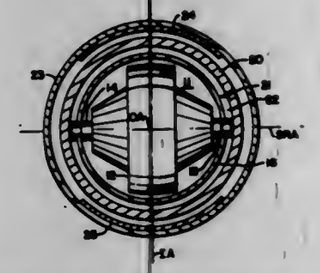
and open upon plunger movement in another direction.

3,273,403
WATER CONDITIONING SYSTEM
James E. Hiers and Edward J. Tischler, St. Paul, Minn., assignors to Union Tank Car Company, Chicago, Ill., a corporation of New Jersey
Filed June 3, 1963, Ser. No. 285,117
22 Claims. (Cl. 74—2)



1. A timing device for controlling the operation of responsive means according to a pre-determined schedule, comprising: shaft means rotated by motor means at a pre-determined speed, operator means mounted on said shaft means for movement transversely thereof to operate the responsive means, cam means on said shaft means for cooperating with said operator means to initially energize said operator means for operation of the responsive means and to subsequently permit said operation at a pre-determined time, and resilient means for biasing said operator means out of operating relationship with the responsive means.

3,273,404
GYROSCOPIC INSTRUMENT
Hans Ehrich, Kiel-Schulensee, Germany, assignor to Anschutz & Co. G.m.b.H., Kiel-Wik, Germany, a limited liability company of Germany
Filed Mar. 6, 1964, Ser. No. 349,953
Claims priority, application Germany, Mar. 7, 1963, A 42,533
1 Claim. (Cl. 74—5)



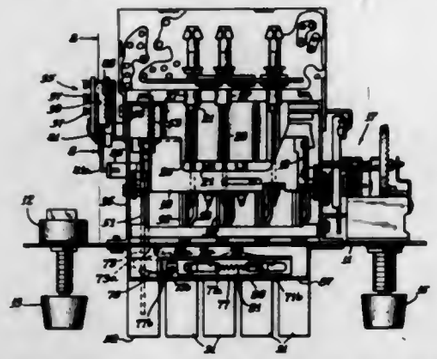
A gyroscope instrument comprising a vessel, an electrically conductive liquid filling said vessel, a float immersed in said liquid, at least one gyroscope mounted

within said float, electric driving means in said float for spinning said gyroscope, means including electrode faces on the inside of said vessel and on the outside of said float for the supply of the electrical energy to said electric

driving means, said float consisting of a mixture of a synthetic plastic material with a filler, said filler having a thermal conductivity higher than that of said plastic material.

3,273,405
CONTROL APPARATUS
Roger P. Durkee, Hopkins, Minn., assignor to Honeywell Inc., a corporation of Delaware
Filed June 19, 1961, Ser. No. 118,011
8 Claims. (Cl. 74—5.7)

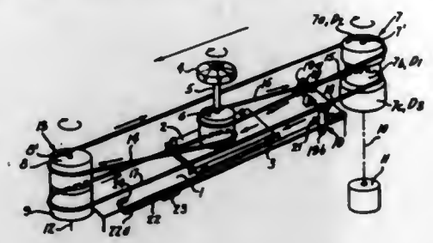
1. In a sensitive instrument: an electric spin motor; a gimbal element, said spin motor having leakage flux and being mounted within said gimbal element for rotation about a spin reference axis; housing means; fluid means, said gimbal element being substantially supported within said housing means by said fluid means for rotation about an output axis perpendicular to said spin reference axis, said gimbal element tending to rotate about said output axis in response to spin motor reaction torque; and compensating means mounted on said housing means, said compensating means being positioned so as to interact with said leakage flux of said spin motor and apply a torque to said gimbal means so as to substantially eliminate the rotation thereof due to said spin motor reaction torque.



3,273,406
GYRO MECHANISMS
Moshe Epstein, 27 Wedgewood Blvd., Haifa, Israel, and Meir Dror, 13 Hagefen St., Sabinia, near Kiriat Bialik, Israel
Filed Nov. 6, 1962, Ser. No. 235,775
Claims priority, application Israel, Nov. 14, 1961, 16,320; Nov. 15, 1961, 16,328
10 Claims. (Cl. 74—5.12)

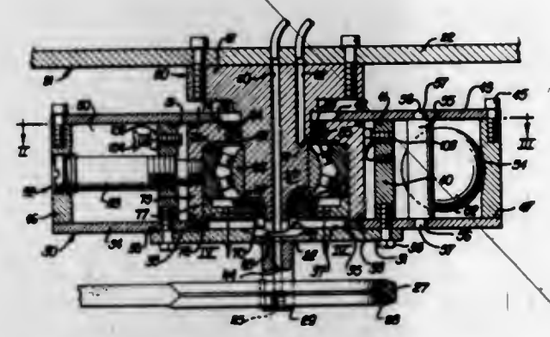
7. A gyro mechanism, comprising in combination a rotor mounted in gimbals so as to have at least two degrees of freedom, a narrow annular slit of uniform width being provided in said rotor at an angle with the axis of rotation, an annular bracket being positioned in fixed spatial relation to said rotor so as to surround the opening of said slit, a wire of such diameter as to be adapted to be wound in said slit in the form of a single layer spiral, an opening being provided in the annular surrounding bracket through which said wire can be inserted and withdrawn, said bracket being at such a distance from the slit as to prevent the escape of the wire from the slit, means being provided for fixedly holding in place said

gimbals during the time of withdrawal of the said wire when the rotor is actuated and for automatically freeing said gimbals after the withdrawal of said wire.



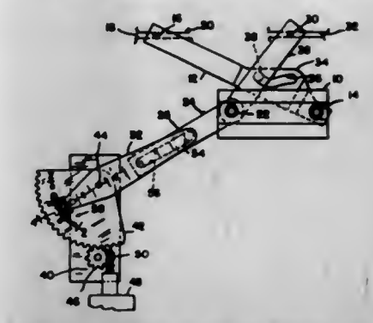
3,273,407
INDICATOR DEVICE
Gustav A. Winkler, Wheaton, Ill., assignor to Motorola, Inc., Franklin Park, Ill., a corporation of Illinois
Filed Sept. 10, 1964, Ser. No. 395,467
6 Claims. (Cl. 74—10.27)

1. An indicator for use in a device operable to two states by a pushbutton having first and second stable positions, one for each state, including in combination, a mask member having an opening therein, a slidable member disposed behind said opening in said mask member and having first and second characters thereon representing the two states to which the device is operable, said slidable member being movable to first and second positions to align said first and second characters respectively with said opening in said mask member so that they are visible, and a bell crank engageable by the pushbutton and pivotal to first and second positions according to the first and second positions of the pushbutton, said bell brank being coupled to said slidable member to move said slidable member between said first and second positions according to said first and second positions of said bell crank, whereby said indicator provides an indication of the operative state of the device.



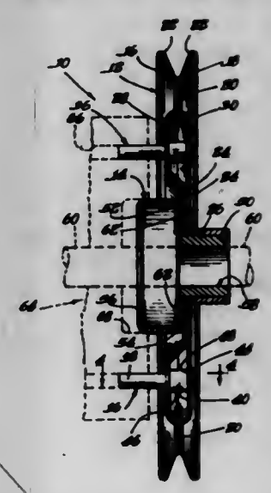
3,273,408
DRIVE APPARATUS FOR A CARRIAGE MOVABLE UPON A GUIDE
Ernst Nagel, Weissiingen, and Werner Steinmetz, Kempten, Zurich, Switzerland, assignors to Pneumafil Corporation, Charlotte, N.C.
Filed Dec. 3, 1964, Ser. No. 415,591
Claims priority, application Switzerland, Dec. 6, 1963, 14,981/63
13 Claims. (Cl. 74—22)

1. Drive apparatus comprising, in combination, a guideway, a carriage movable back and forth upon said guideway, pulley means mounted at the ends of said guideway and at said carriage, one of said pulley means mounted at the end of said guideway being capable of being driven, an endless member extending about said pulley means of said guideway, said pulley means of said carriage being trained by two different strands of said endless member, at least one of said pulley means being constructed to provide a step pulley having pulley steps of different diameter in order to generate a rolling movement of said pulley means of said carriage at one of said strands, an operable member rotatably mounted at said carriage, said pulley means of said carriage being



operatively coupled with said operable member in order to utilize the rotation of said pulley means of said carriage resulting during said rolling movement, reversing means for reversing the direction of movement of said carriage while the direction of rotation of said pulley means and said operable member remains the same, said reversing means cooperating with one of the pulley steps and said endless member in order to displace the latter from its trained pulley step.

3,273,409
MOTION GENERATOR MEANS
Lee B. Holman, Whittier, Calif., assignor to State Steel Products, Inc., City of Industry, Calif., a corporation of California
Filed May 6, 1963, Ser. No. 278,176
12 Claims. (Cl. 74—86)

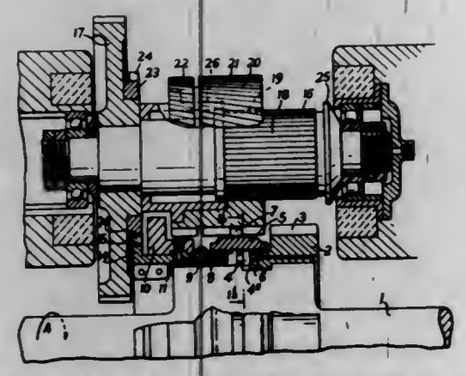


1. A self-balancing motion generator means for use on a material separating means including a screen receptacle adapted to be agitated and carrying said motion generator means, a base means, and driving means including a drive pulley belt for said receptacle on the base means, the combination of: a housing having an axis of rotation and a wall with an axial opening; a shaft portion on said housing co-axial with and below said housing and connected with a drive pulley belt of driving means for rotating said housing; a stub shaft receivable through said axial opening in spaced relation to said housing and connected to said receptacle; bearing means within said housing carried by said stub shaft and supporting said housing, said stub shaft and bearing means being laterally displaceable within said housing; means for moving and retaining said stub shaft and bearing means in selected lateral adjustment; and counterweight means operable within the housing for counterbalancing loads imparted to said housing to maintain a stable axis of rotation of the housing and to thereby impart gyratory motion to said stub shaft and receptacle connected thereto.

3,273,410
WINDOW REGULATOR
Joseph Pickles, Dearborn, Mich., assignor to Ferro Manufacturing Corporation, a corporation of Michigan
Filed Jan. 13, 1964, Ser. No. 337,297
4 Claims. (Cl. 74—89.18)

1. In window regulator mechanism, a support, a flat plate formed of sheet metal pivoted to said support, an operating arm pivoted to said support, pivot means on said support mounting said plate and said arm for independent swinging movement about the axis thereof, a pair of opposed spring retainer end abutments partially severed from the sheet material of said plate at opposite sides of said arm and bent up to confront a portion of said arm, a centering spring retainer abutment partially severed from the sheet material of said plate and bent up to occupy a position intermediate said end abutments, a coil spring under compression retained between said centering abutment and each of said end abutments, said arm having a spring retainer abutment engageable with the adjacent ends of both of said coil springs.

3,273,411
FABRICATED SHEET METAL SHEAVE
Edward H. Schultz, Jr., Glencoe, Ill., assignor to The Nagel-Chase Manufacturing Company, Chicago, Ill., a corporation of Illinois
Filed Nov. 4, 1964, Ser. No. 408,816
5 Claims. (Cl. 74—230.4)



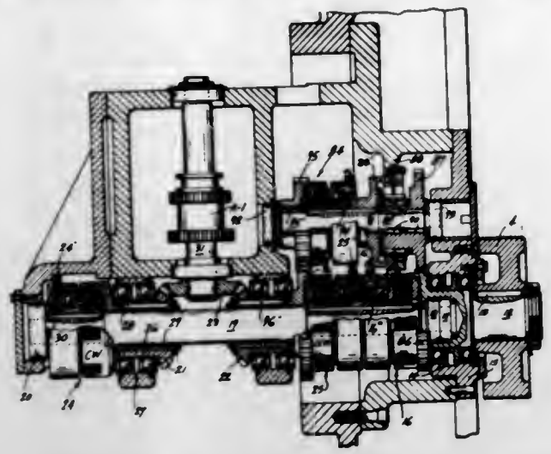
1. A sheave arrangement comprising: first and second sheet material members having outer edge portions defining a peripheral rim, inner edge portions defining a central aperture and annular regions intermediate said rim and said aperture cooperating to define a box section, a plurality of axially aligned hole means perforating said members at arcuately spaced positions on said box section; and a force-transmitting pin means fastened to said box section at each of said hole means, including an elongate portion extending axially beyond the face of one of said members to be engaged by motive means, said pin means further including a radially enlarged portion dis-

posed between said members and having at least one shoulder engaging a said member radially outwardly of the corresponding hole means to brace said pin means against torsional forces and prevent distortion by the engaging motive means.

3,273,412
SYNCHRONOUS SELF-SHIFTING GEAR MECHANISM

Herbert Arthur Clements, Weybridge, England, assignor to S.S.S. Patents Limited, London, England, a British company

Filed Feb. 23, 1965, Ser. No. 434,523
7 Claims. (Cl. 74—339)



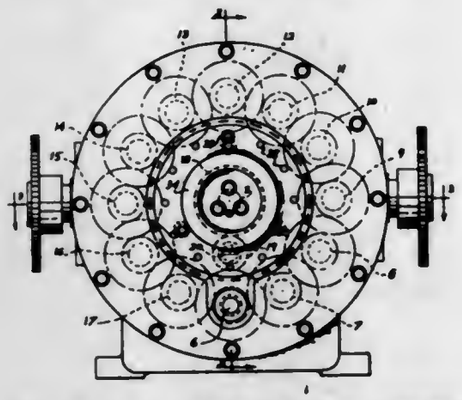
1. Synchronous self-shifting gear mechanism comprising a first rotary gear member, a first set of helical gear teeth carried by said first gear member, a second rotary gear member, means mounting said first and second gear members for rotation about parallel axes, an intermediate member, a second set of helical gear teeth carried by said intermediate member, means constraining said intermediate member for axial movement relative to said second gear member to bring said second set of gear teeth into and out of engagement with said first set of gear teeth, a rotary actuating ring member axially located relative to said first gear member, further helical teeth carried by said actuating ring member and engageable with said second set of gear teeth, pawl and ratchet mechanism for actuating said intermediate member to initiate precise interengagement of said first and second sets of gear teeth, said pawl and ratchet mechanism comprising ratchet teeth drivably connected to one of said actuating ring and first gear members and at least one pawl carried by the other of said actuating ring and first gear members.

3,273,413
TRANSMISSION WITH AUTOMATIC MESHING CONTROL

Richard E. Stobbe and Frank Zankl, Milwaukee, Wis., assignors to Kearney & Trecker Corporation, West Allis, Wis., a corporation of Wisconsin

Filed Aug. 28, 1963, Ser. No. 305,095
20 Claims. (Cl. 74—346)

1. In a multi-speed drive;
a train of gearing including a plurality of shiftable gear clusters;
shift means for each of said gear clusters for shifting said gear clusters singularly or in combination to vary the ratios in said gearing to provide a desired output;
an input drive including a normal speed and a creep speed takeoff;
means to connect said normal speed takeoff to said train of gearing;
detecting means individual to each of said shift means to detect the failure of any of said shift means to complete a shifting operation due to the lack of gear meshing in shifting;
means coordinating said detecting means and operable upon any incomplete shifting for disconnecting said normal speed takeoff and connecting said creep speed takeoff to said train of gearing to condition



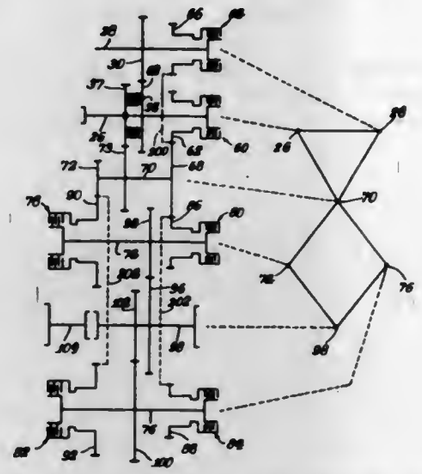
said stuck gears for meshing, and upon meshing thereby complete shifting automatically disconnecting said creep speed takeoff and connecting said normal speed takeoff.

3,273,414
MULTIPLE SPEED TRANSMISSION

Le Roy R. Boggs, Bristol, Tenn., assignor to Universal Moulded Fiber Glass Corp., Bristol, Va., a corporation of Delaware

Filed Dec. 17, 1963, Ser. No. 331,270
5 Claims. (Cl. 74—353)

1. A drive transmission including an output shaft, a series of gear shafts one of which comprises an input shaft, the shafts of said series being parallel to said output shaft and to each other and arranged around the output shaft at equal distances therefrom, each of said gear shafts having two gears thereon of different diameters with the larger gear on each shaft meshing with the smaller gear on an adjacent shaft of the series, a gear on the output shaft, and a gear shiftable in an orbit around the output shaft for selectively interconnecting the gear on the output shaft with the larger gear on any of said gear shafts.



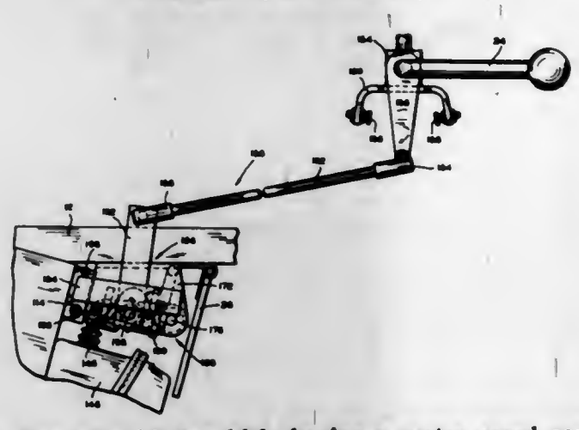
3,273,415
TRANSMISSION

Barry L. Frost, Jackson, Mich., assignor to Clark Equipment Company, a corporation of Michigan

Filed Dec. 30, 1963, Ser. No. 334,204
7 Claims. (Cl. 74—360)

1. In a transmission, an input shaft, a first clutch gear rotatable on said input shaft, a first forward-drive clutch adapted to selectively connect said first clutch gear to said input shaft, a reverse shaft, a second clutch gear rotatable on said reverse shaft, a reverse-drive clutch

adapted to selectively connect said second clutch gear to said reverse shaft, a second forward-drive clutch including a hub member rotatably mounted on said input shaft, a plurality of friction disk members carried by said hub member for rotation therewith, a drum member having a radial flange portion secured to said input shaft and a generally axial cylindrical portion carrying a plurality of friction disk members interleaved with said

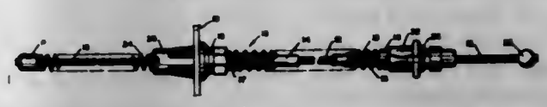


friction disk members on said hub member, and means for compressing together said disk members of said hub and drum members for clutching said hub member to said input shaft, said cylindrical portion of said drum member having a first drive gear, said hub member having a second drive gear, a gear secured to said reverse shaft and in constant mesh with said first drive gear, and gear means selectively driven from said first and second clutch gears and said second drive gear.

3,273,416
SPEED AND DIRECTION CONTROL LINKAGE

Louis A. Haddock, Jr., Battle Creek, Mich., assignor to Clark Equipment Company, a corporation of Michigan

Filed June 1, 1964, Ser. No. 371,554
6 Claims. (Cl. 74—471)

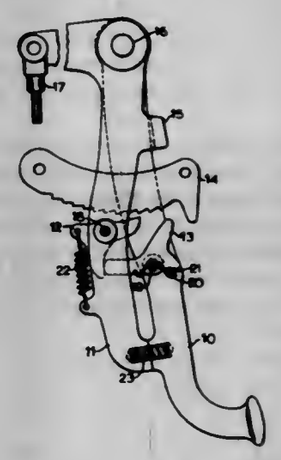


1. For use with a vehicle having a motor speed control which is actuated by an outwardly biased plunger and a direction control switch, speed and direction control linkage comprising a mechanism for changing bidirectional movement to unidirectional movement, the said mechanism including pin means disposed to operatively engage the plunger, an actuating member operatively connected to the said pin means, pivot means for said actuator so that movement of the said actuating member in either of two directions causes the said pin means to move in only a single direction away from operative engagement with the plunger and spring means for biasing the said pin means into operative engagement with the plunger with sufficient force to overcome the outward bias of the plunger, the said actuating member being disposed so that movement of the said actuating member in one of the said two directions actuates the direction control switch, and an operator's control member operatively connected to the said actuating member for moving the said actuating member in either of the said two directions.

3,273,417
CONTROL CABLE CORE ELEMENT POSITIONING MEANS

Warren E. Sevrence, Adrian, Mich., assignor to American Chain & Cable Company, Inc., New York, N.Y., a corporation of New York

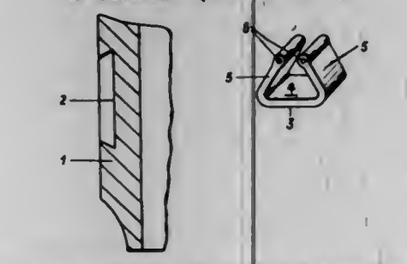
Filed Apr. 6, 1964, Ser. No. 358,148
8 Claims. (Cl. 74—501)



1. In a control cable wherein a core element is axially translatable through a casing fixed at least at one point along its length to displace an actuated member between first and second positions, core element positioning means for nominally locating said actuated member in its first position comprising:
(A) stop means attachable to said core element to abut one end of said casing, and
(B) mounting means movable through said casing and located on said core element to receive said stop means in fixed engagement at a predeterminded point on said core element immediately outside said end of the casing when said actuated member is in its first position.

3,273,418
VEHICLE PARKING BRAKE CONTROL

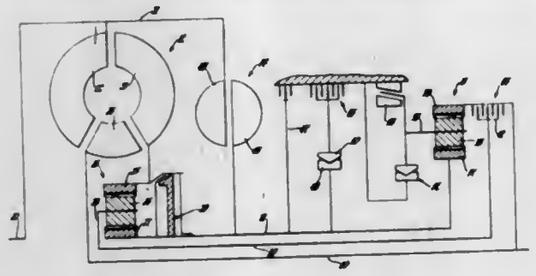
Elmer F. Ellis, 15722 Wisconsin, Detroit, Mich.



Filed Dec. 12, 1963, Ser. No. 330,127
3 Claims. (Cl. 74—539)

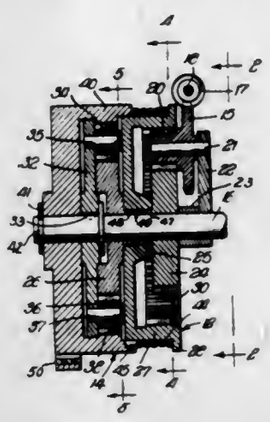
2. In a mechanism of the pawl and ratchet type for operating a parking brake or the like of a vehicle, including in combination a stationary support, a ratchet immovably fixed to said stationary support, a brake lever swingably mounted to said support, and with suitable means to connect it with a brake operating cable or rod, and adapted to be moved between a brake released position and a brake applied position, a pawl pivotally mounted on said brake lever with resilient means urging said pawl into contact with said ratchet for holding said brake lever in brake applied position, a brake pedal, also

swingably mounted on said stationary support and not only adapted to apply force on said brake lever in brake applying direction but also to swing away from said brake lever on urging of resilient means between them, when said brake lever is held by said pawl in a brake applied position, a distance limited by an appropriate stop between said brake lever and said pedal just sufficient to permit a pawl controlling lever, pivotally mounted on said pedal, to pivot to a position from which motion imparted to said pedal in a brake applying direction will cause said pawl controlling lever to force said pawl out of contact with said ratchet, permitting the mechanism to be eased back to brake released position, said pawl controlling lever being of such design that when mechanism reaches the brake released position said pawl controlling lever will have been pivoted by contact with appropriate projection on said ratchet or other non-moving part to position in which said pawl is released to make contact with said ratchet and, in which position said pawl is of such design that it will hold said pawl controlling lever in inoperative position while mechanism is in brake released position and during foot application of brake.



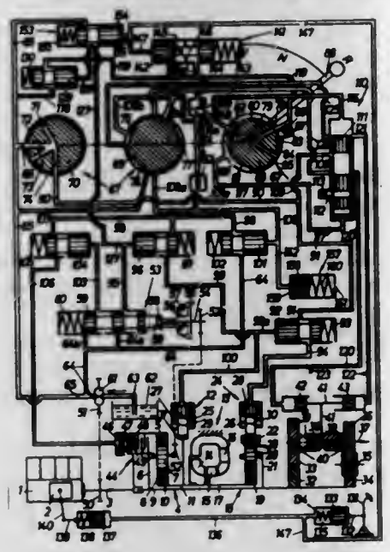
3,273,419
BALANCING WEIGHT CONSTRUCTION
Franz G. Kollmann and Friedrich Laussermair, Munich, Germany, assignors to BMW Triebwerkbau G.m.b.H., Munich-Allach, Germany
Filed Nov. 12, 1964, Ser. No. 410,472
Claims priority, application Germany, Nov. 13, 1963, B 74,240
6 Claims. (Cl. 74—573)

1. An arrangement for fastening balancing weights on rotating bodies, especially on rotors of flow machines rotating at high speeds, within annularly shaped apertures of said rotating bodies arranged in the end faces thereof and forming sidewalls, said weights comprising elastic structural portions, said arrangement comprising:
   mutually cooperating means in said weights and in said apertures,
   said cooperating means in a respective one of said weights being constituted by said elastic structural portions including spaced abutment surfaces thereof,
   said cooperating means in respective one of said apertures being constituted by said sidewalls thereof, said one of said apertures corresponding approximately in width to the distance between said spaced abutment surfaces,
   said respective one of said weights by reason of said elastic structural portions springily expanding and forcing said spaced abutment surfaces against said sidewalls of said respective one of said apertures and being tangentially non-displaceably secured therein by the resulting frictional engagement therewith.



3,273,420
TRANSMISSION
John J. O'Malley, Livonia, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Dec. 6, 1963, Ser. No. 328,538
10 Claims. (Cl. 74—677)

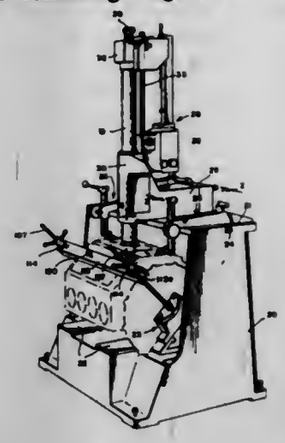
1. In a transmission, a hydraulic torque converter including an impeller, a turbine and a reaction member, a fluid coupling of the type adapted to be selectively filled with and emptied of working fluid and including an impeller and a turbine, an engine driven power input shaft connected to both of said impellers for driving the same, a first gear unit, a planet carrier supporting a planet pinion gear in mesh with a ring gear and a sun gear, a final power delivery shaft, means connecting said converter reaction member to said final power delivery shaft for rotation therewith as a unit, a second gear unit including a planet carrier supporting a planet pinion in mesh with a sun gear and a ring gear, said last mentioned ring gear being connected to said final power delivery shaft for rotation therewith as a unit, an engageable and releasable clutch effective in all forward drive ratios to connect said



first gear unit carrier to said final power delivery shaft for rotation therewith as a unit, means connecting said sun gears to each other and to said fluid coupling turbine for rotation as a unit, means for preventing rotation of said second gear unit planet carrier for completing the establishment of first or low gear drive when said clutch is engaged, engageable and releasable brake means for preventing rotation of both of said sun gears to establish second gear drive when said clutch is engaged, said fluid coupling being filled with fluid and said clutch being engaged to establish direct drive through said transmission.

3,273,421
TIMER TRANSMISSION
Gerald W. Jones, Newton, Iowa, assignor to The Maytag Company, Newton, Iowa, a corporation of Delaware
Filed June 4, 1963, Ser. No. 285,509
12 Claims. (Cl. 74—705)

1. In a power transmission mechanism including an input element and an output element, the combination comprising: first and second relatively rotatable ring gears each having circumferential teeth; a gear assembly including a central gear portion and a sun gear portion; a first gear element, said central gear portion and said first gear element having meshing relationship and being driven by said input element, said first gear element also having meshing relationship with the circumferential teeth of said first ring gear; drive means including a second gear element interposed between said sun gear portion and the circumferential teeth of said second ring gear, said drive means having a driving relationship with the output element; and means for selectively controlling the relative rotation of said second ring gear to said first ring gear.



3,273,422
MULTIPLE SPEED TRANSMISSION
Hellmut Weinrich and Günther Paulsen, Heidenheim (Brenz), and Herbert Müller, Pinneberg, near Hamburg, Germany, assignors to Voith-Getriebe KG., Heidenheim (Brenz), Germany, a corporation of Germany
Filed Nov. 1, 1963, Ser. No. 320,651
12 Claims. (Cl. 74—752)

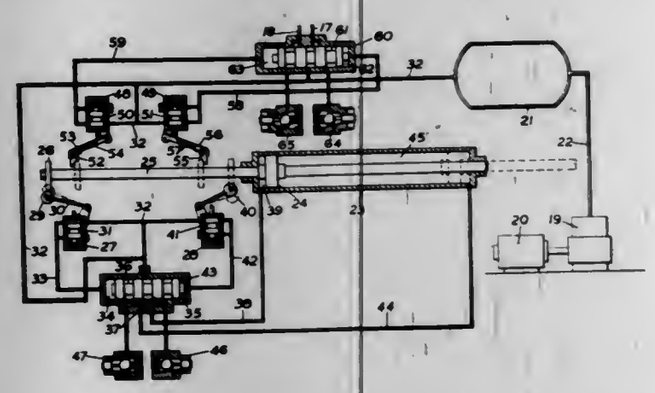
1. In an automatic multiple speed transmission having a power input shaft and a power output shaft, means including change speed means coupling said output shaft to said input shaft and means for selectively reversing the direction of output shaft rotation and comprising a low ratio speed and at least one higher ratio speed, said reversing means being operated by a manual shift member, said low ratio speed including at least a Foettinger type fluid drive for transmitting power in at least one direction of said output shaft, means responsive to the speed of said output shaft for effecting a change in the transmission ratio of said change speed means in at least one direction of output shaft rotation to automatically upshift and downshift between said low ratio speed and said at least one higher ratio speed, and means responsive to actuation of said shift member to automatically render the means operably associated with said at least one higher ratio speed inoperative and to automatically actuate the means operably associated with said low ratio speed for automatically effecting a downshift to said low ratio speed before permitting said reversing means to effect a reversal in the direction of output shaft rotation and then rendering the means for at least one higher ratio speed operative.

3,273,423
BORING MACHINE
Donald B. Rottler, 1221 Poplar Place, Seattle, Wash.
Original application May 27, 1963, Ser. No. 283,446. Divided and this application Dec. 13, 1965, Ser. No. 513,308
10 Claims. (Cl. 77—4)

1. In combination, a bed, a boring unit supported by said bed and presenting a depending boring bar with a boring head at its lower end, centering finger means having centering fingers on said boring head arranged to be extended and retracted in unison, air lifting means for selectively floating the boring unit relative to said bed while said centering fingers are being extended to

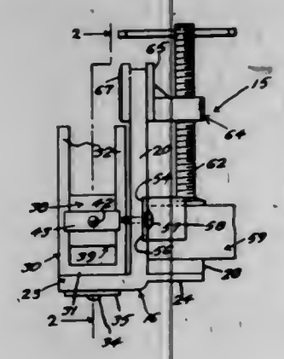
center said boring head, and clamping means for clamping the boring unit on said bed after the boring head has been centered.

3,273,424
PORTABLE RAIL DRILLS
Ralph Hughes, Graysville, Tenn., assignor to The Singer Company, New York, N.Y., a corporation of New Jersey
Filed Apr. 9, 1964, Ser. No. 358,499
4 Claims. (Cl. 77—11)



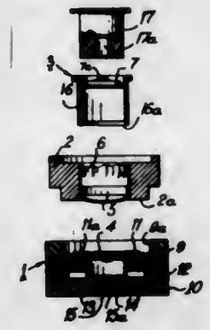
1. A rail drill for drilling a rail in place in the roadbed of a railroad comprising a base member, means for supporting said base member on a pair of spaced rails for adjustment relatively to said rails, means for releasably clamping said base member to that one of the rails that is to be drilled, a support, means for mounting said support on said base member for sliding movement in a direction toward and away from said one of the rails, a rotary drill mounted on said support, means for moving said support to advance said drill into and to retract the same from drilling relation with the rail to be drilled, said means for releasably clamping the base member to the rail comprising a pair of abutments secured to said base member on opposite sides of said drill, a pair of clamping arms having free ends opposed to said abutments and slidably mounted on said base member for movement of the free ends of the clamping arm toward and away from the abutments, and means on said base member for moving said clamping arms toward the abutments, said clamping arms and abutments being adapted for relative movement substantially in the same plane as said drill is movable.

3,273,425
MACHINE TOOL PECKING DEVICES
Albert Warmingham Hodgson, 2 Rope Lane, Wistaston, Crewe, England
Filed Aug. 3, 1964, Ser. No. 386,926
Claims priority, application Great Britain, Sept. 4, 1963, 34,863/63
17 Claims. (Cl. 77—32.3)



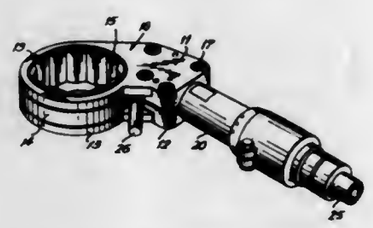
1. In a machine tool including a working head, means mounting said working head for working movement thereof and simultaneously for movement toward and away from a working position, and means for imparting a working movement to said working head; a machine tool pecking device comprising a fluid operated, double-

acting actuating piston and cylinder means, a fluid operated, self sustaining timing device, link means connecting said timing device to said actuating piston and cylinder means controlling the movement of the moving part of said actuating piston and cylinder means with respect to time from said timing device, variable loading means actuable on said moving part of said actuating piston and



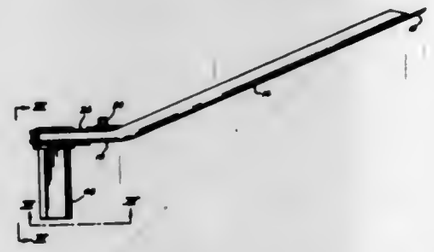
cylinder means in one direction of movement of said moving part thereof, and pecking drive take-off means connected to said moving part of said actuating piston and cylinder means and to said working head transmitting the movement of said moving part of said actuating piston and cylinder means to said working head to move said working head toward and away from said working position.

3,273,426
DRILLING JIG
James L. Cleveland, 351 Clyde Ave., Calumet City, Ill.
Filed Dec. 16, 1963, Ser. No. 330,778
6 Claims. (Cl. 77—62)



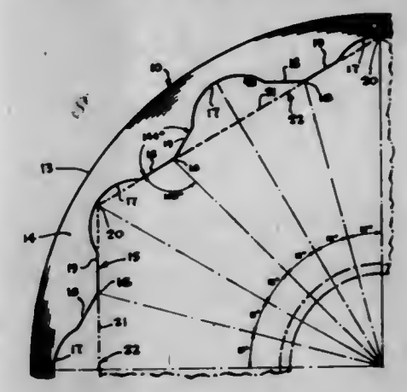
1. A drilling jig comprising a frame, a drilling guide support, means adjustably mounting said support on a first part of said frame, a drilling guide, means adjustably mounting the drilling guide on said support, a bracket detachably anchored to a second part of the frame, and a clamping screw engaging threadedly through said bracket and adapted to clamp a piece of material against a third part of the frame and with a surface of the material facing said drilling guide, said clamping screw, when in clamping engagement with the material, maintaining said bracket anchored to said second part of the frame, said second part of the frame including a top portion and a depending portion, said bracket having a first bifurcated portion straddling said depending portion and a second bifurcated portion engaging under and straddling said top portion.

3,273,427
METHOD AND DEVICE FOR MANUFACTURING BUTTONS CONSISTING OF SEVERAL ELEMENTS
André Zack, 13 Blvd. du Temple, Paris 13, France
Filed Oct. 21, 1964, Ser. No. 405,480
Claims priority, application France, Dec. 10, 1963, 956,633, Patent 1,386,426
6 Claims. (Cl. 79—5)



1. A device for making a button having a pair of confronting disc-shaped center pieces peripherally interconnected by a fabric-shrouded ring, comprising:
(a) a lower die having a depression surrounded by a beveled horizontal peripheral edge for receiving a first disc-shaped center piece;
(b) an annular intermediate die with a vertical bore of constant cross-section removably positioned on said lower die, said bore registering with said beveled edge;
(c) a tubular upper die slidably fitting in said bore, said upper die having a beveled lower peripheral edge confronting said beveled horizontal edge of said lower die;
(d) and piston means removably fitting into said upper die for assembling within said bore a second center piece substantially coextensive with said first center piece, a ring wider than said center pieces but narrower than said bore, and a fabric disc larger than said ring separating said ring from said center pieces and from the wall of said bore, with said center pieces and part of said fabric disc received within said ring, whereby subsequent application of axial pressure to said upper and lower dies brings said beveled edges into engagement with said ring through the intermediary of said fabric disc with consequent crimping of said ring and fabric disc around the peripheries of said center pieces to form a unitary structure.

3,273,428
MECHANICAL NUT DRIVING WRENCH
Bengt Gunnar Rudeke, Goteborg, Sweden, assignor to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Nov. 4, 1963, Ser. No. 321,275
Claims priority, application Sweden, Nov. 7, 1962, 11,941/62
11 Claims. (Cl. 81—52.3)

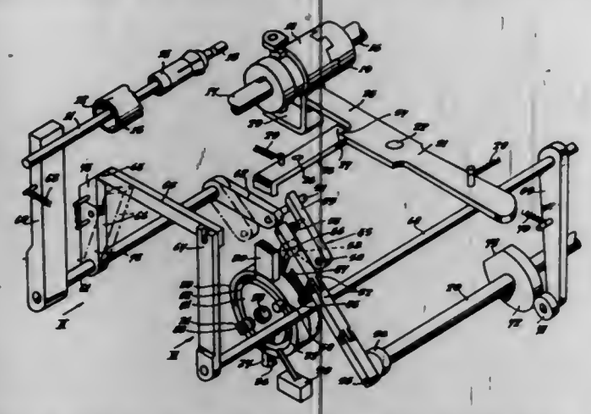


1. A mechanical nut driving wrench operated by impacts and including power operated reciprocating hammer means for delivering a series of rotational blows to a wrench body, said nut driving wrench comprising a pair of spaced apart parallel annular journals forming a head portion, a pressure fluid operated hammer connected at the forward end thereof to said head portion, an impact transmitting anvil block at said forward end of said hammer, an open ended annular socket wrench body coplanar with, but offset from the longitudinal central axis of said anvil block and rotatably carried between said journals for bidirectional rotation therein, a radially directed shoulder on said wrench body abutting said anvil block with the point of abutting contact between said shoulder and said anvil block always defining an obtuse angle between the central axis of said anvil block and a plane through the axis of rotation of said wrench body and said point, with said wrench body rotatable between a position with said anvil block abutting said shoulder and a position with said anvil block remote from said shoulder for permitting a substantial angular displacement of said shoulder relative to said head portion upon an impact delivered by said anvil block and for re-establishing abutting contact between said shoulder and said anvil block subsequently to said impact by manual turning of said hammer.

3,273,429
RATCHET WRENCH
Stephen De Orlow, Jackson, Mich., assignor to Ryerson & Haynes, Inc., Jackson, Mich., a corporation of Michigan
Filed Sept. 30, 1964, Ser. No. 400,396
6 Claims. (Cl. 81—62)

5. A ratchet wrench primarily formed of stamped sheet components comprising, in combination:
(a) a body member of sheet material having first and second sides,
(b) a cylindrical flange defined on said body member from the material thereof projecting from said second side thereof defining a cylindrical bearing surface and an opening in said body member,
(c) a plate formed of sheet material affixed to said body member in spaced relation to said first side thereof,
(d) a noncircular, tubular socket member rotatably received within said opening and of a cross section having inner and outer surfaces corresponding to the configuration of the member with which the wrench is to be employed, an inner end defined on said socket member located intermediate said body member and said plate, said socket member outer surface adapted to rotatably engage said cylindrical bearing surface,
(e) a ratchet wheel having a bore and a circumference, teeth defined on said circumference, said bore corresponding in configuration to the exterior configuration of said socket member and permanently affixed upon the inner end thereof intermediate said body member and said plate, said wheel being of greater dimension than said opening,
(f) a circular opening defined in said plate coaxial with said body member opening,
(g) a cylindrical bearing surface defined on said socket member inner end rotatably received within said circular plate opening,
(h) a ratchet dog located between said body member and said plate adapted to engage said ratchet wheel,
(i) pivot means extending between said body member and said plate pivotally supporting said ratchet dog, and
(j) handle means affixed to said body member.

3,273,430
WRENCH SOCKETS, SOCKET DRIVES AND SIMILAR COUPLERS
Raymond G. Knudsen, James W. Price, and Gene E. Olson, Kenosha, Wis., assignors to Snap-On Tools Corporation, Kenosha, Wis., a corporation of Delaware
Filed Nov. 6, 1963, Ser. No. 321,955
5 Claims. (Cl. 81—121)

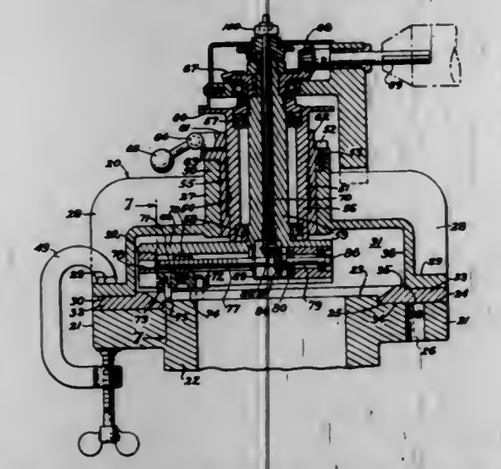


1. A wrench or the like having a peripherally closed socket defined by a plurality of equidistantly spaced peripherally and radially disposed protuberances presenting angularly related straight surfaces extending for the depth of engagement with complementally sized and peripherally disposed straight sided and sharp-cornered geometric fasteners or the like in alignment with the longitudinal axis of said wrench, and outwardly disposed curved concavities radially disposed to project oppositely to said first named straight surfaces and alternately therebetween to merge therewith for defining a continuous geometric fastener engaging member to impart turning moments to fasteners in registry therewith, said outwardly disposed curved concavities having a radius sufficiently greater than the sharp corners of the complemental geometric fasteners to avoid contact therewith.

3,273,431
AUTOMATIC LATHES AND LIKE MACHINE TOOLS
George Henry Luke, Bristol, England, assignor to Bristol Repetition Limited, Bristol, England, a company of Great Britain and Northern Ireland
Filed May 19, 1964, Ser. No. 368,466
Claims priority, application, Great Britain, May 20, 1963, 19,929/63
4 Claims. (Cl. 82—2.5)

1. An automatic machine tool of the kind in which a metal bar is fed through a hollow stock tube in order that repetition parts may be machined and cut off the bar successively, the bar being fed through the hollow stock tube, and comprising an element movable to disengage the working parts of the machine from the machine drive, a pivoted trip lever movable for actuation of said element, a rotary calibrated cylinder provided with a trip dog adapted to engage and operate said trip lever, a pawl and ratchet device for rotating the calibrated cylinder unidirectionally and step by step, said pawl element being reciprocable once for each operation cycle of the machine, each calibration unit on the cylinder indicating a single operation cycle of the machine

and the ratchet being arranged to move the cylinder through one calibration unit for each stepwise actuation by the pawl, spring means to rotate the cylinder contra to the driving direction effected by the pawl and ratchet device, stop means to retain the cylinder, whilst urged by said spring means, in a normal position with a zero calibration mark thereon in registration with a fixed indicator, the position to said trip dog being adjustable on said cylinder, a pivotally mounted feeler adapted to oscil-

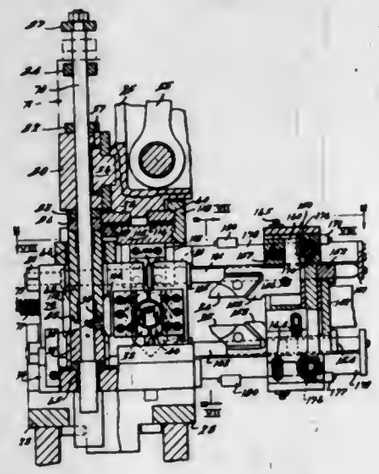


late across the mouth of the stock tube, spring means for moving the feeler in one angular direction of its oscillation, a pin connected to said feeler and mounted to hold the pawl out of engagement with the ratchet, a dog connected to the feeler, an arm mounted to reciprocate and for an end thereof to abut the said dog on the feeler when said arm is at or near the end of a movement to project said arm end, and means including a cam driven by the machine to effect reciprocation of said arm.

3,273,432
UNIVERSAL SELF-CENTERING FLANGE FACING DEVICE

John Hasund, Alameda, Calif., assignor to Thomas A. Short Company, Oakland, Calif., a corporation of California

Filed July 10, 1964, Ser. No. 381,837
3 Claims. (Cl. 82—4)



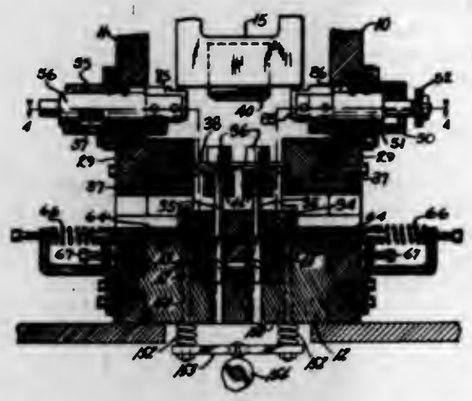
1. A cutting tool for facing an annular radial face comprising in combination:
- a tubular body portion;
- inner and outer independently rotatable concentric shafts housed therein and projecting from the ends thereof;
- a sleeve affixed to and supporting said outer shaft and adjustably fitting in said body portion to adjust the position of said shafts axially of said body portion;
- power applying means operatively connected to one end of said outer shaft;
- a cutter housing mounted on the other end of said outer shaft;
- a cutter tool assembly mounted in said housing for rotation therewith and for free radial movement relative thereto;
- gear means linking said tool assembly to said inner shaft for accomplishing radial translation of said assembly by relative rotation between said shafts;
- and a planetary type drive mechanism having a frame secured to said one end of said outer shaft, a ring gear rotatable with respect to said frame and keyed to said inner shaft, idler pinion gears in said frame engaging said ring gear, a center pinion gear engaging said idler pinion gears, and means for holding said center pinion gear against rotation, thereby slowing down the rotation of said inner shaft and translating said assembly.

3,273,433
TUBULAR STOCK CUTOFF METHOD AND APPARATUS

Alexander Borzym, 6841 Oakman Blvd., Dearborn, Mich.

Filed Dec. 1, 1964, Ser. No. 415,067
10 Claims. (Cl. 83—54)

10. The method of severing tubular stock which comprises advancing a pair of slotting blades simultaneously in parallel path across and in contact with the opposite sides of the wall of the stock in a common plane transverse to the stock, to form slots in opposite sides of the stock, moving said blades apart within said plane to a spacing exceeding the outside diameter of the stock and then retracting the blades along said paths, and thereafter severing the stock by means of a blade projected through one of the slots and across the stock and through the other slot.



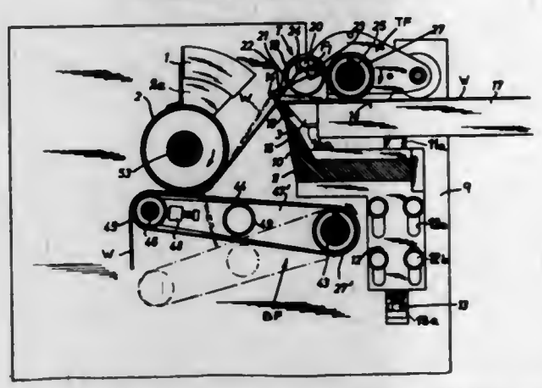
3,273,434
SHEARING MACHINE AND METHOD

Albert F. Hausman and Felix A. Chiplis, Indianapolis, Ind., assignors to Amsted Industries, Incorporated, Chicago, Ill., a corporation of New Jersey

Filed Nov. 24, 1964, Ser. No. 413,539
29 Claims. (Cl. 83—55)

1. In a shearing machine, having a stationary shearing element and a movable shearing element movable relative to the stationary element to perform a cutting operation by stressing in shear to the point of fracture a workpiece placed between them, a reciprocable ram movable over a predetermined path into and out of engagement with the movable shearing element, means constantly urging said ram toward engagement with the movable shearing element, said means comprising a cylinder and piston one of which is movable with the ram, a rotatable shaft, means including a cam carried by said shaft and operable in rotation thereof to move the ram to a retracted

position spaced from said movable shearing element and then to release it to permit fluid-pressure in said cylinder to force the ram toward engagement with said movable shearing element, means for maintaining fluid pressure in said cylinder sufficient to accelerate the ram to a velocity such that, upon striking the moving shearing element following its release, it will cause the movable shearing element to perform the shearing operation, means independent of said cam for limiting movement of the ram after it has struck the movable shearing element, and means operated in timed relation with said shaft for moving said movable shearing element to its retracted posi-



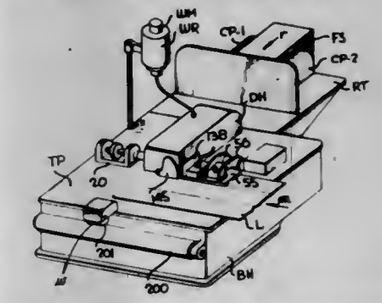
tion while the cam is moving the ram to its retracted position.

27. The method of producing an improved sheared face on a work-piece which is cut by stressing the same in shear to the point of fracture between a stationary shearing element and a movable shearing element confined to move in passing relation with the stationary shearing element, which comprises applying to the movable shearing element, in the direction of movement thereof, an accelerating force adapted to impart to the movable die element as it starts the shearing operation a velocity of at least 6 to 8 feet per second and more than sufficient kinetic energy to shear the material being acted on by the shearing elements.

3,273,435
APPARATUS FOR CROSS-CUTTING ELONGATED WEBS OF FABRIC

Walter Hübner, Kunseberk uber Bielefeld, Günter Myska, Bielefeld, and Horst Riemer, Berlin, Germany, assignors to Durkoppwerke Aktiengesellschaft, Bielefeld, Germany, a corporation of Germany

Filed Aug. 26, 1963, Ser. No. 307,761
Claims priority, application Germany, Aug. 31, 1962, D 39,738
14 Claims. (Cl. 83—210)

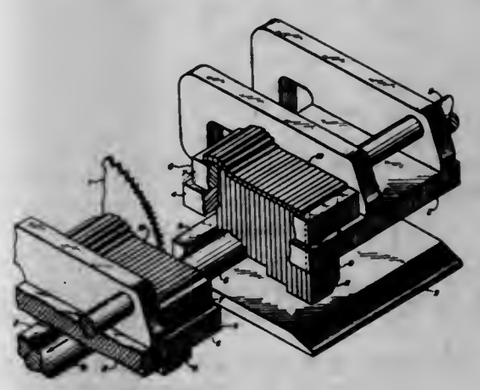


1. An apparatus for cross-cutting an elongated web of fabric, comprising guide means forming a generally horizontal track for said web; sensing means for detecting a transverse gap in the structure of said fabric, said sensing means including a row of upstanding feeler members extending across said track and adapted to enter said gap upon said web passing thereover; test means suspended above said track for contact with said web, said test means being normally maintainable by said web in an elevated position and being arranged to descend into an off-normal position upon a lowering of said web with penetration of said gap by said feeler members; feed means for advancing said web across said row; normally inoperative cutter means for severing said web adjacent said row; and mechanism responsive to a lowering of said test means into said off-normal position for arresting said feed means, actuating said cutter means and thereupon restarting said feed means.

3,273,436
SHEET FEEDING APPARATUS

Kurt Rudolf Schneider, Bainbridge, N.Y., assignor to Eureka Specialty Printing Company, Scranton, Pa., a corporation of Delaware

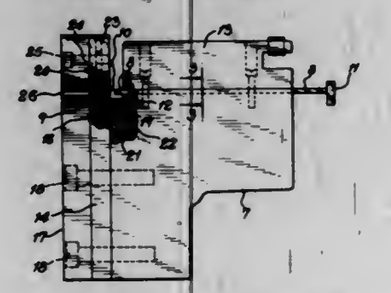
Filed Feb. 7, 1964, Ser. No. 343,488
29 Claims. (Cl. 83—241)



1. An apparatus for feeding sheets comprising a plate along which the sheet is to be fed, a guide structure having a surface for urging the sheet toward the plate, a member mounted on and movable along the guide structure for engaging and feeding the sheet toward an edge of the plate, said member being movable in the guide structure toward and from the plate and being urged toward the plate, and means carried by the guide structure for moving said member and advancing said sheet, said means including a first part engaged with said member and a second part carried by the plate permitting the said movement toward and from the plate.

3,273,437
SAW CLAMP ATTACHMENT

Earl H. Scott, Freemansburg, Pa., assignor, by mesne assignments, to Bethlehem Steel Corporation, a corporation of Delaware



Filed Oct. 19, 1964, Ser. No. 404,872
1 Claim. (Cl. 83—444)

The combination comprising:
(a) a vertical rotary saw blade for sequentially cutting continuously horizontally advancing elongated hot metal workpieces,

(b) a clamp for said workpieces having upper and lower jaw members including flat horizontal clamping surfaces adjacent said blade,
(c) an open rectangular box-like holder mounted beside said upper jaw member, and
(d) a plurality of contiguous flat-sided T-blocks mounted in contacting side by side relationship and freely slidable vertically with respect to one another in said holder and having flat lower ends generally conforming to and engaging the upper and side surface of each workpiece as it rests on the lower jaw member while the workpiece is being cut, thereby holding the workpiece securely against lateral movement and obviating deformation of the workpiece during the cutting operation.

PUNCH HEAD WITH PUNCH-CUT REPLACEABLE DIES
Arthur F. Brook, Poughkeepsie, N.Y.
Filed Sept. 22, 1964, Ser. No. 398,363
1 Claim. (Cl. 83—685)

Punch head with punch-cut dies comprising,
a row of punches for punching a row of perforations in paper or other material,
companion dies for the respective punches,
said dies consisting each of a permanent die bed having a die cavity closely approximating the size and shape of the companion punch and freely receiving said punch and
a sheet of angularly bent thin die forming material suited to the punching of the material for which the punch head is designed,
said sheet of die forming material overlying said die bed and being penetrable by said punch, and
releasable means in the form of a clamp gripping the angularly bent portions of said sheets and fixedly confining said sheet of die forming material over said die cavity in the die bed,
said sheet having a final exact die forming perforation therein produced by the companion punch and forming an exact die fitted to said punch in line with the die cavity in the die bed and thereby adapted for the punching of accurately sized perforations in paper or other material and
whereby upon release of said confining means the punch-cut sheet of final die forming material may be removed and be replaced by a fresh sheet and be cut to accurate die forming shape by the companion punch members.

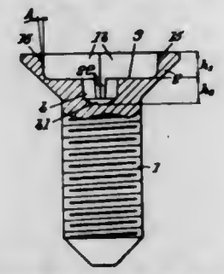
DEVICE WHICH ACCOMMODATES REMOVABLE FRETS ON ANY FRETTED STRINGED INSTRUMENT
Chester P. Keefe, 178 Cypress St., and John C. Navilliat, 69 Bowen St., Providence, R.I.
Filed Aug. 5, 1965, Ser. No. 477,570
4 Claims. (Cl. 84—314)

1. In a stringed instrument having an elongated fingerboard of one material with strings extending lengthwise thereof, said fingerboard having portions of a different material providing grooves extending laterally of the extent of said strings and frets removably mounted and frictionally held in said grooves, said different material providing

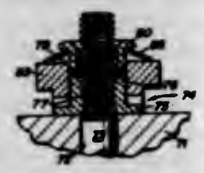
said grooves being of a character to provide greater frictional wearing qualities than the material of the fingerboard to better withstand the wear of insertion and removal of said frets.

3,273,440
ROUND-SHAPED HARMONICA
Shin-Hua Tr'ui, 734 King's Road, Hong Kong
Substituted for abandoned application Ser. No. 113,590, May 5, 1961. This application Mar. 18, 1963, Ser. No. 266,091
20 Claims. (Cl. 84—377)



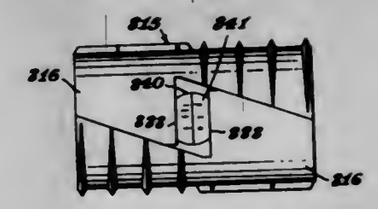
1. A harmonica comprising a disk-shaped reed assembly having a series of reed chambers therein each having an opening at the circumferential edge of the assembly, a casing enclosing said reed assembly, hub means secured within said casing, the reed assembly being rotatably mounted on said hub means, a mouthpiece extending from said casing, said mouthpiece having a number of internal wind passages therein positioned to cooperate with a corresponding number of said openings, and means coupled to the reed assembly to rotate the reed assembly about said hub means to bring a selected group of said openings into cooperating alignment with the wind-passages of said mouthpiece.

3,273,441
NUT CONSTRUCTION
Donald L. Biesecker, Arlington Heights, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill., a corporation of Delaware
Filed Jan. 19, 1962, Ser. No. 167,348
4 Claims. (Cl. 85—35)



1. A molded plastic article for sealing attachment to a threaded fastener and a work panel comprising an elongated member having a closed end and a centrally located chamber of predetermined diameter opening to the opposite end, said elongated member having outer side walls formed with wrench engageable flats, said opposite end being characterized as having an axially extending lip of relatively thin deformable cross section and of a diameter greater than said predetermined diameter, said opposite end further having a diametrical surface with a plurality of curvilinear axially extending vanes of relatively thin deformable cross section extending in the diametrical plane from the vicinity of said recess to the vicinity of the periphery of said diametrical surface, said vanes upon rotation of article about its axis being of a curvature adapted to move fluid material in a generally radial direction.

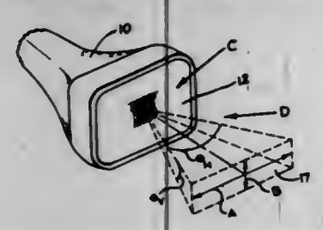
3,273,442
SCREWS
Pierre Launay, 87 Ave. Niel, Paris, France
Original application Mar. 27, 1962, Ser. No. 182,790, now Patent No. 3,175,593, dated Mar. 30, 1965. Divided and this application Nov. 25, 1964, Ser. No. 413,836
Claims priority, application France, Mar. 31, 1961, 857,520, Patent 1,301,266
2 Claims. (Cl. 85—45)



1. A screw having an axis of symmetry and comprising a shank and a head, said head being provided with a slot, said slot being of substantially diamond-shaped cross section in planes perpendicular to said axis, said slot having inclined end walls converging toward the end of said shank, said slot having opposed side walls tapering at an acute angle toward its bottom, the bottom of said slot being flat and transverse to said screw axis, said slot being provided at its bottom with a centrally located frusto-conical axial hole the apex angle of which is at least approximately equal to the acute angle of taper between the opposed side walls, each of said side walls comprising two flat surfaces located in respective planes intersecting each other along a straight line having the same inclination with respect to said axis as the generatrices of the surface of said frusto-conical axial hole, said two planes intersecting said frusto-conical surface.

3,273,443
TORQUE LIMITING NUT
Norman N. Rubin, 10012 Portland Place, Silver Spring, Md.
Filed Feb. 28, 1964, Ser. No. 348,917
1 Claim. (Cl. 85—61)

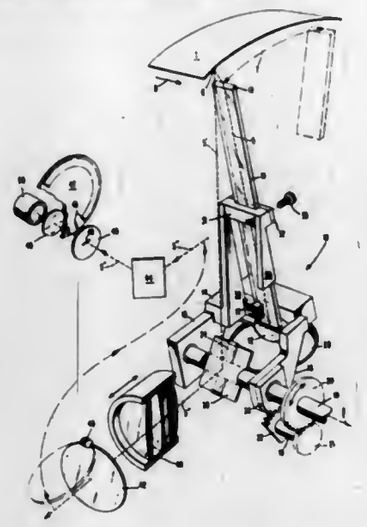
A separable fastener, comprising:
a threaded bolt;
a nut having a base portion and a substantially cylindrical body portion, said base portion being formed with integral ratchet teeth, of the type having one face radial and the other face inclined, said teeth being adapted to be driven, said body portion having a bore increased in diameter adjacent its outer end and being threaded for at least half of the length of the bore adjacent the inner end;
a rotary member journaled on the cylindrical body portion for free rotation with relation to said nut, said rotary member being formed with driving ratchet teeth of the type substantially identical with the base portion teeth, said ratchet teeth of the rotary member being adapted to engage the ratchet teeth of the base portion of the nut to provide a drive, in a clockwise direction, capable of slipping and a positive drive in a counter clockwise direction;
a resilient conical washer having its outer periphery engaging said rotary member to maintain said rotary member driving teeth in driving engagement with the ratchet teeth of the base portion of the nut;
said rotary member and said washer being retained on the cylindrical body portion by a radially outwardly extending collar at the outer end of said cylindrical body portion;
whereby upon resistance to turning of said nut exceeding a predetermined amount, said resilient washer will release said driving teeth from operable engagement with the teeth of the base portion of the nut.



3,273,444
EXPANDABLE DOWEL
Irving S. Houvener and Albert J. Pulley, both of Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Mar. 6, 1964, Ser. No. 349,914
1 Claim. (Cl. 85—79)

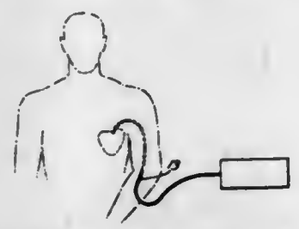
A radially expandable longitudinally contractable dowel having a generally cylindrical configuration, the dowel comprising:
two solid body portions, each of said body portions comprising
a first wedge and
a second wedge, the toe of the first wedge being rigidly affixed to the head of the second wedge, the first wedge and the second wedge having generally
planar spaced apart inclined wedging surfaces lying in generally parallel planes on one side of the body portion, the remaining side of the body portion having a generally cylindrical surface,
at least one circumferentially disposed cavity engaging rib extending from a generally cylindrical surface of the first wedge of the body portion,
a longitudinal rib member is disposed on a generally cylindrical side of the second wedge,
said head portion on each said body portion being a substantially centrally located flat planar surface transversely disposed relative to the longitudinal axis of the dowel and facing toward said inclined wedging surface of said second wedge of its respective body portion, said inclined wedging surface of each of said first wedges defining with said cylindrical surface thereof a radial dimension which decreases from a maximum adjacent said head portion to a minimum at the outer end of said first wedge, said inclined surface of each of said second wedges defining with said cylindrical surface thereof a radial dimension which increases from a minimum adjacent said head portion to a maximum at the outer end of said second wedge,
each of the body portions being arranged with the wedging surface of the first wedge adjacent the wedging surface of the second wedge of the opposite body portion, the heads of the second wedge portions being adjacent and facing each other, the toe of the second wedge of each of the body portions being disposed adjacent the head of the first wedge of the other

body portion, a key comprising a head, a wedging portion having a wedging surface remotely disposed from the head, a spacer having at least one flat surface disposed between the head and the wedging portion, an edge of the flat surface of the spacer being contiguous with an edge of the wedging surface of the spacer and being of constant width in a direction normal to the flat surface, the wedging surface adapted to engage the head of the second wedge of each body portion and extending generally transversely from the dowel movement of the key, thereby forcing the first wedges of each of the body portions closer together and increasing the diameter of the dowel in at least one direction.



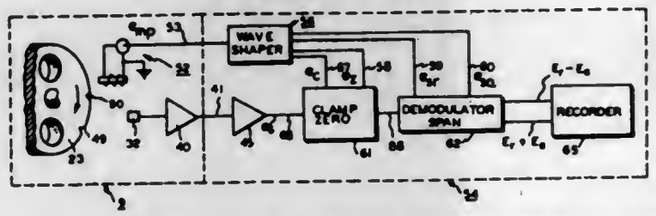
3,273,445
FIBER OPTICAL FACE PLATES HAVING DIFFERENT NUMERICAL APERTURE VALUES IN TWO DIFFERENT DIRECTIONS
Walter P. Siegmund, Woodstock, Conn., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Filed Oct. 22, 1962, Ser. No. 232,192
17 Claims. (Cl. 88—1)

1. An elongated light-transmitting optical fiber comprising a core formed of a transparent material of a predetermined refractive index and of predetermined geometric cross-sectional shape having a plurality of pairs of elongated side wall surface portions formed thereon, and with the surface portions of each pair being disposed in opposed facing relation to each other, a thin elongated layer of cladding material formed upon each surface portion, and all of said elongated layers being arranged to surround and enclose said core, the layers of cladding material upon each pair of opposed surface portions having a lower refractive index than that of said core, and the opposed layers on one of said pairs of surface portions being of a lower refractive index than the refractive index of the opposed layers on another of said pairs.



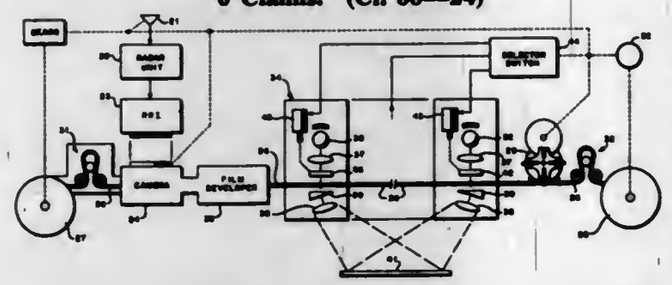
3,273,446
SCANNING DEVICE HAVING A CONSTANT LENGTH OPTICAL PATH
William E. Goetz and Fred L. Hajny, Endicott, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 21, 1962, Ser. No. 246,384
3 Claims. (Cl. 88—1)

1. In a scanning device the combination comprising:
support means for supporting a light reflective object to be scanned in a position such that all points on a surface of said object are equidistant from a line having a position fixed in relation to said support means;
a light source;
frame means for holding said light source, said frame means being pivotably mounted about an axis coincident with said line;
light directing means attached to said frame means and adapted to direct a beam of light from said light source to a point of incidence on said surface;
drive means for moving said frame means about said axis to move said point of incidence in a predetermined path perpendicular to said axis across said surface, effecting a scan of said surface whereby portions thereof are successively illuminated in accordance with the path of said scan;
light receiving and sensing means, including a fixed light receiving aperture, adapted to receive and sense light reflected from said surface; and



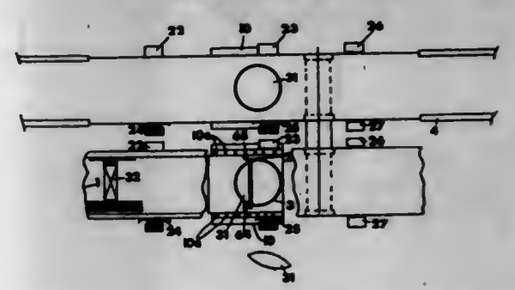
reflecting means pivotally moved by said drive means about said axis at one-half the angular velocity of said point of incidence whereby light reflected from said successively illuminated portions of said surface is directed to said fixed light receiving aperture along a constant distance path.

3,273,447
DETECTION AND MEASUREMENT DEVICE HAVING A SMALL FLEXIBLE FIBER TRANSMISSION LINE
Wallace E. Frank, Westtown, Pa., assignor to The Franklin Institute, Philadelphia, Pa., a corporation of Pennsylvania
Filed Aug. 26, 1963, Ser. No. 304,484
5 Claims. (Cl. 88—1)



1. A detection device for measurement of pressure and pressure related effects comprising in combination a remote light source, a flexible light transmissive fiber transmission line of considerable length with respect to thickness, which thickness is sufficiently small to permit the feeding of the fiber transmission line through a narrow restricted and tortuous course, said transmission line serving as its own feed means through such tortuous course, said transmission line consisting of a light transmitting fiber path having high internal reflectance properties such that the same fiber serves for conveying light from the remote light source at one end of the transmission line to the other end and for transmitting reflected light from said other end in the other direction back to the end at the remote light source, a light reflecting transducer element sufficiently small to pass through a human blood vessel integral with the transmission line end of generally bulbous form terminating the end of the transmission line remote from the light source and providing a light reflecting surface positioned axially in the direction of light transmission along the length of the transmission line, such that a change in the shape of the bulbous element in response to changes in pressure will distort the reflecting surface and thereby cause different amounts of light to be reflected back through the transmission line in accordance with a limited predetermined change of shape of the bulbous member, and light detection means positioned at the same remote end of the transmission line as the light source in position to receive light reflected by the transducer element back to the detection means.

3,273,448
ANALYTICAL LOGARITHMIC RATIO DETERMINATION APPARATUS
Neal B. Kelly, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Dec. 6, 1962, Ser. No. 242,740
2 Claims. (Cl. 88—14)

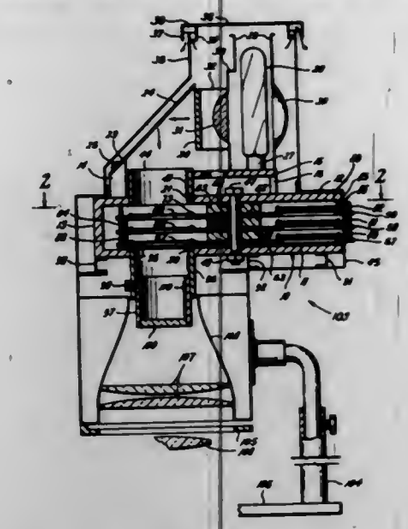


1. Apparatus for accumulating and processing physical data required for a comparison in the form of an approximation of the log R/A as a function of the first term, $(R-A)/(R+A)$, of the series expansion representative of said log R/A comprising, in combination in series electrical circuit in the order recited, means generating voltage pulses in alternation which correspond to the quantity A and the quantity R, respectively, means storing individual separate capacitive electrical charges of magnitude which are functions of said voltage pulses, means generating a D.-C. voltage signal E_a which is a function of the capacitive charge corresponding to said quantity A, means generating a D.-C. voltage signal E_r which is a function of the capacitive charge corresponding to said quantity R, means computing as one term the difference (E_r-E_a) and as another term the sum (E_r+E_a), means computing the ratio $(E_r-E_a)/(E_r+E_a)$ as an approximation of said log R/A, and means indicating said ratio.

3,273,449
DISPLAY APPARATUS
Marvin J. Foral, Doylestown, Pa., assignor to the United States of America as represented by the Secretary of the Navy
Filed May 22, 1963, Ser. No. 282,520
6 Claims. (Cl. 88—24)

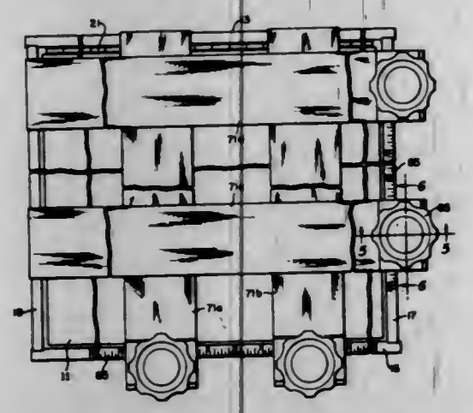
5. A photographic picture correlator, comprising:
a camera having means for taking a plurality of photographs in sequence at a relatively slow rate;
a rapid film developer having means for receiving and developing the exposed photographs from said camera;
a projector having a plurality of optical systems directed toward a common area, a light source in each of said optical systems, means for sequentially and cyclically transmitting light from each of said light sources through said optical systems, and means in each of said optical systems receiving one of a series of the developed photographs and cyclically projecting at a relatively fast succession rate onto said common area the first of a sequence of developed photographs and then each succeeding developed photograph as light from each of said light sources is cyclically transmitted.

3,273,450
DATA PROCESSING APPARATUS
John Helmut Ede, Feltham, Middlesex, Albert S. Pratt, Churchdown, and Brian Constantine Sewell, Teddington, Middlesex, England, assignors, by mesne assignments, to The Rank Organisation Ltd., London, England, a British company
Filed Nov. 15, 1963, Ser. No. 324,086
Claims priority, application Great Britain, Nov. 20, 1962, 43,888/62
4 Claims. (Cl. 88—24)



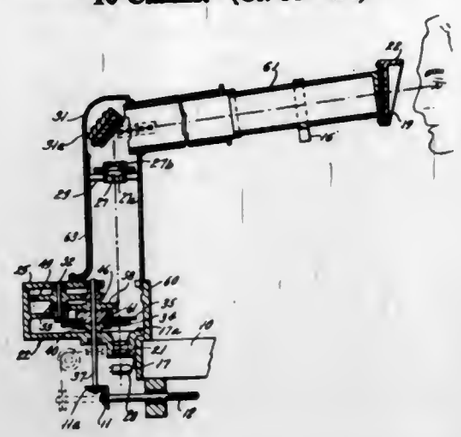
1. Apparatus for gaining access by optical means to predetermined data stored on a film strip through which light is transmitted, said film strip also including coarse and fine position distinguishing marks correlated to the location on the data stored on said film strip, which comprises a guide track for supporting said film strip for movement longitudinally of itself past a film gate, an aperture plate located at said film gate, said aperture plate including an elongated projection slit extending transverse to the direction of movement of said film strip and across which slit the stored data is passed for printing, said aperture plate being also provided with coarse and fine apertures laterally offset from said projection slit and adapted to register with the coarse and fine position distinguishing marks on said film strip, three sets of friction drive means located in longitudinally spaced relation along said guide track for transporting said film strip past said film gate, each said drive means comprising a drive roller located at one side of said film strip, a pinch roller located at the opposite side of said film strip and means for shifting said pinch roller from a retracted position to an advanced position wherein the film strip is pinched between the two rollers and thereby frictionally driven, a first one of said friction drive means being operated at a fast speed and controlled by the coarse position distinguishing marks on said film strip, a second one of said friction drive means being operated at a slower speed and being controlled by the fine position distinguishing marks on said film strip, and the third friction drive means being thereafter operated at an even slower speed for the purpose of scanning the stored data on said film strip.

3,273,451
PHOTOGRAPHIC APPARATUS
Frederick E. Wilson, 10103 Willowgrove, Houston, Tex.
Filed Dec. 17, 1963, Ser. No. 331,201
8 Claims. (Cl. 88—24)



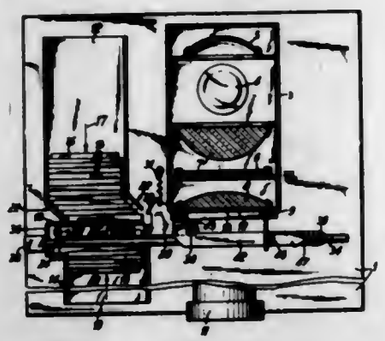
1. Photographic enlarger, comprising a light source, tubular means disposed to receive light from said light source at one end thereof, diffuser means disposed across said one end of said tubular means for scattering said light into said tubular means, opalescent means disposed across

the other end of said tubular means, said tubular means forming a light path from said diffuser means to said opalescent means, means for supporting a photographic



negative in the path of light issuing from said opalescent means, and lens means for directing an image of the illuminated photographic negative onto photographic paper.

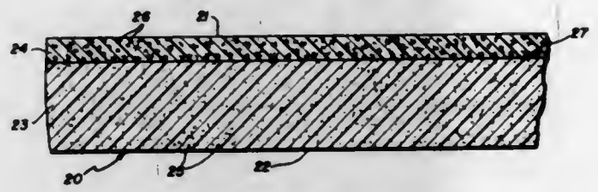
3,273,452
ADJUSTING MECHANISM FOR PHOTOGRAPHIC APPARATUS
Robert P. Saunders, 113 Creekmeadow Lane, Greece, N.Y.
Filed Aug. 31, 1964, Ser. No. 393,164
7 Claims. (Cl. 88—24)



1. A photographic easel comprising a base board, an open rectangular frame hinged to said base board at one edge for swinging movement upwardly away from said board and downwardly toward said board, said rectangular frame including at least two rail portions extending along two adjacent sides of the rectangle, at least one adjusting carriage movably mounted for travel lengthwise along each of said two rail portions, and a masking blade fixed to each of said adjusting carriages for movement bodily therewith, characterized by the fact that each of said adjusting carriages includes a portion slidably embracing the rail on which it is mounted, a rotary member having two tapered flanges for engaging said rail at two spaced points, spring means tending to move said rotary member toward said rail to hold said tapered flanges in tight wedging contact with said rail, and a manually accessible manipulating knob operatively connected to said rotary member to turn said rotary member to drive said carriage along the rail on which it is mounted, thereby to adjust the position of the masking blade mounted on the carriage.

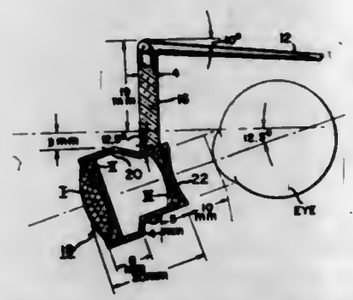
3,273,453
VARIABLE BACK GAUGE TRAVEL ADJUSTMENT MEANS FOR GUILLOTINE TYPE CUTTING MACHINE
Carl Thumim, Chicago, Ill., assignor to Miehle-Goss-Dexter, Incorporated, Chicago, Ill., a corporation of Delaware
Filed Aug. 19, 1963, Ser. No. 304,717
10 Claims. (Cl. 88—24)

1. In a paper cutting machine, a back gauge indicator comprising an optical projecting means and a plurality of dials coacting to produce an image of said dials disposed generally at operator eye level, a lead screw and a gear means connected thereto to rotate said dials proportionately to rotation of said lead screw.



3,273,454
SLIDE PROJECTOR
Gerhard Bast, Braunschweig-Lehndorf, Germany, assignor to Voigtlander A.G., Braunschweig, Germany
Filed Feb. 1, 1965, Ser. No. 429,277
Claims priority, application Germany, Feb. 1, 1964, V 25,298
12 Claims. (Cl. 88—28)

1. In a slide projector, supply guide means for guiding a series of slides along a predetermined path, said supply guide means having a discharge end where an end slide of said series of slides is situated in a position to be removed from said slide guide means and to be displaced therefrom to a projecting position, said supply guide means providing for said path in the region of said discharge end of said supply guide means a direction which is inclined with respect to a portion of said path adjacent but spaced from said discharge end of said supply guide means, so that at least the end slide of said series of slides is displaced with respect to the slide next to said end slide to expose a surface of said slide next to said end slide, thickness-sensing means located at said discharge end of said slide guide means for engaging said surface of said slide next to said end slide so as to sense the thickness of said end slide, said supply guide means having at said discharge end thereof a discharge slot through which said end slide is displaced when moving

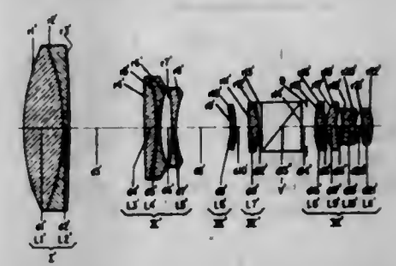


from said supply guide means to said projecting position, and adjusting means automatically actuated by said thickness-sensing means for adjusting the width of said slot to a size corresponding to the thickness of said end slide, whereby if the slide next to said end slide, by clinging to the latter, should tend to be displaced from said supply guide means with said end slide, said slot because it is adjusted to a thickness corresponding to that of said end slide will prevent said slide next to said end slide from being displaced out of said supply guide means with said end slide.

3,273,455
PROJECTION SCREEN
Karl Kaufmann and Augustin Sievers, Bad Lippspringe, Germany, assignors to Mechanische Weberei G.m.b.H., Bad Lippspringe, Germany, a corporation of Germany
Filed May 15, 1964, Ser. No. 367,635
Claims priority, application Germany, May 18, 1963, M 56,883
4 Claims. (Cl. 88—28.9)

1. A projection screen, comprising
(a) a plastic sheet having front and rear surfaces,
(b) coloring particles embedded in the sheet to form a first layer adjacent the rear surface, the plastic sheet being clear in the second layer with the exception of the crystals and the particles embedded in the first layer being present in sufficient quantity to render the first layer opaque, and
(c) reflective crystals, the said crystals consisting of large particles of material with a pre-determined index of refraction embedded in the sheet to form a second layer adjacent the front surface.

3,273,456
BIFOCAL LOUPES AND TELEMICROSCOPIC LENSES THEREFOR
William Feinbloom, 105 E. 35th St., New York, N.Y.
Filed Dec. 7, 1962, Ser. No. 243,048
6 Claims. (Cl. 88—57)

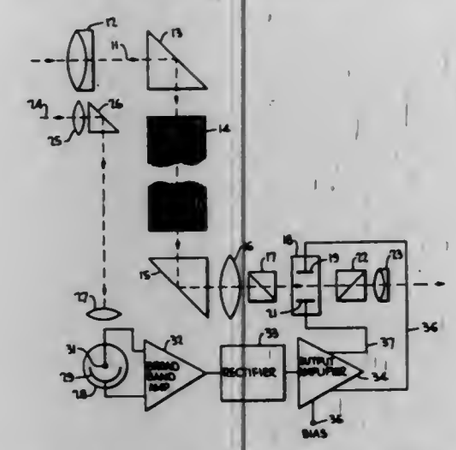


5. A telemicroscopic lens comprising an objective composed of a double convex crown having a thickness d_1 cemented to a concave flint having a minimum thickness d_2 and spaced from said objective by a fixed airspace distance d_3, a double concave eyepiece having a minimum thickness d_4, said double convex crown having an outer radius R_1 and an inner radius R_2, said concave flint having an inner radius R_3 and an outer radius R_4, said eyepiece having radii R_5 and R_6, the indices of refraction and the dispersive values of the double convex crown, the concave flint and the eyepiece being respectively n_1, ν_1, n_2, ν_2, n_3, ν_3, said radii, indices, dispersive values, thicknesses and airspace distance being substantially as set forth as follows:

n_1	1.620
ν_1	60.3
R_1	+19.0
R_2	−36.0
d_1	7.8
n_2	1.649
ν_2	33.8
R_3	−36.0
d_2	0.8
n_3	1.605
ν_3	43.6
d_3	11.3
d_4	0.8

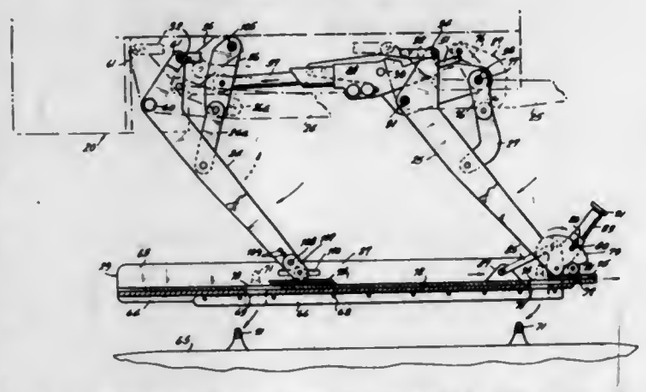
the value of R_4 being chosen for a required close working distance, while the values of R_5 and R_6 are chosen to reduce the optical aberrations of spherical, coma and astigmatism of oblique bundles and so obtain the best possible optical image.

3,273,457
OBJECTIVE SYSTEM COMPRISING A PRINCIPAL OBJECTIVE AND A FOUR-COMPONENT ATTACHMENT
Karl Macher, Bad Kreuznach, Rudolf Solisch, Gottingen, and Walter Wöltche, Bad Kreuznach, Germany, assignors to Josef Schneider & Co., Optische Werke, Bad Kreuznach, Rhineland, Germany
Filed May 12, 1964, Ser. No. 366,878
Claims priority, application Germany, May 14, 1963, Sch 33,278
11 Claims. (Cl. 88—57)



1. An objective system comprising a principal objective and an attachment forwardly of said principal objective, said attachment consisting of four air-spaced components including an at most limitedly adjustable positive first component on the object side of the system, a negative second component following said first component, a negative third component following said second component, and a fixed positive fourth component following said third component and facing said principal objective; said negative second and third components being movable, relatively to each other and to said first and fourth components, into a first position in which the system has a relatively small focal length and a second position in which the system has a relatively large focal length; said second component having an individual focal length whose absolute value is less than that of the individual focal lengths of said first, third and fourth components and less than twice that of the focal length of said principal objective, said first component being a doublet with a convex forward face and a negatively refracting forwardly concave cemented surface having a radius of curvature whose absolute magnitude is less than 1.5 times that of the radius of said forward face, said second component including a doublet with a concave rear face and a positively refracting forwardly concave cemented surface having a radius of curvature whose absolute magnitude is less than 2.5 times that of the radius of said rear face, said principal objective consisting of four air-spaced singlets including two image-side lenses of opposite re-

fractivity separated by an air space which is less than half the axial thickness of the negative one of said lenses; the separations *d*3, *d*6 and *d*8 each having a first value corresponding to said first position and a second value corresponding to said second position:



Lens	Radii	Thicknesses and Separations	n_d	ν
L1	$r1=+275.13$	$d1=58.75$	1.61772	49.78

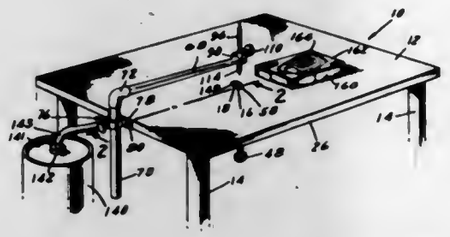
3,273,458
OPTICAL DELAY SYSTEM FOR PROVIDING EYE PROTECTION AGAINST INTENSE LIGHT
Hans W. Kohler, Washington, D.C., assignor to the United States of America as represented by the Secretary of the Army
Filed Sept. 28, 1964, Ser. No. 400,304
9 Claims. (Cl. 88—61)

1. In combination with an optical viewing device having an objective lens and an eyepiece lens, an electro-optical system for protecting an observer against harmful and blinding effects of intense light that may be produced by laser beams which impinge upon the optical viewing device or by atomic or nuclear explosions comprising:
(a) an optical delay means for receiving light from said objective lens and for providing a short time delay in the transmission therethrough of light so received,
(b) an inertia-free optical shutter between said optical delay means and said eyepiece lens, said inertia-free optical shutter being normally open permitting free transmission of light therethrough from said optical delay means to said eyepiece lens, and
(c) means connected to said inertia-free optical shutter for detecting the intensity of the light impinging on said objective lens and causing said inertia-free optical shutter to close when the light intensity exceeds a predetermined maximum.

3,273,459
LAUNCHER FOR STORES
Arthur R. Lardin, Monmouth Mobile Home Park, U.S. Highway 1, Monmouth Junction, N.J.
Filed Aug. 31, 1964, Ser. No. 393,209
11 Claims. (Cl. 89—1.5)



1. A launcher for airborne stores and the like comprising a hollow housing, an integrated launching linkage swingably connected at one end to the housing, said linkage comprising spaced front launching arms, spaced rear launching arms, a front toggle joint swingably connected at one end to the housing and at its other end to the front launching arms, a rear toggle joint pivotally connected at one end to the housing and at its other end to the rear launching arms, and an elongated missile carriage member swingably secured to the outer free ends of each of the launching arms, a gas expansion motor carried by the housing and drivably coupled to at least one of the toggle joints whereby power is applied to the launching arms through the intermediate linkage of the toggle to drive the carriage downward and away from the housing and thereafter retract the said carriage in a continuous motion, and means carried by the carriage and at least one of the launching arms to release a store at substantially the end of the downward motion of the carriage.

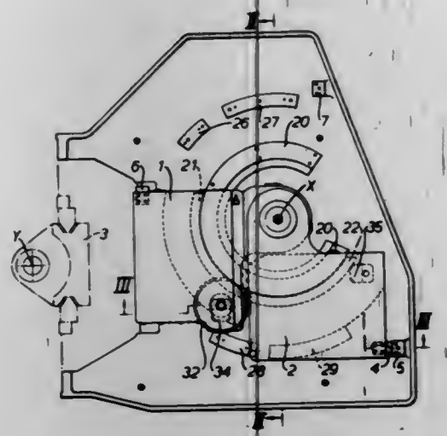
3,273,460
FIREARM WITH GAS OPERATED BREECH BLOCK UNLOCKING MEANS
James D. Mason, 5738 Ferber St., San Diego, Calif. 92122
Filed June 14, 1965, Ser. No. 463,827
3 Claims. (Cl. 89—185)

1. A firearm comprising in combination:
(A) means forming:
(1) a frame,
(2) a gun barrel supported by the frame, said gun barrel having:
(a) a muzzle end,
(b) a breech end,
(c) an orifice between the muzzle and breech ends,
(d) a breech block locking element at the breech;
(B) means forming a chamber surrounding the gun barrel and in communication with the orifice in the barrel, said second mentioned means including:
(1) a movable part slidably carried by the first mentioned means, said movable part being movable rearwardly by expansion of gas in said chamber;
(C) a breech block slidably and turnably carried by the movable part, said breech block having:
(1) a locking element, which upon turning of the breech block, cooperates with the first mentioned locking element for locking the breech block against the breech;
(D) means actuated by said rearward movement of the movable part upon expansion of the gas in the chamber for first turning the breech block to unlock the locking element on the breech block from the locking element on the barrel and for thereafter shifting the breech block rearwardly;
(E) a spring normally urging said movable part forwardly and subsequently to the shifting of the breech block rearwardly, co-operating with the last mentioned means for shifting the breech block forwardly and for thereafter turning the breech block to lock the locking element on the breech block with the locking element on the barrel;
(F) and a shoulder on the barrel for limiting forward movement of said movable part by the spring.

3,273,461
APPARATUS AND METHOD FOR MAKING THREE-DIMENSIONAL CONTOURED ARTICLES
David Livingston McCallum, P.O. Box 151, 9258 Aero Drive, Pico Rivera, Calif. 90660
Continuation of abandoned application Ser. No. 170,631, Feb. 2, 1962. This application Jan. 14, 1965, Ser. No. 426,480
23 Claims. (Cl. 90—13.1)

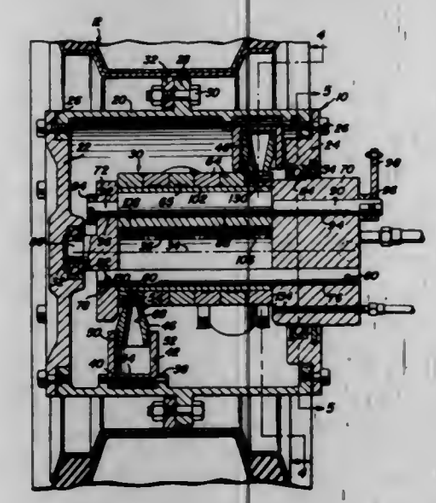
1. In apparatus for making three-dimensional profiled articles, comprising:
(A) workpiece support means for operably supporting a workpiece to be profiled,
(a) said support having an opening therethrough normal to the plane of said support;
(B) a rotary cutting element extending through said opening;
(C) power means for rotating said cutter element;
(D) means for effecting relative movement between said cutter element and support means,
(a) whereby said cutter element may be adjustably moved through said opening to various elevations relative to the top surface of said support means;
(E) a scriber support extending in parallel spaced relation to the support means;
(F) a scriber in axial alignment with said cutter element,
(a) and spaced axially therefrom,
(b) said scriber including a wick for ink,
(c) and a tubular reservoir for supplying ink to said wick;
(G) means for axially moving said scriber toward and away from said cutter element;
(H) suction means for removing cuttings,
(a) said suction means including an inlet conduit having an inlet opening adjacent the cutter element;
(I) a workpiece slidably supported on said support therefor,
(a) said workpiece having its top and bottom sides parallel with the bottom side slidable on said workpiece support means;
(J) and a pattern attached to the top surface of said workpiece.

3,273,462
360-DEGREE COPYING METHOD AND APPARATUS
Alfred H. Cheringou and Jean L. G. Heugas, Basses-Pyrenees, France, assignors to Turbomeca, Bordes, Basses-Pyrenees, France
Filed Oct. 21, 1964, Ser. No. 405,511
Claims priority, application France, Oct. 29, 1963, 952,084, Patent 1,384,664
25 Claims. (Cl. 90—13.5)



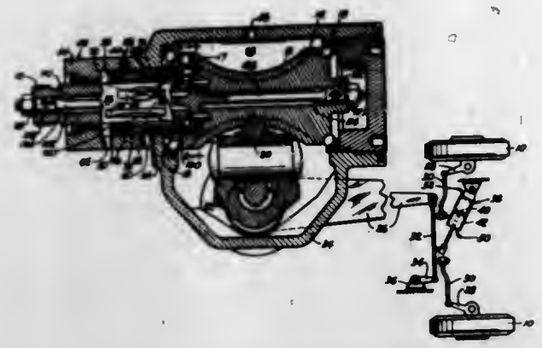
1. A 360-degree copying method involving the use of a single follower in contacting engagement with a pattern to be reproduced with rotary cutting tools machining by their lateral surface and the diameters of which may differ from that of said follower within limits of plus or minus approximately two millimeters, said method comprising displacing the center of the follower relative to its theoretical position whereat the diameter of said follower is equal to that of the cutting tool, in a direction perpendicular to the tangent to the profile of the pattern at the corresponding theoretical copying point, toward or away from said point according to whether the tool is larger or smaller, respectively, than said follower, and limiting said displacement to an amount equal to half the difference between the actual diameters of said follower and of said cutting tool, the follower center being displaced with respect to its theoretical position by tilting said follower about a fixed point.

3,273,463
WORK FIXTURE TABLES FOR BROACHING MACHINES
Victor James Bryant, 132 Westfield Ave., Watford, England
Filed May 7, 1964, Ser. No. 365,684
Claims priority, application Great Britain, May 7, 1963, 17,974/63
14 Claims. (Cl. 90—89)



1. A broaching machine comprising a single tool slide and a pair of movable work tables each independently capable of movement between a respective loading posi-

tion and a common working position whereby tools on the slide can act on the work carried by each work table in

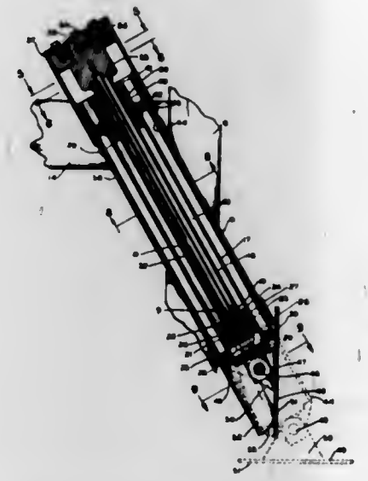


turn while the opposite work table is being loaded and unloaded as it remains in its loading position during the cutting and return stroke of the slide.

3,273,464
VARIABLE VOLUME ROTARY FLUID MOTOR AND PUMP
Ross D. Thurber, E. 13415 5th Ave., Spokane, Wash.
Filed Apr. 16, 1964, Ser. No. 360,191
12 Claims. (Cl. 91—284)

1. A rotary motor comprising a relatively stationary shaft assembly and a motor housing journaled thereon for rotation about a horizontal axis, a plurality of cylinders mounted upon the interior of said housing and rotatable therewith and directed inwardly towards said shaft assembly, a plurality of pistons each reciprocable in one of said cylinders, said shaft assembly including a crankpin comprising a cylindrical sleeve, a plurality of connecting rings rotatably journaled upon said sleeve in side-by-side relation and each fixedly connected to one of said pistons, means for cyclically delivering pressure motive fluid to and discharging it from said cylinders, means adjusting said sleeve towards and from said horizontal axis to thereby vary the stroke of said pistons in said cylinders as said cylinders and pistons revolve respectively about said horizontal axis and said crankpin.

3,273,465
POWER STEERING MECHANISM
Robert T. Eddy, South Bend, Ind., assignor to The Bendix Corporation, South Bend, Ind., a corporation of Delaware
Filed Nov. 30, 1964, Ser. No. 414,566
8 Claims. (Cl. 91—375)



1. In a power steering mechanism including an input member, an output member, and a fluid motor operatively connected to said output member, the combination within a housing of a worm having groove means formed thereon, follower means operatively connected to said output member and engaging said groove means, a pair of relatively rotatable telescoped tubular elements through which fluid flow to and from said motor is controlled, one of which is a part of said input member and the other of which is connected to said worm, a torsion bar having two radially extending arms located between the ends thereof for separating said torsion bar into an upper torsionally preloaded section and a lower torsionally preloaded section, said torsion bar having the upper end thereof rigidly connected to said input member and the lower end thereof rigidly connected to said worm, a bifurcated end portion formed on said input member, said radially extending arms of said torsion bar being located between the bifurcations of said end portion, one of said bifurcations being continuously in contact with one of said arms and the other of said bifurcations being continuously in contact with the other of said arms for causing the lower section of said torsion bar to twist and increase the torsional reaction thereof when said input member is rotated in one direction, and a pair of oppositely disposed pins rigidly connected to said worm and located between said radially extending arms and said bifurcations, one of said pins being continuously in contact with one of said arms and the other of said pins being continuously in contact with the other of said arms for causing the upper section of said torsion bar to twist and increase the torsional reaction thereof when said input member is rotated in the opposite direction.

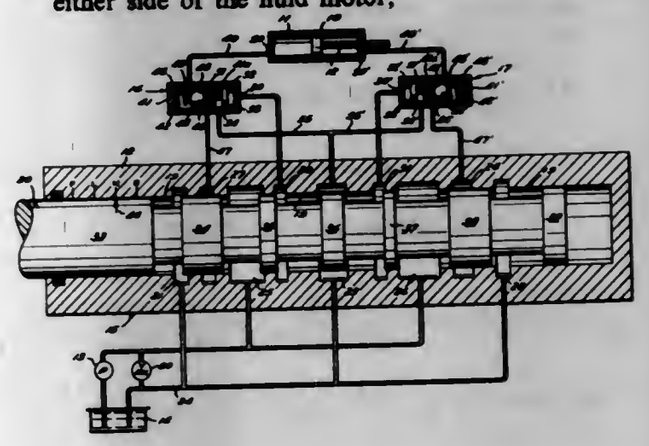
3,273,466
SINGLE BOOM DERRICK UNITS
Roy O. Balogh, Ladue, and Robert G. Bakula, Hanley Hills, Mo., assignors to McCabe-Powers Body Company, St. Louis, Mo., a corporation of Missouri
Original application Sept. 4, 1962, Ser. No. 221,225, now Patent No. 3,154,199, dated Oct. 27, 1964. Divided and this application July 16, 1964, Ser. No. 383,043
8 Claims. (Cl. 91—420)

1. An outrigger for use with trucks and other mobile platforms having portable derricks and the like, said outrigger comprising an outer housing of non-circular cross section having an open end, a double acting hydraulic cylinder disposed within said housing and being adapted for extensible movement through the open end thereof, a piston operatively disposed within said cylinder, a tubular cylindrical piston rod disposed within said cylinder, said piston rod being secured to said piston at its lower end and being rigidly secured to said housing at its upper end, a cylindrical pipe disposed concentrically within said piston rod

in the formation of first and second fluid conduits, a sleeve of non-circular cross section disposed about and encircling said hydraulic cylinder for its entire length and being rigidly secured thereto, said sleeve being in slidable engagement with the interior walls of said tubular housing for supporting said cylinder during the latter's extensible movement, base means pivotally mounted on the outer end of said cylinder, first closure means mounted on the upper end of said cylinder and being movable therewith, said first closure means having an aperture for accommodation of said piston rod, the space between said piston and said first closure means being enclosed by said cylinder forming a first fluid chamber, second closure means mounted at the lower end of said hydraulic cylinder, the

space between said second closure means and piston being enclosed by said hydraulic cylinder forming a second fluid chamber, said first and second fluid conduits being in communication with said first and second fluid chambers, respectively, first supply means for supplying fluid through said second conduit to said second chamber to cause extension of said hydraulic cylinder, second supply means for supplying fluid through said first conduit to said first chamber to cause retraction of said hydraulic cylinder, and valve means carried by said piston rod and operatively associated with said first and second supply means for regulating the amount of fluid to each of said first and second chambers, said valve means being adapted to hold said hydraulic cylinder in a rigid position if the pressure at either of said first or second supply means should fail.

3,273,467
HYDRAULIC SYSTEM
John D. Allen, South Euclid, Ohio, assignor to Fawick Corporation, a corporation of Michigan
Filed Jan. 26, 1965, Ser. No. 428,048
14 Claims. (Cl. 91—420)



1. A hydraulic system for operating a fluid motor from a pump comprising:

a closed-center spool valve comprising a valve body having a bore therein and a plurality of recesses intersecting said bore at spaced locations therealong and including pump recess means for connection to the pump and return recess means for connection to a low pressure return line and additional recesses, and a spool slidably received in said bore and having a plurality of longitudinally spaced lands thereon for sealing engagement with the bore and having reduced diameter portions between its lands;

a first normally-closed check valve connected to one of said additional recesses in the spool valve body and having a port for connection to one side of the fluid motor, a first pressure responsive member connected to another of said additional recesses in the spool valve body and movable in response to fluid pressure thereat to open said check valve;

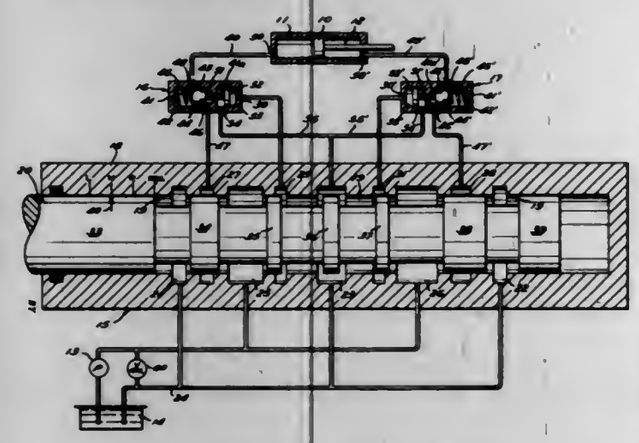
a second normally-closed check valve connected to another of said additional recesses in the spool valve body and having a port for connection to the opposite side of the fluid motor, a second pressure responsive member connected to another of said additional recesses in the spool valve body and movable in response to fluid pressure thereat to open said second check valve;

said spool in a first position thereof along the bore in the spool valve body blocking said pump recess means from both check valves and connecting the respective pressure responsive members in both check valves to the low pressure return through the spool valve body to maintain both check valves closed to block the flow of hydraulic liquid from either side of the fluid motor;

said spool in a second position thereof along the bore in the spool valve body connecting said pump recess means therein to the first check valve to open the latter for flow from the pump to said one side of the fluid motor, said spool in said second position thereof connecting said pump recess means therein to said second pressure responsive member to open the second check valve and connecting said second check valve to said return recess means therein for return flow from the opposite side of the fluid motor;

said spool in a third position thereof along the bore in the spool valve body connecting said pump recess means therein to the second check valve to open the latter for flow from the pump to said opposite side of the fluid motor, said spool in said third position thereof connecting said pump recess means therein to said first pressure responsive member to open the first check valve and connecting said first check valve to said return recess means for return flow from said one side of the fluid motor.

3,273,468
HYDRAULIC SYSTEM WITH REGENERATIVE POSITION
John D. Allen, South Euclid, Ohio, assignor to Fawick Corporation, a corporation of Michigan
Filed Jan. 26, 1965, Ser. No. 428,032
10 Claims. (Cl. 91—420)



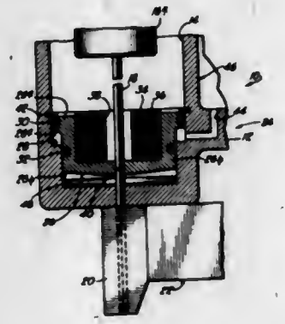
1. A hydraulic system for operating from a pump, a piston and cylinder in which the cylinder has first and second ports on opposite sides of the piston and the piston has a larger exposed area on one side, said system comprising:

a spool valve comprising a valve body having a bore therein and a plurality of recesses intersecting said bore at spaced locations therealong and including a pair of pump recesses for connection to the pump

and return recesses for connection to a return line and additional recesses, and a spool slidably received in said bore and having a plurality of longitudinally spaced lands thereon for sealing engagement with the bore between said recesses and having reduced diameter portions between its lands;

a first normally-closed check valve connected to one of said additional recesses in the spool valve body and having a port for connection to the cylinder at one side of the piston, a first pressure responsive member connected to another of said additional recesses in the spool valve body and movable in response to fluid pressure thereat to open said check valve;

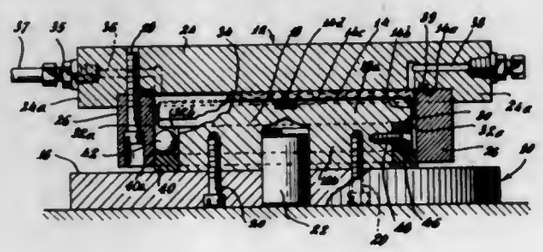
a second normally-closed check valve connected to another of said additional recesses in the spool valve body and having a port for connection to the cylinder at the opposite side of the piston, a second pressure responsive member connected to another of said additional recesses in the spool valve body and movable in response to fluid pressure thereat to open said second check valve;



said spool in a first position thereof along the bore in the spool valve body blocking the pump recesses from both pilot valves and connecting the respective pressure responsive members in both pilot valves to the return line through the spool valve body to maintain both pilot valves closed to block the flow of hydraulic liquid from the cylinder at either side of the piston;

said spool in a second position thereof along the bore in the spool valve body connecting a pump recess therein to the first check valve to open the latter for flow from the pump to the cylinder at said one side of the piston, said spool in said second position thereof connecting a pump recess therein to said second pressure responsive member to open the second check valve and connecting said second check valve to a return recess therein for return flow from the cylinder at the opposite side of the piston;

said spool in a third position thereof along the bore in the spool valve body connecting a pump recess therein to the second check valve to open the latter for flow from the pump to the cylinder at said opposite side of the piston, said spool in said third position thereof connecting a pump recess therein to said first pressure responsive member to open the first check valve and connecting said first check valve to a return recess for return flow from the cylinder at said one side of the piston;



said spool in a fourth position thereof along the bore in the spool valve body connecting both pump recesses to the check valves and connecting the pump to the second pressure responsive member for the flow of hydraulic liquid from the pump to the larger area side of the piston and return flow from the smaller area side of the piston to the larger area side.

3,273,469
FASTENER DRIVING APPARATUS
Richard H. Doyle, Mount Prospect, Ill., assignor to Fastener Corporation, Franklin Park, Ill., a corporation of Illinois
Filed Mar. 6, 1964, Ser. No. 349,902
3 Claims. (Cl. 92—85)

1. A fastener driving tool comprising a housing having a cylinder, fastener driving means including a piston movably mounted within the cylinder, said piston being normally disposed at one end of the cylinder and being movable during a power stroke to the opposite end of the cylinder, cylinder means concentric with the cylinder and disposed at said opposite end of the cylinder, said cylinder means having portions of different diameter, piston means of corresponding different diameters slidably mounted in the cylinder means, means for supplying a pressurized fluid to the cylinder means between said portions of different diameter to bias the piston means toward the drive piston, and means for limiting movement of the piston means toward the drive piston so that the piston means is spaced from but disposed in the path of movement of the drive piston during a power stroke, said piston means being engaged and moved against the bias of the pressurized fluid by the drive piston to cushion the termination of the power stroke of the drive piston.

3,273,470
HYDRAULIC LOAD CELL
Chester D. Bradley, Darien, Conn., assignor to The A. H. Emery Company, New Canaan, Conn.
Filed May 4, 1964, Ser. No. 364,499
6 Claims. (Cl. 92—101)

4. A load cell comprising, in combination:

(A) a base structure including an upstanding piston portion;

(B) a load receiving structure including

(1) an upper portion presenting a load receiving surface, and

(2) a cylindrical skirt portion depending from said upper portion and telescopically and coaxially receiving said piston portion with an annular space therebetween;

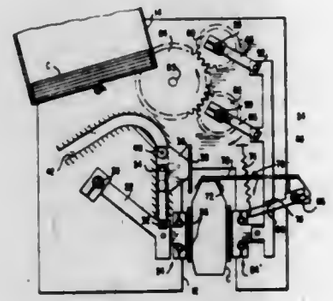
(C) a relatively thin flexible diaphragm of fluid impervious material sealed to said cylinder portion and overlying said piston portion to form a fluid pressure chamber between it and said upper portion,

(1) an annular fold of said diaphragm interlying an upper portion of said annular space;

(D) a ring surrounding said piston portion and presenting an annular support surface underlying said annular space; and

(E) a plurality of balls,

(1) arranged ball to ball on said support surface in a single closed circumferential row extending around said piston portion in said annular space, and



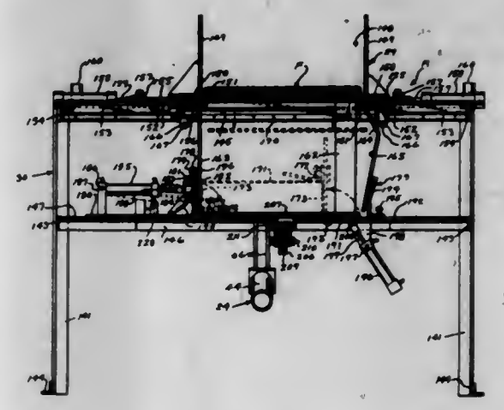
(2) rollably engaging the adjacent cylindrical walls of said portions to guide them in their telescopic movement and allow relative tilting movement therebetween;

(F) said cylindrical skirt extending downwardly beyond said annular space and sealingly engaging the outer peripheral surface of said ring member, whereby to prevent the entry of dust into said annular space;

(G) said ring member being formed of a resilient material so as to yieldably allow the aforedescribed relative tilting movement of said piston and cylinder portions and so as to yield downwardly upon collapsing telescopic movement of said portions to allow said balls to roll rather than skid on said cylindrical walls; and

(H) separate members rigid with said piston and said cylinder portions, respectively, and projecting radially therefrom into said annular space between adjacent balls to resist relative rotation between said portions and thereby prevent rupture of said diaphragm.

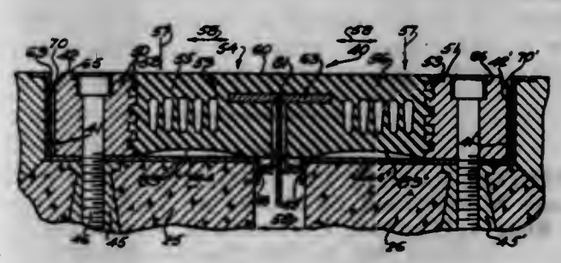
3,273,471
APPARATUS FOR SETTING UP FOLDED CARTONS
Franz Dollheimer, Valdosta, Ga., assignor to Owens-Illinois Glass Company, a corporation of Ohio
Filed Jan. 21, 1964, Ser. No. 339,291
6 Claims. (Cl. 93—53)



1. In packaging apparatus having a magazine for containing a stack of flattened cartons each expandable to form an open-minded, sleeve-like wrapper having a pair of spaced, parallel side panels joined at their upper and lower ends by top and bottom panels, respectively;

a first suction head movable between a feed position to engage the flattened carton at the discharge end of the magazine adjacent the lower end of one of the side panels, and a loading position in which it supports the carton at a carton expanding and loading station,

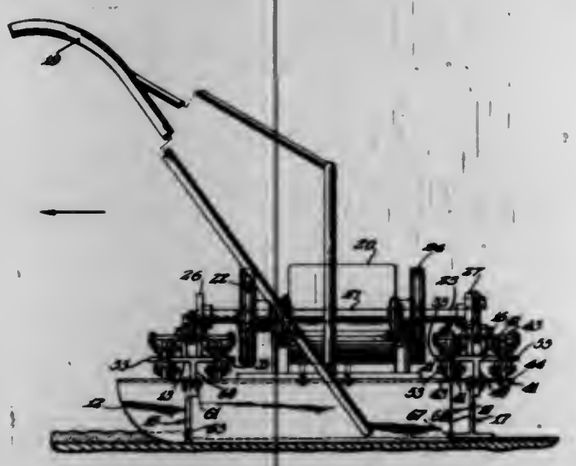
a second suction head mounted for parallel, oscillating movement relative to the position of the first suction head in its loading position between a first position in which it engages the other side panel of the carton adjacent its upper end, and a second position in which it is disposed in spaced, opposed relationship relative to the first suction head,



said first suction head remaining stationary in its loading position during movement of the second suction head from its first to second positions to thereby expand the carton.

3,273,472
CARTON FLAT SET UP MECHANISM
Martin Van Antwerpen and Leslie G. Freedy, Milwaukee, Wis., assignors to Vanant Company, Inc., Milwaukee, Wis.
Original application Aug. 22, 1962, Ser. No. 218,700, now Patent No. 3,247,645, dated Apr. 26, 1966. Divided and this application Oct. 6, 1965, Ser. No. 493,369
3 Claims. (Cl. 93—53)

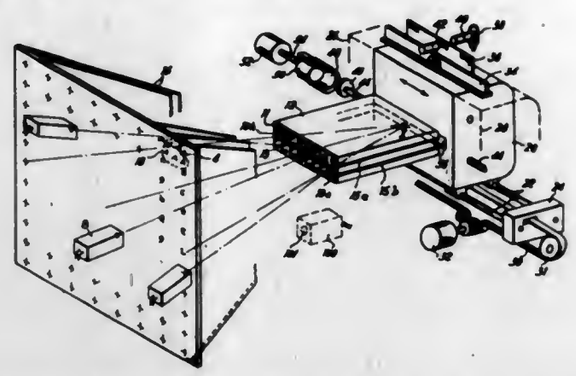
1. A carton flat set up mechanism including a table for receiving a carton flat, said carton being of the type including top and bottom walls and connecting side walls and closure flaps carried by the ends of the top and bottom walls and end walls, a swinging picker plate carried by said table and disposed adjacent to one edge of a carton flat on the table, said carton flat being received on said table with its top wall and respective side wall uppermost and with said respective side wall adjacent said picker plate means for swinging the picker plate back and forth over one side wall of a carton on the table, and picker points carried by said plate adapted to penetrate said side wall of the carton when the picker plate is swung over the flap for raising said side wall upon upward swinging movement of the picker plate for lifting said flap to a raised set up position.



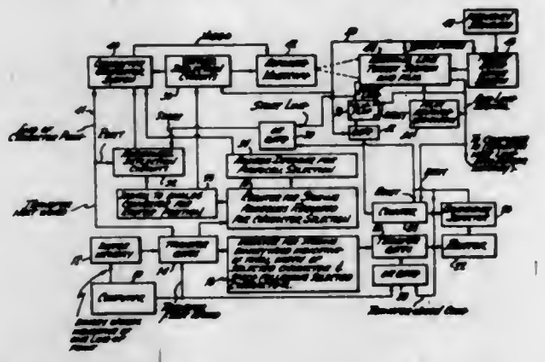
3,273,473
ROAD EXPANSION JOINT
Robert L. Pare, Cranston, R.I., assignor of one-tenth to David R. Black, Jr., Providence, R.I.
Filed Dec. 5, 1963, Ser. No. 328,241
4 Claims. (Cl. 94—18)

1. An expansion joint between two spaced structural elements defining an expansion gap comprising an elastomer block whose midportion spans said gap, a rigid plate

embedded in said elastomer block, said plate lying above and spanning said gap, said elastomer block having a substantially plane surface adapted to serve as a portion of a roadbed with said plate being substantially parallel to said plane portion, said elastomer block being positioned within upper recesses in said spaced structural elements with end portions of said elastomer block being anchored to said structural elements, said plate being positioned above the horizontal centroid of said elastomer block, means for maintaining the position of said plate fixed relative to said structural elements, said elastomer block provided with a plurality of voids located between the ends of said elastomer block and said plate in the region generally below said plate.



3,273,474
EPOXY FLOOR LAYING MACHINE
Johnny L. Hardin, Little Rock, and Harold R. Johnston, Bigelow, Ark., assignors to Clark Equipment Co., Inc., Little Rock, Ark., a corporation of Arkansas
Filed Dec. 26, 1963, Ser. No. 333,325
4 Claims. (Cl. 94—45)

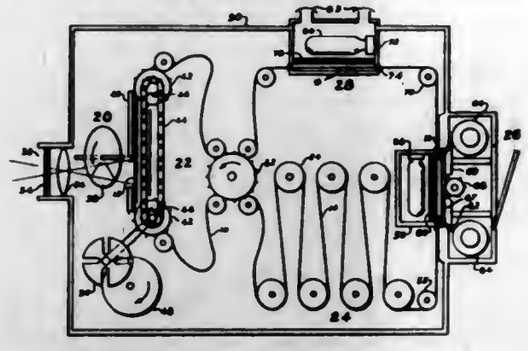


1. In a machine for laying plastic floors, a main frame, runners movable along the surface to be floored supporting said main frame in vertically spaced relation with respect to the floor, a pair of laterally spaced supports extending transversely of said main frame at the front and rear ends thereof, laterally and vertically spaced rollers mounted on each pair of supports, a separate carriage supported between said rollers on each pair of supports for movement transversely of said main frame, a motor, means driven by said motor for reciprocably driving said carriages, a spreader bar secured to and depending from the forwardmost of said carriages and having a scalloped bottom surface beveled to provide sharp edges at the scallops, a smoothing trowel secured to and depending from the rearwardmost of said carriages, and means mounting said spreader bar and trowel shoe on said carriages for vertical adjustable movement with respect to the ground engaging surfaces of said runners in accordance with the thickness of the floor to be laid.

3,273,475
PHOTOGRAPHIC TYPE COMPOSITION DEVICE
Louis M. Moyroud, 50 Brooks St., Medford, Mass., and Rene A. Higonnet, 136 Brattle St., Cambridge, Mass.
Filed Nov. 6, 1963, Ser. No. 321,827
10 Claims. (Cl. 95—4.5)

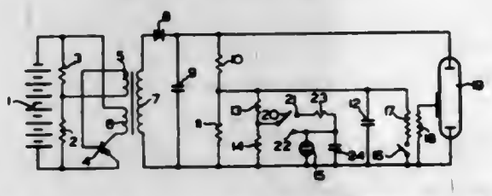
1. In a photographic type composing machine, a method for projecting to a common character image position all the characters of a matrix on which said characters are arranged in rows and columns formation comprising a first step in which all the columns of characters are merged into one column and a second step of continuously sweeping the length of a line to be composed and a third step in which all the rows of characters are merged into one row.

3,273,476
PHOTOCOMPOSING SYSTEM
Harold E. Haynes, Haddonfield, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed May 4, 1964, Ser. No. 364,518
19 Claims. (Cl. 95—4.5)



1. In combination,
means for storing a binary code indicative of a character it is desired to print;
an optical storage matrix in which a plurality of characters, including the desired one, are stored;
a light source responsive to said stored binary code for scanning, in raster fashion, the desired character;
light sensing means for deriving from the scanned character video signals indicative thereof;
a display means for displaying successive traces intensity modulated by said video signals;
a recording medium; and
a rotatable lens system for projecting the successive traces onto said recording medium along parallel side-by-side paths to trace out said desired character.

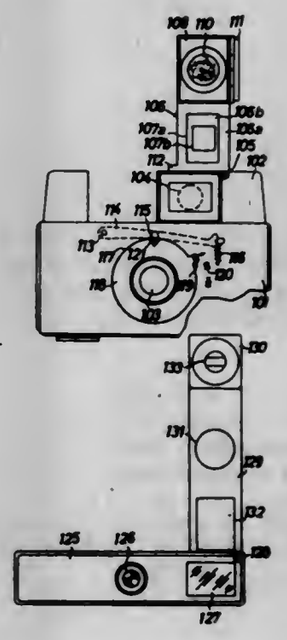
3,273,477
RANDOM EVENTS CAMERA AND METHOD
Edward G. De Hart, Boston, Mass., assignor to De Haart, Inc., Cambridge, Mass., a corporation of Massachusetts
Filed Dec. 31, 1963, Ser. No. 334,710
6 Claims. (Cl. 95—11)



1. A random events camera, comprising in combination, a camera housing defining an aperture, a lens in said aperture, a cinematic exposure means behind said lens, a film belt drive mounted within said camera housing, a film belt memory bank mechanism mounted within said camera housing, a film belt print-out mechanism affixed to and partially penetrating said camera housing, a film belt erasure mechanism mounted within said camera housing,

and a continuous-loop belt or phosphor-coated film threaded through said mechanisms, in the order named and engaged by said drive, characterized in that said film belt printout mechanism comprises
(a) a substantially light-tight lamp enclosure which defines a window and is mounted within said camera housing,
(b) a lamp mounted within said lamp enclosure,

(c) a filter mounted in said window, said filter being substantially transmissive to only infra-red radiation,
(d) guide means mounted within said camera housing for guiding said film belt past said filter, and
(e) a photosensitive film strip, and
(f) a sprocket wheel indexing both said belt and said strip to maintain said strip in contact print relation with the portion of said film belt adjacent said filter.

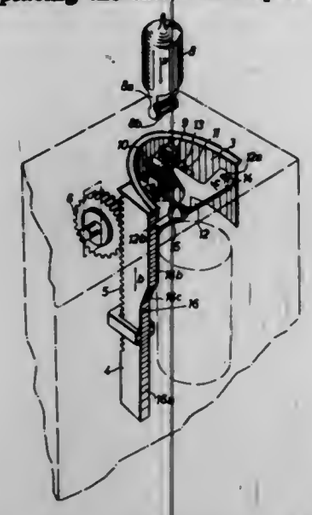


3,273,478
PHOTOGRAPHIC CAMERA WITH BUILT-IN ELECTRONIC FLASH DEVICE
Gotthard Kinder, Braunschweig, Germany, assignor to Voigtlander, A.G., Braunschweig, Germany, a corporation of Germany
Filed Dec. 17, 1964, Ser. No. 419,008
Claims priority, application Germany, Dec. 21, 1963, V 25,073
5 Claims. (Cl. 95—11)

1. In a camera, electronic flash means, a single electrical lamp, and circuit means connected with said electronic flash means and with said single lamp for operating the latter to provide a steady illumination for indicating that the electronic flash means is ready for operation and operating said single lamp to provide intermittent illumination for indicating that a proper exposure cannot be made.

3,273,479
CAMERAS WITH BUILT-IN FLASH ASSEMBLIES
Franz Jakob, Unterhaching, Munich, Germany, assignor to Agfa Aktiengesellschaft, Leverkusen, Germany
Filed Mar. 31, 1964, Ser. No. 356,249
Claims priority, application Germany, Apr. 11, 1963, A 19,851; May 2, 1963, A 43,015
7 Claims. (Cl. 95—11)

1. In a camera with a built-in flash assembly, in combination, a camera housing member, a cap member mounted on said camera housing member and defining therewith a chamber for accommodating components of the camera, flash means for providing flash illumination, said flash means being operatively connected to one of said members for movement relative thereto between a collapsed position where said flash means is relatively close to said members and an operating position where said flash means projects from said members and has a portion most distant from said members, said flash means having at said portion which is most distant from said members when said flash means is in said operating position thereof a reflector and a lamp socket, and said flash means when in said collapsed position thereof providing with said cap member and housing member a camera outline substantially conforming to the outline of a conventional camera without a built-in flash assembly; exposure time setting means carried by said camera housing member; and means compelling

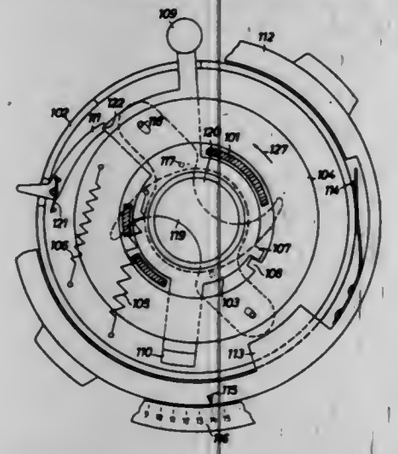


said exposure time setting means to provide an exposure time suitable for flash exposure when said flash means is displaced from said collapsed to said operating position thereof, said compelling means comprising releasable lock means engaging said flash means to prevent movement thereof from said collapsed to said operating position except when said exposure time setting means has a position providing an exposure time suitable for flash exposure, said exposure time setting means when placed in said latter position cooperating with said releasable lock means to actuate the latter for releasing said flash means for movement from said collapsed to said operating position thereof.

3,273,480
BUILT-IN FLASH STRUCTURE FOR PHOTOGRAPHIC CAMERAS
Alfred Winkler, Munich, and Franz Landbrecht and Dieter Engelmann, Unterhaching, Munich, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen Germany
Filed Nov. 24, 1964, Ser. No. 413,522
Claims priority, application Germany, Nov. 29, 1963, A 44,672; Apr. 18, 1964, A 21,608
8 Claims. (Cl. 95—11)

4. In a camera, in combination, housing means; reflector means carried by said housing means for movement from an inoperative position located at least for the most part within said housing means to an operative position projecting outwardly beyond said housing means; rotary drive means carried by said housing means for rotary movement, said housing means having an outer wall formed with an opening through which said rotary drive means is accessible to the operator so that the operator may manually turn said rotary drive means; driven means operatively engaging said rotary drive means

to be driven thereby and connected with said reflector means for displacing the latter in response to movement



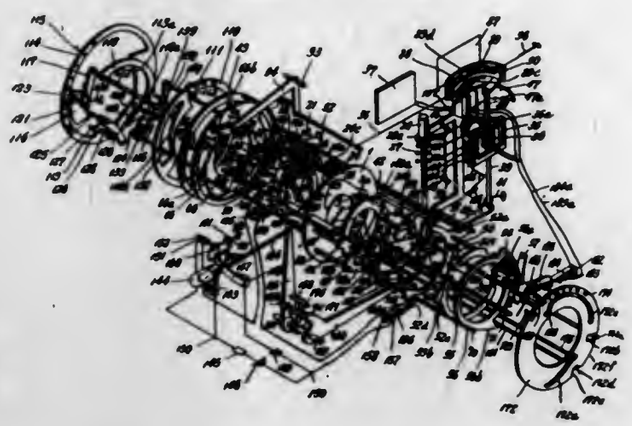
of said driven means by actuation of said rotary drive means; and spring means urging said driven means into engagement with said drive means.

3,273,481

CENTRAL PHOTOGRAPHIC SHUTTER

Gerd Kiper, Unterhaching, near Munich, Germany, assignor to Agfa Aktiengesellschaft, Leverkusen-Bayerwerk, Germany

Filed Feb. 20, 1964, Ser. No. 346,251
Claims priority, application Germany, Mar. 7, 1963, A 42,526
5 Claims. (Cl. 95—63)



1. A photographic shutter of the central type comprising a housing, a pair of rotatably mounted concentric sector operating rings in said housing, a number of shutter sectors, each of said sectors being movably connected to both of said rings to cause them to open and close said sectors when the angular phase between said rings varies from the normal condition and returns to it, driving means connected to each of said rings for imparting separate driving forces to them, releasing means connected to said rings for causing said rings to commence their driven movement, said driving means for one of said rings moving it at a slower angular velocity than said driving means for the other of said rings, adjustable stop means connected to said housing for controlling the distance of motion of said rings whereby the shutter opening and exposure time may be varied in accordance with the adjustment of said stop means, said adjustable stop means comprising a lug on the opening ring of said pair of rings, an abutment member in the path of motion of said lug, an adjusting ring movably mounted on said housing, and said abutment member being on said adjusting ring.

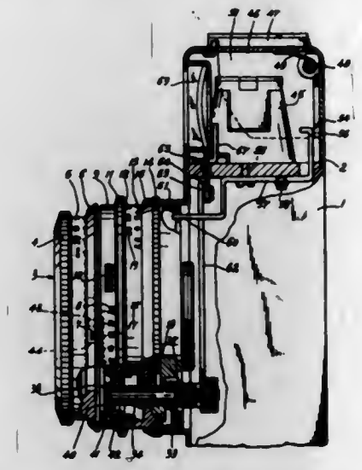
3,273,482

PHOTOGRAPHIC CAMERA WITH AUTOMATIC DIAPHRAGM SETTING IN THE FLASH RANGE

Franz W. R. Starp, Calmbach (Enz), Germany, assignor to Alfred Gauthier G.m.b.H., Calmbach (Enz), Germany, a corporation of Germany

Filed Feb. 4, 1964, Ser. No. 342,365
Claims priority, application Germany, Feb. 6, 1963, G 36,992
7 Claims. (Cl. 95—64)

1. A photographic camera comprising a diaphragm having an optical axis; means for setting the aperture of said diaphragm automatically for taking flash photographs, said means comprising a five-element jointed structure comprising one fixed member and four movable connecting members located around said axis; a guide number setting control calibrated according to flashbulb guide numbers; a range setting control, one of said movable members being controlled by said guide number setting control and a second one of said movable members being controlled by said range setting control; a stop engaging a third one of said movable connecting members to be set thereby; a lever system connected to said stop to cooperate therewith and connected to said diaphragm, whereby the setting of said diaphragm for flash pictures is controlled by the position of said stop; and a spring resiliently biasing said lever system.



3,273,483

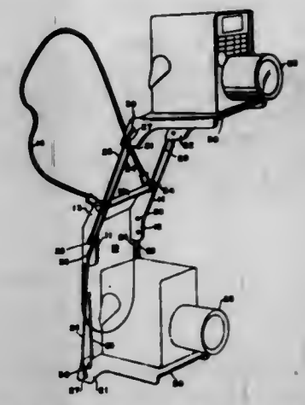
CAMERA WITH STRUCTURE FOR MAKING ADJUSTMENTS ACCORDING TO FLASH-GUIDE NUMBERS

Herbert Weidner, Steinkamp, and Paul Greger, Braunschweig, Germany, assignors to Voigtlander, A.G., Braunschweig, Germany, a corporation of Germany

Filed Oct. 9, 1964, Ser. No. 402,790
Claims priority, application Germany, Oct. 11, 1963, V 24,693
11 Claims. (Cl. 95—64)

1. In a camera, an objective having a distance setting means for setting the objective according to the distance between the camera and an object to be photographed thereby, film speed setting means for setting into the camera the speed of the film to be exposed therein, and diaphragm-setting means having a manually operable range and a non-adjusting position situated beyond said manually operable range, a diaphragm, transmission means operatively connected to said diaphragm-setting means and said diaphragm for transmitting movement of said diaphragm-setting means to said diaphragm for adjusting the latter only when said diaphragm-setting means is in said manually operable range thereof, said transmission means preventing adjustment of said diaphragm by said diaphragm-setting means when the latter is in said non-adjusting position thereof, differential means operatively connected to said distance setting means and said film speed setting means for assuming positions determined by the combination of the settings of said distance setting means and said film speed setting means, and coupling means coupling said differential means to said transmission means only when said diaphragm-setting means is in said non-adjusting position thereof for actuating said transmission means to automatically adjust the diaphragm according to the combined settings of said distance setting means and film speed setting means when said diaphragm-setting means is in said non-adjusting position thereof, said differential means including a differential lever having a pair of spaced cam-follower portions, a pair of cams respectively connected wtih said distance setting means and said film speed setting means for assuming positions determined by the positions of said distance setting means and film speed setting means, respectively, spring means acting on said differential lever for maintaining said cam-follower portions thereof respectively in engagement with said cams

so that the position of said differential lever will be determined according to the combined settings of said distance setting means and film speed setting means, and said coupling means including a coupling lever operatively connected to said differential lever to be angularly moved thereby for transmitting movement of said differential lever to said transmission means for actuating the latter to adjust the diaphragm automatically when said diaphragm-setting means is in said non-adjusting position thereof, said diaphragm-setting means having a camming portion engaging said coupling lever for maintaining the latter out of operative engagement with said transmission means when said diaphragm-setting means is in said manually operable range thereof and releasing said coupling lever for operative engagement with said transmission means when said diaphragm-setting means is in said non-adjusting position thereof.



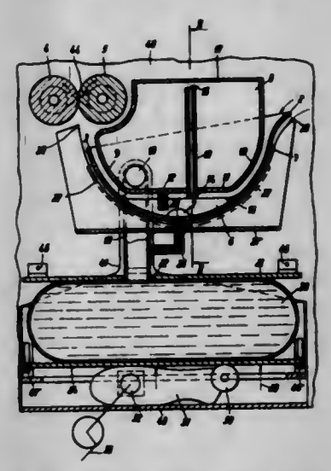
3,273,484

CAMERA SUPPORTS

Charles H. Lapsley, 4200 Tyson Ave., Philadelphia, Pa.

Filed Feb. 18, 1964, Ser. No. 345,666
4 Claims. (Cl. 95—86)

1. A camera support comprising a body-engageable element, camera-mounting means, a first link extending between and having pivotal axes on the element and on said means, a second link extending between and having pivotal axes on the element and means respectively spaced from the pivotal axes of said first link while being parallel thereto, whereby said means traverses a general curved path in moving from a relatively lower position toward a relatively higher position and return during which movement said means and said links have relative movement, said means being extended in one direction beyond the axes of said first and second links thereon and developing a gravitational moment relative thereto, said means in said higher position being movable on and with said links between a first and a second attitude, said means in said first attitude having one link axis on said means generally below and forwardly of the other link axis thereon, and in said second attitude having said one link axis thereon generally below and rearwardly of said other link axis thereon, and latching means responsive to movement



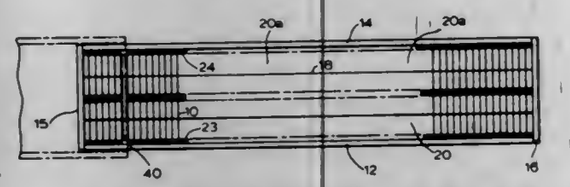
of said camera-mounting means from its first to its second attitude aided by said moment anchoring said mounting means and links against motion whereby the mounting means is supported rigidly in said second attitude on and relative to said element.

3,273,485

PHOTOGRAPHIC DEVELOPING APPARATUS

Walter Limberger, Hamburg-Poppenbuttel, Germany, assignor to Lumoprint Zindler KG, Hamburg, Germany, a German company

Filed Mar. 25, 1964, Ser. No. 354,674
Claims priority, application Germany, Apr. 1, 1963, L 44,521
9 Claims. (Cl. 95—89)



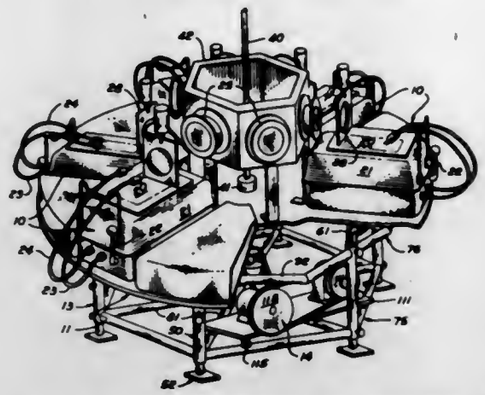
1. A surface-developing apparatus for exposed photographic emulsion carriers which are moistened on the emulsion side to effect development thereof by being guided past a liquid meniscus which the emulsion side faces, which apparatus comprises, in combination, a bath container for holding treatment liquid, guide members associated with said bath container for guiding emulsion carriers through such bath container so as to moisten the emulsion layer sides thereof, constant level liquid reservoir means for adjusting the meniscus level, a supply container for said constant level liquid reservoir means, said reservoir means being located above said bath container, first pipe means associated with said reservoir means and extending from the base of said supply container down to a position below the meniscus level in the filled bath container, second pipe means associated with said reservoir means and projecting upwardly inside the supply container and downwardly outside such container to a height which corresponds to the liquid meniscus level in

the bath container, a compressible reserve tank for developer liquid, first connecting duct means between said reserve tank and the supply container, second connecting duct means between the reserve tank and a lower part of the bath container and means for compressing said reserve tank.

3,273,486
APPARATUS FOR RETAINING AND PROCESSING DENTAL X-RAY FILMS

Charles Garris, 37—03 Little Neck Parkway, Little Neck, N.Y.

Filed Jan. 10, 1964, Ser. No. 336,967
8 Claims. (Cl. 95—98)

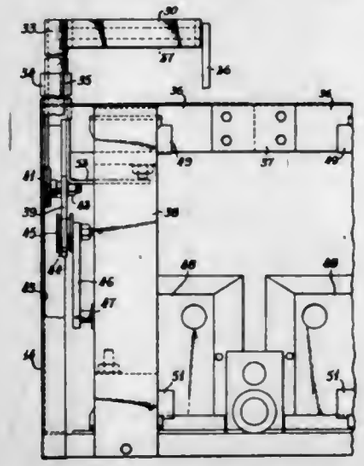


1. An apparatus for retaining and processing relatively small X-ray films, comprising a retainer rack for supporting a plurality of films, said retainer rack including a front wall, a rear wall spacedly located relative to the front wall and substantially parallel thereto, a pair of end walls fixedly attached to the ends of the front and rear walls and substantially perpendicular thereto, and a bottom panel fixedly attached to the end walls and located between the front and rear walls, spring means fitted to inner surface of each of the front and rear walls and projecting inward therefrom, and auxiliary spring means fitted to the inner surface of the bottom panel and projecting upward therefrom, each of said spring means being operative to grip the adjacent edge of the films inserted therebetween, the films being substantially perpendicular to the front and rear walls of the retainer rack, means removably inserted between the front and rear walls of the retainer rack operative to spacedly locate the individual films relative to one another, the front and rear walls of the retainer rack, each has a longitudinal channel cut into the inner surface thereof, the bottom panel having a longitudinal channel cut into the upper surface thereof, the spring means being a coiled tension spring fitted to each of the longitudinal channels in the front and rear walls of the retainer rack, a portion of the outer circumferential surface of the spring projecting beyond the inner surface of the adjoining front and rear wall of the retainer rack, the auxiliary spring means being an auxiliary coiled tension spring fitted to the longitudinal channel in the bottom panel, a portion of the outer circumferential surface of the auxiliary spring projecting beyond the upper surface of the bottom panel, the means removably inserted between the front and rear walls of the retainer rack being a spacer panel, inserted adjacent the surface of one film in the retainer rack, to spacedly locate the next film in the retainer rack, the spacer panel being substantially perpendicular to the front and rear walls of the retainer rack, the width of the spacer panel being narrower than the spacing between the front and rear walls of the retainer rack, to provide gaps between the edges of the spacer panel and the front and rear walls of the retainer rack, respectively, the bottom of the spacer panel being located above the upper surface of the bottom panel of the retainer rack, a spacer holder supporting the spacer panel, the spacer holder including a front wall and a rear wall substantially parallel to one another, the spacing between the front and rear walls of the spacer holder being greater than the spacing between the outer surfaces of the front and rear walls of the retainer rack, and a top wall fixedly attached to the upper edge of the front and rear walls of the spacer holder, the spacer panel being fixedly attached to and suspended from one end of the top wall.

3,273,487
HAM PUMPING DEVICE

Edward A. Schlernitzauer, Tampa, Fla., assignor to Swift & Company, Chicago, Ill., a corporation of Illinois

Filed June 5, 1964, Ser. No. 372,975
10 Claims. (Cl. 99—254)

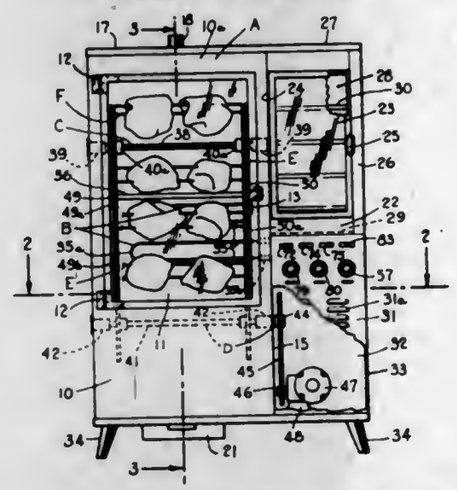


1. An improved apparatus for pumping hams, said apparatus comprising: a horizontal table mounted for rotation about a centrally disposed vertical axis; a plurality of automatic pickle pumping scales mounted uniformly spaced about the top of said table; a main vertical shaft supporting said table at said vertical axis; bearing means holding said main shaft, said bearing means being vertically cushioned on springs; a plurality of casters rollingly supporting said table outwardly of said main shaft, said casters being equally spaced radially and peripherally with respect to said main shaft; an equal plurality of adjustable legs supporting said casters, said legs being telescopically constructed and containing compression springs to equally cushion each of said casters; and drive means connected to said main shaft to turn said table thereby at a desired speed.

3,273,488
BASKET RAISING MECHANISM FOR TWIN FRYERS

Richard J. Anetsberger, Northbrook, Ill., assignor to Anetsberger Brothers, Inc., Northbrook, Ill., a corporation of Illinois

Filed Mar. 15, 1965, Ser. No. 439,596
4 Claims. (Cl. 99—407)

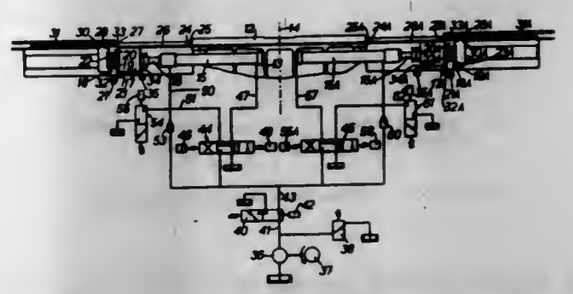


1. In a deep fat fryer having twin food-supporting baskets, a kettle, a vertical flue disposed rearwardly of the kettle in closely spaced relationship relative thereto, and an outer casing enclosing said kettle and flue in closely spaced relationship relative thereto; means for supporting and moving said baskets vertically independently of each other, comprising a lifting rod disposed between said kettle and said flue adjacent and interiorly of each lateral side wall of said casing, a hanger offset inwardly from the upper portion of each said lifting rod away from the adjacent said casing side wall for independently supporting one of said baskets, tubular guide means engaging said rod intermediate its ends, operating means including a movement-imparting member secured intermediate its ends to the lower end of each said lifting rod, and guide pads mounted on each said movement-imparting member adjacent the ends thereof for adjustment relative thereto laterally of said casing for resisting torque applied to the associated said lifting rod by the food-supporting basket supported thereby.

3,273,489
ELECTRIC OVEN

Robert G. Wilson, 643 E. Faris Road, Greenville, S.C.

Filed Oct. 18, 1963, Ser. No. 317,316
9 Claims. (Cl. 99—421)

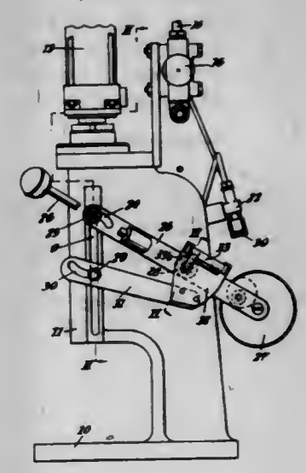


4. For use in an oven enclosure, the combination including, stationary vertically disposed electrical heating means disposed substantially within the central portion of the oven, a first horizontal shaft within the oven enclosure disposed above and in substantial alignment with the electrical heating means, a second horizontal shaft within the oven disposed below and in substantial alignment with the electrical heating means, sprockets adjacent the ends of each shaft whereby each of the sprockets on the upper shaft is substantially aligned with a sprocket on the lower shaft, a pair of horizontally spaced vertically disposed continuous chains carried by respective pairs of aligned sprockets so that a vertical run of the chains passes on each side of the electrical heating means, power operated driving means for turning said shafts continuously, a plurality of substantially horizontally disposed meat supporting means having respective end portions connected to said chains, said supporting means being subjected to the direct application of heat from said electrical heating means on each vertical run of the chains, and means on said chains cooperating with said meat supporting means positioning same for linear non-rotating movement on each vertical run of the chains so that the same side of said meat continuously faces said electrical heating means on both vertical runs of the chains.

3,273,490
PRESS ANVILS

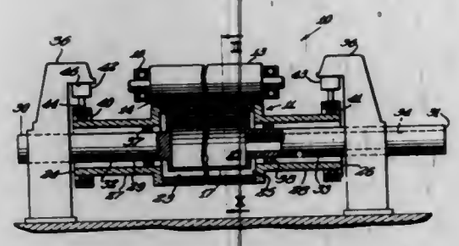
Jack Herbert Beard, Sheffield, England, assignor to Davy and United Engineering Company Limited, Sheffield, England

Filed Sept. 24, 1964, Ser. No. 399,018
Claims priority, application Great Britain, Sept. 26, 1963, 37,857/63
11 Claims. (Cl. 100—229)



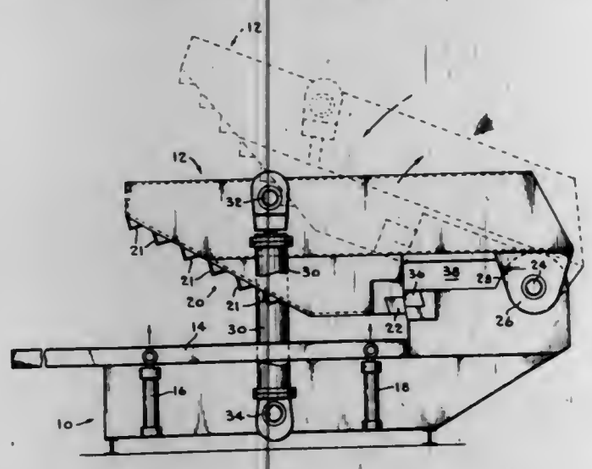
2. Apparatus for moving a horizontally slidable press anvil relative to a press center line bisecting the path of travel of said anvil, said apparatus comprising a first double acting piston and cylinder assembly located on one side of the press center line, first coupling means for coupling the first assembly to the anvil for moving the anvil on that side of the press center line, a second double acting piston and cylinder assembly located on the opposite side of the press center line, second coupling means for coupling the second assembly to the anvil for moving the anvil on that side of the press center line, and means for automatically disengaging the anvil from either assembly when it approaches the limit of the stroke of that assembly in a direction towards the other assembly, and automatically coupling that other assembly to the anvil.

3,273,491
AIR-OPERATED PRESSES



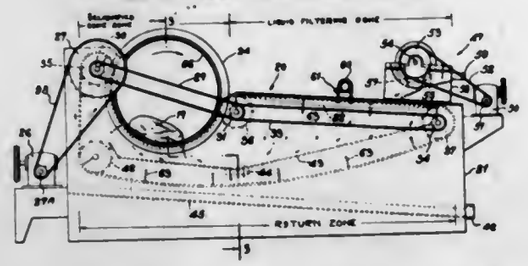
Eric Calvert, Burnley, England, assignor to Joseph Lucas (Industries) Limited, Birmingham, England

Filed Mar. 17, 1965, Ser. No. 440,503
3 Claims. (Cl. 100—53)



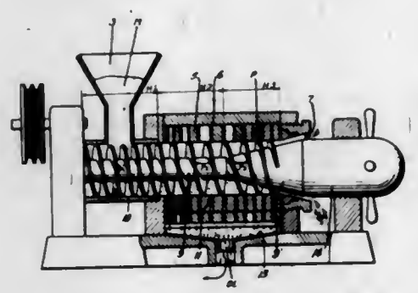
2. A press comprising a hollow housing, a tool holder slidably disposed within the housing, a pair of levers pivotally mounted about a common axis on the housing, one of said levers being connected, at a position removed from the axis, to the tool holder and the other lever being engageable therewith through a spring, a fluid pressure operated device associated with the tool holder for imparting a blow thereto when the tool holder has reached a predetermined position, a first valve on the housing operable to permit flow of fluid to said device to render it operative in response to relative movement between the two levers, against the action of the spring, and a second valve operable to permit flow to said device, said second valve being operated by said levers when said tool holder has reached said predetermined position which will preclude the insertion of an operator's finger beneath the tool holder, said device being operable only when both said first and said second valves have been operated.

3,273,492
SUCTION ROLL COUNTER-DEFLECTOR
Edgar J. Justus, Beloit, Wis., assignor to Beloit Corporation, Beloit, Wis., a corporation of Wisconsin
Filed Oct. 16, 1963, Ser. No. 316,711
18 Claims. (Cl. 100—90)



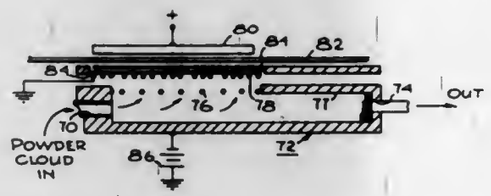
1. A roll assembly for use in a suction press or the like apparatus comprising:
a roll shell having normally a straight line centroidal axis that develops normally a central deflection in response to a load applied to the shell,
shaft means for the roll shell,
fixed support means for supporting said shaft means at the ends thereof,
first bearing means mounted on said shaft means inboard of said fixed support means and engaging said roll shell for normally maintaining said shaft means and said roll shell in coaxially aligned and spaced relation,
second bearing means mounted on said roll shell at the ends thereof for vertical movement relative to said fixed support means and situated between said fixed support means and said first bearing means, and
force imposing means operatively engaging said second bearing means for applying a force to the ends of said roll shell to act against restraint provided by said first bearing means to provide counter deflection of said roll shell in opposition to the deflection caused by a load applied thereto.

3,273,493
APPARATUS FOR PROCESSING SCRAP MATERIAL
Raimond J. Smiltneek, Butler, Wis., assignor to Logemann Brothers Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Oct. 13, 1965, Ser. No. 495,409
11 Claims. (Cl. 100—95)



1. A material processing machine comprising:
a frame having a bed thereon for receiving material to be processed, said frame further provided with a shear member mounted thereon, said bed on said frame being movable with respect to said frame;
a jaw member pivotally mounted on said frame, said jaw member having a crushing portion at the outer end thereof and a shear member mounted thereon between said crushing portion and the point at which it is pivotally mounted on said frame, said shear members on said jaw and frame adapted when said jaw is pivoted to produce a shearing action therebetween; and
a power means for pivoting said jaw on said frame.

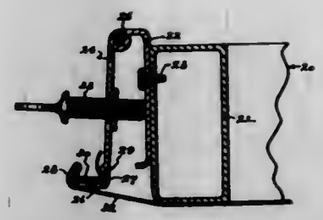
3,273,494
SEWAGE FILTER AND PRESS
Otell M. Cocchiarella, 99 Linden Ave., Verona, N.J.
Filed Mar. 11, 1965, Ser. No. 446,765
18 Claims. (Cl. 100—121)



1. An apparatus for separating liquid from solids by filtration comprising, in combination:
(a) a frame;
(b) an endless belt filter;
(c) means on said frame for supporting said belt and guiding it successively through a filtering zone, deliquefied cake zone and a belt return zone;
(d) means for feeding liquid to said filtering zone;
(e) means for preventing the flow of liquid from said filtering zone to said deliquefied cake zone;
(f) said deliquefied cake zone comprising a depressed collection portion terminating in a portion inclined upwardly at an angle sufficient to cause deliquefied cake to collect and roll into a roughly cylindrical mass in said depressed collection portion to clean said belt; and
(g) means for driving said belt.

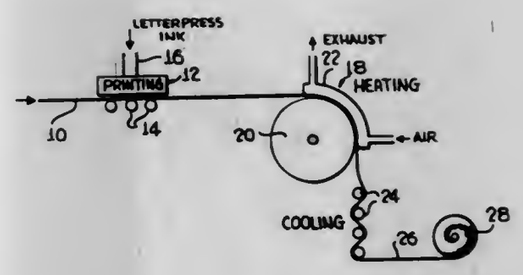
3,273,495
OIL EXPELLER
Masakatsu Ozawa, 207 Minakami, Fujieda, Shizuoka Prefecture, Japan
Filed Mar. 10, 1964, Ser. No. 350,813
Claims priority, application Japan, June 7, 1963, 38/29,219
4 Claims. (Cl. 100—145)

1. An oil expeller comprising a casing having a cylindrical passageway and conduit means connecting said passageway with a collector, an inlet in one end of the casing communicating with said passageway for admitting the material to be pressed into the passageway, an outlet at the other end of the casing for removing the pressed material, and a screw rotatably mounted in said passageway, said screw comprising a first core section of uniform diameter and a second core section of non-uniform diameter adjacent thereto, a thread integral with the core having a uniform diameter equal to the diameter of the passageway and having a first zone of predetermined pitch adjacent the inlet, a second zone of a greater pitch than said predetermined pitch adjacent the first zone, and a third zone of a pitch less than the pitch of the second zone, said third zone being adjacent said second zone and on the core section of non-uniform diameter.



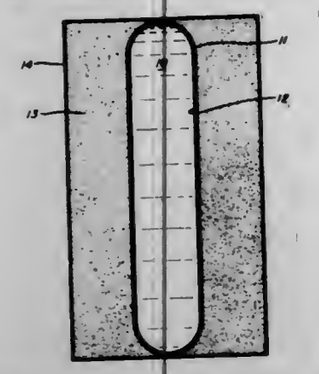
3,273,496
POWDER FEED FOR ELECTROSTATIC PRINTING SYSTEM WITH AN ELECTRIC FIELD FREE CHAMBER
Richard W. Melmon, San Francisco, Calif., assignor, by mesne assignments, to Crocker-Citizens National Bank, as trustee
Filed Aug. 28, 1964, Ser. No. 392,717
4 Claims. (Cl. 101—114)

1. In an electrostatic printing system of the type wherein there is provided an image electrode and a back plate positioned adjacent one surface of said image electrode for establishing an electric field therebetween, and electroscopic powder particles are applied to the opposite surface of said image electrode for passing through the image apertures therethrough into said electric field, means for applying said powder particles to said opposite surface of said image screen comprising conductive walls defining a powder cloud chamber, an input opening in one wall of said powder cloud chamber, an output opening in a second wall of said powder cloud chamber opposite said one wall, means for applying a powder cloud to said input opening of said powder cloud chamber to traverse said powder cloud chamber to the output opening, an opening in a third wall of said powder cloud chamber which is adjacent to said one and said second walls, a plurality of spaced wires extending over said opening in said third wall and electrically connected to said chamber walls, means for positioning said powder cloud chamber and said screen adjacent said opposite surface of said image screen, and means for biasing said plurality of spaced wires relative to said image screen for moving powder particles which have passed through said plurality of spaced wires towards said opposite surface of said image screen.



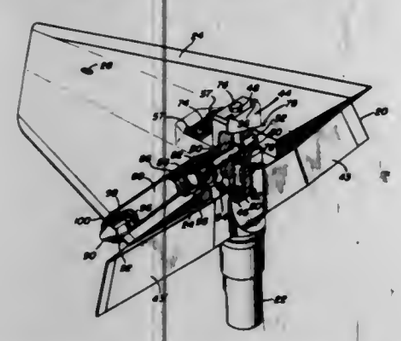
3,273,497
SCREEN STENCIL FRAME
Thomas James Rosema and Harry Russell Farwell, both of Grand Rapids, Mich., assignors to James A. Black, President of General Research, Inc., Grand Rapids, Mich., a corporation of Michigan
Filed Jan. 23, 1964, Ser. No. 339,736
3 Claims. (Cl. 101—128.1)

1. A device for securing a marginal edge of a stencil fabric to a side rail of a stencil frame, comprising: a hinge plate adapted for attachment to the outer surface of said side rail and extending substantially the length of said rail; a hinge leaf hingedly connected to the upper longitudinal edge of said hinge plate and depending therefrom, said hinge leaf terminating slightly above the bottom of said side rail in a channel having an open longitudinal surface, spaced side walls, one of said walls being inclined toward the other wall, said other wall having a plurality of projections extending therefrom toward the first of said walls; and a bar substantially coextensive in length with said channel, said bar having a width approximately equal to the width of said channel and having on one of its edges notches adapted to register with said projections, said bar being insertable in said channel through



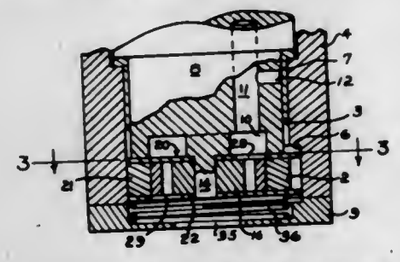
said open longitudinal surface with the marginal edge of the stencil fabric clamped between the bar and the walls of the channel and with the notches in the bar clearing said projections during such insertion, said bar being longitudinally slidable after such insertion to a position of non-registry of said notches with said projections whereby the bar and the marginal edge of the stencil fabric are retained within the channel behind said projections and said inclined wall.

3,273,498
FORMING COLORED PATTERNS UPON POLYOLEFIN SURFACES
Vernon P. Martin, West Chester, Pa., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Mar. 23, 1964, Ser. No. 353,782
8 Claims. (Cl. 101—426)



6. A method of fusing a heat-set, ink composition into the surface of supported films of polyethylene or polypropylene to obtain permanent printed matter thereon which comprises (1) printing on the surface of said films with a letterpress ink composition and (2) subsequently heating the printed surface to a temperature ranging from about 275°–350° F. by passing the reverse side of said supported printed surface at the rate of about 200–600 feet per minute over a heating element having a temperature of about 325° F. to 375° F. while (3) simultaneously subjecting the printed side of the film's surface to a current of hot air having a temperature of about 250°–500° F.; said ink composition consisting essentially of 25–35 parts-by-weight of a coloring pigment, 9–10 parts-by-weight of linseed oil, about one part-by-weight of cobalt naphthenate and 55–64 parts-by-weight of a varnish-solvent mixture consisting of a heat-set varnish and an organic solvent having a boiling range of about 472°–504° F. wherein the varnish is present in an amount of 45–60% by weight.

3,273,499
HIGH TEMPERATURE ILLUMINATING FLARE
Wayne A. Proell, Seymour, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Filed Nov. 24, 1964, Ser. No. 413,647
8 Claims. (Cl. 102—37.8)

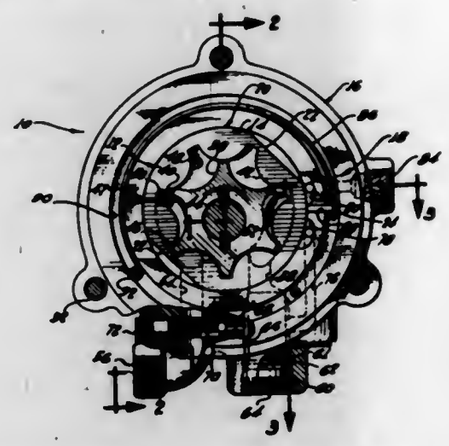


1. A pyrotechnic ignitable by impact and suitable for use as a high temperature illuminating flare, which pyrotechnic comprises chlorine trifluoride and a finely divided metal having a high heat of formation with chlorine and fluorine, said pyrotechnic being in a chemically stabilized condition until reaction is intentionally initiated by impact, said stability being imparted by the presence of a protective impact fracturable barrier separating said chlorine trifluoride from said metal.

3,273,500
SELF-ERECTING FOLDING FIN
Sverre Kongelbeck, Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy
Filed Jan. 25, 1965, Ser. No. 427,995
3 Claims. (Cl. 102—50)

1. A self-erecting structure, comprising,
a spar,
a first hinge pin means rigidly connected to said spar and extending with its longitudinal axis perpendicular to the longitudinal axis of said spar,
said first hinge pin means having a collar at one end thereof,
a bearing mounted on said hinge pin means,
an erectable member mounted on said spar and being pivotable about the longitudinal axis of said first hinge pin means from a folded position to an erected position on said spar,
an aerodynamically smooth housing on said member covering said bearing, said hinge pin means, and said collar,
plug means covering one end of said housing,
torsion spring means within said housing and connected at one end to said plug, and at its other end to said collar, said torsion spring means urging said member into said erected position,
latch pin means slidably mounted within said spar along its longitudinal axis,
spring means mounted in said spar for urging said latch pin means into said erectable member when said member is pivoted to said erected position, and
a second hinge pin means attached to said erectable member and extending perpendicular to the longitudinal axis of said spar, said erectable member being pivotable about the longitudinal axis of said second hinge pin means,
said second hinge pin means engaging said latch pin means to restrain said latch pin means against the urging of said spring means until said erectable member is pivoted to said erected position.

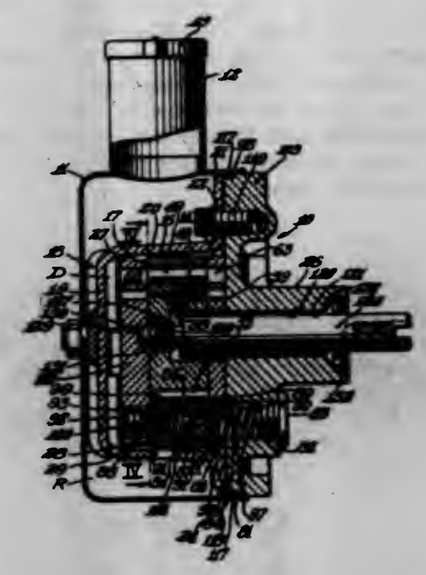
3,273,501
AUTOMATICALLY REVERSIBLE PUMPING MECHANISM
Dwight L. Tothero, York, Pa., assignor to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Oct. 1, 1964, Ser. No. 400,692
7 Claims. (Cl. 103—3)



1. In an automatically reversible pumping mechanism, the combination of an externally toothed inner pump gear rotatable about a first axis; an internally toothed outer pump gear; a carrier having a gear journalling opening therein dimensioned to rotatably receive said outer gear, the axis of said carrier opening being offset from said first axis, said carrier being adapted to circumscribe said inner gear, said pump gears when rotated forming intake and exhaust spaces; rotatable driving means operatively secured to said inner gear; means forming suction and discharge passageways including a first port member on one side of said gears having an opening therethrough opposite said intake space and a second port member on the other side of said gears having an opening therethrough opposite said discharge space; and means accommodating predetermined rotation between said carrier and said first and second port members about said first axis upon a reversal in gear rotation to maintain said intake and exhaust spaces opposite said first and second port member openings.

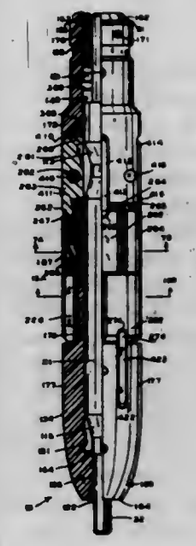
3,273,502
PUMPING AND METERING DEVICE
Roger G. Martz, Lebanon, Ind., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Filed Feb. 24, 1964, Ser. No. 346,644
2 Claims. (Cl. 103—5)

1. In combination, a pumping and metering device for drawing against at least 25" Hg suction and metering accurately continuous flow rates as low as .3 gallon per hour, comprising a housing having an internal cylindrical cavity, a pumping means including a gear set consisting of outer and inner gear members with said outer gear member having a plurality of internal teeth and said inner gear member having a different plurality of external teeth progressively engaged with the teeth of said outer gear member in response to rotation relative each other within the cavity to solely define a plurality of variable sized rotatable liquid oil pumping chambers, shaft means to support the inner gear member eccentrically of the outer gear member and housing cavity and to drive the gear set within the housing, inlet and outlet porting means



adjacent and open to the gear set operable to provide for fluid transfer through the defined pumping chambers, a metering means including a cylindrical periphery on the outer gear member having at least one flattened portion on its cylindrical periphery which defines within the cavity at least one peripheral chamber of relatively small fixed volume, a vane of width equal to the axial length of the defined peripheral chamber, means for biasing said vane to engage the periphery of the outer gear member for sweeping the peripheral chamber of fluid upon the rotation of the outer gear member in the housing, inlet and outlet porting means disposed, respectively, on opposite sides of the vane each adjacent and open to the defined peripheral fluid chamber operable upon rotation of the

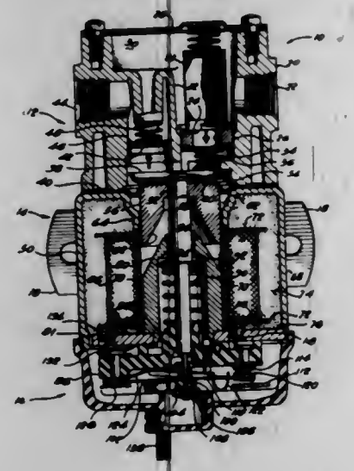
outer gear member for transferring the fluid through the peripheral chamber, a passageway of fixed volume in said housing to communicate the outlet porting means of the pumping gear set chambers to the inlet porting means of the metering peripheral chamber, a second passageway of fixed volume in said housing between the outlet porting means of the pumping gear set and the inlet porting means of the pumping gear set, and a check valve in said second passageway opened whenever the pressure at the inlet porting means of said peripheral chamber exceeds the inlet pressure at said pumping chamber by a predetermined amount with said valve being held open in response to all pressures in excess of said predetermined amount to pass all liquid in excess of that accepted by said metering chamber.



3,273,503
STACK UP SLIPPER PUMP AND COMPACT VALVE ASSEMBLY
Hubert M. Clark, Bloomfield Township, Oakland County, and Gilbert H. Drutchas, Birmingham, Mich., assignors to TRW Inc., a corporation of Ohio
Filed Dec. 26, 1963, Ser. No. 333,763
9 Claims. (Cl. 103—42)

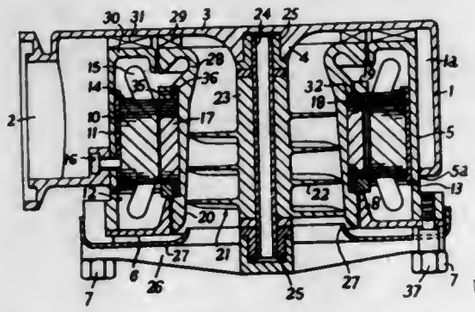
1. In a pump,
a stack up of parts forming a pump cartridge and including a ring member having a bore forming a pump chamber and plate members forming surface face seals on opposite sides of said ring member all disposed in an axial row,
rotary fluid displacement means in said pumping chamber,
said stack up of parts having an axial through opening extending through said ring member spaced outwardly of said bore and disposed parallel to the axis of said bore,
casing means enclosing said stack up of parts and together therewith forming separated inlet and outlet zones,
means including said ring member forming a by-pass passage,
said ring member having as a part of said by-pass passage a portion disposed transversely of and intersecting said through opening and extending outwardly therefrom in opposite direction to open into said inlet zone,

and a flow control valve in said axial through opening regulating the by-pass of fluid between said zones, whereby the valve is balanced by flow on both sides of the valve.



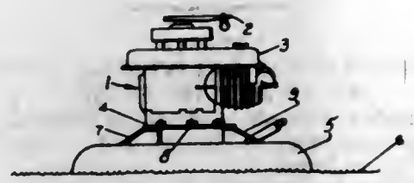
3,273,504
WELL PUMPING PROCESS AND APPARATUS THEREFOR
Cecil Ray Lyles, 2101 E. 16th St., Farmington, N. Mex.
Filed July 26, 1965, Ser. No. 474,573
2 Claims. (Cl. 103—52)

1. An oil well apparatus providing for an external by-pass of fluid therepast for operation in a well tubing comprising a frame with a longitudinally extending recess therethrough, rod holding means in said frame, said rod being slidably held in said recess in one of two positions, toggle means actuated by said rod and pivotally attached to said frame for motion of one portion thereof inward and outward on upward and downward motion of the rod with respect to said frame, two series of sealing elements each of which series circumscribe the periphery of said



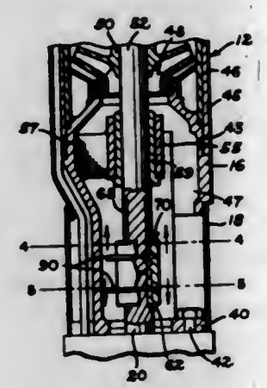
frame, each of the elements of each of said series having a spring nested therein and said spring pressing each of said elements outward, one edge of one portion of said element engaging said toggle, the other end of said element engaging an element of said other series engaged by a toggle, spaces between the elements of one series not contiguous with spaces between elements of the other series, said series being adjacent each other, said rod having portions of different thickness along its length, said springs urging said extensible member into contact with toggles and said toggles into contact with said rod, and resiliently actuated releasable locking means between said rod and said frame.

3,273,505
ELECTRICALLY OPERATED FUEL PUMP
Marshall Miles, Wilmette, Joseph D. Northrup, Mount Prospect, and Edward T. Prell, Chicago, Ill., assignors to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Filed Nov. 10, 1964, Ser. No. 410,116
8 Claims. (Cl. 103—53)



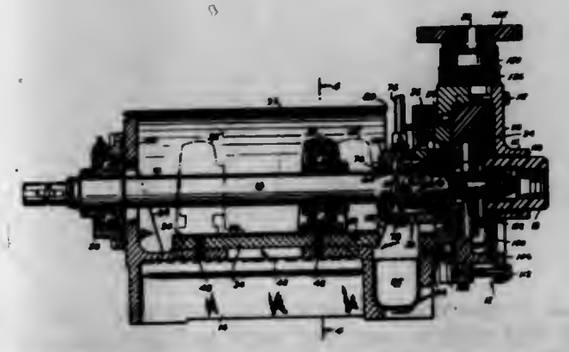
1. In a fuel pump assembly of the type having an inlet port normally adapted to be closed by an inlet valve and communicating with an outlet valve through a diaphragm chamber whose volume is adapted to be varied by a movement of a diaphragm for either drawing fuel into said chamber or pumping fluid from said chamber, the improvement comprising a coil having a movable armature carried on a shaft fixedly connected to said diaphragm and biased to move said diaphragm in one direction for pumping fuel from said chamber, a copper bobbin for said coil, an integrally formed magnetic housing for said coil having one wall portion surrounding said coil and an inner wall portion encircling said armature and engaged against one end of said copper bobbin, an end plate engaged against the end of said one wall and spaced from the other end of said bobbin with a small recess in the periphery of said plate into which said one wall is partially crimped to prevent relative rotation of said plate, a wax encapsulation adapted to be poured through said recess after said crimping and surrounding said coil to prevent displacement of said coil with the level of said wax being visually ascertainable, a stationary core for said coil having an aperture through which said shaft extends, a snap acting switch having a blade movable in either of two directions for respectively establishing or opening a circuit to said coil, an actuator adapted to be threaded on the extending end of said shaft and having a pair of spaced apart flanges located on opposite sides of said blade, and movable with said diaphragm for operating said blade in either of said two directions dependent on which flange engages said blade, and a spring clip having one leg passing through a slot in said actuator and an aperture in said shaft and another leg formed to grasp the end of said shaft for holding said actuator in its adjusted position.

3,273,506
MOTOR-DRIVEN PUMP UNITS
Archie William Holmes Jamieson, Slough, England, assignor to Plessey-U.K. Limited, Ilford, England, a British company
Filed Aug. 17, 1964, Ser. No. 390,777
Claims priority, application Great Britain, Aug. 30, 1963, 34,352/63
2 Claims. (Cl. 103—87)



1. A fuel pump for submerged installation in a fuel tank, comprising a volute-type pump housing formed with a lateral delivery connection, said housing being closed at one side of the volute and having a circular opening at the other side, a stator housing having a substantially cylindrical external surface fitting into said aperture and sealingly secured therein to project into proximity of said closed side of the pump housing and having a generally cylindrical inner surface concentric with said external surface, and an end wall projecting radially inwardly from said cylindrical inner surface to form with said closed side of the pump housing a generally radial diffusor channel, diffusor guide vanes in said diffusor channel extending axially between the opposed surfaces of said closed side of the pump housing and said end wall respectively, a stator body of ferromagnetic material fitted on said cylindrical inner surface of the stator housing in fixed relation to the stator housing, a stator winding accommodated in said stator body, a perforate end shield secured to the assembly of said pump housing and stator housing, the said end shield and the closed side of the pump housing having aligned bearing means coaxial with the cylindrical surfaces of the stator body, a rotor body mounted for rotation in said bearing means, said rotor body having a central portion coaxial with said bearings, an outer wall portion, radially spaced from the central portion to form with said central portion an annular passage coaxial with said central portion, said outer portion having a substantially cylindrical outer surface and being connected to said central body by a substantially helical fin portion and having at its end adjacent to the closed side of the pump housing an outwardly extending flange to form with said closed side passage chamber extending substantially radially of the housing, said flange portion having impeller blades extending into said chamber axially of the central portion into close proximity of the closed end of the pump housing, said radial chamber of the rotor being substantially aligned with said radial passage of the stator, an annular rotor body of ferromagnetic material secured on the cylindrical outer surface of said outer wall portion to face the cylindrical inner surface of the stator body, said ferromagnetic rotor body being equipped with a short-circuit winding of the squirrel-cage type, the arrangement being such as to permit the entry of liquid delivered from said chamber in the rotor to enter between the adjacent walls of the stator and rotor body so as to immerse the said bodies.

3,273,507
TRANSPORTABLE FLOAT-SUPPORTED CENTRIFUGAL PUMP ASSEMBLY
James Bruce Handford, Paradise Point, Gold Coast, Queensland, Australia
Filed Oct. 7, 1964, Ser. No. 402,078
Claims priority, application Australia, Oct. 15, 1963, 36,509/63
11 Claims. (Cl. 103—87)

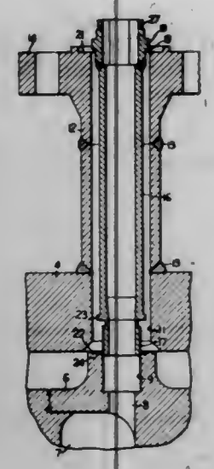


1. A transportable float-supported centrifugal pump assembly, said assembly consisting of a single float fabricated into the form of a closed loop rectangular in shape with its sides formed from lengths of hollow tubing of circular cross-section having mitered ends welded together to form a structure sealed against the ingress of liquid, said float serving to support an internal combustion engine above the liquid to be pumped; a centrifugal pump driven by said internal combustion engine and supported by said float below the surface of the liquid to be pumped; ancillary means for the supply of fuel to, and the control of operation of, said internal combustion engine; an inlet orifice to draw liquid into the pump; and a discharge pipe extending from the pump casing to convey the liquid under pressure from the pump after it has been acted upon by the rotation of the pump impeller vanes.

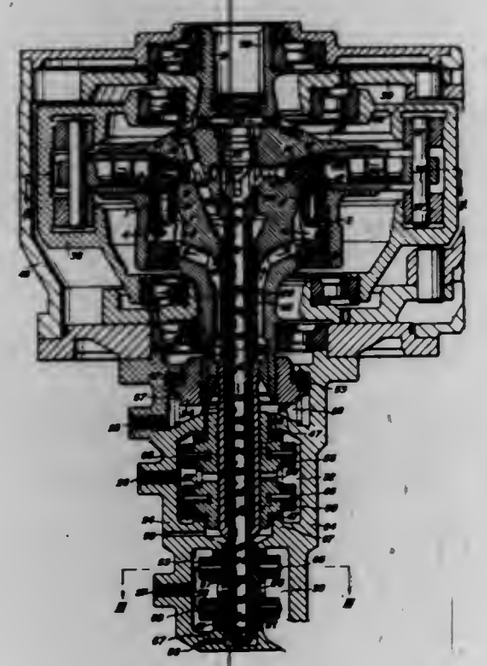
3,273,508
PUMPS
Kenneth R. Lung, Morehead City, N.C., assignor to The Tait Manufacturing Company, Dayton, Ohio, a corporation of Ohio
Filed Jan. 18, 1965, Ser. No. 426,161
6 Claims. (Cl. 103—87)

1. A pump unit comprising a motor including a projecting motor shaft having spline means formed externally on the end portion thereof, a pump housing rigidly connected to the end of said motor, a pump shaft rotatably supported within said housing, spline means formed externally on the end portion of said pump shaft, a tubular coupling having corresponding internal spline means engaging the end portion of said motor shaft and the adjacent end portion of said pump shaft to provide a positive drive connection therebetween, means defining diametrically opposed grooves in said end portion of each said shaft spaced a predetermined distance from the end thereof, means defining diametrically opposed slots in said coupling opposite each said groove and spaced apart axially to provide full circumferential driving engagement between the central portion of said coupling and the end portions of said shafts, and retaining clip means removably inserted in said slots for engaging said corresponding grooves to limit relative axial movement between said coupling and said shafts.

3,273,509
CENTRIFUGAL PUMP
Edward A. Margus, Morris Plains, N.J., assignor to Vanton Pump & Equipment Corp., a corporation of New Jersey
Filed Apr. 7, 1964, Ser. No. 357,874
1 Claim. (Cl. 103—103)



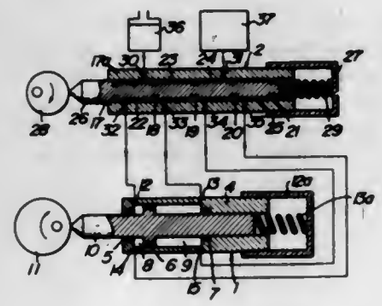
A centrifugal pump comprising a casing which houses an impeller carried on an overhung shaft, an elongated base, said pump casing being mounted at one end of the base, a fixed bearing mounted at the other end of the base, a seal around said shaft at the casing, a movable bearing slidably mounted on the base adjacent the seal, said bearings being well spaced apart axially for good support of the overhung shaft, a slide plate fixedly mounted on the base beneath the movable bearing to afford sliding of the movable bearing away from the seal toward the fixed bearing for easy access to the parts of the seal, said slide plate and movable bearing having guide means extending longitudinally of the base to keep the slidable bearing in accurate alignment with the fixed bearing and the pump as the bearing is moved toward or away from the seal, said movable bearing being secured in position by inverted T head bolts the heads of which are received in the base, said base having wide slots for the heads of the T bolts, and the slide plate having narrow slots over the said wide slots for the shanks of the T bolts, said plate being fixedly mounted on the base to thereby form T slots for the T bolts.



3,273,510
EXTRACTION CONNECTION FOR DOUBLE CASING MACHINE
Joseph J. Jacobs, Trenton, N.J., and David R. Basco, Wauwatosa, Wis., assignors to Allis-Chalmers Manufacturing Company, Milwaukee, Wis.
Filed July 16, 1964, Ser. No. 383,024
3 Claims. (Cl. 103—111)

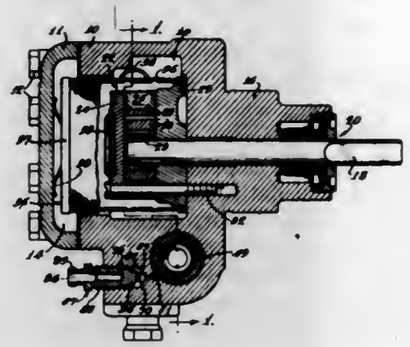
1. An extraction connection for a machine having inner and outer casings comprising: walls defining a first threaded opening through the outer wall of said inner casing; walls defining a second opening through the outer wall of said outer casing in substantial alignment with said threaded opening; an externally threaded conduit threadably engaged within said threaded opening and passing through said second opening, the outside diameter of said conduit being less than the diameter of said second opening to permit lateral deflection of said conduit within said second opening; an annular shoulder on said conduit having an outside diameter substantially equal to the diameter of said second opening, said shoulder being positioned in said second opening when said threaded engagement is completed, the distance between said shoulder and the threaded end of said conduit being greater than

the distance between the outer surface of said inner casing and the outer end of said walls defining said second opening to permit said threaded engagement to be initiated prior to insertion of said shoulder into said second opening; and means associated with said shoulder and said walls of said second opening providing a fluid tight seal therebetween.

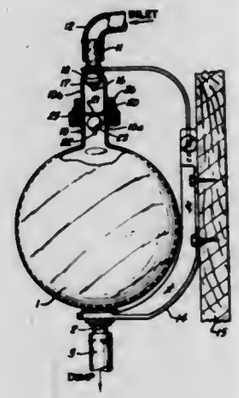


3,273,511
ROTARY MULTI-FLOW PUMP OR COMPRESSOR
Karl Eickmann, 2420 Isshiki, Hayama-machi, Kanagawa-ken, Japan
Filed June 4, 1963, Ser. No. 285,259
Claims priority, application Germany, June 12, 1962, E 23,017
10 Claims. (Cl. 103—161)

1. In a fluid handling machine, in combination, rotor means having an axis and including a main portion with a first diameter having a plurality of circumferentially spaced working chambers expanding and contracting during rotation, and inlet ducts and outlet ducts communicating with said working chambers, said rotor means having a fluid distributing portion projecting in axial direction from one axial end of said main portion and having a diameter smaller than the diameter of said main portion, said distributing portion rotating with said main portion and including a plurality of tubular members surrounding each other and forming in and between each other an inlet passage connected with said inlet duct and a plurality of delivery passages respectively connected with selected outlet ducts whereby the fluid pressures in said delivery passages are determined by the pressures in the working chambers with which said selected outlet ducts are connected.



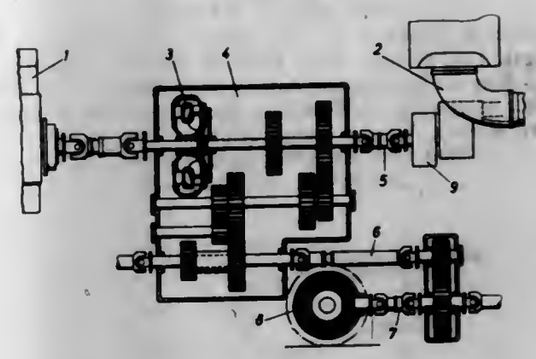
3,273,512
PUMP DEVICE FOR DELIVERING A MINUTE QUANTITY OF FLUID
Kasumi Yoshida, Mito-shi, and Mitsuo Shimada, Katsutashi, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan
Filed Mar. 16 1964, Ser. No. 352,274
5 Claims. (Cl. 103—171)



3. A pump device for delivering a minute quantity of fluid comprising a pump mechanism of reciprocating type, a fluid supply source and a fluid receptacle, fluid passage means forming operative connections of said pump mechanism to said fluid supply source and to said fluid receptacle, said fluid passage means comprising a mechanism for controlling said connections, said pump mechanism comprising two working chambers for respectively effecting discharge and suction of fluid and also comprising means operable to alternately change the volumes of said working chambers at a uniform rate of speed, said last-named means comprising a rotary cam member and a piston actuated thereby, said mechanism for controlling said connections comprising a rotary cam means operable at a high speed, said last-named mechanism being effective to operatively connect said working chambers to said fluid receptacle upon the attainment of maximum volumes of said two working chambers, said last-named mechanism being also effective to operatively connect said working chambers to said fluid supply source when the volumes of said working chambers have, respectively, reached their minimum.

3,273,513
OIL BURNER PUMP UNIT WITH AIR PURGING MEANS
Raymond W. Roper, Rockford, Ill., assignor to Sundstrand Corporation, a corporation of Illinois
Filed Apr. 28, 1965, Ser. No. 453,558
11 Claims. (Cl. 103—203)

1. In an oil burner pumping system, a casing, means providing an inlet to the casing adapted for connection with a source of burner oil, a drive shaft mounted in the casing, a pump in the casing driven by said shaft, having a low pressure intake communicating with said inlet and having a high pressure outlet, means providing a burner port in the casing adapted for connection with an oil burner, a discharge passage in the casing connecting the high pressure outlet and the burner port, a pressure responsive valve in the discharge passage adapted to establish communication between the high pressure outlet and the burner port upon the buildup of a predetermined discharged pressure, air purging means comprising a port in the casing communicating with said passage, a cylindrical recess in the casing communicating with said purge port and opening to the exterior of the casing, a manually operable air purge plug threadably adjustable in said recess, said plug comprising a cylindrical member having a reduced inner end portion slightly spaced from the recess wall and providing between the wall and the reduced portion a restrictive annular passage, a valving surface on the reduced end portion cooperable with said bleed port and movable relative to the bleed port upon threadable adjustment of the plug between a port closed position and a port open position, a longitudinal passage through the plug member from the exterior of the casing to the vicinity of the reduced end portion, and a radial port in the plug member connecting said annular passage and said longitudinal passage.

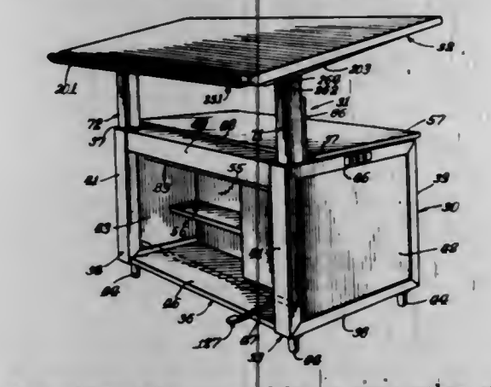


3,273,514
FLUID CONVEYING APPARATUS
Lloyd F. Bender, Hayward, Wis.
Filed June 17, 1965, Ser. No. 464,628
8 Claims. (Cl. 103—236)

1. Fluid conveying apparatus comprising, a vessel having a fluid inlet conduit at its upper end, a fluid outlet conduit at its lower end, and a vacuum conduit adjacent its upper end, said fluid inlet conduit having a one-way check ball to prevent flow of fluid from said vessel and also having distributor means comprising a shiftable ball in said inlet conduit to distribute the fluid around the vessel as it flows into the vessel, said outlet conduit having a one-way fluid discharge valve which closes when said vessel is subjected to vacuum and opens when said vessel is open to atmosphere; and shiftable valve means for alternately placing said vacuum conduit and consequently said vessel in communication with a source of vacuum and with the atmosphere.

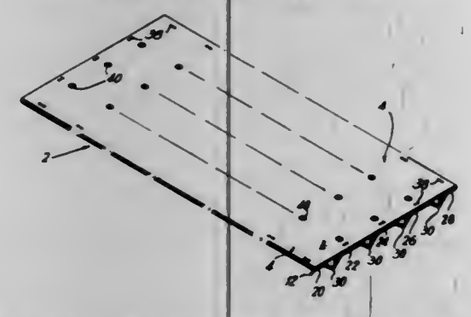
3,273,515
LOCOMOTIVE WITH A MAIN AND AN AUXILIARY DRIVING MACHINE
Georg Oestreicher, Cologne-Deutz, and Georg Oberländer, Oberursel (Taunus), Germany, assignors to Klockner-Humboldt-Deutz Aktiengesellschaft, Cologne, Germany
Filed Nov. 23, 1964, Ser. No. 413,198
Claims priority, application Germany, Nov. 23, 1963, K 51,437
8 Claims. (Cl. 105—96.2)

1. In combination with a self-propelled vehicle having a driving axle: a diesel engine, transmission means interposed between and drivingly connectable with said diesel engine and said driving axle for conveying driving energy from said diesel engine to said driving axle, said transmission means including a mechanical transmission and a hydraulic transmission interposed between said mechanical transmission and said diesel engine for conveying driving energy from said diesel engine to said mechanical transmission, and a gas turbine selectively connectable to said mechanical transmission for conveying additional driving power from said gas turbine through said mechanical transmission to said driving axle while bypassing said hydraulic transmission.



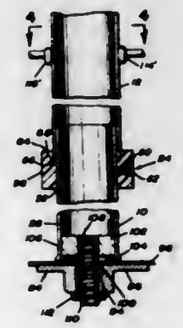
3,273,516
LONGITUDINAL SHOCK ABSORBING ASSEMBLY FOR VEHICLES
Konrad Trümper, Weidenau/Siegen, and Karl Raab, Wiesbaden, Germany, assignors to Rheinstahl Siegener Eisenbahnbedarf Gesellschaft mit beschrankter Haftung, Siegen, Germany
Filed July 7, 1964, Ser. No. 380,906
Claims priority, application Germany, July 16, 1963, R 35,680
20 Claims. (Cl. 105—392.5)

1. A longitudinal shock absorbing assembly comprising, in combination, first elongated shock receiving frame means disposed to receive longitudinal shocks, and second elongated load carrying frame means, one of said frame means having longitudinal ramp tracks upwardly rising in opposite directions with respect to a horizontal plane; roller means connected to the other frame means for longitudinal movement therewith and engaging said ramp tracks resting thereon and running along the same so as to transmit the weight of a load on said second load carrying frame means to said supporting frame means; and brake means actuated only during movement of said roller means toward the higher ends of said ramp tracks,



said brake means being not actuated during movement of said roller means away from said higher ends of said ramp tracks, said brake means being applied during said movement of said roller means toward the higher ends of said ramp tracks by the weight of said load on said load carrying frame to brake relative longitudinal movement between said first and second frame means with a force depending on the weight of the load.

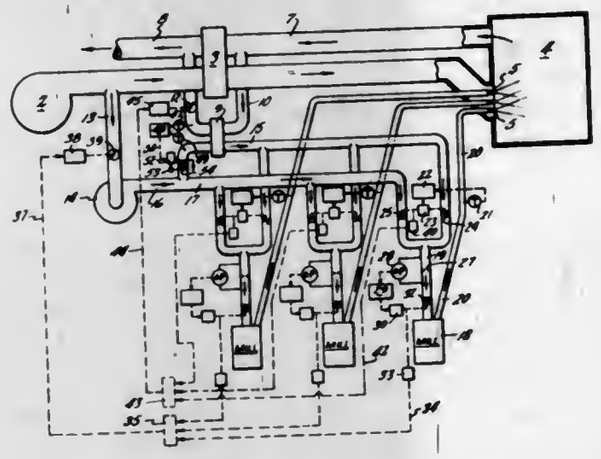
3,273,517
DRAFTING TABLE
Franklin R. Amthor, Jr., Manitowoc, and Henry J. Brelvogel, Two Rivers, Wis., Egon R. Hoenle, Chicago, Ill., and Roy E. Kanitz and James M. Katzfey, Two Rivers, Wis., assignors to Hamilton Manufacturing Company, Two Rivers, Wis., a corporation of Wisconsin
Filed Feb. 12, 1964, Ser. No. 344,303
26 Claims. (Cl. 108—2)



1. A drafting table comprising a supporting structure, a column assembly mounted for vertical movement on said supporting structure comprising two laterally spaced vertically extending columns and a horizontally extending center member rigidly connecting the upper ends of said columns together, means for guiding the vertical movement of said column assembly on said supporting structure, means for vertically moving said columns equally, a drafting board on said column assembly, said means for guiding the vertical movement of said column assembly preventing forward and rearward tilting movement of said assembly, the rigid connection of said center member with said columns and said equal moving means preventing lateral tilting of said column assembly.

3,273,518
PALLET
Frank C. Shina, Floral Park, N.Y., assignor to United Board & Carton Corporation, New York, N.Y., a corporation of New Jersey
Filed Aug. 2, 1965, Ser. No. 476,581
3 Claims. (Cl. 108—55)

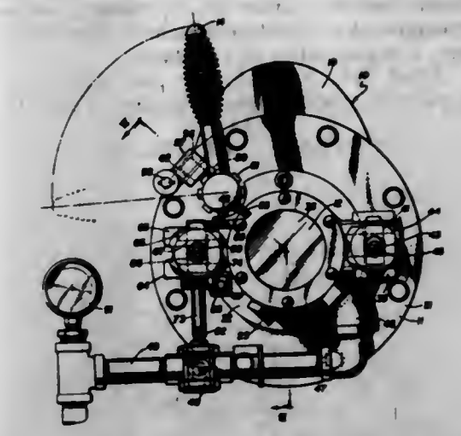
1. A pallet of the type which may be used to support materials above the level of the supporting surface whereby the pallet may be lifted with the material thereon, the combination of, a flat sheet of corrugated paper board which presents a material-supporting surface, an undersheet of corrugated paper board having substantially the overall longitudinal and transverse dimensions of said flat sheet with a plurality of parallel flat strip portions positioned along the underside of said flat sheet and equally spaced from each other, said flat strip portions including a pair of edge strips positioned respectively along the longitudinal side edges of said flat sheet, said undersheet including a plurality of integral leg portions corresponding in number with the number of spaces between said flat strip portions and positioned respectively in said spaces with edges coextensive with the respective edges of said flat strip portions and integral therewith whereby each of said flat strip portions is separated from the next adjacent flat strip portion by an integral leg portion, each of said leg portions comprising two flat portions which are at an angle to each other and which are interconnected by a supporting ridge which is adapted to rest upon the supporting surface whereby said pallet is supported by a plurality of parallel supporting ridges, and attaching means attaching said flat strip portions to said flat sheet, said undersheet having its corrugations extending substantially transversely of said flat strip portions and said flat portion of said leg portions whereby said flat portions of each of said leg portions are rigid between the supporting ridge of the leg portion and the adjacent flat strip portion.



3,273,519
ARTICLE SUPPORT CONSTRUCTION
Philip Duboff, Kearny, N.J., assignor to Shelfmaker Products Corp., Kearny, N.J., a corporation of New Jersey
Filed Jan. 29, 1965, Ser. No. 429,065
3 Claims. (Cl. 108—105)

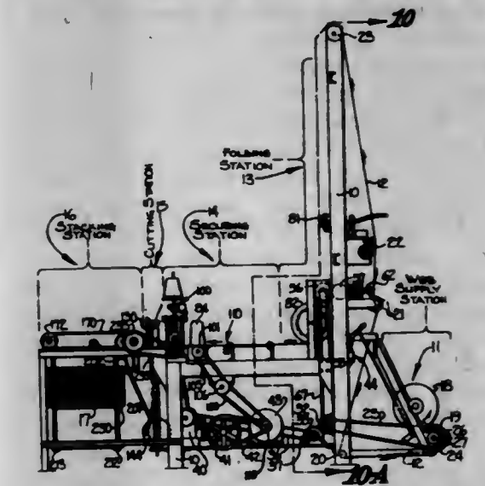
1. An article support construction comprising:
a supporting base;
a first elongated pole;
attaching means coupling said first elongated pole to said supporting base to maintain said first pole in vertical upstanding disposition;
a second elongated pole in nested telescoping relation with said first pole and extending above said first pole;
collar means slidable along one of said poles and lockable in any desired location therealong;
said collar means being engageable with an end of one said poles to adjust the height at which said second pole is extended above said first pole;
said second pole being rotatable relative to said first pole and having its uppermost end free from engagement with any supporting surface; and
article support means secured to said second pole and rotatable therewith;
said attaching means including a nut secured within the lower portion of said first pole and a screw means threadably engaged with said nut and projecting therefrom beyond the lower end of said first pole;
said nut being spaced inwardly a short distance from the lower end of said first pole to thus define a bottom margin between the lower surface of said nut and the lower end of said first pole;
said bottom margin being flared outwardly;

said supporting base having aperture means therein for reception of said projecting screw means;
said screw means being tightened after insertion through said aperture means to thus engage said first pole lower end with the top of said supporting base, said bottom margin flaring outwardly to assure a firm and stable coupling between said first pole and said supporting base.



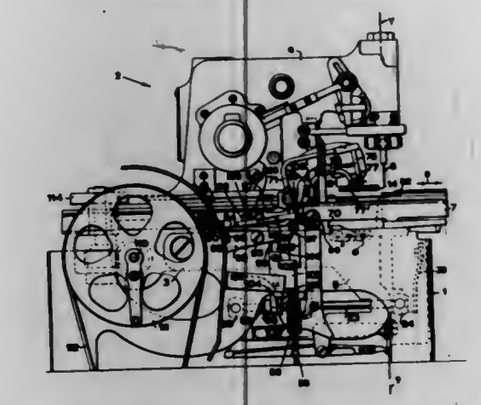
3,273,520
METHOD AND APPARATUS FOR AIR TEMPERATURE REGULATION
Richard D. Hottenstine, Windsor, Conn., assignor to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware
Filed Dec. 29, 1964, Ser. No. 421,967
11 Claims. (Cl. 110—56)

1. A pulverized fuel system for a vapor generator having a furnace, burners for burning a pulverized fuel in the furnace, a gas pass for conveying convection products from said furnace, a secondary air heater located in said gas pass, and a means for conveying secondary air through said secondary air heater and thence to the furnace to support combustion therein comprising: a plurality of pulverizers; a primary air heater located in said gas pass, said air heater being in parallel relation with said secondary air heater with respect to gas flow; means for passing primary air through said primary air heater to the mills for fuel drying and thence to the burners; means for supplying tempering air to the pulverizers; means for controlling said tempering air flow in response to the temperature leaving each pulverizer; means for selecting the pulverizer having the lowest tempering air flow; means for regulating the gas flow through the primary air heater in accordance with the tempering air flow supplied to the selected pulverizer, whereby said tempering air flow may be maintained at a minimum value.



3,273,521
FURNACE DOOR
George J. Nyberg, Worcester, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts
Filed Nov. 9, 1964, Ser. No. 409,690
6 Claims. (Cl. 110—179)

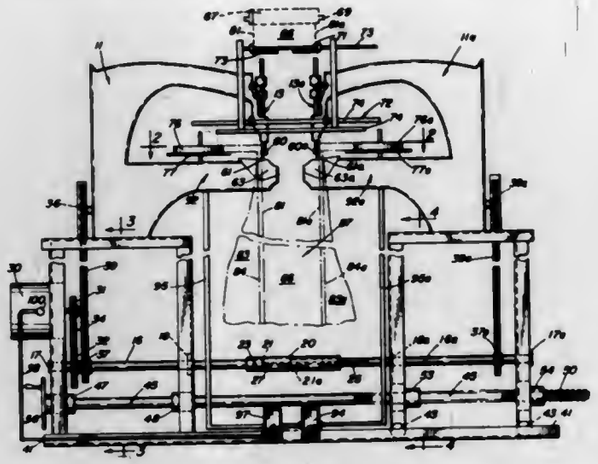
1. A furnace door, comprising
(a) a housing adapted to be mounted on a furnace wall,
(b) a transparent window hingedly mounted on the housing,
(c) a shutter mounted in the housing and movable from a first position in which it lies between the window and the interior of the furnace and a second position in which it does not so lie,
(d) apparatus operative, on occasion, for causing a flow of air through the housing into the furnace,



(e) means preventing the opening of the window unless the said apparatus is operative and unless the shutter is in the said second position.

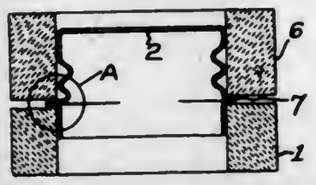
3,273,522
MECHANISM FOR AUTOMATICALLY PRODUCING PREFOLDED DIAPERS
Graves T. Gore and Albert D. Martin, Ware Shoals, and Norman Smith, Greenwood, S.C., assignors to Riegel Textile Corporation, a corporation of Delaware
Filed Aug. 24, 1964, Ser. No. 391,691
9 Claims. (Cl. 112—2)

1. A mechanism for automatically producing prefolded diapers comprising a frame portion, driven feeding means carried by said frame and adapted to feed the continuous web of diaper material through said mechanism, a supply means carried by said frame for supplying an open width continuous web of diaper material to said mechanism, folding means carried by said frame and disposed adjacent said supply means and adapted to fold the traveling continuous web of diaper material in the desired prefold along at least two fold lines to define a longitudinally extending multiple layer center panel and two side panels in the folded material, securing means carried by said frame and disposed adjacent said folding means comprising a pair of sewing means adapted to apply longitudinal lines of stitches through the multiple layer center panel of the folded diaper material for securing the traveling folded continuous web of diaper material in the desired prefolded condition, and cutting means carried by said frame and disposed adjacent said securing means for transversely cutting the traveling folded and secured continuous web of diaper material into individual diapers of a predetermined length.



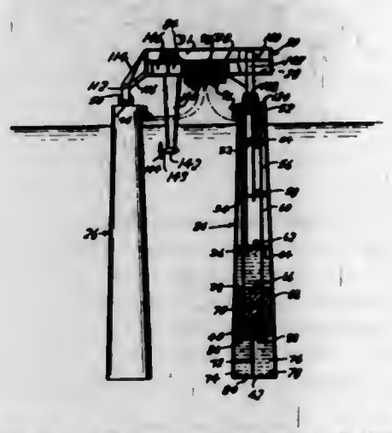
3,273,523
BUTTONHOLE-STITCHING MACHINE AND THREAD-SEVERING MEANS THEREFOR
Hermann Pudelko, Bielefeld, Germany, assignor to Durkoppwerke Aktiengesellschaft, Bielefeld, Germany, a corporation of Germany
Filed Feb. 9, 1965, Ser. No. 431,319
Claims priority, application Germany, Feb. 10, 1964, D 43,575
17 Claims. (Cl. 112—65)

1. In a buttonhole-stitching machine having support means, stitch forming means on said support means for feeding at least an underthread and a stay cord to a stitching location, and a fabric carrying table cooperating with said stitch forming means for positioning a fabric at said location while being generally linearly shiftable on said support means from a starting position at the commencement of a buttonhole-stitching operation with a generally reciprocating movement returning substantially to said position upon conclusion of said operation, the improvement which includes thread-severing means for cutting said underthread and said stay cord upon conclusion of said operation, said thread-severing means comprising:
cooperating blade means mounted on said table and engageable with said underthread and said stay cord in the region of said position for severing them upon actuation of said blade means;
an angularly oscillatable shaft on said support means operatively connected with said blade means for actuation thereof upon angular displacement of said shaft in one rotational sense;
actuating means connectable with said shaft for angularly displacing same in said rotational sense;
mechanism on said support means for selectively blocking and unblocking angular displacement of said shaft; and
abutment means on said table cooperating wtih said mechanism for preventing displacement of said shaft during said reciprocating movement of said table, but permitting displacement of said shaft upon termination of said reciprocating movement.



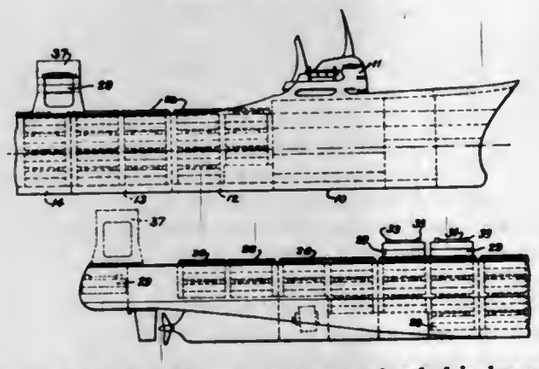
3,273,524
SEWING MACHINE METHOD FOR PRODUCING AN ENVELOPE
Leo H. Koltun, 6659 N. Francisco Ave., Chicago, Ill.
Filed Jan. 21, 1964, Ser. No. 339,148
8 Claims. (Cl. 112—262)

1. A method of producing an envelope in which each marginal side edge of an elongated strip of material is securely attached to the periphery of separate parallel opposed panels which extend transversely of said strip to form said envelope, said method comprising the steps of:
placing respective peripheral edges of said separate opposed panels to operatively engage respective fastening heads of laterally spaced fastening means of tandem machines adapted to feed in unison in the same direction;
placing remaining portions of said panels in a vertically extending workpiece receiving and manipulating zone below and between said spaced apart machines;
positioning said elongated strip under said fastening heads with each said marginal side edge thereof in alignment with said respective peripheral edges of corresponding said separate opposed panels;



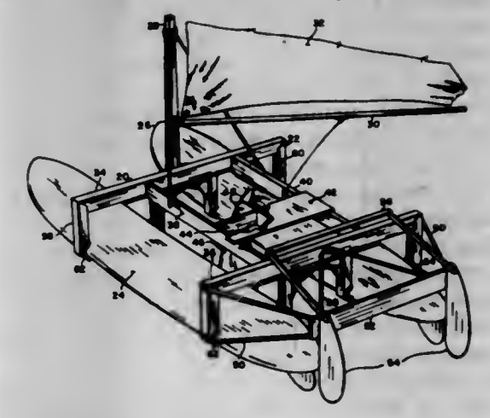
concurrently progressively advancing said peripheral edges of said panels and each said marginal side edge of said elongated strip and simultaneously joining opposed side edges of said strip to corresponding said peripheral edges of said panels along substantially the entire perimeter of said panels to complete a circuit path and produce said envelope.

3,273,525
TAMPER-PROOF CAPS FOR CONTAINERS
Frederick G. Robinson, Broad Balk, Kemp Road, Swanland, East Yorkshire, England
Filed Sept. 2, 1964, Ser. No. 393,838
3 Claims. (Cl. 113—121)



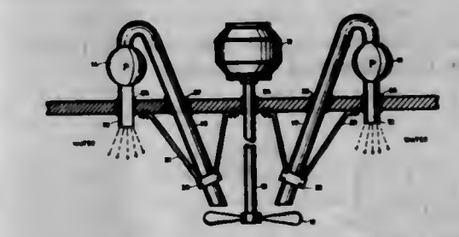
1. In the method of manufacturing a ductile tamper-proof cap which is reusable after opening, said cap having a lowermost peripheral bead and a skirt therebelow, said cap used as a closure for the mouth of a container having a neck and a shoulder on said neck, that improvement in providing a weakened portion of the cap which consists of forming an interrupted line of weakening in said rolled peripheral bead of the closure cap on the shoulder of the neck of the bottle by the steps of compressing the upper and lower surfaces of said peripheral bead between an upper stationary pressing member and a lower non-rotatable pressing member which is reciprocably movable toward and away from said upper member to form upper and lower annular portions of the bead into flattened relation and folded against each other, said lower movable member having an outer pressing shelf and an inner knife edge, the continuity of said knife edge being interrupted by a series of equally spaced radial slots to thereby cut an interrupted circular line completely through the entire thickness of the lower fold of said compressed bead and partially through the thickness of the upper fold of said compressed bead by the axial up and down movement of said knife edge, said cutting being performed by the knife edge being confined at the juncture of the lower inner bead fold line and the dependent skirt, whereby the unscrewing of said cap automatically ruptures the closure along the line of weakening provided at the lower fold of said peripheral bead and the torn portions thereof curve inwardly after said rupture.

3,273,526
STABLE OCEAN PLATFORM
Lawrence R. Glosten, 71 Columbia St., Seattle 4, Wash.
Filed Nov. 15, 1963, Ser. No. 324,038
5 Claims. (Cl. 114—.5)



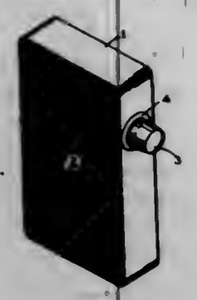
1. A marine platform comprising a superstructure housing, three elongated flotation hulls, each of said hulls having transverse bulkheads spaced lengthwise thereof and dividing the hull into ballast tanks, pivot means connecting the upper ends of said hulls to equally spaced circumferential portions of said superstructure housing and guiding said hulls for swinging relative to said superstructure housing about said pivot means between positions projecting downward from said superstructure housing with their lengths upright and substantially coplanar positions with their lengths generally parallel and horizontal, and means operable to supply gas simultaneously to corresponding ballast tanks of all of said hulls for effecting simultaneous and coordinated swinging thereof toward horizontal positions and further operable to provide a supply of water simultaneously to corresponding ballast tanks of all of said hulls for effecting simultaneous and coordinated swinging of said hulls relative to said superstructure housing about said pivot means toward upright positions.

3,273,527
INTEGRATED BARGE AND CARGO SHIP CONSTRUCTION
Jerome L. Goldman, 1420 N.B.C. Bldg., New Orleans, La.
Filed Dec. 28, 1964, Ser. No. 421,237
3 Claims. (Cl. 114—43.5)



1. A cargo ship for carrying cargo loaded in barges for quick loading and unloading comprising
(a) a main hull having cargo hold areas along the longitudinal axis thereof;
(b) the stern of said hull having beam width continuations above the water line forming with the stern of said hull an open-ended barge transfer well;
(c) the cargo hold areas being of a size along the fore and aft axis of the hull to receive two tiers of cargo barges with the fore and aft axis of the barges athwart ship of the main hull;
(d) and a barge transfer crane astride of the cargo hold areas and movable along the longitudinal axis of the hull from the cargo area closest the bow of the main hull to and onto said hull continuations so that the crane is above said barge transfer well;
(e) and cargo barges receivable by said crane with the fore and aft axis of the barges transversely of the longitudinal axis of the hull.

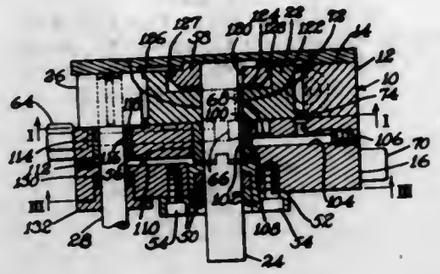
3,273,528
WINDSURFER
Michael C. Kiefer, 509 Amphitheater Drive, Del Mar, Calif.
Filed July 20, 1964, Ser. No. 383,852
7 Claims. (Cl. 114—61)



1. A craft of the catamaran type, comprising in combination:
(A) a main frame;
(B) two surfboards;
(C) and clamping means on the main frame engageable with opposite edges of both surfboards for removably attaching the surfboards to the main frame.

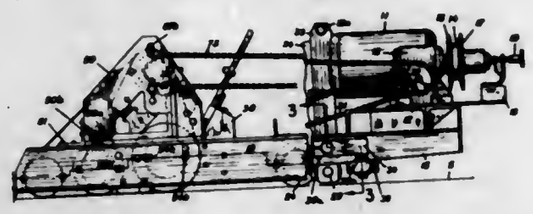
3,273,529
MEANS AND METHOD FOR INCREASING THE SPEED OF SHIPS
Alexander M. Senkewich, New York, N.Y., assignor of five percent to James M. Hellman, Rye, N.Y., and five percent to Marjorie Kingston, Flushing, N.Y.
Filed Feb. 18, 1965, Ser. No. 433,561
5 Claims. (Cl. 115—34)

1. Ship propulsion means comprising a propeller mounted on a hull, means for removing air from around said propeller comprising at least one pipe extending through said hull to the vicinity of said propeller, pump means mounted within said hull for removing the air from the propeller area into the hull and then out again to aid in propelling said hull.



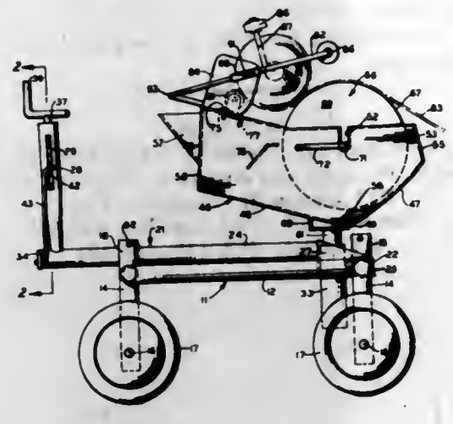
3,273,530
MONO-FREQUENCY SOUND SOURCE
James J. Hill, 3750 E. 10 Court, Hialeah, Fla.
Filed Aug. 2, 1965, Ser. No. 476,350
1 Claim. (Cl. 116—137)

A manually operated mono-frequency sound source comprising a means forming a base,
a tuning fork parallel with and secured to said base for resonance at a predetermined audio frequency,
a flat striker spring secured at one end thereof to said base and positioned in parallel relation to said fork including a striker member secured in the opposite end portion thereof and positioned in predetermined spaced relation from said fork when said striker spring is in its idle position,
an operating member slidably retained on said base for reciprocation transverse said fork from an idle to an activated position,
a push button secured on one end of said operating member,
spring means biased between said base and said member for urging the latter into said idle position.
a pawl means pivotally secured for a limited range of oscillation on said operating member including an integral tripping projection,
an abutment integral with said base positioned in the path of movement of said tripping projection when said operating member is moved to its said activated position,
a stop projection in said base in the path of return movement of said tripping projection of said pawl means for restoring the latter to its initial position when said operating member is moved to its idle position,
a sear projection integral with said pawl means for momentarily engaging and disengaging the opposite said end of said striker spring when said operating member is moved to its said activated position and said pawl means is rotated by engagement with said abutment whereby said striker spring will flex and impact said striker member against said fork for oscillating the latter at its fundamental frequency when said push button is operated,
a cover casing secured to said base constructed to be held in the hand with one side thereof substantially transparent to sound and including an aperture through said casing for the free operation of said button by a finger of the hand.



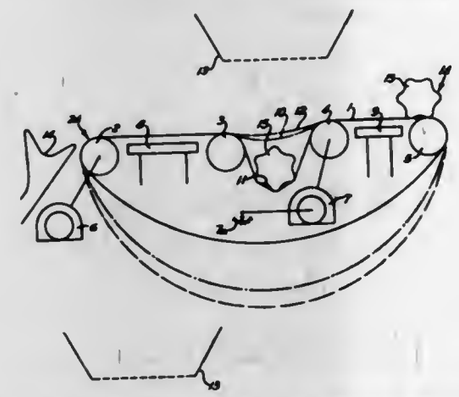
3,273,531
APPARATUS FOR APPLYING ADHESIVE
Harold W. Boothroyd, Wenham, and Harry Phillips, Hamilton, Mass., assignors to United Shoe Machinery Corporation, Flemington, N.J., a corporation of New Jersey
Filed July 23, 1963, Ser. No. 297,073
6 Claims. (Cl. 118—202)

1. Apparatus for applying adhesive comprising a casing formed to provide a recess for receiving a rotary applying wheel, an applying wheel mounted on a shaft, a bearing associated with the casing for journaling said shaft with a major portion of the applying wheel in said recess, a member located substantially within the confines of the casing and cooperating with the peripheral surface of the wheel in a location where the wheel leaves the casing for determining the amount of adhesive carried by the wheel, and means for introducing adhesive into said recess at a point adjacent to said member, said casing and bearing be-



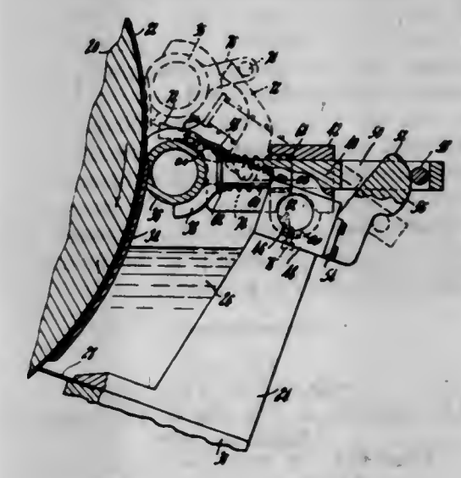
ing formed to provide passageways leading from a point in the recess adjacent to said member, through the bearing, to a point in the recess adjacent to the location where the wheel re-enters the casing, whereby a continuous flow of adhesive through said bearing, to lubricate and clean the bearing, is provided when the applying wheel is rotated in a direction toward said member.

3,273,532
SURFACE COATING APPARATUS
John Brzuskiewicz, Dolton, and Roy F. Lo Presti and Wayne Ridenour, Chicago, Ill., assignors, by mesne assignments, to Barker Chemical Company, Chicago, Ill.
Filed Oct. 30, 1963, Ser. No. 320,156
7 Claims. (Cl. 118—202)



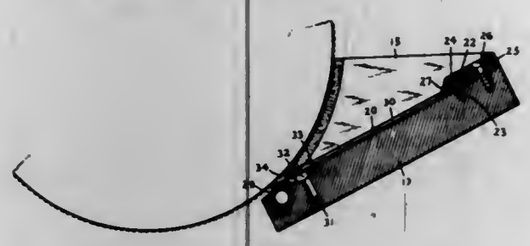
1. An apparatus for applying a hot melt type of coating material to a surface, comprising a frame, driving means on the frame for driving the apparatus along the surface to be coated, said driving means comprising a driving motor on the front end of the frame and driving wheels positioned to the rear of the center of gravity of said apparatus and adapted to roll on the surface to be coated, adjustable guiding means on the said front end of the frame and extending laterally of the frame and adapted to bear in guiding engagement on vertical lateral justing the height of the frame relative to the surface to surfaces along the surface to be coated for guiding the apparatus along the surface to be coated, frame height adjusting means on said front end of said frame for adbe coated and comprising a front roller mounted adjacent the front of the frame and adapted to roll on the surface to be coated and support some of the weight of the apparatus, and means connected to said front roller for raising and lowering the front roller, whereby when the front roller is raised or lowered, the rear of the frame is lowered and raised as it pivots about the driving wheels, means adjacent the rear end of the frame for holding a supply of hot melt type coating material and keeping it molten and for delivering the molten material, and means on the rear end of the frame for forming and applying a layer of the molten hot melt material from the holding and delivering means to the surface to be coated.

3,273,533
ROOFING FELT LAYING MACHINE
Wendel J. Sims, Rte. 1, Box 90, Gilroy, Calif.
Filed Nov. 26, 1963, Ser. No. 326,011
15 Claims. (Cl. 118—235)



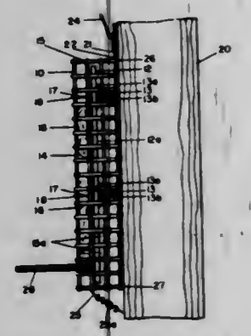
1. A roofing felt applying machine comprising a carriage having wheels, a trough, means mounting said trough for pivotal movement relative to said carriage about a vertical axis, a drum mounted in said trough rotatable about a horizontal axis with said drum partially extending above said trough, and guide means for mounting a roll of felt with its axis parallel to said drum and the underside of the felt in contact with a portion of said drum above said axis.

3,273,534
APPARATUS FOR COATING HOT BILLETS OF OPTIONAL SHAPE WITH A LUBRICATING POWDER
Laurent Hyvert, Paris, France, assignor to Compagnie du Filage des Metaux et des Joints Curty (Cefilac), Paris, France, a corporation of France
Filed Mar. 24, 1964, Ser. No. 354,313
Claims priority, application France, Mar. 29, 1963, 929,803
6 Claims. (Cl. 118—308)



1. Apparatus for coating with a lubricating powder before extrusion or piercing a metal billet heated to a hot extrusion or a hot piercing temperature, comprising an endless conveyor belt disposed between a first station where said billet is received onto said belt and a second station where said billet is delivered to means for advancing same to an extrusion or piercing machine, said belt being disposed upon and in engagement with roller members, being positioned substantially transversely of the longitudinal axis of the billet and forming a path of travel for said billet between said first and second stations, at least one of said roller members having a driving connection with a motor means which effects travel of said belt along said path, between said first and second stations two of said roller members being spaced apart a distance such that a pocket can be formed in said belt below said path and of a size sufficient to hold said billet, operable means for raising and lowering that portion of said belt between said two spaced apart roller members during travel of said belt when said billet is intermediate said two spaced apart roller members to form said pocket and to eliminate said pocket, said belt having a total length which permits formation of said pocket of a depth such that said billet when in said pocket is rotated about its longitudinal axis by travel of said belt and lubricating powder dispersing means positioned opposite said pocket and spaced apart therefrom for delivering said lubricant onto said billet when in said pocket.

3,273,535
TRAILING-BLADE-COATER INCLUDING ADJUSTABLE DRAG-BLADE
Garo Krikorian, Paxton, Mass., assignor to Rice Barton Corporation, Worcester, Mass., a corporation of Massachusetts
Filed Oct. 6, 1964, Ser. No. 408,716
10 Claims. (Cl. 118—410)

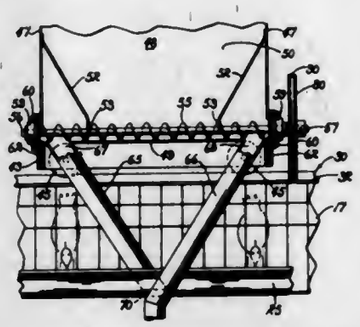


1. In a coater having a backing roll around which a traveling web to be coated is drawn, a liquid coating reservoir and doctor blade assembly which comprises a liquid coating enclosure having an open face disposed against said web and supporting backing roll; a trailing type doctor blade forming a base portion of said enclosure and having the trailing edge thereof yieldably supported with relation to said traveling web in position closing the leaving edge of said open face; a drag blade disposed in narrowly spaced relation to said traveling web across the width of the web and having the face thereof conformed generally to the web and backing roll over which the web passes; said drag blade extending from above the top face of said liquid coating material and terminating in an inner submerged edge spaced from said doctor blade thus forming a wall of said enclosure and generally preventing contact of said material with the traveling web portion contiguous to said drag blade so that substantially that portion only of the traveling web extending from said inner submerged edge of the drag blade to the leaving edge defined by said doctor blade is in contact with said liquid coating; and adjustable supporting means on which said drag blade is shiftable relatively to said backing roll to vary the width of the space between the inner submerged edge of the drag blade and the doctor blade and thereby the thickness of coating material driven past the yieldable trailing edge of said doctor blade.

3,273,536
TRAILING-BLADE COATER INCLUDING FLUID SEAL
Merrill F. Galer, Monroe, and Morrison N. Stiles, Westport, Conn., assignors to Time Incorporated, New York, N.Y., a corporation of New York
Filed June 26, 1961, Ser. No. 119,431
4 Claims. (Cl. 118—413)

1. A coating apparatus which cooperates with a rotatable cylinder serving as a back-up surface for a web to be coated comprising a coating blade, a coating blade support holding the coating blade in position to engage the web, a pair of end walls carried by the blade support adjacent the rotatable cylinder to confine the coating material therebetween, means defining a slot in the base of each end wall to receive the side edge of the blade therein, the height of the slot being greater than the thickness of the blade, the coating blade protruding forwardly of the end walls in the direction of movement of the cylinder and the web against the cylinder and defining a space forward of each end wall between the blade and the surface to be coated, the forward end of each said slot communicating with one of said spaces, and passage means establishing communication between a source of fluid under pressure for supplying the fluid to said space to provide a fluid seal for said space.

3,273,537
WILDLIFE FEEDER
San W. Orr, Room 305, 122 W. Washington Ave., Madison, Wis.
Filed Feb. 10, 1965, Ser. No. 431,512
3 Claims. (Cl. 119—51)

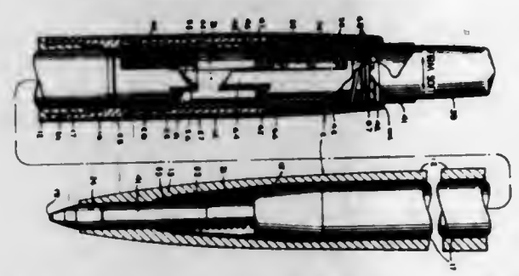


1. A wildlife feeder comprising:
(a) an enclosure having a front screen made of shape retaining material and a continuous side wall connected thereto, said enclosure having an open back side,
(b) said screen having a plurality of openings therein of sufficient size to permit wildlife to withdraw food from said enclosure therethrough,
(c) a plate adapted to be removably positioned within said enclosure approximately parallel to said front screen, and
(d) means spaced substantially within said enclosure and being detachably connected to said screen and bearing against the back of said plate for continually forcing said plate toward said screen, wherein the continuous side wall of the enclosure has a plurality of openings of sufficient size to permit wildlife to withdraw food from said enclosure therethrough, wherein the means for forcing the plate toward the front screen comprises a plurality of springs, each of said springs engaging the rear surface of said plate and having an integral wire extension connected to the front screen whereby to force said plate toward said screen.

3,273,538
TIME OPERATED ANIMAL FEEDING DEVICE
David R. Woerner and Joseph F. Woerner, both of 823 Azalea St., Houston, Tex.
Filed Mar. 10, 1965, Ser. No. 438,517
8 Claims. (Cl. 119—51.12)

1. An automatic feeding device comprising a housing with a base portion having an upstanding flange sized to receive a removable food receptacle, said housing having a compartment with a horizontal opening, a cover plate over said food receptacle, a radial extension of said cover plate adapted to extend through said horizontal opening and into said compartment for mounting said cover plate, means to adjust the alignment of the cover plate when positioned over said food receptacle, means to support the cover plate when not positioned over said food receptacle, means to urge the cover plate into contact with said food receptacle, and means to rotate the cover plate and uncover said food receptacle at the expiration of a pre-selected interval of time.

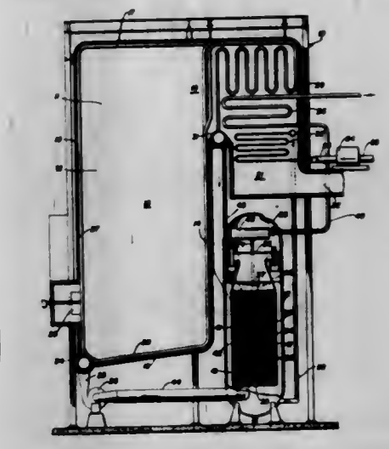
3,273,539
FEEDING SYSTEM
Robert B. Cooper, 4832 N. Fruit, Fresno, Calif.
Filed Mar. 27, 1964, Ser. No. 355,173
13 Claims. (Cl. 119—52)



2. An animal feeding system comprising a pair of substantially parallel feed troughs, a feed hopper having a pair of feed discharge members extended therefrom, means mounting said hopper adjacent to the troughs for reversible movement therealong with said discharge members individually extended toward the troughs to discharge feed therein, and feed conveying means mounted in the hopper for automatically alternately directing feed from the hopper through one discharge member into its respective trough during movement of the hopper in one direction and for directing feed from the hopper from the other discharge member into its respective trough during movement of the hopper in the other direction.

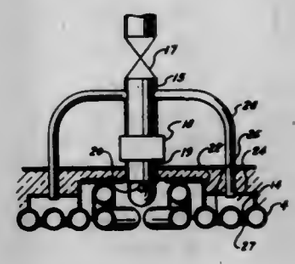
3,273,540
POULTRY SPUR PROTECTOR
Gabriel Fuentes, Jr., P.O. Box 867, Bayamon, Puerto Rico
Original application May 4, 1964, Ser. No. 364,601. Divided and this application July 19, 1965, Ser. No. 484,150
4 Claims. (Cl. 119—144)

1. A protective glove for poultry having spurs on its legs comprising an elongated strap with centrally located orifice therein, a spur receiving and enclosing protective shield member affixed to said strap over said orifice capable of receiving said spur when said orifice is placed over said spur and means on said strap to secure it to said leg of said poultry.



3,273,541
ADJUSTABLE RESILIENT WRITING INSTRUMENT
Richard L. Thurman, Beloit, and August J. Coutre, Janesville, Wis., assignors to The Parker Pen Company, Janesville, Wis., a corporation of Wisconsin
Filed Sept. 18, 1963, Ser. No. 309,723
9 Claims. (Cl. 120—42.03)

3. In a writing instrument of the type comprising a housing having an open end, a writing unit including a writing tip, said writing unit being mounted movably in said housing for movement between a projected position in which the tip extends through and beyond the open end of said housing and a retracted position in which the tip is withdrawn into said housing, actuating means for moving said unit between said positions, retaining means for retaining said unit in said projected position and means for disabling said retaining means to allow said unit to move to said retracted position, the improvement comprising; means for supporting said retaining means movably within said housing and resilient means urging said retaining means toward the open end of said housing, said retaining means being yieldable against the influence of said resilient means away from the open end of said housing in response to the application of pressure to said writing tip.

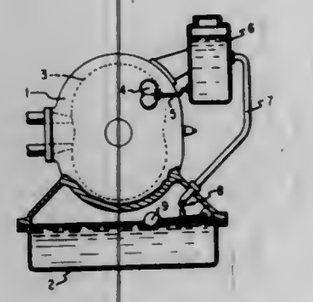


3,273,542
STEAM GENERATING UNIT
Louis E. Griffith, Worcester, Mass., assignor to Riley Stoker Corporation, Worcester, Mass., a corporation of Massachusetts
Filed May 19, 1964, Ser. No. 368,657
2 Claims. (Cl. 122—33)

1. A steam generating unit, comprising
(a) a combustion chamber having burners mounted on its walls and having tubes designed for relatively low-pressure operation lining its walls and forming a heat exchanger therewith, the chamber having a convection pass means extending therefrom,
(b) a water boiler designed for relatively high-pressure operation having a steaming section and a steam-separating section, the boiler consisting of a vertically-elongated housing having the steaming section with an indirect heat exchange means in its lower portion and the steam separator in the upper portion,
(c) circulation means introducing an inert gas into the tubes of the combustion chamber,

(d) means connecting the tubes of the combustion chamber to the heat exchange means in the steaming section of the water boiler,
(e) means connecting the indirect heat exchange means in the said steaming section to the circulation means, and
(f) an economizer located in the said convection pass means and connected directly to the steaming section of the boiler to preheat the water before it reaches the boiler.

3,273,543
FURNACE WALL BLOWER IMPROVEMENT
Elwood P. Petit, Windsor, Conn., assignor to Combustion Engineering, Inc., Windsor, Conn., a corporation of Delaware
Filed Oct. 20, 1964, Ser. No. 405,167
17 Claims. (Cl. 122—392)



1. In a vapor generator having a furnace, tubes lining the walls of said furnace, means for burning an ash bearing fuel within said furnace whereby ash collects on the tube lined walls of the furnace, and means for directing a jet of cleaning medium along at least a portion of a furnace wall, the method of cleaning ash off the walls of said furnace comprising: burning fuel within the furnace and forming a layer of ash and slag on the walls thereof; removing ash from co-planar tubes lining a wall of the furnace, in a limited area immediately adjacent the jet means; thereafter directing the jet of cleaning medium across said co-planar tubes lining said furnace wall so that it operates against the edge of the remaining ash layer whereby the ash beyond said immediately adjacent area is removed.

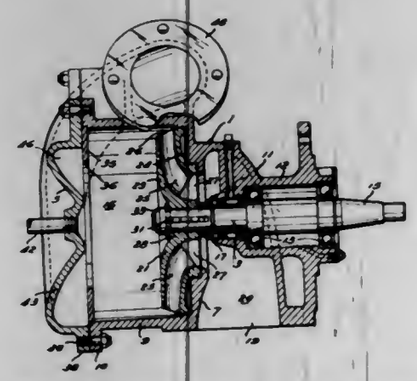
3,273,544
ROTARY PISTON INTERNAL COMBUSTION ENGINE

Wolf-Dieter Bensinger, Stuttgart-Unterturkheim, Hans-Otto Derndinger, Stuttgart-Wangen, and Franz G. F. Behles, Ingolstadt, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany

Filed Mar. 20, 1964, Ser. No. 353,387
Claims priority, application Germany, Mar. 23, 1963, D 41,204
14 Claims. (Cl. 123—8)

1. A rotary piston internal combustion engine of trochoidal construction having a housing provided with internal cam surfaces and an oil pan forming the oil sump and flangedly connected below the housing, comprising:

additional oil storage tank means disposed relatively high,



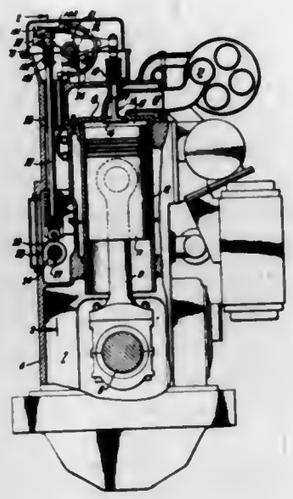
first line means operatively connecting said additional tank means with the oil sump,

and second line means including oil pump means connecting said additional tank means with the engine to supply lubricating oil from said additional tank means to the internal cam surfaces of the engine.

3,273,545
METHOD AND APPARATUS FOR SEPARATING FLUIDS

Stanley B. McFarlin, Jeromesville, Ohio, assignor to The Gorman-Rupp Company

Filed Oct. 13, 1964, Ser. No. 403,620
17 Claims. (Cl. 123—41.47)

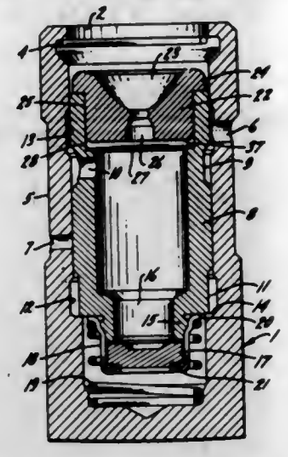


1. A cooling system comprising a liquid cooling jacket of an internal combustion engine, a plurality of radiators, means for conducting liquid from said jacket selectively to said radiators including a header connected to said jacket, separate branch tubes leading from the header to the radiators and valves in said branch tubes to control the flow of liquid from the header to the radiators, a tank connected to the radiators to receive liquid and gas discharged therefrom, a centrifugal pump positioned to receive a mixture of liquid and gas from said tank and to pump and separate them, and means to conduct the separated liquid into said jacket.

3,273,546
VALVE TIMING SELECTOR

Henry R. von Arx, Berkeley, Calif., assignor to General Metals Corporation, Oakland, Calif., a corporation of California

Filed Jan. 24, 1964, Ser. No. 340,058
8 Claims. (Cl. 123—90)



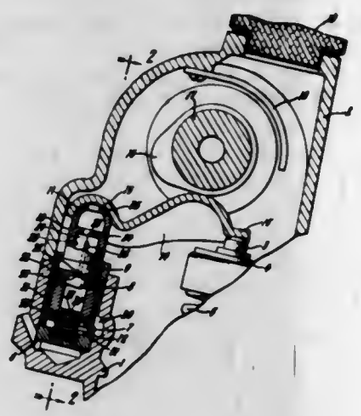
1. A valve timing selector for use with an engine having a cam shaft and a reciprocating valve comprising a forward cam on said cam shaft, a reverse cam on said cam shaft, a first cam train including a first follower and a first pushrod operated in a first path by said forward cam, a second cam train including a second follower and a second pushrod operated in a second path by said reverse cam, a rocker in engagement with said valve, means on said rocker including opposite walls defining a cross chamber, a slide reciprocable in said cross chamber and including surfaces slidable on said walls, a forward hook projecting from said slide on one side of said rocker, a reverse hook projecting from said slide on the other side of said rocker, means on said rocker forming a cylinder, means on said slide forming a piston reciprocable in said cylinder, means for supplying said cylinder with actuating fluid to reciprocate said slide in said rocker, a first tappet engaging said first pushrod and engageable with said forward hook when said slide is in one reciprocated position, and a second tappet engaging said second pushrod and engageable with said reverse hook when said slide is in another reciprocated position.

3,273,547
HYDRAULIC TAPPET WITH METERING MEANS

Kenneth W. Lesher, Wheaton, Ill., assignor to Standard Screw Company, Bellwood, Ill., a corporation of Illinois

Filed Jan. 12, 1965, Ser. No. 424,901
10 Claims. (Cl. 123—90)

1. A metering valve for a tappet having a hollow open ended cylinder, a hollow plunger mounted for reciprocation therein, a passage formed in the cylinder wall and in the plunger wall through which oil may reach the interior of the plunger, a pressure chamber defined within the cylinder and between it and the plunger, a closure for said plunger, a passage through said closure, said value comprising means within the plunger for metering flow through said closure passage comprising a disklike member, a plurality of raised portions formed one on each face of said member, each comprising a wall-like member having adjacent ends approaching but separated from each other, the area of separation of the ends of each pair of wall-like members being identical, and a surface formed on said closure within said plunger against which the adjacent wall-like member is adapted to be seated in response to pressure within the plunger, said wall-like members being

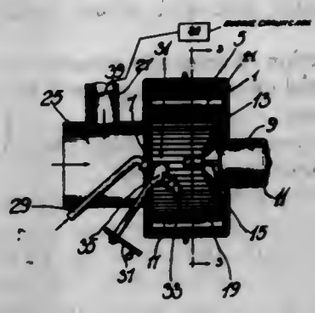


so disposed on said first-mentioned member as to surround the opening to said closure passage regardless of which of said wall-like members faces said seating surface.

3,273,548
HYDRAULIC LASH ADJUSTER

Donald J. Hoffman, Grand Rapids, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Sept. 29, 1965, Ser. No. 491,246
4 Claims. (Cl. 123—90)

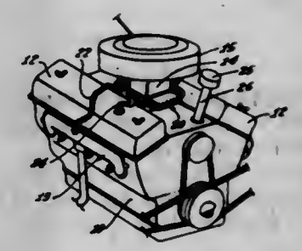


2. In a hydraulic lash adjuster, a generally upstanding dash pot, means for supplying hydraulic fluid to the dash pot including a hollow plunger therein having a side port, said port being inclined upwardly from the exterior of the plunger and constituting the sole inlet for fluid flow into the plunger, and a tube inclined upwardly within the plunger for conducting said fluid thereinto from said port, said tube having a bulbous external enlargement sealingly fitting said port.

3,273,549
INTERNAL COMBUSTION ENGINE CARBURETOR HAVING A FAN

Olivier Deland, L'Acadie, St. Jean, Quebec, Canada

Filed Nov. 18, 1963, Ser. No. 324,429
9 Claims. (Cl. 123—119)



3. A carburetor for supplying a mixture of air, vaporized and liquid fuels to a combustion engine comprising: a fan having a rotary impeller formed with peripheral blades and a main air inlet; means discharging hot vaporized fuel into said air inlet to warm the air entering said fan and liquid fuel inlet means discharging fuel centrally of said rotary impeller on said blades so as to be atomized thereby.

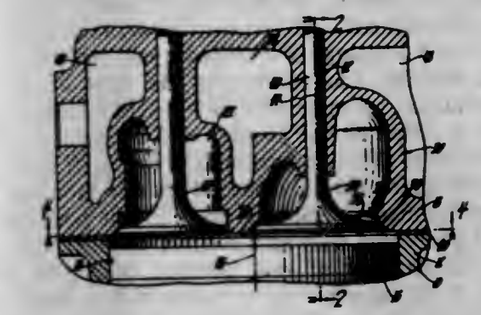
3,273,550
CARBURETION SYSTEM

Warren Ball, 1304 N. Gordon St., Hollywood, Calif.

Filed Nov. 24, 1964, Ser. No. 413,506
23 Claims. (Cl. 123—119)

1. In a system for recycling gaseous fluids through the combustion zone of an internal combustion engine, wherein passage means conveys gaseous fluid from the engine to the intake of the engine, the improvement comprising:

a first valve and a second valve operating in parallel to control flow through the passage means in response to changes in the pressure in the intake,



the first valve being open at relatively low vacuum in the intake and progressively closing in response to rise in the vacuum,

the second valve being closed at a relatively high vacuum in the intake and progressively opening in response to rise in the vacuum.

3,273,551
CYLINDER INLET PASSAGE FOR AN INTERNAL COMBUSTION ENGINE

Harry A. Julien, Oxford, and Carl J. Robinson, Pontiac, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Sept. 30, 1964, Ser. No. 400,460
7 Claims. (Cl. 123—188)

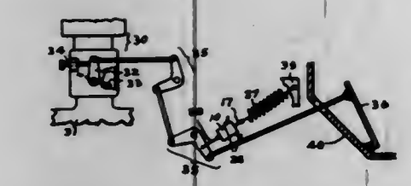
1. In an internal combustion engine, a cylinder, a cylinder head closing one end of the cylinder, means defining an inlet passage through the cylinder head and communicating with the cylinder, and a poppet inlet valve

having a central axis and reciprocably disposed in the passage for controlling communication of the inlet passage with the cylinder, said inlet passage means being characterized by:

a throat portion of generally circular cross-section opening into the cylinder and adapted to be closed by the inlet valve;

an entrance portion spaced from the throat portion and offset from the valve axis;

means defining a fluid flow path extending from the entrance portion around one side of the valve axis and blending into the throat portion in a descending spiral configuration, said fluid flow path defining means including a valve guide boss surrounding the valve axis and extending into the flow path and a side wall extending tangentially from the guide boss to the entrance portion and terminating at its lower edge in a web connecting the guide boss with the throat portion, said web terminating the descending spiral configuration portion of the flow path; and



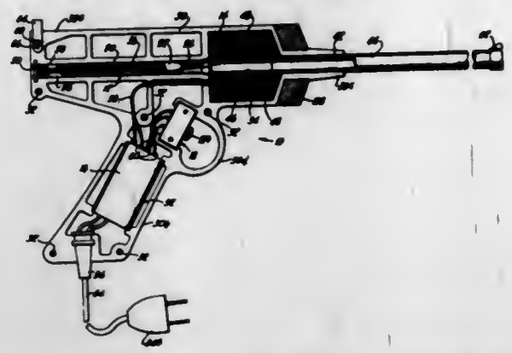
a flow directing vane projecting into the flow path between the entrance portion and the throat portion, said vane lying in a plane offset from and parallel to the valve axis.

3,273,552

SPRING ACTUATED SAFETY SWITCH FOR THE FUEL SUPPLY LINKAGE OF AN INTERNAL COMBUSTION ENGINE

Walter Leon Plath, 8251 42nd Ave. NE., Seattle, Wash.

Filed July 15, 1964, Ser. No. 382,824
2 Claims. (Cl. 123—198)



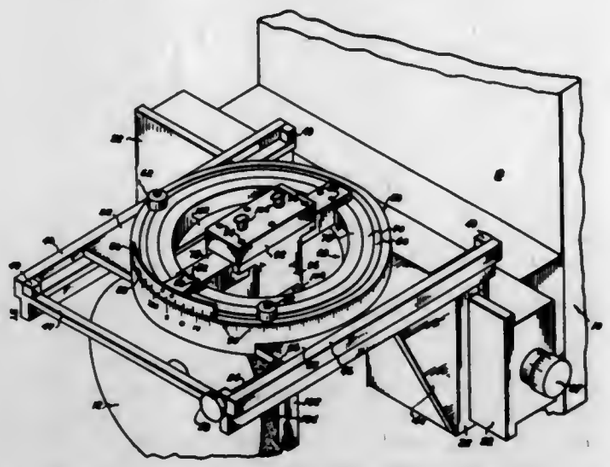
1. The combination with an internal combustion engine, of a fuel intake control valve controlling the supply of fuel to said engine, said valve having an idling position in which a minimum amount of fuel is supplied to the engine; valve control means remote from said intake control valve; linkage connecting said valve control means with said valve; a return spring adapted for connection with said linkage and capable of exerting a substantial force yieldingly urging said fuel intake control valve toward its idling position, said return spring being yieldable to valve opening force exerted through said valve control means; ignition means including a conductor controlling the supply of current for ignition purposes to said engine; a safety switch adapted to be connected in line with said return spring and controlling the flow of current through said ignition conductor, said safety switch comprising a housing; two spaced apart terminals carried by said housing and controlling the flow of current in said conductor; a contact member in said housing movable between a closed circuit position and an open circuit position relative to said two terminals; a spring of less strength than said return spring disposed in said housing urging said contact member into an open circuit position; and a pull rod connected with said contact member and extending to the exterior of said housing, said pull rod and housing being adapted to be connected in line between said return spring and said linkage and said return spring being capable of exerting a substantially greater force in urging said contact member into a closed circuit position than is exerted by the spring within said housing in urging said contact member into an open circuit position.

3,273,553

ELECTROMAGNETICALLY OPERATED GUN

Richard H. Doyle, 104 S. Albert St., Mount Prospect, Ill.

Filed Sept. 12, 1963, Ser. No. 308,535
8 Claims. (Cl. 124—3)



2. An electric gun energized by an undulating potential source for propelling a projectile having a magnetic portion comprising a housing having a barrel structure, winding means on the housing including an axial opening aligned with the barrel for receiving the projectile, control circuit means connected between the undulating potential source and the winding means for connecting the winding means to the potential source for a period of time no greater than one undulation in the potential supplied by the source, and manually operable means carried on the housing for controlling the operation of the control circuit means.

3,273,554

RADIUS AND TANGENT DRESSER FOR ABRASIVE WHEELS

Lothar P. Bunge, 3312 Eleven Mile Road, Warren, Mich.

Filed Nov. 8, 1963, Ser. No. 322,311
4 Claims. (Cl. 125—11)

1. A dresser for abrasive wheels, comprising:

a first member fixed with respect to said wheel;

a frame mounted on said first member and slidable therealong in a first direction;

an annular member slidable in said frame in a second direction perpendicular to said first direction, said annular member being the outer race of an annular bearing;

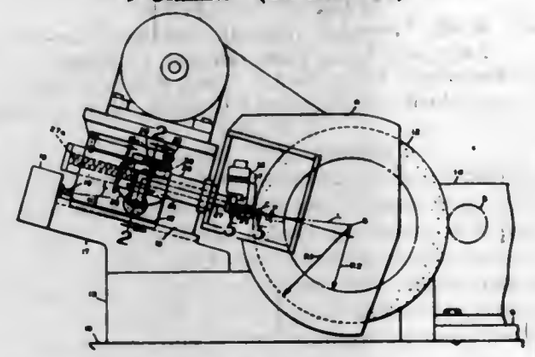
an annular inner race rotatable within said outer race;

a slide bar fixed to diametrically opposed points on said inner race;

a sliding structure adapted to slide along said slide bar;

an arm support on said sliding structure adapted to slide along said sliding structure in the direction perpendicular to the extension of said slide bar;

an arm fixed to said arm support;



and a cutting tip mounted in said arm and adapted to cut the face of said abrasive wheel.

3,273,555

METHOD AND APPARATUS FOR DISTRIBUTING WEAR OF TRUING ROLLER

William B. Seidel, Cincinnati, Ohio, assignor to The Cincinnati Milling Machine Co., Cincinnati, Ohio, a corporation of Ohio

Filed Jan. 22, 1964, Ser. No. 339,383
9 Claims. (Cl. 125—11)

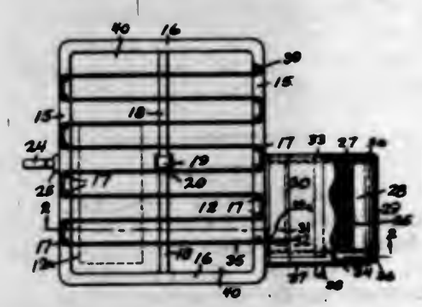
1. A method of truing an arcuate profile on a grinding wheel with a cylindrical truing roller comprising,

(a) aligning the roller with the axis thereof perpendicular to a radial plane containing the axis of the grinding wheel,

(b) positioning the roller for point contact of one edge of the periphery of the roller with the periphery of the grinding wheel on said radial plane,

(c) moving the roller around the periphery of the grinding wheel and maintaining said one edge of the periphery of the roller in point contact with the periphery of the grinding wheel for an initial truing cut,

(d) advancing the roller in discrete increments for successive truing cuts on the grinding wheel along a line inclined with respect to said radial plane to move the point of contact of the roller with the grinding wheel across the roller as successive truing cuts are taken, and



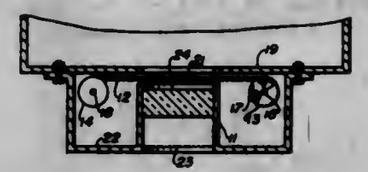
(e) maintaining the axis of the roller perpendicular to said radial plane as the roller is advanced in discrete increments to maintain the point of contact between the periphery of the roller and the periphery of the grinding wheel in said radial plane.

3,273,556

OUTDOOR GRILL

Warren B. Mogensen, 1609 E. 32nd St., Sioux Falls, S. Dak.

Filed Nov. 20, 1964, Ser. No. 412,739
5 Claims. (Cl. 126—25)



3. An outdoor grill comprising a grill framework, a plurality of vertically positioned spaced pins attached to said framework, a disposable wire member wound about said pins to provide a grill surface, a wire reel positioned adjacently to said grill, said wire reel providing a continuous supply of wire for said disposable wire member, a casing enclosing said wire reel, said casing having an opening for permitting passage of wire therethrough.

3,273,557

VACUUM FURNACE WINDOW

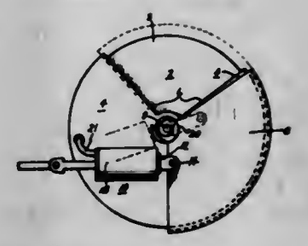
Niels R. Borch, Livermore, and Robert S. Juntz, Hayward, Calif., assignors to the United States of America as represented by the United States Atomic Energy Commission

Filed Jan. 12, 1965, Ser. No. 425,094
7 Claims. (Cl. 126—200)

1. A viewing window assembly for use in combination with vacuum furnaces operable at high temperatures, comprising:

(a) a viewing window hermetically coupled in planar alignment to an apertured outer wall of a vacuum furnace to provide a transparent viewing path for viewing the interior of the furnace from a point outside said furnace,

(b) a transparent tape of polyethylene terephthalate resin disposed between and in planar relation with said viewing window and said aperture defined by said vacuum furnace wall thereby preventing matter from the interior of the furnace from impinging on at least a part of said window and maintaining the transparency of the viewing path in the presence of high temperatures,



(c) transport means to move said tape along a path transverse to the viewing surface of said window at a rate greater than the rate at which impinging interfering matter collecting on said tape causes the viewing path through said tape and said window to become impervious to light.

3,273,558

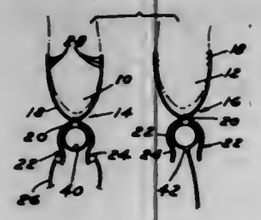
SELF-CONTROLLING GAS GENERATOR

Willis A. Boothe, Scotia, N.Y., assignor to General Electric Company, a corporation of New York

Filed July 28, 1964, Ser. No. 385,608
5 Claims. (Cl. 126—271)

1. A gas generator comprising

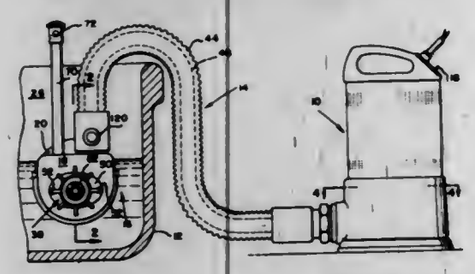
a cylindrical storage tank having a black absorption surface for transmitting heat at a high rate to a liquid within said tank to evaporate the liquid,



reflective means surrounding said tank, having a sector shaped opening to expose part of said surface of said storage tank,

a reflecting shield movable between an open and closed position whereby in the closed position said shield completely covers the opening and thereby covers said exposed surface of said storage tank and in the open position completely exposes the opening and thereby exposes said surface of said storage tank,

a cylinder connected to said storage tank, and



a piston travelling in said cylinder connected to said shield and responsive to the pressure in said storage tank to cause said shield to cover said exposed portion of said storage tank when the pressure exceeds certain values.

3,273,559
METHOD AND APPARATUS FOR MONITORING THE APPROACH OF BIRTH
Henry Lee Evans, Ann Arbor, Mich., assignor to Conductron Corporation, Ann Arbor, Mich., a corporation of Delaware
Filed Aug. 28, 1963, Ser. No. 305,149
7 Claims. (Cl. 128—2)

1. A system for indicating the approach of childbirth in a female mammal comprising an electrical circuit including first and second elements physically and mechanically independent of each other adapted for insertion in the vaginal cavity of the female and co-operable electrically with each other to control a measurable parameter of said circuit as a function of the proximity of said elements to each other, means associated with said elements adapted to removably attach said first element to one lip of the cervical opening of the female and said second element to the other lip with no physical or mechanical association between the elements, and telemetering means located externally of the female and coupled to said electrical circuit for translating variations in said parameter into a signal for indicating the spacing of said cervical lips from each other.

3,273,560
HYDROTHERAPY UNIT
Candido Jacuzzi, Lafayette, Calif., assignor to Jacuzzi Bros., Inc., Richmond, Calif., a corporation of California
Filed Aug. 5, 1963, Ser. No. 299,698
12 Claims. (Cl. 128—66)

3. A portable hydrotherapy apparatus for use in bathtubs and the like which comprises:

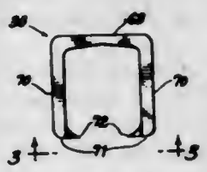
(A) a pump housing adapted to be removably positioned outside of a bathtub adjacent thereto with said housing containing

(1) an electric motor and

(2) a water pump connected to said electric motor to be driven thereby and having a pump inlet and a pump outlet,

(B) a unitary nozzle housing adapted to be removably positioned in a bathtub below the water level therein and having mounted therein for support thereby a water inlet and a discharge nozzle, and

(C) conduit means connecting said pump housing and said nozzle housing and adapted to extend therebetween over the edge of a bath tub, with said conduit means having



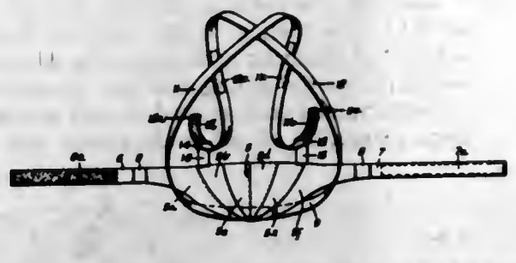
(1) a first water conducting passageway connecting said pump inlet to said water inlet, and

(2) a second water conducting passageway connecting said pump outlet to said nozzle.

3,273,561
BANDAGING MATERIAL FOR MEDICAL PURPOSE
Helmut Wolf, Neuwied (Rhine), Germany, assignor to Lohmann K.G., Fahr (Rhine), Germany
No Drawing. Filed Nov. 4, 1963, Ser. No. 321,278
Claims priority, application Germany, Nov. 3, 1962, L 43,364
4 Claims. (Cl. 128—156)

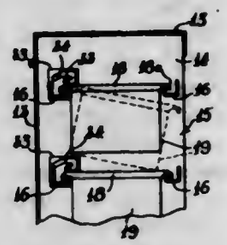
1. A bandage for medical purposes, comprising a single web of creped material, three-dimensional embossed areas on said web extending over a plurality of creped folds and pulling said crepe folds into drome-shaped elevations while maintaining the creped formation, said crepe folds being consolidated or compacted at the lower edge of the embossed areas by compression of said creped folds.

3,273,562
SKIN AND SURGICAL CLIPS
Adolph M. Brown, deceased, late of Beverly Hills, Calif., by Marthe E. Brown, administratrix, Beverly Hills, Calif., assignor of twenty percent to Rene G. Le Vaux and twenty percent to Ernest C. Wood
Original application Feb. 24, 1960, Ser. No. 10,595, now Patent No. 3,098,232, dated July 23, 1963. Divided and this application Apr. 17, 1963, Ser. No. 273,791
1 Claim. (Cl. 128—337)



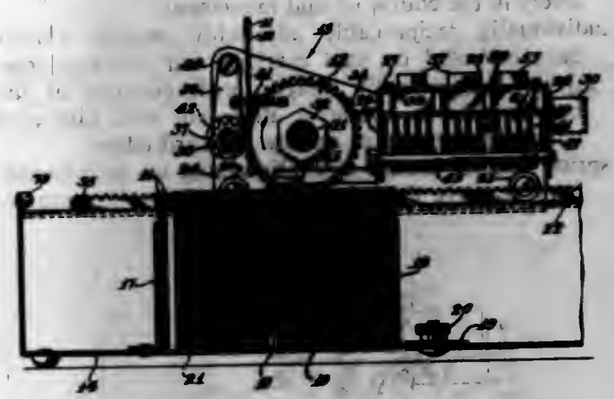
A skin clip comprising a flat, sheet metal member which is deformable and which remains in the shape to which it is deformed consisting of a crosswise extending bail portion, an elongate arm extending forwardly perpendicularly from each of the outer ends of said bail portion, said bail portion and arms having flat top and bottom surfaces of substantial width by comparison with the depths between said top and bottom surfaces and with each arm having a forward end portion and inner and outer lateral edges throughout the lengths thereof, spicules integral with the inner edges of each arm in the forward end portion thereof and extending inwardly in the direction towards each other and angularly downwardly beyond the plane formed by the bottom walls of the arms, the forward edge of said crosswise extending bail being tapered rearwardly from the outer ends inwardly towards the center to provide a bail of decreasing width from the outer ends towards the center of the bail.

3,273,563
MATERNITY GIRDLE
Raymond P. Bonang, 5 Calef Ave., Saco, Maine
Filed Sept. 18, 1964, Ser. No. 397,566
8 Claims. (Cl. 128—579)



1. A maternity girdle comprising an abdominal pouch contoured to embrace the abdomen of a wearer, said pouch terminating at its opposite longitudinal extremities in waist encircling bands, means for adjustably connecting the ends of said bands over the back of the wearer, a supporting harness consisting of a continuous strap, the

central longitudinal area of which extends across and is secured to the central lower boundary of said pouch, the opposite longitudinal extremities of said strap beyond said central area being free from said pouch and respectively terminating in elongated shoulder strap extensions which are directed diagonally upward to partially overlie the adjacent portions of said pouch and adapted to criss-cross



over the back and pass forwardly and downwardly over the shoulders of the wearer, and means for adjustably securing the free ends of said criss-crossed extensions at spaced points along the upper longitudinal boundary of said pouch, whereby continuous and uniform support is provided for the abdomen along both the upper and lower extremities of said pouch.

3,273,564
SUSPENSION MEANS
Walter Feldmahr, Canton, N.Y., assignor to Gary Industries, Inc., doing business as Acco Products, Ogdensburg, N.Y., a corporation of Nevada
Filed Jan. 26, 1965, Ser. No. 428,115
1 Claim. (Cl. 129—16)

In a structure for suspending file folders having hook-like extensions on opposite ends thereof, said structure comprising, a pair of spaced apart parallel horizontally extending rails over which the hook-like extensions are engaged, guide blocks one at each end of one of said rails, a convolute slotted track in each guide block, a lock bar coextensive with said one rail and having its ends engaged in said tracks; said tracks each including a lower horizontal portion disposed transversely of the guide rail and into which the guide rod may be moved to locate the rod closely adjacent to the said one rail to prevent upward displacement of the one hook-like extension engaged thereover, said lower horizontal portion extending from adjacent said one rail forwardly toward the other rail and terminating at its forward end in an upwardly extending slot portion and being restricted in its width at its juncture with said upwardly extending slot portion to restrain movement of the lock bar into said upwardly extending slot portion, a second substantially horizontal slot portion in communication with the upper end of said upwardly extending slot portion and extending rearwardly therefrom, the rearmost end portion of said upper horizontal slot portion being inclined downwardly to restrain movement of the lock bar in a forward direction when said lock bar is carried into said upper horizontal slot portion said rearmost end portion terminating rearwardly of said one rail and said one hook-like extension to allow upward displacement of the hook-like element when said lock bar is moved into said rearmost end portion.

3,273,565
FILE CARD RETRIEVAL APPARATUS
Malcolm G. Townsley, Park Ridge, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Oct. 17, 1962, Ser. No. 231,080
10 Claims. (Cl. 129—16.1)

1. In card sorting apparatus for retrieving cards from a pack of cards wherein one of their edges is exposed and has a magnetic portion and code notches:

supporting means for the pack of cards,

a retrieval assembly including:

frame structure mounted for relative movement with respect to said supporting means for traversing said edges,

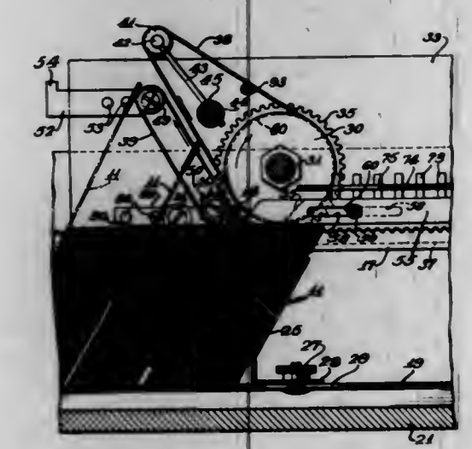
magnetic card withdrawing means movably mounted on said frame structure and operative to attract said magnetic portions on the cards and withdraw the cards successively from the pack in the course of said relative movement, and barrier code bars adjustably mounted on said frame structure and adjacent to said edges with one of their end portions adjacent to said magnetic means in such relation thereto that the card edges are adapted to be blocked by said end portions against any substantial movement toward said magnetic means,

said bars being correlated with said code notches and being selectively settable to position the bars with said end portions corresponding to the code notches of a selected card to be withdrawn from the pack but to block withdrawal of all other cards from the pack,

said end portions of said bars being so located with respect to said magnetic means that the code notches of the selected card afford escape clearance past the bar ends for withdrawal by the magnetic means,

means for effecting said relative movement between said supporting means and said assembly to effect successive passing of said magnetic means in magnetic attracting relation past said magnetic portions whereby said selected card is magnetically attracted through its magnetic portion toward said magnetic means, and means for moving said magnetic means to effect withdrawal of said selected card.

3,273,566
FILE CARD RETRIEVAL DEVICE
Louis A. Smitzer, Chicago, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Oct. 17, 1962, Ser. No. 231,215
9 Claims. (Cl. 129—16.1)



9. In card sorting apparatus for retrieving selected cards from a pack of cards wherein one of the edges of the cards is exposed and has a magnetic portion and code notches,

a carriage constructed and arranged for relative longitudinal movement in traversing relation along said card edges,

card withdrawing means mounted on said carriage and including magnetic means operative during said movement to attract said magnetic portions of the cards and withdraw the cards from the pack successively in the course of said movement,

individually reciprocably adjustably settable barrier bars mounted on said carriage and movable relatively longitudinally thereon with portions of the bars located in operative alignment with said card withdrawal means to oppose the card edges,

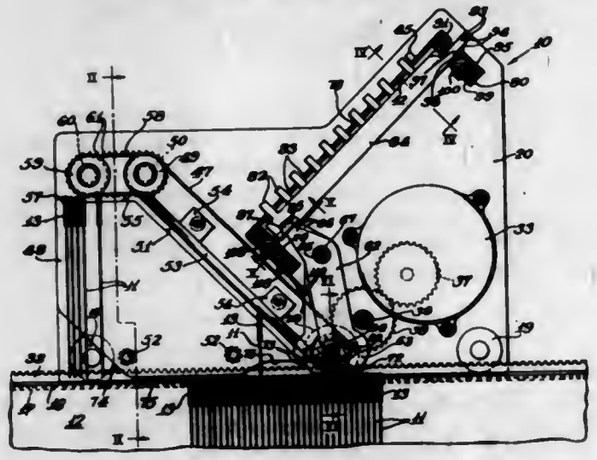
spring biasing means normally acting on said barrier bars to move them longitudinally into clearance re-

lation relative to said withdrawal means so that card edges can escape thereby for withdrawal, means for selectively setting said bars according to predetermined code determination in longitudinal opposition to said biasing means into blocking relation to withdrawal of all cards except any card that has matching code notches,

stripper means mounted on said carriage and cooperative with the set bars to preclude withdrawal of any other than the card having matching code notches while said magnetic portions are in the magnetic field of the withdrawal means and after said set bars progress beyond the edges of the other cards during said relative movement,

and means for actuating said withdrawal means.

3,273,567
FILE CARD RETRIEVAL DEVICE
Louis A. Smitzer, Chicago, Ill., assignor to Bell & Howell Company, Chicago, Ill., a corporation of Illinois
Filed Oct. 17, 1962, Ser. No. 231,216
14 Claims. (Cl. 129—16.1)

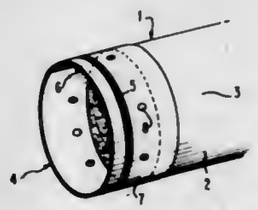


1. In card sorting apparatus for retrieving cards from a pack of cards wherein each card has one edge thereof equipped with code notched magnetic means including respective portions adjacent to the ends of said edge, and with all of such edges of the cards adapted to be disposed in a substantially common plane and exposed for retrieval sorting,

a selfcontained retrieval unit comprising:

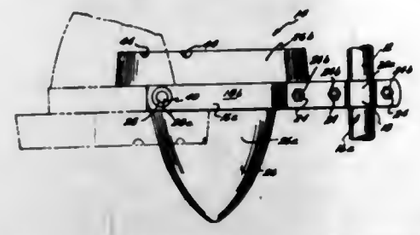
a supporting carriage frame structure including side frame members having means for supporting the carriage frame structure for relative movement in a path with respect to supporting structure in which said cards are supported with said edges in said common plane, and the carriage frame structure in said relative movement successively traversing said edges of said cards,

individual magnetic card extracting means mounted on the carriage frame structure adjacent to each of the respective side frame members for magnetically attracting the respective opposite end magnetic portions of the card edges and spaced substantially apart to leave substantial portions of the card edges between said magnetic end portions available for card selection purposes,



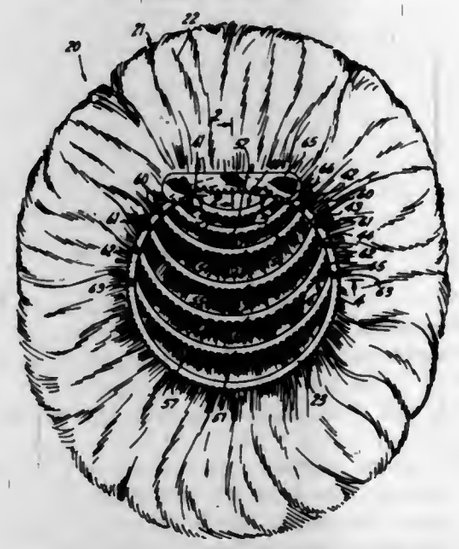
card selecting individually settable barrier bars carried by the carriage frame structure between said spaced magnetic card extracting means and having means for setting said bars according to a predetermined code related to said notches to block extraction of all cards except any card

that has matching code notches in its edge portion between said end magnetic portions in the course of relative card sorting movement of the unit and the cards,



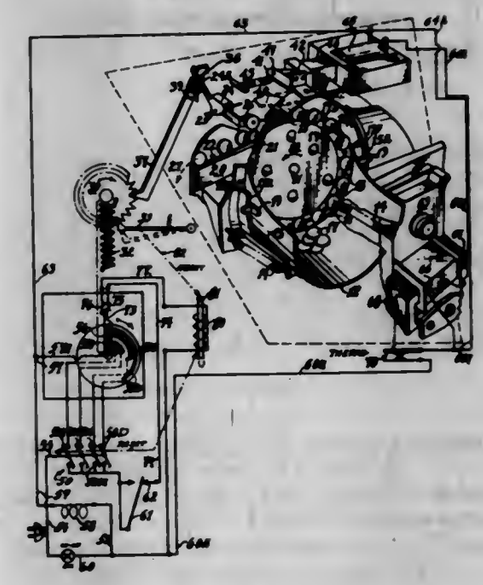
card withdrawing means carried by and having parts operative at each respective side of the carriage frame structure clear of said card selecting means and associated with each of said magnetic card extracting means to effect withdrawal from the remaining cards of any selected card extracted by the magnetic card extracting means, and means carried by the carriage frame structure for driving said card withdrawing means.

3,273,568
SELF-LIGHTING CIGARETTE
Canio Di Carlo, Jr., 159 Claremont Ave., Montclair, N.J.
Filed Aug. 4, 1965, Ser. No. 477,109
5 Claims. (Cl. 131—7)



1. In a cigarette having a cigarette wrapper, a tobacco filler only within said wrapper and an igniter disposed at one end of said wrapper, said igniter comprising a hollow member of the same sectional configuration as the cigarette wrapper and extending beyond said tobacco filler and wrapper, said member comprising an outermost zone of paper, a median zone of paper impregnated with an ignitable compound, and an innermost zone of paper adjacent to said wrapper and filler, all of the ignitable compound being spaced from the outer end of said tobacco filler and wrapper.

3,273,569
PERMANENT ASH RECEPTACLE
James M. Callouette, 13862 Ponderosa, Apt. G, Santa Ana, Calif.
Filed May 7, 1964, Ser. No. 365,653
3 Claims. (Cl. 131—241)

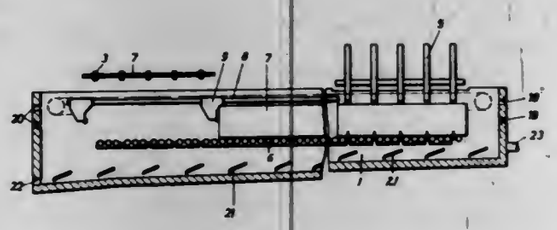


1. A cigar and cigarette ash receptacle comprising in combination, a cantilever bracket having an end portion provided with attachment means to secure said bracket to a stationary member and an opposite end portion comprising a pair of oppositely disposed generally arcuate arms having substantially parallel end portions and forming a generally U-shaped horizontal bracket portion, an ash receiving tray formed with a relatively deep cup-shaped ash receiving portion providing a relatively low center of gravity for said tray and an annular flange at the upper end thereof, and means mounting said tray on said bracket comprising at least one pivot pin intersecting the substantially parallel end portions of said arms and said tray subjacent said annular flange and spaced from the vertical axis comprising said center of gravity on the opposite side thereof from said attachment means thereby requiring the portion of said annular flange nearest said attachment means to rest on said bracket portion to dispose said ash receiving portion upwardly, said ash receiving portion being of such size as to pass through said bracket portion upon pivoting of said tray on said bracket to inverted position wherein said flange on said tray engages the underside of said bracket portion to retain said tray in such inverted position.

3,273,570
ANNULAR WIG SUITABLE FOR ATTACHMENT TO THE NATURAL HAIR
Ethel Allison, 685 Park Place, Brooklyn, N.Y.
Filed May 28, 1965, Ser. No. 464,595
5 Claims. (Cl. 132—53)

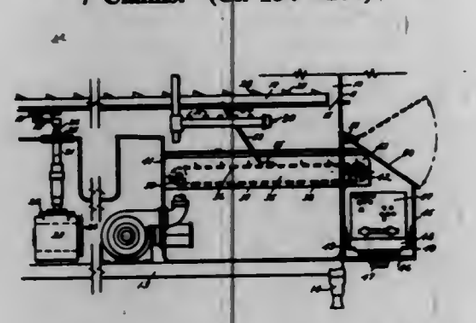
1. A wig comprising an annular array of radially extending hair, an annular binding extending about the internal circumference of said annular array and securing together the hair of said annular array, a plurality of arcuate arrays of radially extending hair, a plurality of arcuate bindings each securing together the hair of a respective arcuate array, said arcuate arrays being arranged in generally concentric radially spaced relation with respect to each other and extending chordally across said annular binding, said arcuate bindings being secured at their respective ends to spaced regions of said annular binding.

3,273,571
PRE-SELECTIVE COIN COUNTER
Herman L. Selden, Chicago, Ill., assignor to Lion Manufacturing Corporation, Chicago, Ill., a corporation of Illinois
Filed Jan. 24, 1964, Ser. No. 340,033
11 Claims. (Cl. 133—8)



1. In a combination with a rotary transport disc inclined from the vertical and operative to pick up coins at a lower region of its transit and carry the same close to the rim of the disc seriatim upwardly along an upper level into engagement with a coin-sensing means and beyond to a discharge zone, a coin-sensing means in the form of a lever pivotally mounted near said discharge zone with an end portion disposed to move toward and away from the rim of the disc, and a coin-engaging part in the form of a conically-shaped roller rotatable at said end portion of the lever about an axis at approximately right angles to the plane of travel of the coins with the base of the cone disposed away from the disc, and means yieldingly urging the lever and said end and roller thereof in a direction toward said rim to a normal position for engagement with edge portions of coins of given diameter transported therebeneath by said disc, whereby such coins tend to be caught and wedged by the conical pitch of said roller toward the disc to prevent escape from the roller.

3,273,572
CONTINUOUS COOLING OF METAL SLABS AND THE LIKE IN A WATER BATH
Gerhard Schwarze, Kaarst, near Neuss, Hanns-Peter Lemm, Duesseldorf, Hermann Hover, Duesseldorf-Benrath, and Otto Wiecheropp, Duesseldorf, Germany, assignors to Schloemann Aktiengesellschaft, Duesseldorf, Germany
Filed Feb. 10, 1964, Ser. No. 343,714
Claims priority, application Germany, Feb. 11, 1963, Sch 32,748, Sch 32,856
5 Claims. (Cl. 134—104)

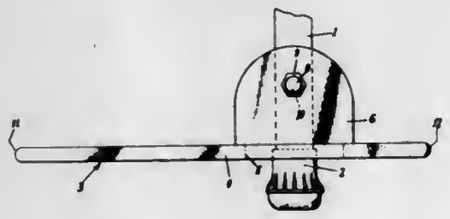


1. Apparatus for cooling metal articles such as slabs, plates and thick sheets by immersion in a substantially vertical position in a cooling liquid bath, said apparatus comprising a relatively long and narrow cooling bath tank, a slide pivotally mounted adjacent one end of said tank for movement about a horizontal axis substantially

parallel to the longitudinal axis of said tank from a horizontal position to a substantially vertical position, a plurality of arms supported for longitudinal sliding movement on said slide, means for delivering said articles in a horizontal position and depositing the same on said arms, said horizontal pivotal axis being so located that the weight of said article on said arms tends to cause

pivotal movement of said slide, arms and articles from a horizontal to a substantially vertical position, a power cylinder mounted on said tank, a piston in said cylinder and a piston rod connected to said slide for assisting in the pivotal movement thereof, means for lowering said arms and said articles vertically into said tank, and means for moving said articles from said arms and for conveying said articles to the opposite end of said tank.

3,273,573
DISHWASHING MACHINE AND REFUSE DISPOSAL AND METHOD
Creston R. Southard, Winston-Salem, N.C., assignor to Champion Dish Washing Machine Company, Winston-Salem, N.C., a corporation of North Carolina
Filed Sept. 14, 1964, Ser. No. 396,319
7 Claims. (Cl. 134—104)



4. In a dish washing machine and refuse disposal apparatus for receiving and conveying dishes supported in dish racks along a directed path of travel through a spray cabinet having nozzles at spaced intervals to spray water on dishes from above and below the racks comprising a spray cabinet having front and side walls, said front wall having a dish rack-receiving opening, means for supporting dish racks introduced into the cabinet through said front wall opening and advanced along a directed path of travel, a dish rack advancing means supported between said dish rack-supporting means having a plurality of spaced-apart dish rack engaging pawls thereon with each of said pawls extending vertically above said dish rack-supporting means to engage and intermittently advance a dish rack in only one direction of movement of said dish rack advancing means through the spray cabinet, means for actuating said dish rack advancing means, an endless belt conveyer for receiving refuse from dishes in said dish racks mounted beneath said dish rack advancing means, means for actuating the belt conveyer to move the refuse caught thereon to a remote location, and a receptacle for receiving refuse caught on said conveyer belt mounted beneath the discharge end of the conveyer at said remote location.

3,273,574
ARCHITECTURAL STRUCTURE
Carl F. Huddle, 3 Kenberton Drive, Pleasant Ridge, Mich.
Original application Aug. 29, 1963, Ser. No. 305,483. Divided and this application Aug. 2, 1965, Ser. No. 481,155
5 Claims. (Cl. 135—3)

1. An architectural structure comprising a frame, a pair of arch members each comprising a pair of transversely spaced leg portions connected by an intermediate bight section adapted to be positioned in opposed relationship and with respective ones of said leg portions pivotally mounted on said frame for angular swinging movement of said arch members to and from a first position and a second position angularly spaced from said first position, connecting means extending between and connected to said intermediate bight sections of said arch members, each said leg portion including extensible means for providing a controlled expansion and contraction of said arch members, and means for actuating said extensible means effecting a controlled expansion and separating movement of said bight sections of said arch members and a corresponding tensioning of said connecting means resulting in the application of a torque to said arch members effecting pivoting movement thereof between said first position and said second position.

3,273,575
ATTACHMENTS FOR CRUTCHES AND LIKE WALKING AIDS
Thomas R. Aldrich, 1151 Windsong Lane, Siesta Key, Sarasota, Fla.
Filed June 29, 1964, Ser. No. 378,913
1 Claim. (Cl. 135—62)

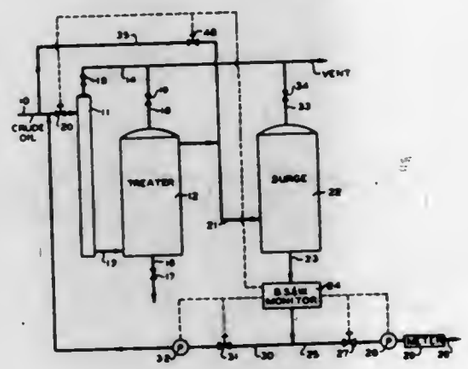
An attachment for a walking aid of the type including an elongated support having a ground-engaging lower end portion comprising, in combination,

an elongated shoe member having an opening therethrough,

said shoe member comprising a front portion located forwardly of said opening and a rear portion located rearwardly of said opening;

a pair of upstanding members fixed to said shoe member and spaced apart transversely thereof with each of said upstanding members disposed at a different side of said opening,

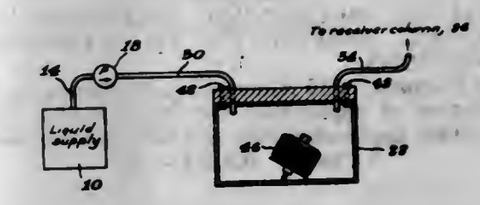
said opening being dimensioned to accommodate the ground-engaging lower end portion of the walking aid to which the attachment is applied,



in such fashion that such lower end portion extends between said upstanding members, said upstanding members each being provided with a lateral opening, said lateral openings being aligned transversely of said shoe member and alignable with a transverse opening in the lower end portion of the walking aid; and

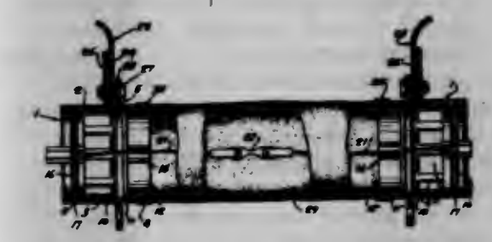
pivot shaft means carried by said upstanding members extending across said opening and transversely of said shoe member, and said pivot shaft means comprising an axle extending through said aligned openings, and

said pivot shaft means being operative to removably count said shoe member on the ground-engaging lower end portion of the walking aid with said shoe member then free to pivot about said pivotal axis relative to the ground-engaging lower end portion of the walking aid,



said rear portion of said shoe member being heavier than said front portion whereby, when the walking aid is raised to free the lower end portion thereof from the ground, said shoe member will gravitate pivotally to cause said front portion to swing upwardly and said rear portion to swing downwardly, said shoe member thus automatically assuming a position in which said front portion will not tend to catch on or otherwise engage the ground in such manner as to trip the user.

3,273,576
MEASUREMENT AND CONTROL SYSTEM
Dale A. Fluegel and Louis E. Kuntz, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed Dec. 31, 1962, Ser. No. 248,381
6 Claims. (Cl. 137—2)



1. An oil transfer system comprising a source to supply oil, treating means to remove B.S. & W. from oil, said treating means having an inlet and a outlet, a receptacle to receive oil, first conduit means to convey oil from said source to the inlet of said treating means, second conduit means to convey oil from the outlet of said treating means to said receptacle, third conduit means to convey oil from the outlet of said treating means to the inlet thereof, fourth conduit means to convey oil from the inlet of said treating means to the outlet thereof, means connected to said second conduit means to measure the B.S. & W. content of the oil in said second conduit means, and means responsive to said means to measure to (1) pass oil through said first and second conduit means when the measured B.S. & W. content is in a predetermined range, (2) pass oil through said third conduit means when the measured B.S. & W. content exceeds said predetermined range and (3) pass oil through said fourth and second conduit means when the measured B.S. & W. content is below said predetermined range.

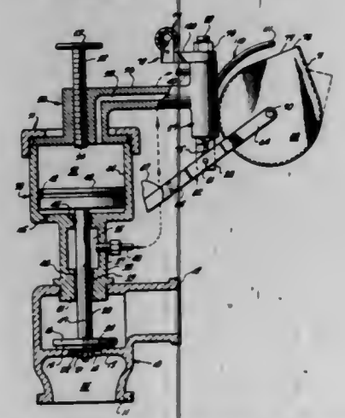
3,273,577
METHOD AND APPARATUS FOR DAMPING A PULSATING FLOW OF LIQUID
John C. Moore, Lake Jackson, Tex., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed June 18, 1964, Ser. No. 376,133
5 Claims. (Cl. 137—13)

4. In an improvement in a chromatographic column apparatus which includes a liquid supply, chromatographic column, and a pump to provide a flow of said liquid to said column, said column being characterized as being resistant to liquid flow therein, said pump being characterized as producing surges of pressure in said fluid flow when said pump acts against the resistance to flow of said column and a chamber filled with said liquid, said chamber connected in series with and intermediate said pump and said chromatographic column, the improvement which comprises: a sealed bellows arrangement immersed in said liquid-filled chamber, said bellows being filled with a volume of a substantially incompressible liquid being equal to the total volume of the bellows at its mechanical compression limit, and a volume of gas substantially insoluble in said liquid being equal to the difference between the volumes of the bellows at its mechanical compression and extension limits, said gas being at about atmospheric pressure at the extended limit of the bellows.

3,273,578
CRASH CLOSED SHUT-OFF VALVE
John H. Clark, Indianapolis, Ind., assignor to the United States of America as represented by the Secretary of the Army
Filed Aug. 9, 1962, Ser. No. 216,004
8 Claims. (Cl. 137—68)

1. A crash closed shut-off valve for use in a fluid system and actuated by displacement of components of that system comprising:

(a) a valve body having a fluid passage therethrough;

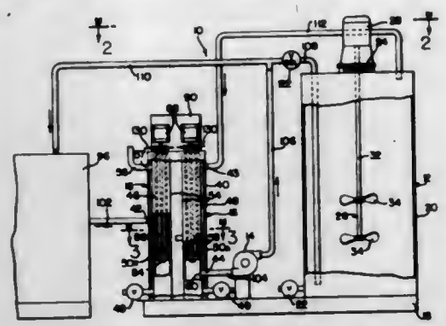


(b) a valve controlling fluid flow in the passage, disposed for movement along a longitudinal axis within said valve body between a normal valve open position and valve closed position;

(c) releasable locking means coacting between said valve body and said valve to lock said valve in the valve open position until a predetermined tensile force acting along said longitudinal axis is exerted on said valve;

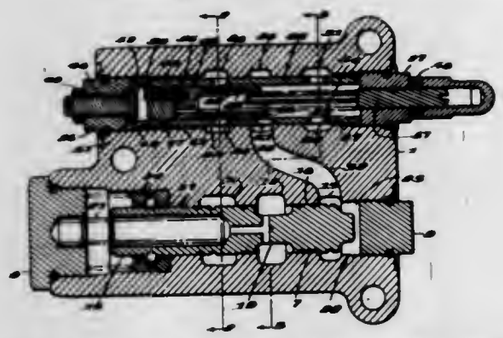
(d) second locking means coacting between said valve body and said valve to lock said valve in the valve closed position in response to the movement of said valve from the valve open position to the valve closed position;

(e) actuating cable means attached to said valve body and adapted to transmit tensile force to said valve body along said longitudinal axis and to break, without damage to the valve and fluid system, when said tensile force is substantially greater than that needed to move the said valve to the valve closed position.



3,273,579
HYDRAULIC MECHANISM INCLUDING PILOT CONTROL RESPONSIVE TO ATMOSPHERIC CONDITIONS
George Koculyn, 3239 Altura Ave., La Crescenta, Calif.
Continuation of application Ser. No. 109,981, May 15, 1961. This application July 6, 1965, Ser. No. 480,217
9 Claims. (Cl. 137—80)

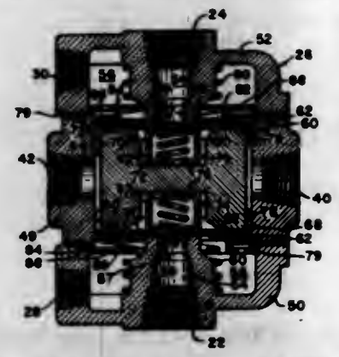
1. Hydraulically powered means in association with an existing hydraulic pressure source for providing reciprocating motion responsive to temperature comprising a piston having first and second effective pressure areas with the first area being greater than the second, a two-position control valve, the second area and the inlet of the control valve being in continuous communication with the pressure source, variable-centroid balance means operating the control valve against the valve inlet pressure, duct means connected from the control valve for supplying water at a predetermined rate to the balance means when the control valve is in one valve position for varying the centroid of the balance means to cause the balance means to move from a first one of two stable positions in which the control valve is in said one position to the second of said two stable positions, the control valve responding to movement of the balance means from the first to the second stable position thereof to move to a second valve position to provide communication between the piston first area and the pressure source for reciprocation of the piston by unbalanced hydraulic pressure forces on the first and second areas, the balance means in the second stable position being responsive to removal of moisture from the balance means to unbalance same for movement thereof toward the first of said two stable positions, movement of the balance means from the second to the first of said stable positions effecting movement of the control valve from the second to said one valve position, and self-adjusting temperature actuated means directly operable against the balance means for governing the motion of the balance means from the second to the first stable positions thereof.



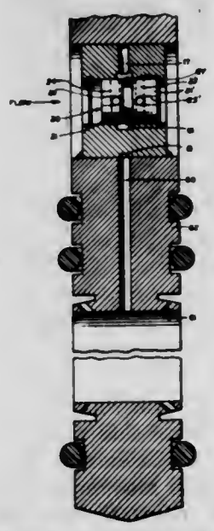
3,273,580
SOLUTION CONCENTRATION CONTROL AND MAKE-UP SYSTEM
Charles M. Ladd, 14180 Garfield Ave., Detroit 39, Mich.
Filed Jan. 27, 1964, Ser. No. 340,286
11 Claims. (Cl. 137—93)

1. In a system for maintaining the concentration of a processing solution substantially at a predetermined level,
a solution resistance sensing chamber containing a reference cell and an actuating cell,
a reservoir tank of make-up solution normally at a relatively high level of concentration,
a supply of said processing solution,
and pump and conduit means for drawing processing solution from its tank through said sensing chamber and into and through said pump for delivery back to said supply of processing solution and alternatively to said reservoir tank,

said conduit means conducting said processing solution from its supply into said sensing chamber by gravity,
said conduit means conducting solution from said pump to said reservoir tank having a normally closed valve therein adapted to open and close upon actuation by means responsive to the electrical resistance of said solution in said actuating cell.



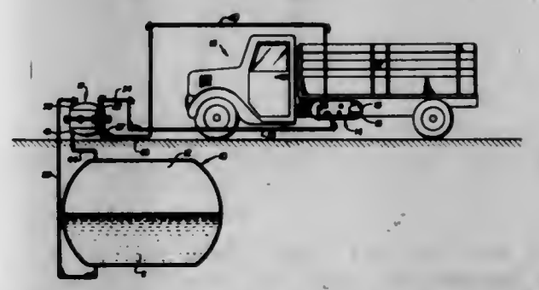
3,273,581
PILOT OPERATED UNLOADING VALVE HAVING RELATIVELY ADJUSTABLE LOADING AND UNLOADING LIMITS
Kyle E. McAfee, Jr., Lima, Ohio, assignor to The New York Air Brake Company, a corporation of New Jersey
Continuation of application Ser. No. 180,466, Mar. 19, 1962. This application Mar. 1, 1965, Ser. No. 440,663
7 Claims. (Cl. 137—108)



1. In a pressure responsive, pilot-operated unloading valve including piloted unloading valve means shiftable between loading and unloading positions under the control of a pressure responsive pilot valve means, the pilot valve means including an element shiftable to first and second control positions when the applied pressure reaches first and second valves, respectively, the improvement which comprises means for adjusting said pilot valve means to vary at least one of said values relatively to the other of said values.

3,273,582
DUAL CIRCUIT PROTECTION VALVE
Harry M. Valentine, Elyria, Ohio, assignor to Bendix-Westinghouse Automotive Air Brake Company, Elyria, Ohio, a corporation of Delaware
Filed Apr. 12, 1963, Ser. No. 272,600
9 Claims. (Cl. 137—111)

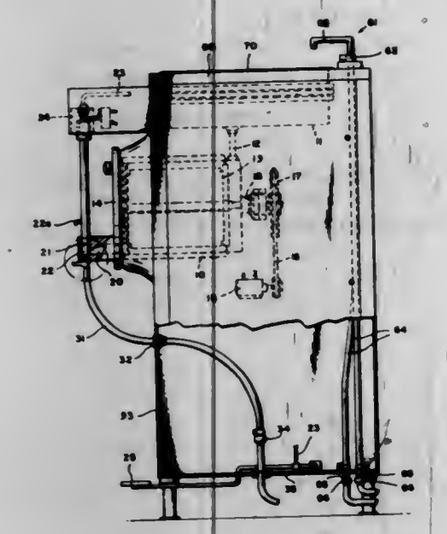
1. A fluid pressure responsive control valve comprising a casing having two pairs of spaced apart inlet and delivery cavities and ports, a pair of axially aligned passages communicating each inlet cavity with its delivery cavity, a pair of opposed axially aligned check valves for controlling the one-way flow of fluid through said passages from said inlet to said delivery cavities, a third inlet port in said casing, a fluid conduit in said casing connected to said third inlet port and communicating at its opposite ends with the respective delivery cavities, a second pair of opposed check valves in said conduit for controlling the one-way flow of fluid from said conduit to the respective delivery cavities, bore means in said casing in axial alignment with said first pair of check valves and communicating at its opposite ends with said delivery cavities, a fluid pressure responsive element in said bore means having opposed motive areas exposed to the pressure in the respective delivery cavities, and means carried by said pressure responsive element on opposite sides thereof for engaging said first mentioned check valves to positively retain one or the other closed whenever the pressure responsive element is moved theretowards in response to pressure in one delivery cavity which is greater by a predetermined amount than the pressure in the other delivery cavity.



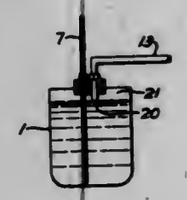
3,273,583
PRESSURE RELIEF VALVES
Sydney E. Carlton, 240 W. Hereford, Gladstone, Oreg.
Filed July 25, 1963, Ser. No. 297,507
4 Claims. (Cl. 137—112)

1. In a relief valve for mounting in the gate of a gate valve and operable in the closed position of said gate valve a body portion having a top and bottom, an axial bore extending through said body, an annular groove extending outwardly from said bore at substantially the plane of the mid-point, an inwardly directed groove on the exterior of said body member in the same plane as said annular groove, a transverse radial passage in said body connecting said grooves, a double headed piston mounted for axial slidable movement in said bore, said piston having an annular groove substantially at its mid-point said groove being substantially less in width than the annular groove of the bore dividing the piston into two, a transverse passage through each head adjacent the median groove and spaced from each other so that one of them is always in communication with the bore annular groove and said radial passage and an axial passage connecting the transverse passage with the exposed outer surfaces of each piston head.

3,273,584
BALANCED PRESSURE PUMP FOR LIQUID PETROLEUM FUEL
Kenneth K. Kennepohl, 46151 N. Sierra Highway, Lancaster, Calif.
Filed Feb. 3, 1964, Ser. No. 342,310
2 Claims. (Cl. 137—209)



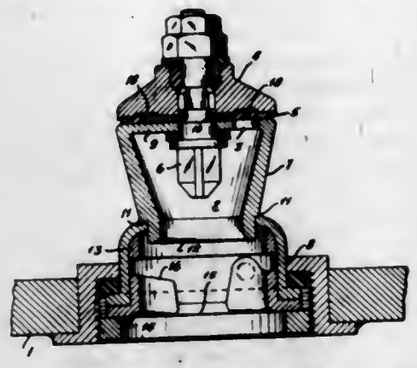
1. A liquid petroleum pump system comprising a supply tank having an upper level connection and a lower level connection, a consumer storage tank having an upper level connection and a lower level connection, a pump device intermediate said tanks and fuel conections from said supply tank through the pump device to the storage tank and from said storage tank through the pump device to the supply tank, said pump device comprising opposite hollow sections, a reciprocating element between said sections, one of said sections having a supply chamber on one side of said reciprocating element, and the other of said sections having a discharge chamber on the other side of said reciprocating element, a supply port to said supply chamber having an inflow check valve therein, an outflow port from said supply chamber having an outflow check valve therein, a discharge port to said discharge chamber having an inflow check valve therein, an exhaust port from said discharge chamber having an outflow check valve therein, a pump shaft member extending into said discharge chamber in reciprocating driving relationship with said reciprocating element, said fuel connections from the supply tank to the storage tank comprising a line from the lower level connection of the supply tank to the supply port of the supply chamber and a line from the outflow port of the supply chamber to the lower level connection of the storage tank, said fuel connections from the storage tank to the supply tank comprising a line from the upper level connection of the storage tank to the discharge port of exhaust chamber and a line from the exhaust port of the discharge chamber to the upper level connection of the supply tank, whereby to equalize pressures on opposite sides of the reciprocating element while said reciprocating element is reciprocated by said pump shaft during a pumping cycle.



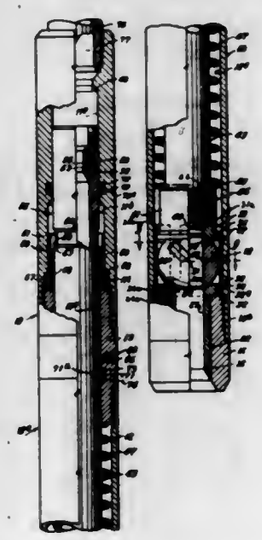
3,273,585
FLUSHING APPARATUS FOR DISPENSING FREEZERS
Robert S. Patch, Bainbridge Island, Wash., assignor to Sweden Freezer Manufacturing Co., a corporation of Washington
Filed Mar. 18, 1963, Ser. No. 265,939
4 Claims. (Cl. 137—240)

1. In combination, a dispensing freezer having a freezing chamber with a discharge opening, a lift valve for

selectively closing said opening, a drain tube, and hollow stopper means on said tube detachably fitting into said discharge opening and having a lift finger adapted to engage said valve and lifting it from closing position without blocking the drain tube whereby cleaning fluid in said chamber can be drained therefrom to a point remote from said discharge opening.



3,273,586
DETERGENT FEED SYSTEMS
Donald J. Killmeyer, Pittsburgh, Pa., assignor to Calgon Corporation, a corporation of Pennsylvania
Filed Feb. 24, 1964, Ser. No. 346,852
3 Claims. (Cl. 137—268)



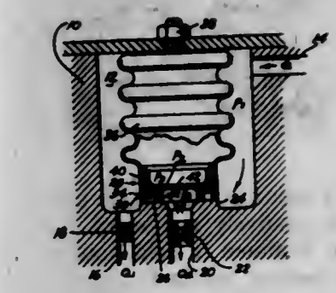
1. A granulated detergent package for automatic dispensing of detergent in solution comprising a rigid sealed container substantially filled with dry granulated detergent, a water inlet fixture on said container, an outlet fixture on the top of said container including a terminus in the interior of said container at a point on a horizontal plane such that when the container is upright, the volume above which plane is no greater than about one-sixth of the total volume of the container but which is sufficiently great when occupied by air to provide insulation for said fixtures from hot detergent solution and effective protection for the container seal from pressure shocks.

3,273,587
LAGER VALVE
Irwing F. Fausek, Clayton, and Robert F. Lamping, St. Louis County, Mo., assignors to Modern Engineering Company, St. Louis, Mo., a corporation of Missouri
Filed Dec. 26, 1963, Ser. No. 333,487
6 Claims. (Cl. 137—323)

4. In a lager valve having a stationary orifice surrounded by a seat area, a seal-holder cooperating with and movable relative to said orifice between a position whereat said orifice is closed and a position whereat said orifice is open, a seal movable with said seal-holder and maintained in contact with said seat during such movement; the improvement which comprises, a cavity between said seal-holder and said seal at the location which is aligned with said orifice when the valve is in its closed position.

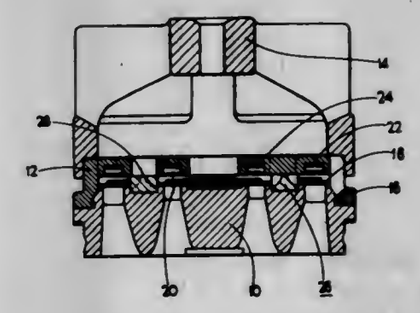
3,273,588
FLOW CONTROL VALVE FOR USE IN A WELL TUBING STRING
William W. Dollison, Dallas, Tex., assignor to Otis Engineering Corporation, Dallas, Tex., a corporation of Delaware
Continuation of application Ser. No. 328,157, Nov. 29, 1963, which is a continuation of application Ser. No. 100,667, Apr. 4, 1961. This application Apr. 7, 1965, Ser. No. 448,565
9 Claims. (Cl. 137—460)

1. A well flow control device for use in a well tubing string including: an elongate housing having a bore extending therethrough; means for connecting said housing in a well tubing string with the bore of said housing in alignment with the bore of said tubing string; a valve element having a passage extending longitudinally therethrough and mounted for movement longitudinally within said housing between a first position and a second position; seal means between said valve element and said tubular housing for sealing between said valve element and said housing whereby fluid flowing through said housing may pass only through said valve element passage; valve means mounted within said housing and operatively associated with said valve element for opening and closing said passage in accordance with the movement of said valve element, said valve means opening said passage when said valve element is in said first position, said valve means closing said passage when said valve element is in said second position; resilient means in said housing



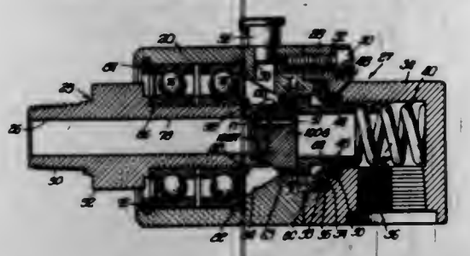
disposed about said valve element and engaging said housing and said valve element and biasing said valve element to said first position wherein said passage is open; a collet disposed about said valve element and mounted in fixed position relative to said housing; recess means on the exterior of said valve element, said collet having yieldable latch means engageable with said recess means on the exterior surface of said valve element with a force supplementing the force exerted on said valve element by said biasing means for releasably holding said valve element in said first position wherein said passage is open; and means restricting said passage of said valve element whereby a predetermined rate of fluid flow through said passage produces a differential pressure acting on said valve element with a force in excess of the force with which said biasing means and said yieldable latch means of said collet sleeve restrains said valve element in said first position to release said latch means and move said valve element from said first position to said second position with a sudden snap action, thereby operating said valve means for closing said passage.

3,273,589
LOW PRESSURE PILOT VALVE
William W. Dollison, 1441 Larchmont, and Donald F. Taylor, Jr., 3555 Vancouver, both of Dallas, Tex.
Filed Nov. 20, 1961, Ser. No. 154,394
9 Claims. (Cl. 137—495)



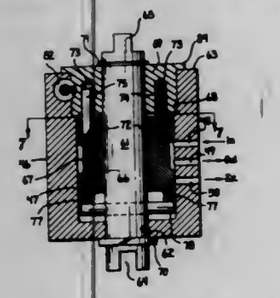
1. A pilot valve for use with a fluid pressure device having a passageway, a valve seat in said passageway and a ball check valve seatable on said valve seat by fluid pressure upstream of said valve seat, said pilot valve comprising: a housing having a bore therein closed at one end and open at the other end thereof, said housing being adapted to be connected to said fluid pressure device so that the open end of said bore is in fluid communication with said passageway downstream of said valve seat, a plunger disposed in said bore for axial movement between first and second positions therein, said plunger being adapted to engage said ball valve to unseat said ball check valve when said plunger is in its first position and to allow said ball check valve to be seated when said plunger is in its second position, first and second seal means sealing between said plunger and bore at spaced apart points adjacent said open and closed ends of said bore respectively, the area sealed by said first seal means being less than the area sealed by said second seal means, passage means fluidly communicating the open and closed ends of said bore, spring means for resiliently biasing said plunger to its second position, and means for venting said open end of said bore through said housing to atmosphere when said plunger is in its second position.

3,273,590
PRESSURE RESPONSIVE VALVE HAVING A UNIFORMLY PROGRESSIVE AND SMOOTH OPENING CHARACTERISTIC
Stephen G. Woodward, Elmira, N.Y., assignor to The Bendix Corporation, Elmira, N.Y., a corporation of Delaware
Filed June 4, 1964, Ser. No. 372,500
4 Claims. (Cl. 137—510)



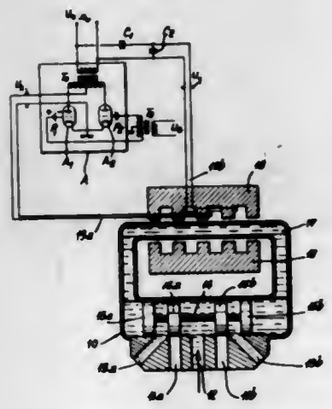
1. A fluid pressure responsive valve device comprising: a housing member having walls defining a fluid chamber, a fluid supply conduit connected to said housing for supplying an input fluid flow to said fluid chamber, a fluid outlet conduit connected to said housing, a valve member disposed within said fluid chamber for controlling fluid flow from said fluid chamber to said outlet conduit, said valve member having first and second annular radially-spaced valve lands forming an intermediate annular valve chamber therebetween, a bellows member having a first end fixedly secured to said housing, said bellows having a second free end connected to said valve member, first passage means formed in said valve member, fluidly connecting said annular valve chamber and the interior of said bellows, second passage means fluidly connecting said fluid outlet conduit and the interior of said bellows.

3,273,591
COMPRESSOR VALVE WITH REMOVABLE GUIDE MEANS
Warren A. Stewart, Easton, Pa., assignor, by mesne assignments, to Cooper Industries, Inc., a corporation of Ohio
Filed Jan. 21, 1964, Ser. No. 339,152
3 Claims. (Cl. 137—512.1)



1. A valve for compressors comprising a seat member, a guard member secured thereto,
flat annular valve discs disposed between said seat member and guard member,
and a separate guide member between said valve discs, said guide member being removably mounted partially within the seat member and having spaced portions respectively slidably engaging a periphery of said valve discs.

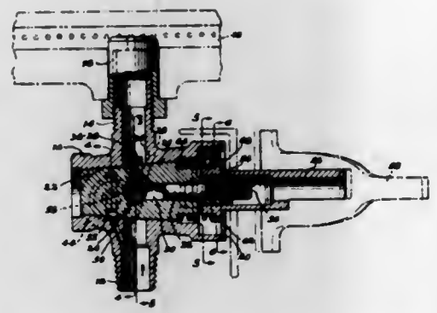
3,273,592
ROTATING UNION CONTROL VALVE
Louis H. Deubler, James A. Porter, and Maurice Thomas, Northbrook, Ill., assignors to Deublin Company, Northbrook, Ill., a corporation of Illinois
Filed Mar. 27, 1964, Ser. No. 355,398
4 Claims. (Cl. 137—624.13)



1. In a rotating union embodying a control valve, the combination of a relatively stationary housing, a rotor member rotatably mounted in said housing and projecting from one end thereof, means for coupling the projecting end of said rotor to a rotating driving device adapted to receive fluid conducted through said rotating union, a discharge passageway extending axially through said rotor member, a fluid inlet chamber in the other end of said stationary housing, and valve means for controlling the flow of fluid from said inlet chamber into the discharge passageway of said rotor member, said valve means comprising a rotatable valve disk mounted in said rotor to rotate therewith, a non-rotating valve disk mounted in said inlet chamber, a tubular carrier sleeve in said inlet chamber in which said non-rotating valve disk is mounted, means slidably supporting said carrier sleeve, a spring in said inlet chamber acting against said carrier sleeve to hold said non-rotating valve disk resiliently pressed against said rotatable valve disk, and valve ports in both of said disks operative to move into and out of registration by the relative rotation between said disks for controlling the flow of fluid from said inlet chamber to the discharge passageway through said rotor member.

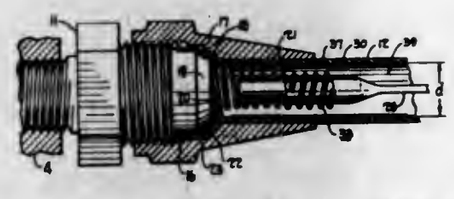
3,273,593
TIMER MECHANISM
Charles W. Kinsley, Indianapolis, Ind., assignor to Glass Machinery Inc., Indianapolis, Ind., a corporation of Indiana
Filed Aug. 26, 1964, Ser. No. 392,143
13 Claims. (Cl. 137—624.17)

1. For use with a fluid-actuated device having a first port and a second port, timed pilot valve means for controlling fluid flow to and from said ports comprising a first pilot valve including a portless rotor and shiftable means concentric with and non-rotatably driven by said rotor between a position connecting said first port with a source of fluid under pressure and a position connecting said first port with exhaust, and means operable during rotation of said rotor to adjust the phase relation of said shiftable means to said rotor by rotative adjustment of said shiftable means about the axis of said rotor, a second pilot valve including a second portless rotor and second shiftable means concentric with and non-rotatably driven by said second rotor between a position connecting said second port with a source of fluid under pressure and a position connecting said second port with exhaust, and means operable during rotation of said second rotor to adjust the phase relation of said second shiftable means to said second rotor by rotative adjustment of said second shiftable means about the axis of said second rotor, and means for driving said rotors at a fixed ratio of angular velocities.



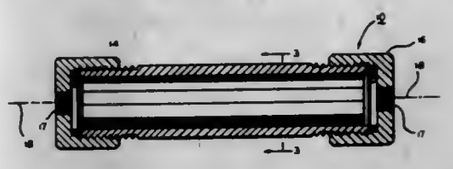
3,273,594
ELECTROHYDRAULIC ACTUATOR
Ferdy Mayer, Grenoble, France, assignor to Inventions Finance Corporation, a corporation of Delaware
Filed May 26, 1961, Ser. No. 112,915
Claims priority, application France, May 27, 1960, 4,249
3 Claims. (Cl. 137—625.66)

1. A fluid actuator comprising an electric motor fieldpiece, means feeding said fieldpiece with electric signals, a channel including a section extending in the immediate vicinity of said fieldpiece, liquid filling said channel, at least the liquid in said section of the channel being conductive and being subjected to a propelling action by the modifications in the field produced by the signals in said fieldpiece, means for varying the characteristics of said signals thereby to vary the strength of said field, and a slide member disposed in said channel for reciprocatory sliding movement and having opposite end portions communicating with the liquid in the channel on opposite sides of said fieldpiece, the cross-sectional area and configuration of said end portions being matched to the cross-sectional area and configuration of said section of said channel, so that said slide member reciprocates with a force and velocity matched to the optimum power fluid distribution conditions, when said conductive liquid reciprocates in said section of said channel under the optimum electric motor performance conditions.



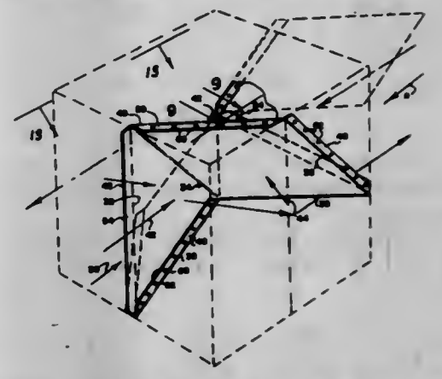
3,273,595
GAS FLOW CONTROL VALVE
Thomas A. Novak, Parma, Ohio, assignor to The W. J. Schoenberger Co., Cleveland, Ohio
Filed Mar. 4, 1964, Ser. No. 349,441
6 Claims. (Cl. 137—637.4)

1. A fuel gas flow control valve for a gas burner adapted to operate at "high" and "intermediate" and "low" heat settings, said valve including a body portion having a gas inlet port and a gas outlet port directionally aligned through said body, said body having a central bore intercommunicating said inlet and outlet ports, a pair of gas passageway grooves formed in said body to extend from said outlet port in opposite directions to diametrically opposed intake positions at the central bore wall intermediately of said inlet and outlet ports, a valve plug slipfitted into said central bore and being rotatable within said body about an axis transverse to the direction of alignment of said inlet and outlet ports, said plug having a transverse bore extending diametrically therethrough in open communicating relation with said inlet and outlet ports in one positional adjustment of said plug member, said plug having an axial bore intersecting and leading away from said transverse bore, a diagonal bore separate from said transverse bore leading into the interior of said plug from an inlet opening on the periphery of said plug rotatable into registry with said inlet port when said transverse bore is in open communication with one of said grooves and opening at its other end into said axial bore thereby providing a "low heat" gas supply orifice



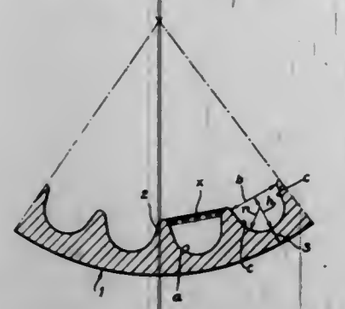
into said axial bore, a throttle valve member disposed in said axial bore and positionally displaceable therein in axial directions for variably throttling said orifice, a radial bore separate from said transverse bore and said diagonal bore leading into the interior of said plug from an inlet opening on the periphery of said plug rotatable into registry with said inlet port when said transverse bore is in open communication with the other of said grooves and opening at its other end into said transverse bore thereby providing an "intermediate heat" gas supply to said outlet port, and manual control means connected to said plug for rotating the latter in said body between valve fully off and "high heat" and "intermediate heat" and "low heat" positions.

3,273,596
HYDRAULIC PULSATION ABSORBER
Reginald W. Beckett, Elyria, Ohio; Mildred Jean Beckett, executrix of said Reginald W. Beckett, deceased
Filed Sept. 3, 1963, Ser. No. 306,243
7 Claims. (Cl. 138—30)



1. In a hydraulic system having a conduit having a diameter of the order of ⅜ to ½ inch and a pump connected to the conduit, operation of the pump producing sonic vibrations in the audible frequency range in the liquid and the conduit, a device for dampening said vibrations and rendering them substantially inaudible comprising a cushion member in the form of an elongated tube composed of a resilient deformable elastomeric material sealed at spaced points to provide a closed elongated cushioning chamber, said cushioning chamber containing a gas at approximately atmospheric pressure, the outer diameter of the tube being such as to provide a clearance between the exterior of the tubular cushion member and the interior of the conduit, and means for resiliently mounting the cushion member in the conduit adjacent the point of attachment of the conduit to the pump.

3,273,597
SURGE ARRESTOR
George W. Reznor, Mercer, Pa., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland
Filed Jan. 29, 1964, Ser. No. 341,040
3 Claims. (Cl. 138—30)



1. A surge arrestor adapted to be connected in a pressure line conducting a column of pulsating liquid for smoothing out the pulses in said column of liquid, said arrestor comprising a casing defined by a substantially hollow cylindrical member having an internal diameter substantially larger than the internal diameter of said pressure line, means closing the ends of said casing and affording means for connecting said casing into said pressure line with the longitudinal axis of said casing extending coincident with the axis of said pressure line, and a yielding capsule contained within said casing for absorbing the pulses of said column of liquid, said capsule being formed of a pair of spaced apart compliant membranes joined in spaced apart sealed relationship and having a quantity of compressible gas held therebetween, said capsule being coiled upon itself and confined in said coiled condition by the said casing and presenting in such coiled condition a passage for movement of said pulsing column of liquid and a large compliant surface to said liquid.

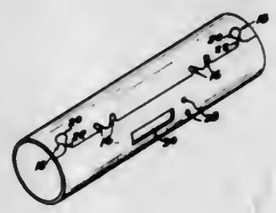
3,273,598
DUCT STRUCTURE
William H. Goettl, 4627 N. Granite Reef Road, Scottsdale, Ariz.
Filed Mar. 23, 1964, Ser. No. 353,842
8 Claims. (Cl. 138—37)

1. In a dual passage duct structure the combination of: a rectangular in cross section hollow duct structure having four sides and having two passages therein; a baffle separating said passages; first and second sheet metal baffle plates of said baffle; each of said baffle plates comprising a triangular section and a trapezoidal section; an edge of each trapezoidal section connected to an edge of each triangular section of each baffle plate; each trapezoidal section disposed at an angle to each triangular section of each baffle plate whereby said edge of each trapezoidal section is connected to a respective edge of each triangular section to provide a 90 degree twist in the baffle structure formed by the two plates; each triangular section being disposed at right angles to two opposite sides of said rectangular in cross section duct structure; one of said triangular portions of one of said plates being disposed at 90 degrees to a respective triangular portion of the other baffle plate.

3,273,599
INTERNALLY FINNED CONDENSER TUBE
Hermann Heeren, Nurnberg, Germany, assignor to Maschinenfabrik Augsburg-Nurnberg AG., Nurnberg, Germany
Filed Nov. 4, 1964, Ser. No. 408,975
Claims priority, application Germany, Nov. 9, 1963, M 58,859
1 Claim. (Cl. 138—38)

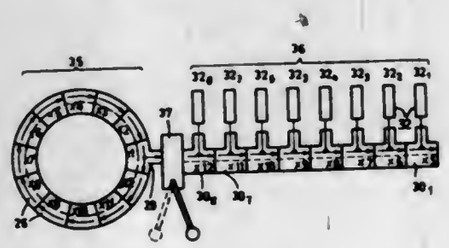
A water-cooled tube for a heat exchanger such as for condensing saturated steam comprising a tubular body having a generally cylindrical inner wall, a plurality of fins extending longitudinally of said body and projecting from said wall toward the interior of said body with grooves having circular arc bottoms lying between adjacent fins, and the distance b between the tips of adjacent fins and lying within the range of the line x of the interior water friction between adjacent fins is larger than the height h of line b above the lowest point in bottom a formed of an arc having a radius r, in which

$$\frac{b}{2r} > 1.0 < \frac{b}{h}$$



and straight sides for said grooves composed as tangents divergently extending from the circular arc bottoms to the tips of the fins, the tubular body being such that water freely flowing through the center of said body will pull the water flowing through said grooves substantially at the velocity of the freely flowing water despite the frictional resistance on the water in the grooves caused by the water-exposed surfaces in said grooves.

3,273,600
FLEXIBLE TUBE
Alfred H. Swan, Newport Beach, Calif., assignor to Air Reduction Company, Inc., Murray Hill, N.J., a corporation of New Jersey
Filed June 10, 1963, Ser. No. 286,826
4 Claims. (Cl. 138—122)



4. A flexible substantially nonshortening, smooth-bored tube, comprising:
(a) a plastic channel-shaped strip having a substantially flat web portion and a flexible flange along each of its lateral edges projecting outwardly generally transversely to said web, each of said flanges being adapted to flex angularly relative to said web portion,
(b) said strip being helically wound to form a tube defined by the edgewise abutment of the web portions of adjacent convolutions such that the adjacent flanges of said convoluted strip project radially outwardly from said tube and the confronting side faces of said flanges are contiguous along a helical seam therebetween,
(c) and sealing means extending in a helical path along the helical seam between the convolutions of said coiled strip linking the respective adjacent flanges,
(d) said sealing means comprising a flexible plastic strip overlapping the outer edges of said adjacent flanges, joined to the outer side faces of said flanges and leaving the contiguous side faces of said flanges free to move apart at their inner ends, upon the application of tension to said convoluted strip, to permit the adjacent webs of each convolution of said strip to separate by the angular flexing of said adjacent flanges while maintaining said convolute tube fluid tight.

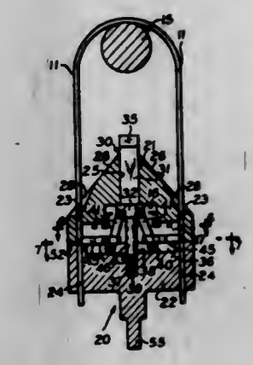
3,273,601
STAMPED TUBULAR PRODUCT AND METHOD OF MAKING THE SAME
William J. De Gain, Detroit, Mich., assignor to Koppy Tool & Die Company, Ferndale, Mich., a corporation of Michigan
Filed Apr. 4, 1963, Ser. No. 270,756
7 Claims. (Cl. 138—166)

1. A tube product comprising: a generally rectangular sheet bent in circular form so that a pair of opposed edges abut one another and form a seam; and a plurality of tab connectors closing the seam, each consisting of a male member extending from the edge forming one side of the seam and a complementary female opening in the edge forming the opposite side of the seam and each being of the type which resists separating motion in a direction parallel to the plane containing the edges of the sheet, a plurality of such tab connectors being of the type which may be closed by bringing the edges of the sheet toward one another in the direction of the plane of the sheet, and at least one tab connector, disposed adjacent to an end of the tube, being of the type which is closed by a motion in a direction perpendicular to the plane of the sheet.

3,273,602
MEANS AND METHOD FOR UNWEAVING IN WAVE WEAVING LOOMS
Heinrich Fend, Regensdorf, Zurich, Switzerland, assignor to Verwaltungsgesellschaft der Werkzeugmaschinenfabrik Oerlikon, Zurich, Switzerland
Filed Oct. 12, 1964, Ser. No. 403,195
Claims priority, application Switzerland, Oct. 14, 1963, 12,599/63
19 Claims. (Cl. 139—1)

1. In a wave weaving loom, a plurality of shuttles weaving simultaneously, a controllable program storage mechanism for controlling harness motion, a harness change mechanism operably connected with said program storage mechanism, a transmission device capable of being switched-in between said program storage mechanism and said harness change mechanism for prolonging a program for controlling harness motion a number of repetitions equal to the number of shuttles employed during weaving.

3,273,603
DEVICE FOR OPERATING LOOM SHEARS
José Lladó Lladó, Calle Jorge Girona Salgado 12, Barcelona, Spain
Filed June 15, 1964, Ser. No. 375,162
Claims priority, application Spain, June 18, 1963, 289,437
3 Claims. (Cl. 139—127)

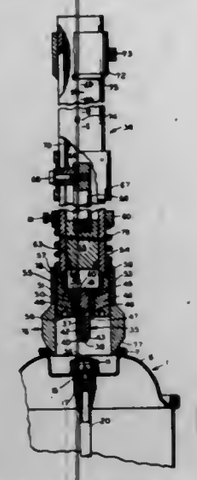


1. In a loom having a stationary frame, a reciprocating slay and shear means for the weft yarn, carried by said slay, a device operating said shear means comprising a first support member secured to said frame in adjustable relation to said slay, a second support member secured to said first support member for vertical adjustment, said second support member being provided with an angular slot, a roller movable in said slot, and a lever attached to said roller and actuating said shear means in synchronism with the movement of the slay so as to effect the cutting operation when the slay has beaten up the yarn.

3,273,604
SHUTTLE BOXES FOR LOOMS FOR WEAVING
Wallace R. Brooksbank, Embsay Tannery, Skipton, England
Filed Jan. 27, 1964, Ser. No. 340,468
Claims priority, application Great Britain, Feb. 5, 1963, 4,752/63
5 Claims. (Cl. 139—183)

1. A shuttle box for looms having an open mouth adapted to receive a shuttle, and means for braking a shuttle propelled into the box through said open mouth comprising two brake lining support members extending in opposed side-by-side spaced relation toward said mouth, at least one of said support members having a one-piece, continuous brake lining strip formed of shuttle braking material, said strip being treated at the open end of said mouth with a first wax having a relatively high melting point to provide a hard impact-resistant surface adjacent said shuttle box mouth, said strip being further treated over the remainder of its length with a second wax having a lower melting point than said first wax to provide a braking surface that is more flexible and less hard than said impact-resistant surface.

3,273,605
STAPLE TWISTER
Daniel A. Ferrara, Jr., New Rochelle, N.Y., assignor to Ferrara Industries, New York, N.Y., a partnership of New York
Filed July 8, 1963, Ser. No. 293,505
7 Claims. (Cl. 140—93.6)

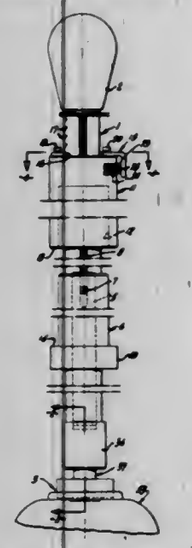


1. Apparatus for twisting together a pair of wires, such as the legs of a staple comprising, in combination, a body arranged for driving connection to a power tool for rotation by the latter; said body being formed with a pair of relatively elongated rectilinear bores substantially parallel to its axis of rotation and disposed on either side thereof for receiving the legs of a stable for twisting of the legs for rotation of said body; latch means in said body in association with said bores and operable automatically, responsive to insertion of staple legs into said bores, to latch the staple legs against withdrawal; cam means in said body normally maintaining said means in the automatic latching position; and an operator projecting axially from said body for engagement with the twisted portion of the staple legs and operatively associated with said cam means, said operator, responsive to a pre-selected twisting of the staple legs, operating said cam means to release said latch means for movement to a position releasing the staple legs for withdrawal; said body being formed with a recess extending diametrically of its axis of rotation and intersecting each of said bores; said latch means comprising a pair of relatively elongated latch bars disposed in said recess and pivoted intermediate their ends to said body, the latching ends of said bars intersecting said bores; said cam means being disposed in said recess normally in engagement with said bars and preventing rotation of the latter in a staple leg releasing direction.

3,273,606
METHOD AND APPARATUS FOR PACKAGING PAINT AND THE LIKE IN A PRESSURIZED DISPENSING CONTAINER
Paul J. O'Neill, Jr., Terra Linda, Calif, assignor to Union Machine Company, San Francisco, Calif.
Filed Oct. 29, 1962, Ser. No. 233,721
7 Claims. (Cl. 141—3)

1. The method of packaging a paint, which includes a base paint and a colorant, within a pressurized dispensing container having a discharge valve adapted to be opened to discharge the contents thereof, comprising the steps of:
providing a propellant and a base paint under pressure within said container, and thereafter discharging a

charge of colorant under pressure through said discharge valve into said container and simultaneously



preventing escape of fluid from said container during such discharge.

3,273,607
METHOD AND APPARATUS FOR PACKAGING PAINT AND THE LIKE IN A PRESSURIZED DISPENSING CONTAINER

Paul J. O'Neill, Jr., Terra Linda, Calif., assignor to Union Machine Company, San Francisco, Calif., a corporation of California

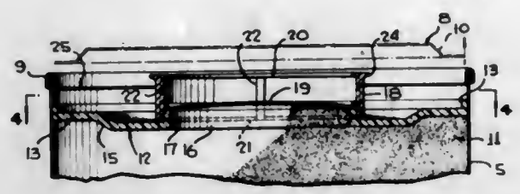
Filed June 16, 1964, Ser. No. 375,563
7 Claims. (Cl. 141—3)

1. The method of packaging a paint, which includes a base paint and a colorant, within a pressurized dispensing container having a discharge valve adapted to be opened to discharge the contents thereof, comprising the steps of:

providing a colorant under pressure within a closed vessel,

connecting said vessel with a colorant gun and injecting a measured quantity of colorant into said gun from said vessel by the internal pressure of said vessel,

providing a propellant and a base paint under pressure within said container,



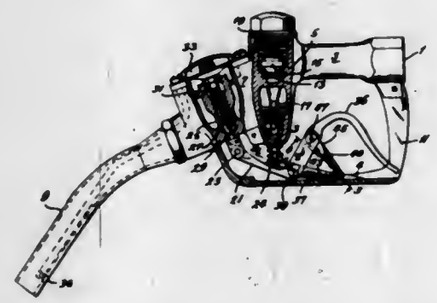
connecting said gun with the discharge valve of said container and discharging said measured quantity of colorant into said container through said discharge valve, and simultaneously preventing escape of fluid from said container,

and thereafter discharging a measured quantity of a drier into said container while the latter is still pressurized.

3,273,608
DISPENSING CONTAINER FOR SHORTENING OR THE LIKE

Henry E. Frankenberg, Berwyn, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York

Filed Dec. 16, 1963, Ser. No. 331,016
15 Claims. (Cl. 141—27)

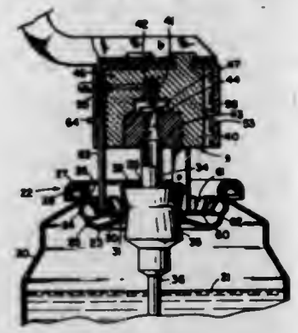


1. A self-contained dispensing container for fill such as shortening or the like comprising a body, a top closure, and a dispensing follower slidably mounted in the body and adapted to engage over fill beneath said top closure and having a dispensing opening therethrough so that upon removal of the top closure on a filled container and application of pressure downward on said follower the follower will press downward on the fill and force some thereof upwardly through the opening, said follower having means therein entirely in underlying relation to said closure, for measuring quantities of fill thus displaced upwardly through the follower opening.

3,273,609
DISPENSING NOZZLE HOLD-OPEN CATCH

Mervin L. Carder and Hazel L. Sutcliffe, Kirkwood, Mo., assignors to Husky Corporation, Kirkwood, Mo., a corporation of Missouri

Filed Aug. 24, 1964, Ser. No. 391,695
15 Claims. (Cl. 141—206)



1. An automatic shut-off nozzle for delivering liquid to a tank, comprising a body having a liquid conduit therethrough, a discharge spout, a control valve in the conduit, a spring urging said valve into closed position, a manually operable lever for opposing the thrust of said spring and thereby opening said valve, a fulcrum for said lever carried by said body and permitted to be released for movement away from said body when the tank is filled, guard means rigid with said body and disposed on the opposite side of said lever from said valve, a ratchet arm pivoted to a portion of said lever remote from said fulcrum and supported at its free end on a portion of said structure, a pawl pivoted to a portion of said lever more remote from said fulcrum than said ratchet arm pivot and having its free end selectively engageable with said ratchet arm, spring means interposed between said body and said lever intermediate said fulcrum and said ratchet arm pivot and biasing said lever away from said valve spring opposing position whereby, when said fulcrum is released, to cause said lever to pivot about said ratchet arm pivot and lift said pawl out of hooked engagement with said ratchet.

3,273,610
VALVED PRESSURIZED FLUID DISPENSING RECEPTACLE WITH RECEPTACLE-ATTACHED FITTING

John W. Frost, 512 E. Parkway Blvd., Appleton, Wis.

Continuation of application Ser. No. 129,816, Aug. 7, 1961. This application Apr. 16, 1964, Ser. No. 363,046
5 Claims. (Cl. 141—353)

1. In a device comprising a pressurized valved receptacle having a valve and containing fluid under pressure and an appliance for dispensing said fluid and utilizing the potential energy stored in said fluid by reason of said pressurization;

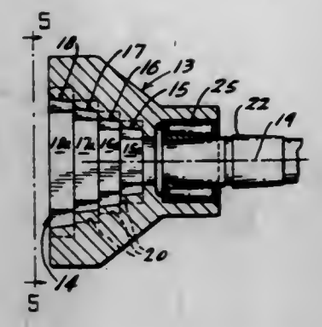
wherein said receptacle comprises a dished metal closure member having a horizontally-extending annular bottom, an outer circular portion extending upwardly from the outer edge of said annular bottom and extending inwardly at its upper portion to terminate at its upper peripheral portion with a crimped seal to the body of said receptacle, an inner portion extending upwardly from the inner edge of said annular bottom, a substantially annular top portion on said inner portion having a hole in the center thereof through which a tubular member extends, said fluid being dispensed through said tubular member;

apparatus to maintain said receptacle in engaged relation with said appliance and open the valve in said receptacle;

said apparatus comprising a substantially annular member surrounding said inner upwardly extending portion and lying against said bottom, a plurality of members extending diagonally outward and upward from the outer periphery of said annular member into the metal of said outer circular portion, and a plurality of members extending upwardly from the outer periphery of said annular member and thence substantially horizontally;

and, as a part of said appliance, a receiver having an outer wall and an inner wall defining a space therewithin, tube means extending from said appliance through said inner wall, an orifice member in said receiver, said orifice member having an orifice communicating with said space in said receiver and communicatingly engaged with the interior of said receptacle through said hole in said annular top portion;

said orifice member depressing said tubular member to open said valve in said receptacle;



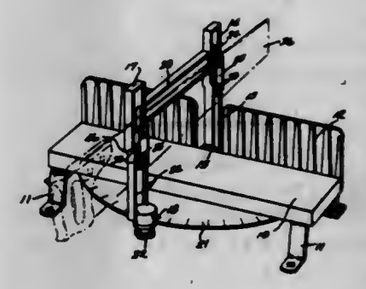
and a substantially circular downward extending member attached to said receiver and provided with a plurality of surfaces equal in number and spacing to the said portions extending upwardly and outwardly from said annular member, each of said surfaces having a beginning and an end and extending in an arc around the axes of said orifices and extending upward from its beginning to its end;

each of said surfaces being engaged by the horizontally extending portion of one of said upwardly and horizontally extending portions.

3,273,611
LATHE CENTERS

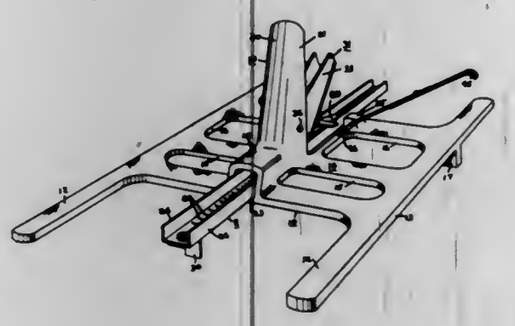
Frederick M. Haggvist, Toledo, and Arthur E. Van Epps, Dayton, Ohio, assignors to The Freeman Supply Company, Toledo, Ohio, a corporation of Ohio

Filed July 13, 1964, Ser. No. 382,059
4 Claims. (Cl. 142—53)



1. Self-centering lathe centers for square stock comprising: a pair of heads having longitudinally extending axes, each of said heads having an axially extending shaft extending from one end thereof, the end of each of said heads opposite said shaft having an outwardly stepped recess comprising a plurality of generally pyramidal-shaped stepped portions, each of which has at least four side abutment surfaces equally spaced from said axis, said abutment surfaces being tapered outwardly, the shaft on one of said heads being rigidly attached to said one of said heads and being adapted to be centered in the head stock of a lathe, and the shaft on the other of said heads being journaled in said other head for support by the tail stock of said lathe, whereby stock having flat sides is automatically centered when one end is wedged in one of said heads and the other of said heads is wedged upon the other end of the stock.

3,273,612
MITER BOX WITH MAGNETIC SAW GUIDES



Burton G. Keddie, Brookfield, Wis., assignor to Hempe Manufacturing Company, Inc., Milwaukee, Wis., a corporation of Wisconsin

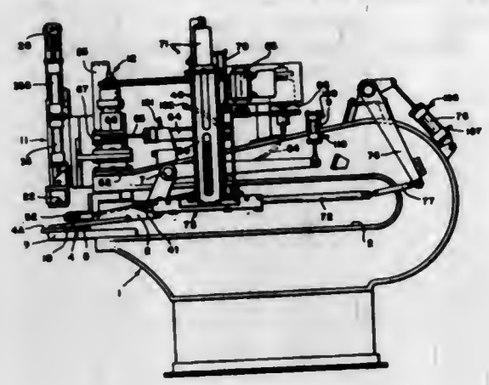
Filed Jan. 10, 1964, Ser. No. 337,027
12 Claims. (Cl. 143—89)

1. A miter box having a work table, front and rear saw blade guide supports, saw blade guides mounted on said supports, said saw blade guides comprising channel-shaped ferromagnetic pole pieces having laterally spaced vertically elongated flanges which constitute parallel magnetic poles and a block of permanent magnetic material between said flanges to energize said poles, said vertically elongated flanges providing magnetic attraction for a saw blade in various positions of vertical adjustment thereof.

3,273,613
PORTABLE SAW GUIDE AND WORK HOLDER
Aaron Sanford Craven, Jr., 505 Independence Ave., Philadelphia, Pa.
Filed May 18, 1964, Ser. No. 367,971
12 Claims. (Cl. 143—167)

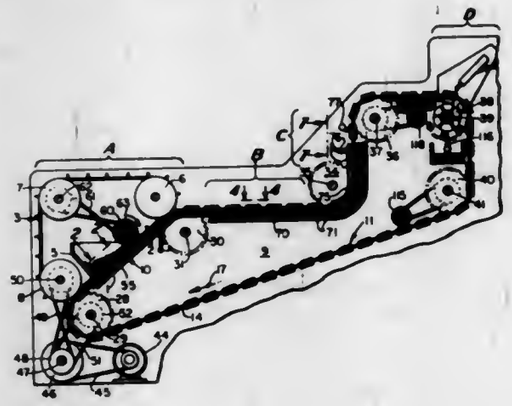
1. A portable saw guide and work holder device adapted for quick securement to and detachment from a work piece, comprising in combination,

(a) a main body having a substantially planar undersurface adapted to seat downward flatwise upon the work piece and from which depends a pair of laterally spaced apart alignment stops adapted to simultaneously engage one edge of the work piece, at least one outer edge of said main body extending rectilinearly longitudinally at a right angle to the straight line extending between the points of engagement of said alignment stops with the work piece,



(b) an elongated rack member carried by said main body above the planar undersurface of the latter and being shiftable longitudinally thereof between the said spaced apart alignment stops, said rack member having a clamping stop depending from the end thereof remote from said alignment stops and projecting downward below the undersurface of said main body,

(c) a handgrip extending upward from said main body by means of which said device may be grasped by one hand and readily positioned as desired with respect to the work piece,



(d) rack member driving means engaged with said rack member and effective when actuated to drive said rack member longitudinally of said main body to advance said clamping stop toward said alignment stops until the work piece is clamped therebetween, said rack member driving means being carried by said handgrip and including actuating means grippable simultaneously with said handgrip and operable to drive said rack member as aforesaid when so gripped.

3,273,614
METHOD AND MEANS FOR PATCHING ASSEMBLED PLYWOOD PANELS
Per Olof Skoog, P.O. Box 102, Olympia, Wash.
Filed June 27, 1961, Ser. No. 119,978
17 Claims. (Cl. 144—310)

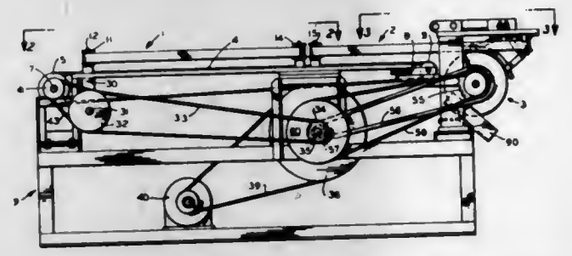
16. The method of patching the surface portion of a piece of building material having a defect thereon, comprising: (1) positioning a routing means over said defect and removing said defect by routing out a recess in the outer surface of said material, (2) generally simultaneously with said routing operation forming a mating patch for said recess with a patch forming means at a point located away from but in close proximity to said routing operation, (3) upon completion of said routing and patch forming steps transferring said routing means away from and transferring said mating patch over said recess in said patch forming means so that said patch forming means also acts as a hold means for said mating patch, and (4) employing a portion of said patch forming means to deliver said patch to said recess.

3,273,615
APPARATUS FOR ORIENTING FRUIT HAVING STEMS, AND FOR PITTING SAID FRUIT
Henry Aguilar, 1309 27th Ave., San Francisco, Calif.
Original application Jan. 30, 1963, Ser. No. 255,016, now Patent No. 3,212,545, dated Oct. 19, 1965. Divided and this application Aug. 5, 1965, Ser. No. 477,433
10 Claims. (Cl. 146—19)

4. A machine for orienting and pitting drupe bodies, such as cherries having stems projecting from a side thereof;

(a) supporting means for supporting a plurality of said drupe bodies for movement thereover in one direction in a generally horizontally extending path of travel;

(b) drupe moving means supported over said supporting means in a position for engagement with drupes on the latter, and for movement over said supporting means in one direction for rolling such drupes thereon in said one direction, and means connected with said drupe moving means for so moving the latter;



(c) guide means engageable with the stem on each drupe during rolling of said drupes by said drupe moving means for guiding the stem on each drupe to a position generally trailing each drupe;

(d) pit engaging and ejecting means supported for reciprocable movement through each drupe when the latter is engaged by said drupe moving means and when said stem is in trailing relation to said drupe for ejecting each pit from each drupe;

(e) means so supporting said pit engaging and ejecting means;

(f) means connected with said pit engaging and ejecting means actuated by engagement with and movement of said drupe moving means for so reciprocating said pit engaging and ejecting means.

3,273,616
FREESTONE DRUPE PITTER
Carl T. Petersen, Lafayette, Calif., assignor to Filper Corporation, San Ramon, Calif., a corporation of California
Filed Apr. 7, 1965, Ser. No. 446,279
5 Claims. (Cl. 146—28)

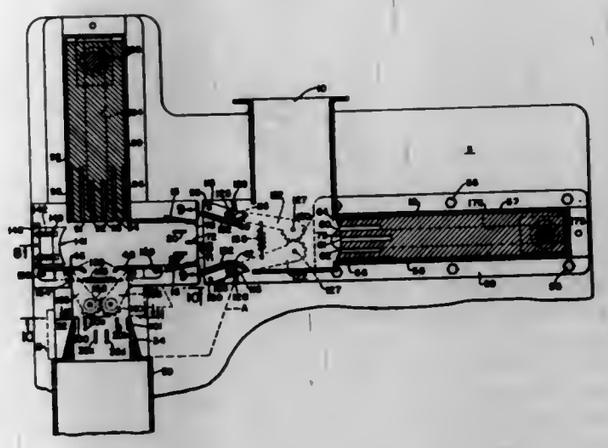
1. In a freestone drupe halver and pitter, the combination of:

(a) a pair of annular, horizontally disposed, coaxial, members supported for rotation in one direction about their common axis;

(b) means supporting said members for such rotation;

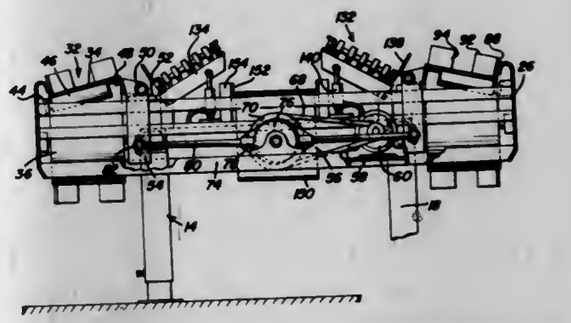
(c) means connected with said members for rotating them simultaneously in said one direction;

(d) the outer peripheral surfaces of said members being bevelled toward their adjacent sides to coact for forming a generally V-shaped seat on the uppermost sides of said members for supporting a whole drupe thereon at spaced points generally at opposite sides of the pit therein;



(e) a disc coaxial with said annular members disposed between the latter and supported for rotation thereof in the same direction as the direction of rotation of said annular members;

(f) means connected with said disc for rotating the latter in said one direction at a substantially higher rate of rotation than the rate of rotation of said members;

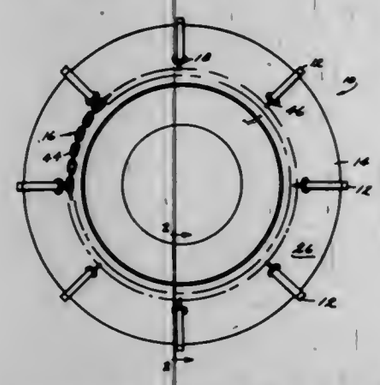


(g) circumferentially spaced portions of the peripheral outer edge of said disc projecting radially outwardly of the adjacent closest portion of said bevelled surfaces and having circumferentially facing surfaces facing in the direction of rotation of said disc and extending radially outwardly a sufficient distance to engage the trailing end of a pit in a whole drupe supported on said bevelled surfaces for moving such pit out of the leading end of said drupe.

3,273,617
HIGH SPEED MECHANISM FOR SEGMENTING CRINKLE CUT VEGETABLES
Frank G. Lamb, Lake Oswego, Oreg., assignor to Lamb-Weston, Inc., Portland, Oreg., a corporation of Oregon
Filed Jan. 24, 1964, Ser. No. 339,967
8 Claims. (Cl. 146—78)

1. In a high speed vegetable cutting mechanism for continuously and sequentially segmenting a vegetable product into center cut portions, the combination comprising: a first series of cutting elements mounted in one direction for removal of all but two slabs of said product and for segmenting said product into a plurality of center segments, a second series of cutting elements mounted in a direction at right angles to said one direction to remove said two slabs and for segmenting said slabs into a plurality of elongated center cuts, the segmenting cutting elements of each of said first and second series being mounted in at least two different planes with respect to said one direction and said direction at right angles, respectively, and a means for each stage to push said product therethrough, said means comprising a reciprocating plunger having slots in the product-contacting end thereof to accommodate said cutting elements, and means for separately discharging said slabs and said center cuts.

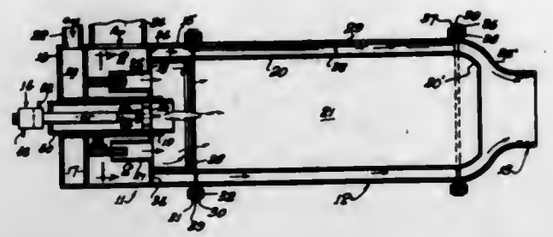
3,273,618
ASPARAGUS TRIMMER
John F. Flodin, Sunnyside, Wash., assignor to Flodin Inc., a corporation of Washington
Filed Feb. 26, 1964, Ser. No. 347,439
7 Claims. (Cl. 146—81)



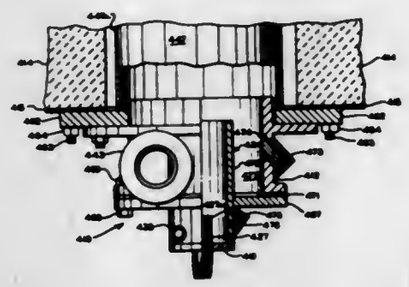
2. A machine for handling and trimming asparagus or similar articles comprising, an elongated support extending between a container loading station and an article severing station, container return means mounted by the support for continuously conveying unloaded containers toward the loading station, a pair of container supporting conveyors disposed on opposite longitudinal sides of the container return means adapted to convey loaded containers from the loading station toward the severing station, means mounting said container supporting conveyors in transversely tilted positions to facilitate removal of articles in the loaded containers from opposite longitudinal sides of the support, a pair of endless belts mounted along said opposite longitudinal sides of the support for easy removal, compartment means mounted on said belts for positioning articles transferred thereto from the loaded containers, means continuously moving said belts in transversely tilted condition along the container supporting conveyors toward the severing station, and severing means operatively mounted by the support at the severing station for cutting articles positioned in the compartment means.

3,273,619
ANTI-STEALING SAFETY DEVICE FOR PURSES
Walter Marini de Azevedo, Rua Buarque de Macedo, 28, Apt. 6, Rio de Janeiro, Brazil
Filed Jan. 23, 1964, Ser. No. 339,710
Claims priority, application Brazil, Feb. 22, 1963, 147,190
6 Claims. (Cl. 150—47)

1. A safety device for a purse and the like comprising a base element, a guide rail element mounted on said base element securing said base element to the material of said purse, guide rails upon said guide rail element at opposite sides thereof, a needle loosely mounted upon said guide rail element, a slide sliding upon said guide rails having an aperture therein through which said needle extends when said slide is displaced by gravity in one direction along said guide rails and which covers said needle when located in the opposite direction, said slide forming the sole means for retaining said needle on said guide rail element.



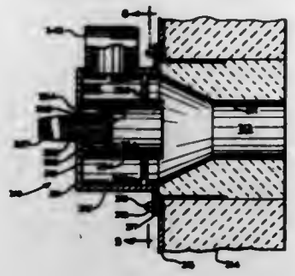
3,273,620
TIRE CHAINS
James T. Phillips and George D. Phillips, both of Rte. 2, Southwood Drive, Gastonia, N.C.
Filed Aug. 14, 1964, Ser. No. 389,625
1 Claim. (Cl. 152—228)



A traction device for a vehicle tire comprising a plurality of high molecular weight polyethylene traction elements adapted to be disposed transversely over the periphery of a vehicle tire, said polyethylene having a density of at least 0.94 and a molecular weight of at least 800,000, attaching means for securing said traction elements to said tire and means connecting said traction elements to said attaching means.

3,273,621
BURNER ASSEMBLY
Herman T. Childree, Cason, Tex., assignor to General Dynamics Corporation, Pomona, Calif., a corporation of Delaware
Filed July 20, 1964, Ser. No. 383,564
10 Claims. (Cl. 158—7)

1. A burner assembly comprising a mixing section, a combustion section, a nozzle section and a pilot burner; said mixing section including a fuel manifold, an air manifold, a fuel inlet means operatively connected to said fuel manifold, an air inlet means operatively connected to said air manifold, nozzle means operatively attached to said fuel manifold, nozzle means operatively attached to said air manifold, said air nozzle means extending into said air manifold in a direction toward said fuel nozzle means while providing communication between said air manifold and said combustion section, said fuel nozzle means extending partially through said air nozzle means for discharging fuel thereinto; said combustion section including a combustion chamber operatively connected to said mixing section and said nozzle section, a turbulence creating means positioned in said combustion chamber, and cooling means operatively associated with said combustion chamber and said nozzle section; said pilot burner including means for supplying air and fuel thereto and an ignitor/flame rod assembly therefor.

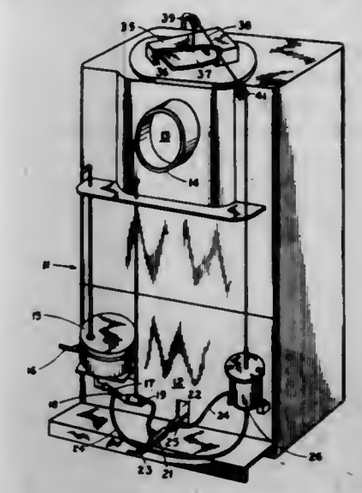


3,273,622
SELF-STABILIZING COMBUSTION APPARATUS
John D. Nesbitt, Toledo, Ohio, assignor to Midland-Ross Corporation, Toledo, Ohio, a corporation of Ohio
Original application June 7, 1965, Ser. No. 473,267, now Patent No. 3,244,219, dated Apr. 5, 1966, which is a division of application Ser. No. 102,316, filed Apr. 11, 1961. Divided and this application Nov. 8, 1965, Ser. No. 516,817
2 Claims. (Cl. 158—7)

1. Self-stabilizing burner apparatus for heating a tubular element comprising, in combination: wall means including a backplate forming a substantially cylindrical combustion chamber having an inlet end and an exit end, said chamber being in fluid communication with said tubular element; a burner body circumposing the exit end of said combustion chamber and forming therewith an annulus in fluid communication with said tubular element; fuel pipe means for delivering a stream of fuel substantially axially to said combustion chamber, said fuel pipe means having an outlet end disposed within said combustion chamber somewhat downstream from the backplate thereof; first air inlet pipe means for delivering a stream of air to said combustion chamber, said first air inlet pipe means being disposed tangentially to said combustion chamber and perpendicularly to the axis thereof and being disposed intermediate said backplate and the outlet end of said fuel pipe means; and second air inlet pipe means for delivering a stream of air to said annulus, said second air inlet pipe means being disposed substantially perpendicularly to the axis of said combustion chamber.

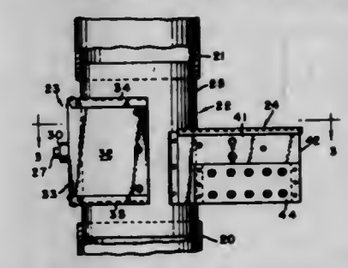
3,273,623
SELF-STABILIZING COMBUSTION APPARATUS
John D. Nesbitt, Toledo, Ohio, assignor to Midland-Ross Corporation, Toledo, Ohio, a corporation of Ohio
Application June 7, 1965, Ser. No. 473,267, now Patent No. 3,244,219, dated Apr. 5, 1966, which is a division of application Ser. No. 102,316, Apr. 11, 1961. Divided and this application Nov. 3, 1965, Ser. No. 516,818
2 Claims. (Cl. 158—7)

1. Self-stabilizing burner apparatus comprising, in combination: wall means including a backplate forming a substantially cylindrical combustion chamber having an inlet end and an exit end; wall means forming a burner body circumposing said combustion chamber and forming an annular chamber therewith; a refractory tunnel block having a tunnel in fluid communication with said combustion chamber and said annular chamber; a fuel inlet pipe for delivering a stream of fuel substantially axially to said combustion chamber, said pipe having an outlet end disposed within said combustion chamber at a point somewhat downstream from the backplate thereof; an air inlet connection for delivering a stream of air to said annular chamber; air inlet conduit means extending from said combustion chamber to said annular chamber for delivering a portion of said stream of air from said annular chamber to said combustion chamber for combusting a portion of said stream of fuel, said air inlet conduit means being disposed tangentially to said combustion chamber and perpendicularly to the axis thereof and being disposed upstream from the outlet end of said fuel inlet pipe; and a restricted orifice disposed within said annular chamber being adapted to restrict the flow of the remaining portion of the stream of air from said annular chamber to said tunnel, thereby causing the remaining portion of the air stream and the uncombusted portion of the stream of fuel to mix rapidly in said tunnel.



3,273,624
THERMOSTATIC LIQUID FUEL CONTROL DEVICE FOR FURNACES
John D. Webster, Norfolk, Va., assignor of three-twentieths to Joseph M. Carson, Jr., and three-twentieths to Grover C. Outland, both of Norfolk, Va.
Filed Sept. 25, 1964, Ser. No. 399,324
14 Claims. (Cl. 158—28)

1. A liquid fuel control device connectible to a furnace of the type having a fuel supply main conduit interconnecting a supply of fuel and said furnace and having a feeder valve mounted in said fuel supply main conduit, comprising:

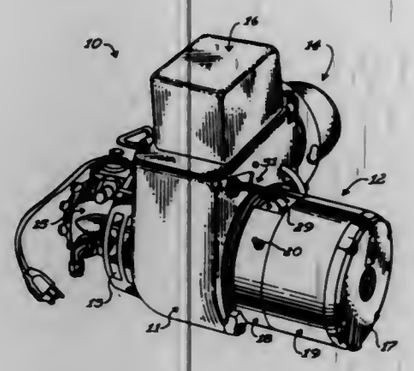


(A) a bypass conduit having its respective ends adapted to be connected to said main conduit before and after said feeder valve;

(B) a dispenser valve mounted in said bypass conduit, said dispenser valve including a spring actuated plunger movable between a position obstructing the flow of fuel through said bypass conduit to a position permitting the flow of fuel through said bypass conduit, said spring urging said plunger into said position obstructing the flow of fuel through said bypass conduit; and

(C) a heat-responsive dispenser valve actuator, including a metallic plate adapted to be supported upon said furnace and connected to said dispenser valve plunger via cable means, said plunger being movable against the action of said spring to said position permitting the flow of fuel through said bypass conduit as said metallic plate flexes in response to firing of said furnace.

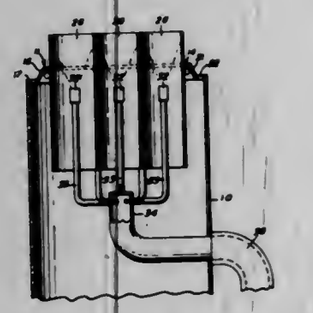
3,273,625
STACK DAMPER AND CONTROL ASSEMBLY FOR FURNACES
Paul R. Holtzman, 200 S. Railroad St., and Allen B. Holtzman, Rte. 3, both of Myerstown, Pa.
Filed Aug. 3, 1965, Ser. No. 476,954
4 Claims. (Cl. 158—28)



1. A stack damper and control assembly for a furnace equipped with a stack, a burner motor and burner motor control unit; the assembly including a damper unit interposed between the furnace and stack, the damper unit comprising a damper cylinder, a disk-shaped damper within said cylinder, a rectilinear operating shaft mounted in said cylinder, said damper being diametrically fixed to said operating shaft, and a damper control unit operatively connected to said damper unit, the damper control unit including unidirectional, low speed, high torque motor means in direct engagement with the operating shaft of said damper unit, switch means on said damper control unit in circuit with the burner control unit and the burner motor, and switch-actuating means mounted on said operating shaft and rotatable therewith, for operating said switch means at predetermined intervals.

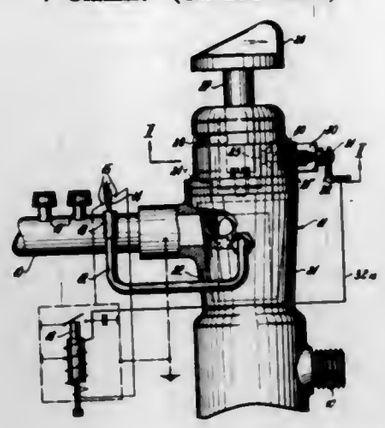
3,273,626
BURNER CONTROL SYSTEM
Richard W. Brown, Excelsior, Minn, assignor to Honeywell Inc., Minneapolis, Minn., a corporation of Delaware
Filed Feb. 19, 1965, Ser. No. 433,851
13 Claims. (Cl. 158—28)

1. In an oil burner system in which an oil pump is rotated by the rotor of an electric motor having a run actuator to provide running torque and a start actuator to aid the run actuator in providing a high starting torque which is necessary to institute rotation of the rotor;



a time delayed temperature responsive switch mounted to be responsive to the ambient temperature of the motor, and having a single electrically energizable actuator electrically connected in circuit with the run and start actuator to be responsive to the electrical current drawn by the motor,

and a fast-acting electric flame detector including a flame relay having a normally closed no-flame switch connected in series with only the start actuator to de-energize the start actuator upon detection of flame,

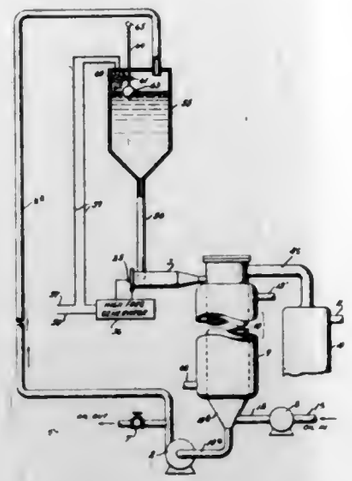


to provide oil burner safety cutout action by operation of the temperature responsive switch in respone to the electrical current drawn by the motor in the event of failure to sense the establishment of flame, to prevent start of the motor and subsequently to provide oil burner safety cutout action in response to the locked rotor current of the motor in the event of the false sensing of flame during a standby period, and to provide motor protection in the event of an abnormally high motor ambient temperature.

3,273,627
FLARE STACK BURNER ASSEMBLY
John Smith Zink, Hershel Goodnight, and Robert D. Reed, Tulsa, Okla., assignors to John Zink Company, Tulsa, Okla., a corporation of Delaware
Filed Mar. 16, 1965, Ser. No. 440,216
7 Claims. (Cl. 158—99)

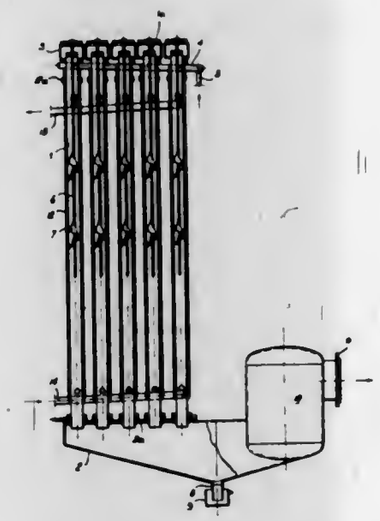
1. In a flare stack burner, an elongated vertically disposed tube for guiding a combustible gas for upward movement therein, a burner tip at the upper end of said tube having a central opening for the escape of said gas, partition means within said central opening through which a portion of gas may escape, means for discharging water droplets into the gas within said partition means, and means providing for ignition and combustion of that portion of the gas escaping from the stack exteriorly of said partition means and which is shielded from the water droplets.

3,273,628
INTERRELATED GAS VALVE AND MANUAL IGNITER CONTROL
Heinrich Puttfarcken, Wernau (Neckar), Germany, assignor to Junkers & Co., G.m.b.H., Wernau (Neckar), Germany
Filed Dec. 3, 1963, Ser. No. 327,695
Claims priority, application Germany, Dec. 3, 1962, J 22,756
7 Claims. (Cl. 158—115)



1. In a gas burning apparatus, in combination, a gas supply conduit; a first and a second burner communicating with said conduit, said burners being sufficiently close to each other so that ignition of one burner results in automatic ignition of the other burner; a valve provided in said conduit upstream of said burners, said valve comprising a housing and a valve member being movable in said housing between a first position, a second position and a third position in which said valve respectively prevents flow of gas to both of said burners, permits flow of gas to said one burner, and permits flow of gas at least to said other burner; and a control circuit including a hand-powered high tension electromagnetic current generator including a coil having a primary circuit and a circuit breaker arranged in said primary circuit, electrode means defining a spark gap adjacent to said one burner, conductor means connecting said current generator with said electrode means, and short-circuiting means for short-circuiting said circuit breaker and including a normally closed switch arranged in parallel with said circuit breaker, said switch comprising a first contact located in said housing and secured to and movable with said valve member, and a second contact engaging said first contact in all but said second position of the valve member, so that the switch is closed in said first and third positions of said valve member and is open to enable ignition of said one burner by said current generator only when said valve member is moved to said second position and the current generator generates a current which suffices to produce a spark across said gap.

3,273,629
METHOD AND APPARATUS FOR REMOVING WATER FROM FUEL AND OTHER OILS
Ralph G. Sargeant, Lakeland, Fla., assignor to Pet Milk Company, St. Louis, Mo., a corporation of Delaware
Application May 24, 1962, Ser. No. 198,687, now Patent No. 3,209,812, dated Oct. 5, 1965, which is a division of application Ser. No. 841,478, Sept. 22, 1959, now Patent No. 3,072,490, dated Jan. 8, 1963. Divided and this application Nov. 6, 1964, Ser. No. 416,176
4 Claims. (Cl. 159—3)



1. The method of removing relatively small percentages of water from oils which comprises freeing the oil and water mixture from any air which it may contain, flowing the air free oil and water mixture as a solid, confined stream under substantial hydraulic pressure; applying high-frequency electrical energy to the flowing liquid, while

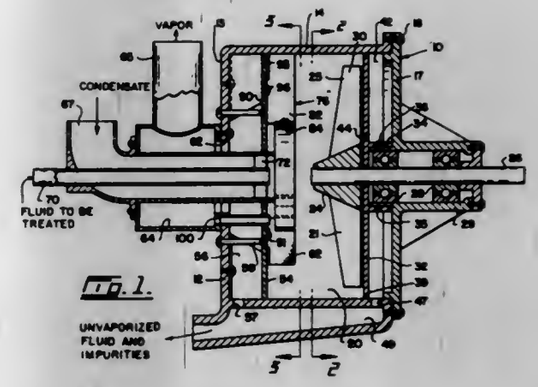
under such pressure; then discharging the mixture into a flash evaporation zone while maintaining said zone under high vacuum and at such temperature as to cause the water

content only of the mixture to flash into vapor, and separately withdrawing the water-free oil from said evaporating zone.

3,273,630
FALLING FILM EVAPORATOR FOR CONCENTRATING ALKALINE LIQUORS
Hans Kühnlein, Fullinsdorf, Basel Land, Switzerland, assignor to Hch. Bertrams Aktiengesellschaft, Basel, Switzerland
Filed Aug. 19, 1963, Ser. No. 302,846
Claims priority, application Switzerland, Aug. 20, 1962, 9,920/62, 9,921/62
5 Claims. (Cl. 159—6)

1. Apparatus for concentrating alkaline liquor, which comprises at least one upright tube, means for introducing alkaline liquor near the top of said tube for forming a continuous liquor film descending along the interior wall of said tube, heating means for heating the exterior wall of said tube, means for withdrawing concentrated liquor from the lower end of said tube and mechanical obstructing means arranged within the interior of said tube and spaced from said film for obstructing liquor particles entering the space defined by said liquor film and for conducting said particles back to said film, said obstructing means comprising at least one screw member mounted on rod means extending within said tube, said screw member having a slanted surface, the pitch of said screw member being about 150 mm. while the inclination of the slanted surface of the screw is about 20° relative to the axis of the tube.

3,273,631
ULTRASONIC FLUID HEATING, VAPORIZING, CLEANING AND SEPARATING APPARATUS
George E. Neuman, Burnaby, British Columbia, Canada, assignor to Neuman Enterprises Limited, Nassau, Bahama Islands, a corporation of the Bahamas
Filed Jan. 13, 1964, Ser. No. 337,241
17 Claims. (Cl. 159—6)



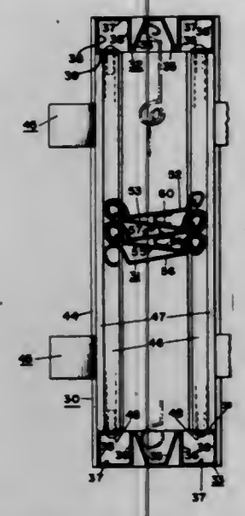


Fig. 1.

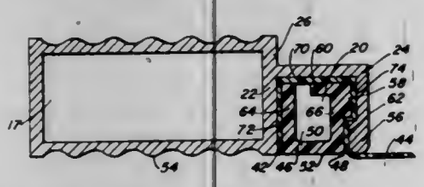
1. Ultrasonic apparatus for heating, vaporizing, cleaning and separating flowing fluids, comprising a closed chamber, an impeller having radially-extending blades mounted for rotation in the chamber and adapted to be rotated at high speeds, said blades having broad surfaces in planes generally parallel to the axis of rotation of the impeller, means for directing fluid into the impeller blades during rotation of the impeller, said fluid being moved at high speed along a circular path around the axis of the impeller in the chamber by the impeller blades, at least one stationary blade extending longitudinally thereof in a substantially radial direction and mounted in the chamber across said circular path near the impeller and forming an obstruction to the movement of the fluid around the chamber, said stationary blade having a front impinged broad surface extending transversely of said blade and generaly parallel to said axis of rotation and against which the fluid is directed and a back leeward surface where a low pressure area is formed, said chamber having a clear space on the impinged surface side of said stationary blade in which said movement of the fluid is unobstructed before impinging against said surface, said fluid flowing around an edge of the stationary blade between the latter and at edges of the impeller blades, and outlet means for the chamber adjacent the stationary blade through which fluid exits from the chamber, whereby the impeller blades moving past the stationary blade generate ultrasonic vibrations in the fluid in the chamber.

3,273,632
FIRE DAMPER
Francis J. McCabe, Penns Park, Pa., assignor to Air Balance Inc., Philadelphia, Pa., a corporation of Pennsylvania
Filed June 17, 1964, Ser. No. 375,855
17 Claims. (Cl. 160—1)



17. A blade assembly for a folding shutter comprising a plurality of one piece blades each of which is formed from substantially constant thickness sheet material, each blade including a central web and a pair of parallel ex-

tending hinge elements formed respectively at opposite edges of said web and extending longitudinally continuously for substantially the full web length, one hinge element on one blade being interfittable within a hinge element on an adjacent blade by sliding the former endwise into the latter to form a hinged blade pair, each of said hinged blades of said pair when interfitted with the other being

relatively rotatable through a sufficient angle so that said blade assembly may be opened out into flat curtain form and may also be compacted into a minimum volume by reversely folding blades of said assembly against one another, at least one hinge element of each of alternate blades physically engaging one another when said blade assembly is compacted.

3,273,633
SHOWER DOOR CONSTRUCTION
Maynard J. Seidmon, Chicago, Ill., and George J. Ellis, Grand Rapids, Mich., assignors to Theodore Efron Mfg. Co., Chicago, Ill., a corporation of Illinois
Filed Mar. 10, 1964, Ser. No. 350,782
3 Claims. (Cl. 160—381)

1. In a shower enclosure panel a framing construction for a plastic sheet secured along its marginal edges to the framing construction,

said framing construction including a generally rectangular frame,

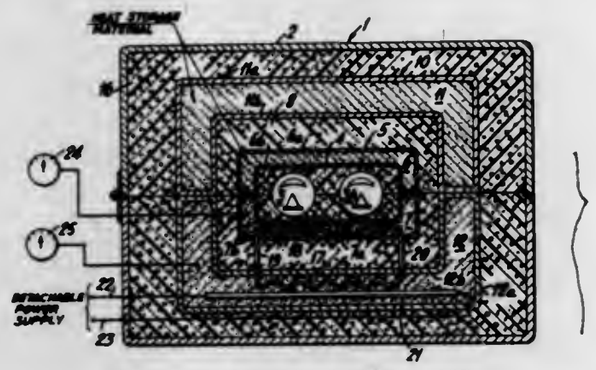
said frame being of hollow core formation and including an integral open channel defined by parallel inner and outer walls on each side thereof,

said channel being disposed adjacent an inner marginal edge of said core;

an integral longitudinal rib extending inwardly of said channel from one of said walls;

spline means anchoring said sheet with respect to at least two surfaces of said channel,

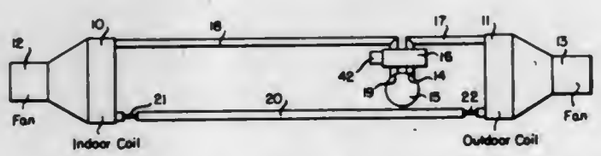
said spline means comprising generally parallel jaw-like elements including longitudinally extending off-set portions co-extensive therewith and adjacent terminal edges of said jaw-like elements,



said off-set portions and said jaw-like elements being resiliently deformable whereby upon installation in said channel said jaw-like elements will be compressed toward one another;

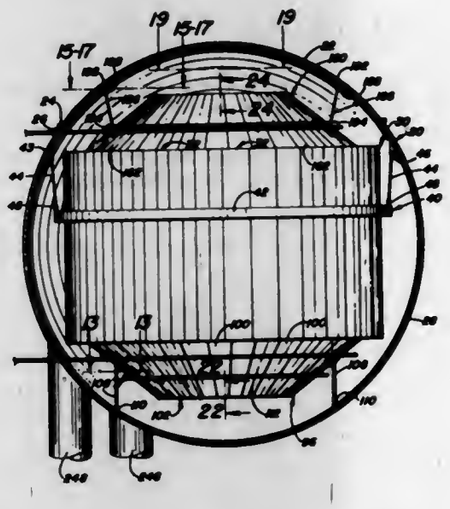
a first one of said off-set portions adjacent a terminal edge of one of said jaw-like elements engaging and being resiliently biased into anchoring relation within said open channel for cooperation with said longitudinal rib in keying relation therewith to obviate inadvertent dislodgement of said spline from said channel;

a second one of said offset portions adjacent a terminal edge of one of said jaw-like elements extending toward the said first one of said jaw-like elements to limit relative lateral movement of free ends of said jaw-like elements toward each other;



whereby portions of said plastic sheet overlying said two surfaces of said channel will be securely locked by said spline means to prevent displacement of said sheet from said frame construction.

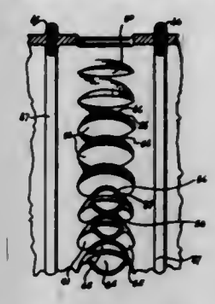
3,273,634
SELF-SUSTAINING TEMPERATURE CONTROL PACKAGE
Charles D. Snelling, 2949 Greenleaf St., Allentown, Pa.
Filed Jan. 4, 1965, Ser. No. 422,894
8 Claims. (Cl. 165—1)



1. A self-sustaining temperature control package adapted to sustain a given temperature for prolonged periods which comprises, a container having insulatedly packed therein a temperature-sensitive object and a plurality of heat sinks, each containing a heat storage material therein characterized by a relatively high heat of fusion, an inner one of said heat sinks being thermally associated with said temperature-sensitive object, at least one other of said heat sinks being insulated from and surrounding said object and said inner heat sink, and an insulation surrounding at least said other heat sink within said container, such that any heat loss from said inner heat sink is greatly minimized.

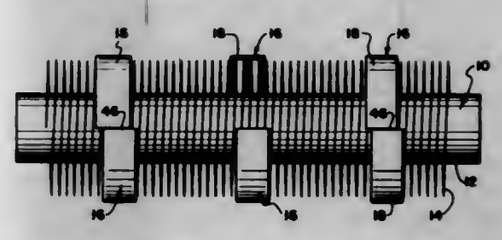
3,273,635
HEAT PUMP CONTROLS
Harry W. Jobes, Hallandale, Fla., assignor to Hupp Corporation, Cleveland, Ohio, a corporation of Virginia
Filed Apr. 17, 1964, Ser. No. 363,050
11 Claims. (Cl. 165—12)

1. A control for defrosting a heat pump operating on a heating cycle, said heat pump having indoor and outdoor coils, compressor means for circulating refrigerant through said coils and a valve means for connecting the delivery side of said compressor means to said indoor coil on the heating cycle or to said outdoor coil for cooling or defrosting comprising: a clock mechanism for registering the time of operation of said compressor means, means for preventing the operation of said clock except when the outdoor ambient temperature is below the level at which frost accumulates on said outdoor coil, means energized when said clock registers a predetermined accumulated time for operating said valve means to connect the delivery side of said compressor means to said outdoor coil to heat said outdoor coil, and means responsive to a rise in the pressure of refrigerant in said outdoor coil to reverse said valve means to again connect the delivery side of said compressor means to said indoor coil.



3,273,636
SPACE SIMULATION CHAMBER
Thomas N. Hickey and Charles B. Hood, Jr., Columbus, Ohio, assignors to Cryovac, Inc., Columbus, Ohio, a corporation of Ohio
Filed Oct. 31, 1962, Ser. No. 216,625
25 Claims. (Cl. 165—67)

1. A space simulation chamber comprising, in combination, an outer structural wall; a thermal shroud within said structural wall, said shroud comprising in combination, a plurality of side wall panel assemblies each of said assemblies including a plurality of adjoining refrigerated side wall panels; yieldable connecting means between adjoining edges of said side wall panels; yieldable connecting means between adjoining edges of said side wall panels; means for passing refrigerated fluid between said side wall panels; a plurality of support rods attaching said side wall panels to the structural wall of said space simulation chamber; a plurality of adjoining refrigerated top wall panels; top wall mounting means attaching said top wall panels to the structural wall of said space simulation chamber; a plurality of refrigerated bottom wall panels; and bottom wall mounting means for attaching said bottom wall panels to the structural wall of said space simulation chamber.

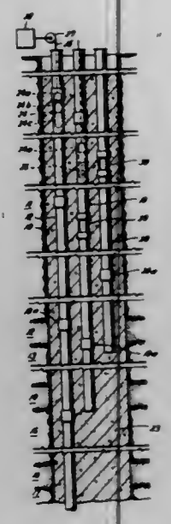


3,273,637
HEAT EXCHANGER
Theron F. Pauls, Oak Park, Ill., assignor to Olin Mathieson Chemical Corporation, New York, N.Y., a corporation of Virginia
Original application June 3, 1957, Ser. No. 663,062, now Patent No. 2,999,308, dated Sept. 12, 1961. Divided and this application Oct. 5, 1960, Ser. No. 67,147
5 Claims. (Cl. 165—171)

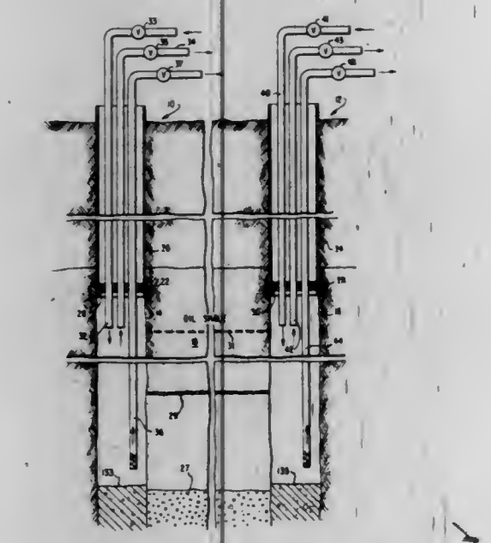
1. A hollow sheet metal plate having extending internally therein a system of fluid passages with said passages comprising spaced parallel fluid passageways extending longitudinally in said plate and also distended out of the plane of said plate with the distention of said passageways in a cross-section thereof normal to said plane extending out of said plane an amount greater than the width of said passageways in said cross-section so that said passageways in said cross-section are elongated to have their major axis extending in a direction transverse said plane, the thickness of said plate between said pas-

sageways being less, in gradations throughout the cross-sectional extent thereof, than the thickness of said plate in portions circumscribing said passageways, a portion of said plate between said passageways having at least one opening through said plate adjacent at least one integral fin extending out of and substantially transverse said plane of said plate.

3,273,638
FINNED TUBE PROTECTOR
Raymond A. Darling, 5306 E. 26th St., Tulsa, Okla.
Filed July 1, 1964, Ser. No. 379,673
5 Claims. (Cl. 165—134)



3. In combination with a finned tube including a central tube having a plurality of radially extending ribs on the outer periphery thereof, a removable fin protector comprising a pair of complementary semi-circular housings cooperating for encasing a plurality of adjacent fins, each of said semi-circular housings comprising an arcuate outer housing having an inner diameter slightly greater than the outer diameter of the fins, a radially inwardly directed rib member carried by the outer housing and having an inner diameter substantially equal to the outer diameter of the central tube for engagement therewith, and an angular flange provided on the outer ends of the rib for extending the inner periphery thereof through an arc greater than one half the circumference of the central tube for facilitating securing of the complementary semi-circular housings around the central tube.



3,273,639
WELL PRODUCTION METHODS AND APPARATUS
Maurice P. Lebourg and John T. Dewan, Houston, Tex., assignors to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas
Filed July 27, 1960, Ser. No. 45,694
4 Claims. (Cl. 166—4)

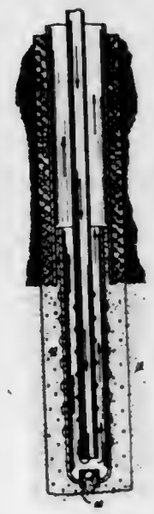
2. A method for completion of one string of tubing relative to a coextensively extending string of tubing in a well bore comprising the steps of: disposing a first string of tubing coupled by collars in a well bore to the greatest depth at which production is expected; disposing a second string of tubing coupled by collars in the well bore wherein the string of tubing includes a section of pipe having a characteristically different length as com-

pared to other pipe lengths to develop characteristic magnetic anomalies identifiable from collar couplings and having a characteristic radioactivity anomaly; logging the earth formations traversed by the first string of tubing with radioactivity anomaly detecting means to obtain indications of the radioactivity of the traversed earth formations and indications of the characteristic radioactivity anomaly in the second string of tubing as a function of depth; and logging the second string of tubing with magnetic anomaly detecting means to obtain indications of collar couplings and magnetic anomalies of said pipe section as a function of depth.

3,273,640
PRESSURE PULSING PERPENDICULAR PERMEABILITY PROCESS FOR WINNING STABILIZED PRIMARY VOLATILES FROM OIL SHALE IN SITU
Morgan G. Huntington, Galesville, Md., assignor to Pyrochem Corporation, Salt Lake City, Utah, a corporation of Utah
Filed Dec. 13, 1963, Ser. No. 330,334
9 Claims. (Cl. 166—7)

1. An in situ process for winning oil shale from an oil shale formation, the formation including a production bore hole and an injection bore hole drilled therein, as well as a path of lateral fluid communication through the otherwise impervious oil shale between the production and injection bore holes, the process comprising;

(a) preheating the oil shale adjacent the path of lateral fluid communication with hot water to a temperature just below that at which pyrolysis of the oil shale begins,



(b) introducing superheated steam under pressure into the path of lateral fluid communication through the injection bore hole,

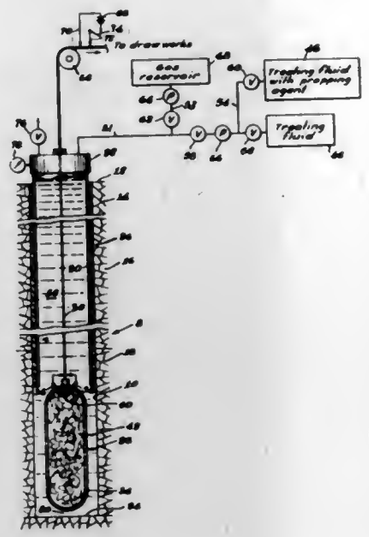
(c) cyclically varying the superheated steam pressure between the limits of rock pressure and a lower pressure sufficient to prevent undue steam condensation,

(d) removing steam and oil shale entrained vapor from the production well, and

(e) treating the removed steam and oil entrained vapor after first reducing the partial pressure of steam by contact catalysis in the presence of hydrogen.

3,273,641
METHOD AND APPARATUS FOR COMPLETING WELLS
Henry A. Bourne, Ponca City, Okla., assignor to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma
Filed Dec. 16, 1963, Ser. No. 330,927
10 Claims. (Cl. 166—12)

1. A method of completing an oil and gas well or the like including the steps of:



positioning in the well, a well screen having fusible means temporarily closing a plurality of transverse openings therein;

placing a permeable cement in said well around the exterior of said screen; and

melting the fusible means temporarily closing said openings.

3,273,642
METHOD OF IMPLODING FRANGIBLE CAPSULES USED IN WELL TREATMENTS
John Karpovich, Caro, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Jan. 20, 1964, Ser. No. 340,852
4 Claims. (Cl. 166—39)

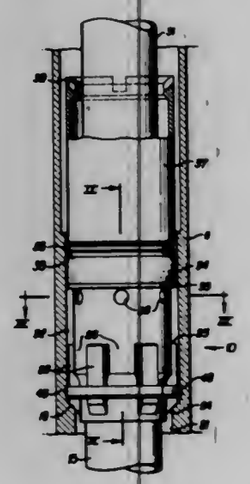
1. A method of imploding in a bore hole adjacent to an earth formation a frangible sealed hollow vessel having ignitable internal heating means therein, comprising disposing said vessel in a generally liquid medium in a bore hole, pressurizing said medium to a pressure equal to at least half the pressure required to fracture said formation, and then igniting said internal heating means to substantially instantaneously raise the temperature of said vessel to a temperature much above the temperature of said medium, whereby the combination of the thermal stresses created in said walled vessel and the lower internal pressure of the vessel as compared with the higher pressure of the medium cause said vessel to implode.

3,273,643
METHOD OF INITIATING FOAM IN DROWNED WELLS
William E. Billings and Reginald M. Lasater, Duncan, Okla., assignors to Halliburton Company, Duncan, Okla., a corporation of Delaware
No Drawing. Filed Jan. 24, 1964, Ser. No. 339,886
17 Claims. (Cl. 166—45)

1. A method for treating subterranean wells containing aqueous liquid which comprises adding a foaming agent to the liquid in the well whereby the water and foaming agent are mixed, said mixing producing an aqueous solution of said foaming agent within the well, adding a foam initiator composition capable of evolving nitrogen to said solution in said well and allowing said foam initiator composition to evolve nitrogen whereby a foam comprising aqueous liquid and gas flows from the well.

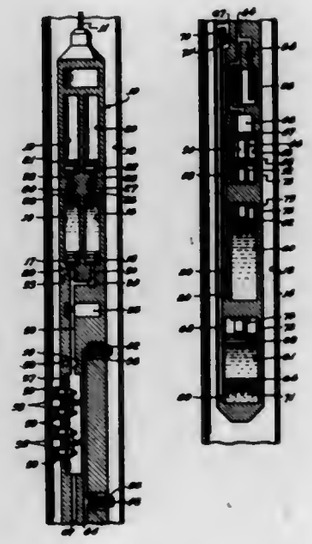
3,273,644
SYSTEM AND APPARATUS FOR PUMPING OIL WELLS
Russell R. Waterman, Long Beach, Calif., assignor of ten percent to Vernon D. Beehler, Los Angeles, Calif.
Filed Sept. 24, 1962, Ser. No. 225,598
4 Claims. (Cl. 166—62)

1. A system for heating and pumping an oil well from a reservoir of production fluid at a production zone comprising a heating line extending from ground surface into the well and having a heat exchanger section extending into the reservoir from a location adjacent the top to a location adjacent the bottom thereof, a production tubing line extending from the surface into the well and having a stand pipe section extending into said reservoir, said heat exchanger being separate from and located between said stand pipe section and the adjacent circumference of the well, said stand pipe section comprising a hollow casing having a sump chamber therein, said stand pipe section having adjacent the upper end of the sump chamber and adjacent the upper end of said reservoir a production inflow port, said inflow port being substantially at the level of the top of said heat exchanger, and pumping means in communication with the lower end of the sump and connected to said production line whereby to pass production fluid from the sump to the surface.



3,273,645
WELL COMPLETION APPARATUS
Raymond W. Der Mott, Houston, Tex., assignor to Schlumberger Well Surveying Corporation, Houston, Tex., a corporation of Texas
Filed July 23, 1962, Ser. No. 211,525
14 Claims. (Cl. 166—55.1)

8. Well perforating apparatus adapted for suspension by an electric cable in a well bore having at least one string of pipe therein comprising: perforating means having a prescribed direction of lateral firing, selectively operable anchor menas for selectively engaging the wall of a string of pipe including wall-engaging members movable laterally between non-engaging and wall-engaging positions, rotator means intermediate said anchor means and said perforating means operative for rotating said perforating means relative to said anchor means

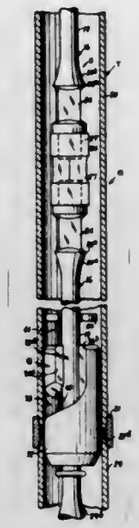


when said wall-engaging members are in said wall-engaging position, and position responsive means connected to said wall-engaging members for providing electrical signals of the position of said wall-engaging members.

3,273,646
CIRCULATING CASING HANGER ASSEMBLY
Raymond W. Walker, Huntington Beach, Calif., assignor to Shaffer Tool Works, Brea, Calif., a corporation of California
Filed July 2, 1963, Ser. No. 292,390
11 Claims. (Cl. 166—86)

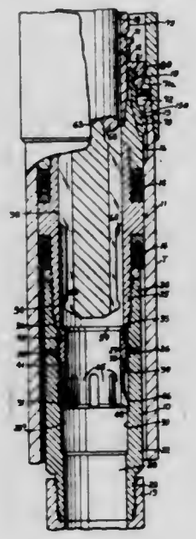
1. A circulating casing hanger assembly adapted to be permanently inserted into a well head structure for use in cementing additional casing therewithin, comprising:
- a tubular, elongated casing hanger member having upper and lower ends,
- means on said lower end of said casing hanger member for carrying well hole casing adapted to be permanently cemented into position within the well hole structure,
- supporting means on the inner surface of said casing hanger member for receiving and landing additional well tools,
- radially extending circumferentially spaced rib portions provided on said casing hanger member and adapted to support said casing hanger member in the well head structure, said ribs including downwardly directed support shoulders at one end thereof and upwardly directed stop shoulders at the other end thereof,
- the spaces between said ribs providing longitudinally extending channels for allowing cement to pass upwardly therethrough,
- circumferentially spaced, transverse fluid ports in said casing hanger member spaced from said casing hanger member lower end and above said radially extending rib portions,
- a movable sealing element carried on the exterior of said casing hanger member adjacent said ports, said sealing element adapted to be longitudinally moved across said ports to seal off flow through said ports and into abutting engagement with said stop shoulders on said ribs when in sealed positions; and
- a longitudinally movable seal element setting sleeve cooperating with said seal element and threadably engaging said casing hanger member, said setting sleeve including means for rotating and moving said sleeve longitudinally, whereby fluid flowing around the periphery of said casing hanger member and into said ports can be sealed off by said seal element being moved into sealing engagement across said ports by said seal setting sleeve.

3,273,647
COMBINATION WELL TESTING AND TREATING APPARATUS
George E. Briggs, Jr., and Timothy D. Brown, Houston, Tex., assignors to Halliburton Company, Duncan, Okla., a corporation of Delaware
Filed Aug. 19, 1963, Ser. No. 302,943
6 Claims. (Cl. 166—100)



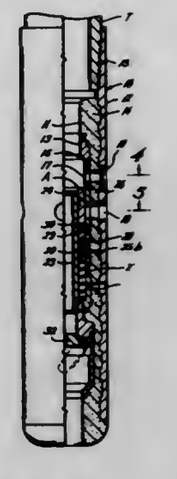
1. A device for injecting fluids into an earth formation adjacent to the walls of a borehole comprising: a body adapted to be lowered into the borehole, sealing means mounted on said body and adapted to isolate an area of borehole wall and establish fluid communication therewith when urged thereagainst, means on said body propellant for urging said sealing means into engagement with a wall of the borehole, the body having two sample-receiving chambers each connected to said sealing means by a valved passage, respectively, the body also having a chamber containing treating fluid for injection into the formation within said isolated area, means on the body forming a passage connecting said sealing means with the injection-fluid chamber so as to establish communication with said isolated area, and means for displacing injection fluid from said injection-fluid chamber into said formation within said isolated area, whereby separate samples of formation fluid may be obtained before and after injecting treating fluid into the formation.

3,273,648
WELL TOOLS
Charles F. Barnard, 3116 Caruth Blvd., Dallas, Tex.
Filed July 8, 1963, Ser. No. 293,456
15 Claims. (Cl. 166—175)



1. A well tool assembly including: a flow conductor having a longitudinal flow passage; and a plurality of well tools in the flow conductor for removing deposits on internal surfaces of the flow conductor reciprocably movable in said passage in limited longitudinal ranges in the passage of the flow conductor, each of said well tools having valve means for closing said longitudinal passage and being movable upwardly in said range in said longitudinal passage when closing said flow passage by fluids flowing upwardly in said passage and moving downwardly in said range in said flow passage when not closing said passage, said well tools removing deposits from internal surfaces of the flow conductor during their longitudinal movement

in the flow conductor, said valve means of each of said well tools being operative to open and close said passage

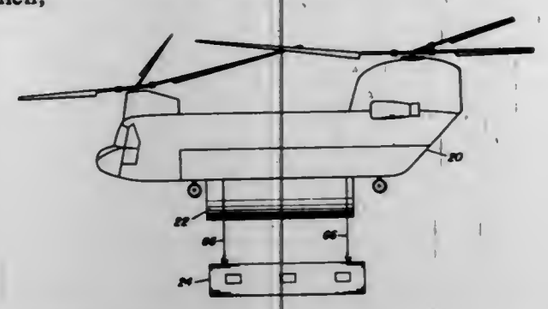


of said well tool independently of the operation of the valve means of the others of said well tools.

3,273,649
EQUALIZING VALVE MEANS
Jack W. Tamplen, Celina, Tex., assignor to Otis Engineering Corporation, Dallas, Tex., a corporation of Delaware
Filed Sept. 26, 1963, Ser. No. 311,687
8 Claims. (Cl. 166—224)

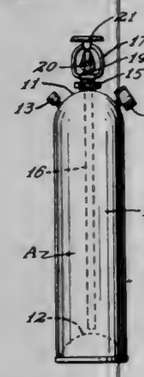
8. An equalizing device including: a tubular body having a longitudinal bore with a lateral port formed in the wall of the body opening into the bore thereof; a tubular valve slidable longitudinally in said body between a position closing said lateral port and a position spaced from said lateral port; a shifting tool movable into said body and said valve; and means on said shifting tool and on said valve coengageable to interconnect said shifting tool and said valve for movement of said valve longitudinally of said body from one of said positions to the other and means for maintaining said co-engageable means on said valve and said shifting tool engaged until said valve is returned from said other position to said one position.

3,273,650
AUTOMATIC FILL-UP AND CEMENTING DEVICES FOR WELL PIPES
Thomas E. Alexander, Houston, and Wayne F. Nelson, Waxahachie, Tex., assignors to Koehring Company, Waxahachie, Tex., a corporation of Wisconsin
Filed Apr. 13, 1964, Ser. No. 359,366
9 Claims. (Cl. 166—225)



1. A fill-up device including,
- a tubular body having means for connecting said body in a well pipe string,
- said body having an orifice establishing communication between the exterior and interior thereof whereby fluid from the annulus surrounding the body and pipe string may flow through the orifice and into the string,
- an annular element mounted for movement within the body and movable to a position closing flow into the pipe string,
- said annular element being subjected to the pressure of the fluid flowing through said orifice into the pipe string,
- means for subjecting said annular element to the static pressure in said annulus surrounding said body in opposition to the pressure of the fluid flowing through said orifice into the pipe string whereby a differential pressure is created across said annular element,
- releasable means for normally holding said annular element in a position allowing flow through the orifice and into the pipe string,
- said releasable holding means being released by the differential pressure caused by a predetermined increase in the velocity of flow of fluid passing through said orifice to permit movement of said annular element,
- said differential pressure also moving said annular element to a position closing further flow into the pipe string, and
- means permitting downward flow through said tubular body and through the central portion of said annular element whereby circulation may be established through said device to the annulus surrounding said body and said well pipe string.

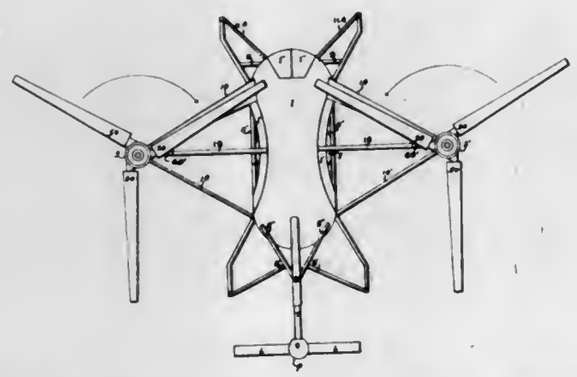
3,273,651
FIRE FIGHTING EQUIPMENT
William O. Andrews, 4716 College Ave., San Diego, Calif.
Filed Jan. 6, 1965, Ser. No. 423,877
8 Claims. (Cl. 169—1)



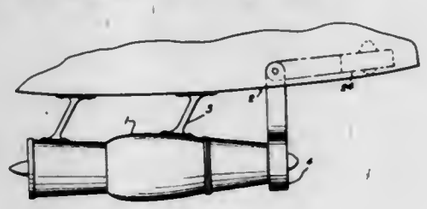
1. Fire fighting mechanism comprising in combination:
- (A) A navigable flying machine having:
  - (1) a motor,
  - (2) winch means driven by the motor,
  - (3) control mechanism means for rendering winch means operative and inoperative;

(B) means forming a tank for fire extinguishing material and forming a platform for supporting firemen;

(C) cables connected with the last mentioned means and the winch means;
(D) and a hose connected with the tank and extendible to the areas of platform.



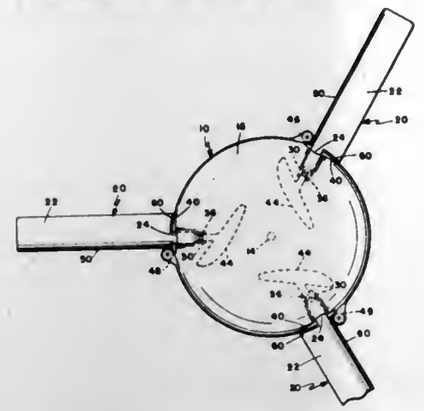
3,273,652
FIRE EXTINGUISHER
Gerhardt A. Neumann, Minneapolis, Minn., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware
Filed July 20, 1964, Ser. No. 383,832
1 Claim. (Cl. 169—30)



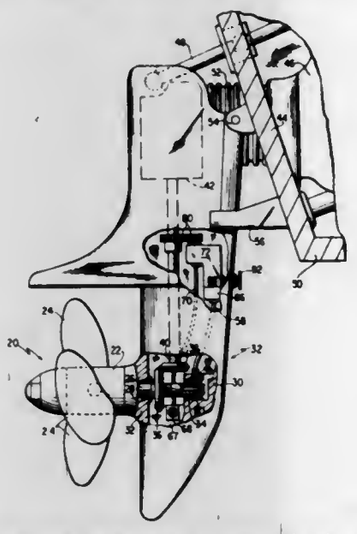
A portable readily movable fire extinguisher comprising:
a pressure compartment,
a pressure indicator secured to said compartment,
a dry chemical powder within said pressure compartment,
gas under pressure within said compartment,
said pressure compartment being vertically elongated and having a base portion upon which said compartment may rest in a vertical position,
a sprinkler head secured to the upper end of said compartment and supported centrally thereof,
said compartment having a rounded upper end from which said sprinkler head projects, said sprinkler head being coaxial thereto,
said sprinkler head including a closure plug and a fusible element holding said plug in compartment closing position, and
a deflector means supported above and concentric with said sprinkler head and said closure plug and operable to deflect the greater portion of the powder outwardly and downwardly over said rounded compartment end when said plug is released.

3,273,653
ROTARY WING AIRCRAFT
Frank W. McLarty, 337 S. Edgefield Ave., Dallas, Tex. 75208
Filed Oct. 4, 1957, Ser. No. 688,318
3 Claims. (Cl. 170—135.2)

3. A rotary wing aircraft comprising a fuselage framework, outrigger frames at each side of the fuselage framework on which are mounted paired rotors on upright shafts, means of rotating the upright paired rotor shafts using a common shaft driven by a prime-mover, said paired rotors becoming autorotational immediately and automatically on diminution of power from the prime-mover, and means of controlling longitudinal tilt of the fuselage frame relative to the horizon on an axis parallel to lines projected from the center of the hub of each rotor perpendicular to a vertical plane passing through the longitudinal axis of the fuselage frame, said means of tilt control consisting of an auxiliary rotor, mounted near an end of the fuselage frame, whose normal thrust is in the said vertical plane passing through the longitudinal axis of the fuselage frame, and whose blades are provided with hydraulic means of adjusting and preferably reversing their angle of attack consisting of means of reciprocating a fluid retaining cylinder, having two compartments provided with suitable annular flexible seals preventing passage of fluid, longitudinally of a smaller parallel telescoped cylindrical housing through which extends a rotor shaft rotating in tapered roller bearings mounted in said shaft housing, a second cylinder having suitable thrust bearings mounted on said reciprocable cylinder relative to which the second cylinder rotates, and linkages, rigidly attached to the second cylinder, between the rotatable cylinder and the rotor blades, to which each linkage is attached pivotally at points spaced from longitudinal axes on which the blades pivot, said means not employing hydrauic fluid conveyed through the rotor shaft.

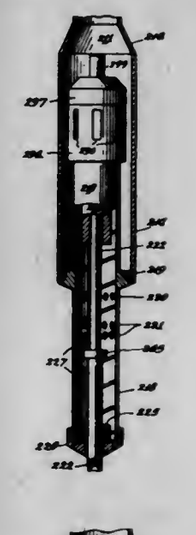


3,273,654
MOVABLE TURBINE-FAN UNIT FOR AN AIRCRAFT JET ENGINE
Robert W. Pinnes, Rockville, Md., assignor to the United States of America as represented by the Secretary of the Army; and/or the Administrator of the Federal Aviation Agency
Filed June 18, 1965, Ser. No. 465,218
10 Claims. (Cl. 170—135.7)

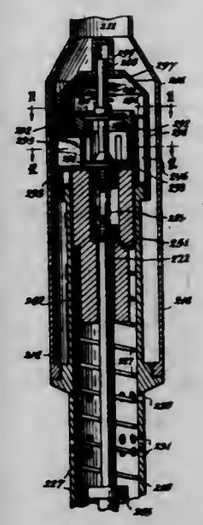


1. A movable turbine-fan unit comprising:
(a) a turbine including rotor and stator blades;
(b) a plurality of fan rotor blades fixedly mounted on said turbine for rotation therewith;
(c) a plurality of fan stator blades longitudinally aligned with said turbine stator blades; and
(d) means for moving said turbine into and out of register with the rear of a jet engine.

3,273,655
CENTER BODY PIVOTALLY RETRACTABLE ROTOR
Peter F. Girard, La Mesa, Calif., assignor to The Ryan Aeronautical Co., San Diego, Calif.
Filed Aug. 2, 1965, Ser. No. 476,261
12 Claims. (Cl. 170—160.12)



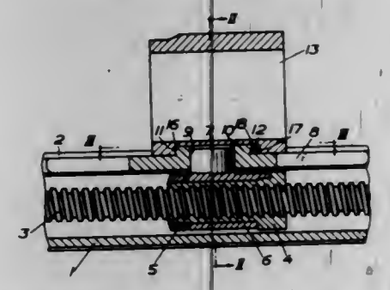
1. In an aircraft, a lifting rotor having means for rotatable mounting on the aircraft and being retractable and extensible in flight, the rotor comprising:
a hollow center body;
a plurality of rotor blades mounted to rotate with said center body and being pivotal to swing in a plane substantially perpendicular to the axis of rotation of the center body; and
means operatively connected to said blades to swing the blades simultaneously and synchronously in a common direction between extended positions substantially radial to said center body and retracted positions disposed substantially chordally of the center body, independent of rotational speed of the rotor.



3,273,656
HYDRAULICALLY ACTUATED CONTROLLABLE-PITCH PROPELLER SYSTEM FOR OUTBOARD MOTORS AND OUTDRIVES
John Le Grand Bird, Upland Drive, Greenwich, Conn.
Filed June 30, 1964, Ser. No. 379,180
17 Claims. (Cl. 170—160.32)

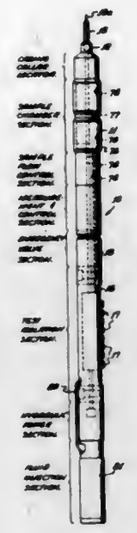
14. A hydraulically actuated controllable-pitch propeller for outboard motors and outdrives comprising a hub having cylinder means therein, movable piston means in said cylinder means, a plurality of blades mounted on said hub having stub shafts rotatably received in said hub, pitch control arms secured to said stub shafts and each having first and second ends on generally opposite sides of said stub shaft, a plurality of springs in said hub pressing said first ends of the control arms against said piston means for engaging said piston means for changing the pitch setting of the blades in response to movement of said piston means, said hub having means for admitting hydraulic liquid into said cylinder means for moving said piston means, and a plurality of stop screws in the hub for engaging the second ends of said control arms for limiting the range of movement of said piston means for limiting the range of pitch adjustment, and gear means ganging all of said stop screws together for simultaneous adjustment thereof.

3,273,657
IMPACT TOOL
Donald J. Willems, Omaha, Nebr. (10341 Minnick, Oak Lawn, Ill.), and Henry A. Spitzley, 564 West St., Portland, Mich.
Continuation of application Ser. No. 838,475, Sept. 8, 1959. This application Mar. 9, 1964, Ser. No. 351,277
44 Claims. (Cl. 173—121)



10. A pneumatic impact tool comprising a pressure chamber; means for introducing air into said pressure chamber, a piston housing communicating with said pressure chamber; a piston slidably mounted in said piston housing; said piston having a longitudinal aperture extending therethrough; means for controlling air flow from said pressure chamber to said piston housing; an impact pin extending from a position proximate to said means for controlling air flow through said aperture in said piston; means for closing the end of said piston housing opposite of said means for controlling air flow; said means for closing the end of said piston being adapted to permit the impact pin to slide therethrough; means on said impact pin for transferring the momentum of said piston in its

power stroke to said impact pin; elastic means for applying a force which tends to hold said means for controlling air flow in a closed position; elastic means for applying a force which tends to hold said means for controlling air in an open position, said elastic means being proximate to said means for controlling air flow and responsive to the motion of said impact pin; and elastic means positioned between said piston and said means for closing the end of said piston housing, said elastic means being adapted to urge said piston to its normal starting position after each power stroke.

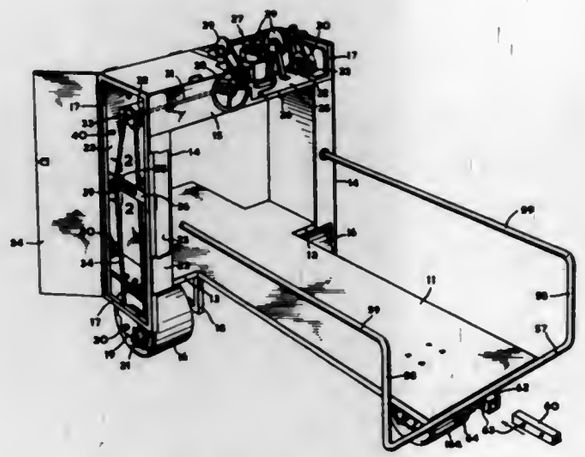


3,273,658
FEEDING SLIDE ARRANGEMENT FOR ROCK DRILLING MACHINES OR THE LIKE
Sven Laurentius Ytterfors and Åke Eugén Jansson, Nacka, Sweden, assignors to Atlas Copco Aktiebolag, Nacka, Sweden, a corporation of Sweden
Filed Mar. 6, 1962, Ser. No. 177,872
Claims priority, application Sweden, Mar. 16, 1961, 2,801/61
9 Claims. (Cl. 173—141)

1. A feeding slide arrangement for rock drilling machines or the like comprising a feed bar, spaced apart guideways extending in parallel relation along said feed bar, a slide movable along said feed bar on said guideways, a driving device on said feed bar for feeding and retracting said slide along said guideways, a drilling machine on said slide, a first pair of dovetail surfaces in opposed arrangement on said drilling machine, a second pair of dovetail surfaces in opposed arrangement of said slide and extending transversely to said guideways and substantially co-planar with the upper edges thereof, one dovetail surface of said first pair being in engagement upon assembly with one dovetail surface of said second pair while the said second dovetail surface of the said first pair is not in engagement with the said second dovetail surface of the said second pair leaving a space therebetween, and a removable locking wedge insertable in the said space between the said second two dovetail surfaces of said pairs providing the sole means for fixedly locking said drilling machine to said slide.

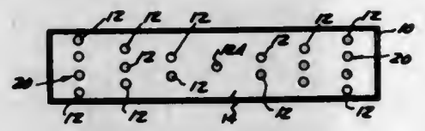
3,273,659
WELL SAMPLING AND TREATING TOOL
Francois H. K. Reynolds, Jr., Houston, Tex., assignor to Halliburton Company, Duncan, Okla., a corporation of Delaware
Filed Aug. 19, 1963, Ser. No. 302,823
12 Claims. (Cl. 175—4)

1. In a well fluid sampling tool adapted to be lowered into a well casing on a wire line, the combination of: a tool body having a lateral opening, the tool body having a sample-receiving chamber, a barrel member insertable into said lateral opening into operative position on the body, releasable means for securing said barrel member to the body, the barrel member being provided with fluid sample inlet elements which project through said lateral opening in the body when the barrel member is secured in operative position, each element having a jet charge for perforating the casing and admitting well fluid through said fluid inlet elements into the interior of said barrel member, conduit means on the body connecting the interior of said barrel member with said sample-



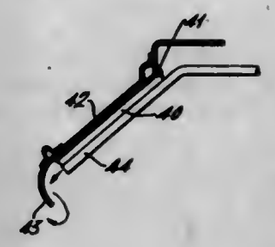
receiving chamber, and laterally extendible means on the body adapted to move the body laterally and to hold said fluid inlet elements in contact with the casing.

3,273,660
METHOD AND APPARATUS FOR CHANGING SINGLE DRILL PIPE STRINGS TO DUAL DRILL PIPE STRINGS
John Gordon Jackson and Charles O. Vail, Denver, Colo., assignors to Gas Drilling Services Co., Los Angeles, Calif., a partnership
Filed Oct. 30, 1963, Ser. No. 320,088
14 Claims. (Cl. 175—57)



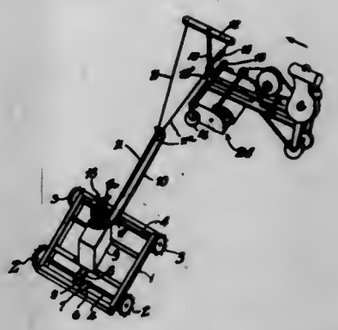
10. A method for changing from a single drill pipe drilling section to a dual drill pipe drilling section comprising the steps of introducing an inner drill pipe section into an outer drill pipe section to form a fluid passage inside the inner drill pipe section and an annular fluid passage between the outer and inner drill pipe sections, locating an expandable coupling unit between the sections to seal the two fluid passages from each other and establish communication of the two respective fluid passages with corresponding fluid passages of adjacent drill pipe members, and firmly positioning the inner section in the outer section by expanding the coupling unit.

3,273,661
BOAT TRAILER AND LAUNCHER
Eugene G. Shannon, 215 Courtleigh Blvd., Toronto, Ontario, Canada
Filed Feb. 17, 1965, Ser. No. 433,324
3 Claims. (Cl. 180—27)



1. A boat trailer and launcher comprising:
a platform having a front and a back end, at least one end of the platform being open to permit a boat to be floated onto the platform when the latter is submerged,
wheel means at both ends of the platform by which the platform can roll over the ground, the wheel means including at least one drivable wheel,
a source of motive power,
transmission means between said source and said drivable wheel for selectively rotating the drivable wheel to drive the platform over the ground,
the wheel means at one end of the platform being steerable to steer the platform while it is being so driven,
manual means for steering said steerable wheel means,
and at the front end of the platform coupling means by which the front end can be hitched to the back of a vehicle for trailing therebehind with the front end wheel means raised clear of the ground.

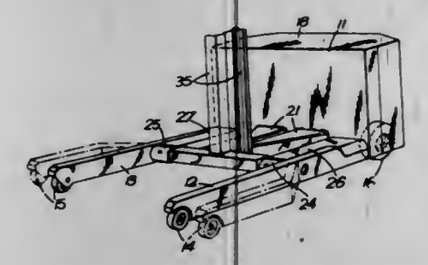
3,273,662
STEREO SOUND SYSTEM
Charles G. Roberts, 23861 Verne, Detroit, Mich.
Filed Dec. 27, 1965, Ser. No. 516,446
8 Claims. (Cl. 181—31)



1. A stereo sound system comprising
(a) an enclosure with an open side,
(b) a plurality of speakers mounted in the enclosure and facing said open side, and with the speakers disposed to form an arcuate surface, and arranged in vertical rows about a central speaker so that as the distance from the central speaker increases, the number of speakers in each vertical row increases.

3,273,663
VEHICLES FOR TRAVELLING OVER LAND AND/OR WATER
Christopher Sydney Cockerell, Bassett, Southampton, England, assignor to Hovercraft Development Limited, a company of Great Britain and Northern Ireland
Filed May 6, 1965, Ser. No. 453,655
Claims priority, application Great Britain, Sept. 1, 1958, 27,978/58
5 Claims. (Cl. 180—7)

1. A vehicle of the type adapted to travel or hover over a surface and to be supported above said surface at least in part by a cushion of pressurised gas contained beneath the vehicle in a cushion space located between the underside of the vehicle and the surface over which it is travelling, comprising a main body structure, a wall structure mounted so as to extend below the main body structure and adapted to flex to accommodate major variations and irregularities in the clearance between said main body structure and the surface, said wall structure consituting a part of the peripheral boundary of said cushion space, and a further flexible structure carried by said wall structure and extending below the latter, said flexible structure constituting a further part of the peripheral boundary of said cushion space and being of flexible material so as to yield to and pass over minor obstructions in its path, said flexible structure being lighter and capable of quicker response to variations and irregularities in the surface over which the vehicle is travelling than said wall structure.

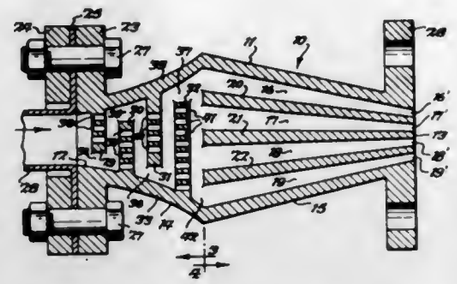


3,273,664
REMOTE AUTOMATIC CONTROL OF POWER DRIVEN EQUIPMENT
Edward L. Ramer, Hockessin, Del., deceased; Mildred A. Ramer, executrix, Hockessin, Del.
Filed Dec. 12, 1963, Ser. No. 330,163
16 Claims. (Cl. 180—79)

1. A system for lawn mowing, harvesting and the like comprising as essential components thereof a control unit and at least one field unit having a steering mechanism movably mounted on said field unit to afford a right-hand steering part and a left-hand steering part, said control unit comprising a vehicular framework supported by wheels and axles for said wheels, one of said axles being equipped with means for propelling the framework through a power train connected with a horizontal continuously rotatable arm which is attached at one end to

a vertical shaft mounted on said framework and connected also to the steering mechanism of a powered field unit by means of two guide lines one of which is connected to the said right-hand steering part and the other of which is connected to the said left-hand steering part and, said power train being actuated by the continuously rotation of the horizontal arm resulting from the forward movement of the field unit.

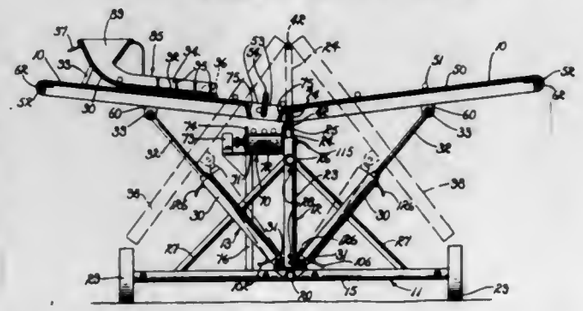
3,273,665
RUNNING GEAR ARRANGEMENT FOR INDUSTRIAL TRUCKS
Cecil Goodacre, Basingstoke, England, assignor to Lansing Bagnall Limited, Basingstoke, England, a British company
Filed Aug. 4, 1964, Ser. No. 387,461
Claims priority, application Great Britain, Aug. 6, 1963, 31,053/63
3 Claims. Cl. (180—85)



1. An industrial load-handling truck having a body portion, an upstanding load-carrying mast supported by the body portion, a pair of transversely spaced straddle legs projecting from the body portion, each leg being pivotally mounted on the body portion independently of the other leg about a substantially horizontal axis extending transversely of the leg, a pair of wheels for supporting the body portion from the ground, which wheels are mounted in fixed vertical relation to and beneath the body portion, an electric motor for driving at least one of the wheels supporting the body portion, at least one wheel for supporting each leg from the ground, which wheel is mounted on the end of the leg remote from the body portion and in fixed vertical relation thereto, and resilient means located remote from the pivot axis between adjacent parts of each leg and the body portion to limit resiliently up and down pivotal movement of said end of the leg remote from the body portion.

ERRATUM

For Class 181—31 see:
Patent No. 3,273,662

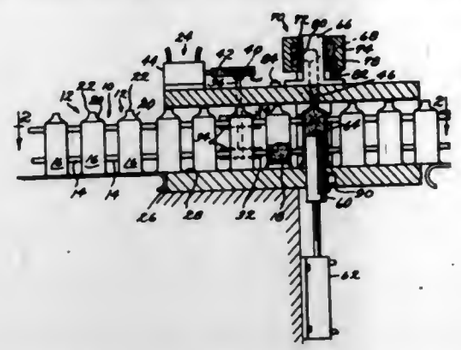


3,273,666
MULTI-PASSAGE MUFFLER PRODUCING COLLIDING FLUID STREAMS
Charles M. Hamilton, 876 Niagara St., and Daniel M. Kapral, 441 Fargo Ave., both of Buffalo, N.Y.
Filed Mar. 5, 1965, Ser. No. 349,712
9 Claims. (Cl. 181—56)

1. A muffler comprising a housing, an inlet in said housing, an outlet in said housing, a plurality of baffles in said housing extending transversely to the path of flow between said inlet and said outlet, a relatively large opening means associated with each of said baffles, each of said relatively large opening means being out of alignment with the relatively large opening means associated with other of said baffles to thereby cause portions of the flow entering said housing from said inlet to follow a sinuous path through said relatively large opening means, a plurality of relatively small opening means in each of said baffles to permit a portion of the flow to pass therethrough which does not pass through the relatively large opening means of each baffle whereby the flow emanating from said relatively large opening means of a baffle is caused to mix with the flow emanating from the

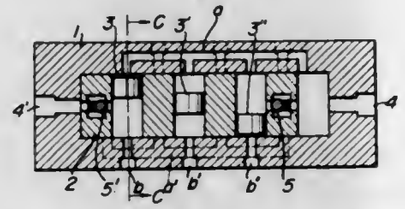
relatively small opening means of the same baffle to thereby effect an extensive mixing action on said flow passing through said housing, and a plurality of partitions extending generally in the direction of flow of gases through said muffler and providing passageways which converge toward said outlet.

3,273,667
HARVESTING SCAFFOLD FOR ORCHARDS
Kazuo Hiyama and Howard Kazuhiko Hiyama, both of 8184 E. Adams, Fowler, Calif.
Filed July 20, 1964, Ser. No. 383,751
7 Claims. (Cl. 182—129)



1. A mobile scaffold comprising a vehicle having predetermined forward and rearward ends, a pair of substantially planar workmen support platforms; means mounting the platforms in edgewardly adjacent relation in elevated position on the vehicle for pivotal elevational movement about an axis extended longitudinally of the vehicle; powered means interconnecting the vehicle and the platforms adapted to pivot the platforms between picking position with the platforms outwardly and upwardly inclined from their axis and transport position with the platforms outwardly declined therefrom and inwardly folded for narrowed travel, said platforms having a discharge opening adjacent to the axis to which objects tend to roll when deposited on the platforms when in picking position; and an elongated conveyor mounted on the vehicle beneath the opening and extended from beneath the platforms.

3,273,668
EXTRUSION APPARATUS AND METHOD
Martin L. Abel, Oak Park, Mich., assignor to Permawick Company, Detroit, Mich., a corporation of Michigan
Filed Nov. 13, 1963, Ser. No. 323,308
5 Claims. (Cl. 184—1)

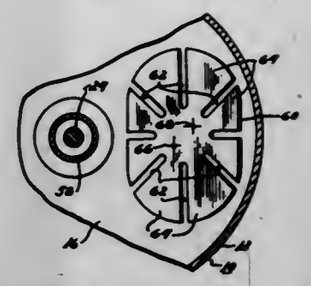


5. The method of extruding oil-impregnated fibers into bearing wells, which includes the steps of, providing a container filled with a predetermined amount of oil-impregnated fibers, positioning said container within an extruding device having an outlet orifice with an outlet of said container in alignment with the outlet orifice of said extruding device, placing a bearing well of a bearing in

communication with said outlet orifice, and extruding the oil-impregnated fibers out through said outlet orifice into

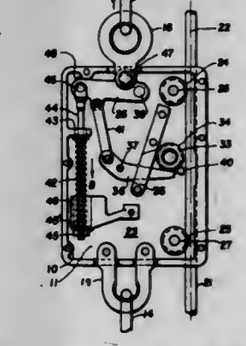
said bearing well by applying pressure to a portion of said container.

3,273,669
CENTRALIZED LUBRICATING SYSTEM
Hiroshi Fujita, Shiga-ken, Japan, assignor to Daikin Kogyo Co., Ltd., Osaka, Japan, a corporation of Japan
Filed Apr. 10, 1964, Ser. No. 358,699
Claims priority, application Japan, Apr. 12, 1963, 38/19,210
1 Claim. (Cl. 184—7)



A centralized lubricating system including a plurality of distributing valve assemblies arranged in series with each other in a loop of conduit line, each of said distributing valve assemblies comprising a casing having an axial cavity formed therein and openings formed in the opposite end walls of said casing to communicate with the adjacent ends of said cavity, a pilot plunger fitted in said cavity for free reciprocatory sliding movement therein over a definite length of stroke with a number of spaced bores formed through said pilot plunger transversely thereof and in alignment with each other, a corresponding number of metering plungers fitted in said respective transverse bores for free reciprocatory sliding movement therein, and a pair of check valves arranged in said pilot plunger at the opposite ends thereof and each in communication with the adjacent one of said transverse bores and also with the adjacent one of said end openings in a manner so as to allow fluid flow through said check valve in an outward direction, and fluid passage means including two sets of aligned outlet ports communicating with said respective transverse bores, the arrangement being such that the fluid directed under pressure into said transverse bores alternately through said end openings in said casing is discharged from the valve assembly through a set of said outlet ports by means of said metering plungers.

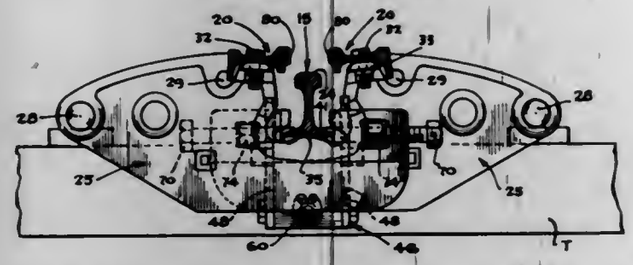
3,273,670
VIBRATIONAL DAMPER
Elmer W. Kleinlein, Troy, Mich., assignor to American Motors Corporation, Detroit, Mich., a corporation of Maryland
Filed June 1, 1964, Ser. No. 371,540
2 Claims. (Cl. 188—1)



1. Sound attenuating means for use with motor-compressor units, and comprising,

a substantially flat uniplanar member oblong in shape and having a plurality of bifurcating slots formed therein,
said slots extending radially outward from centrally of said member breaking the outer edge and forming distinctly separate friction damper fingers of differing size and shape between respectively different of said slots,

a motor compressor housing including a dome shaped cover member having an inner concave surface,
and means for securing said bifurcated member within the protection of said dome shaped member and to the vibration responsive surface thereof for best covering said surface and having the peripheral extremities of said damper fingers frictionally engaged thereto.



3,273,671
LOAD TRANSFER DEVICE AND BRAKING ARRANGEMENT
Carlos Vrana, Long Island City, N.Y., assignor to Kantfall Products Corp., Brooklyn, N.Y., a corporation of New York
Filed Dec. 20, 1963, Ser. No. 332,226
2 Claims. (Cl. 188—44)

1. A load transfer arrangement adapted to transfer a load upon release of normal load support, comprising a carrier linked to a load member and normal load support means, load transfer actuating means integral to said carrier comprising a counter weight connected to a finger, a spring each adapted to actuate a finger connected to said counter weight, said counter weight and spring co-acting and adapted to actuate said finger, said normal load support means applied to said load transfer actuating means, said load transfer actuating means adapted to immediately act upon any change in normal support means, transferred load support means within said carrier, said transferred load support means separate from said load support means and substantially parallel to the axis of said carrier, and load transfer means within said carrier including; guide means between said transferred load supporting means; a freely moveable wedging member of a size in excess of the space between said fixed guide means and said transferred load support means adapted to be guided by said guide means; said finger engageable with said freely moveable wedging member and adapted to move said wedging member towards said guide means; said freely moveable wedging member carried by said carrier unconnected to said carrier and unconnected

to said load transfer actuating means; said freely moveable wedging member adapted to engage said guide means and said transferred load support means immediately upon resumption of said normal load support.

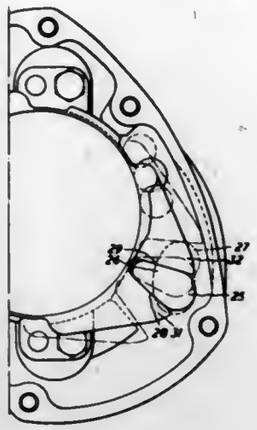
3,273,672
RETARDER
Fred W. Creedle, Park Ridge, and Ray W. Mars, Downers Grove, Ill., assignors to American Brake Shoe Company, New York, N.Y., a corporation of Delaware
Filed Sept. 3, 1964, Ser. No. 394,135
9 Claims. (Cl. 188—62)

1. A retarding system for retarding the movement of railroad cars with a braking force proportional to the weight of a railroad car, said railroad car having its wheels disposed on traffic rails, at least one which is vertically movable with respect to the railroad ties,

a plurality of levers mounted on opposite sides of at least one of said traffic rails and each of said levers adapted for pivotal movement,

braking means secured to each of said levers and engageable with a car wheel to exert a retarding force thereon,

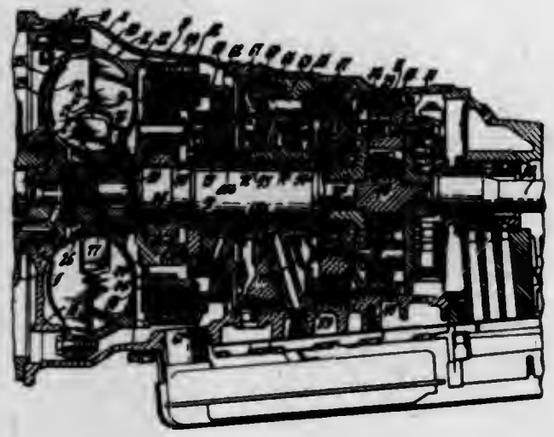
means on each of said levers for supporting said one traffic rail,



the weight of said railroad car on said one traffic rail forcing said levers to pivot in opposite directions of pivotal movement to bring said braking means together to exert a retarding force proportional to the weight of said railroad car on said one traffic rail,

means connecting said levers to said one traffic rail, and

lifting means supported on said ties for lifting said one traffic rail upwardly to remove the weight of said railroad car from said levers and through said connecting means to pivot said retarding rails to move said braking means further apart.

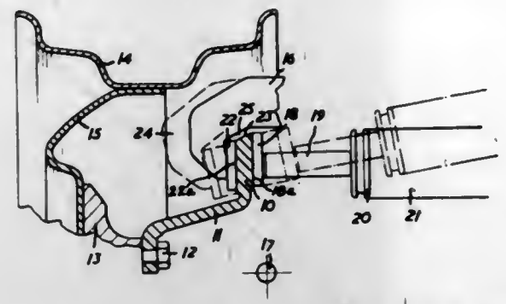


3,273,673
DISC BRAKES
Gordon John Edwards, Solihull, and George Eric Thompson, Birmingham, England, and Alexander Senkowski, deceased, late of Warwickshire, England, by Barclays Bank Limited, executor, London, England, assignors to Girling Limited and Tractor Research Limited, both British companies of Birmingham, England, and Coventry, England, respectively
Filed Dec. 14, 1964, Ser. No. 418,347
4 Claims. (Cl. 188—72)

1. A disc brake comprising a stationary housing, a rotatable shaft extending axially through said housing, axially spaced friction surfaces in said housing, friction members axially movable on and rotatable with said shaft, co-operating pressure plates located between said friction members, opposed co-operating inclined recesses in the adjacent faces of said pressure plates, roller means in said recesses, radially projecting lugs on said pressure plates, opposed abutment surfaces on said lugs, a cam located between said lugs for engagement with said abutment surfaces to effect relative angular movement of said pressure plates in opposite directions, a camshaft rotatable about its axis and carrying said cam, and means for guiding said shaft in said housing in a path such that as the shaft moves circumferentially with the pressure plates in the normal direction of rotation of said friction members it also moves radially inwards whereby the mean effective

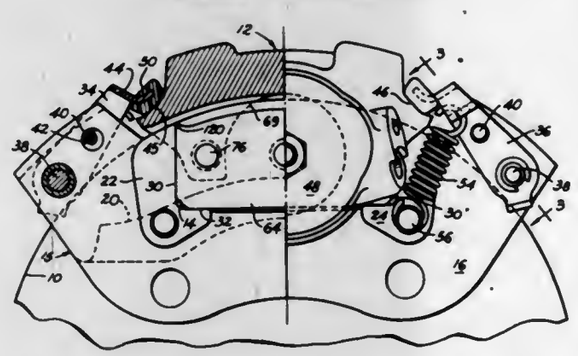
position of the points of engagement of the cam with the said abutment surfaces on the pressure plates remains substantially constant.

3,273,674
TORQUE BOOSTED BRAKE
Kenneth E. Snyder, Northville, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Sept. 18, 1963, Ser. No. 309,759
9 Claims. (Cl. 188—72)



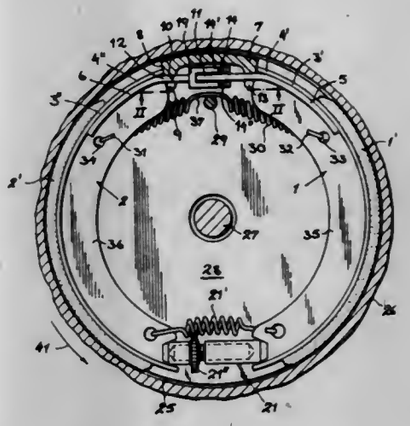
4. In a transmission of the type having friction gripping surfaces adapted to be engaged and released, a cylinder, a piston axially movable in response to fluid pressure for initiating engagement of said friction gripping surfaces, said piston being rotatable with respect to said cylinder in response to contact of said friction gripping surfaces, a recess in said piston, means for limiting the angular rotation of said piston and for applying additional thrust acting in assistance to said fluid pressure comprising a pin fixed to said cylinder and a plurality of balls positioned in said recess between said pin and a wall of said cylinder.

3,273,675
DISC BRAKES FOR VEHICLES
Peter William Brown, Birmingham, England, assignor to Girling Limited, Birmingham, England, a British company
Filed Apr. 29, 1964, Ser. No. 363,373
3 Claims. (Cl. 188—73)



1. A disc brake comprising a rotatable disc, a caliper straddling a portion of the peripheral edge of the disc, a hinge adapted to mount said caliper to a rigid relatively

stationary part for angular movement about an axis substantially at right angles to that of the disc, friction members located in the caliper for engagement with opposite sides of the disc, means located in the caliper for applying at least one friction member to the disc, and annular parallel braking paths on opposite sides of the disc for engagement by said friction members, the annular centerline of one of said paths being spaced radially inwardly with



respect to the other whereby one braking path is staggered radially inwardly with respect to the other, the outer edges of the respective braking paths being located substantially on the peripheral edges of the disc and lying substantially on an arc struck about the axis of said hinge whereby the relatively radial staggered position of said braking paths is constant with respect to the axis of said disc throughout the wear life of the pads.

3,273,676
SPOT-TYPE DISC BRAKES
René Thirion, Paris, France, assignor to Societe Anonyme D.B.A., Paris, France, a company of France
Filed Nov. 30, 1964, Ser. No. 414,559
Claims priority, application France, Dec. 4, 1963, 955,951
7 Claims. (Cl. 188—73)

1. A disc brake comprising a rotating disc, a U-shaped fixed support including two limbs located on the opposite sides of said disc, an outwardly opening recess formed in said limbs, a pair of friction pads located in said recess and cooperating with the opposite friction surfaces of the disc, a floating stirrup including an actuator operatively connected to the adjacent friction pad and a pressure member operatively connected to the second friction pad, a pair of levers pivotally mounted at their outer end thereof on the fixed support at the opposite sides of the said recess and the inner ends of which extend in operating position of said levers over the outer periphery of said recess over the adjacent portions of the stirrup, a pin removably mounted on the fixed support and providing the pivotal connection at the outer end of said levers, a safety pin permanently secured to each lever, an opening formed in the fixed support and through which extends the safety pin, said opening having a size larger than that of the safety pin, a pair of springs respectively connecting the inner-end of said levers to the fixed support, and biasing in operating position of the levers the stirrup inwardly with respect to said recess and thus apply the friction pads onto a seat formed at the bottom of said recess as well as create a clearance between the safety pin and the said opening, the latter having a size enabling a pivotal movement of said levers within a predetermined range which is however insufficient to enable an escape of the stirrup from the recess, the attachment point of said springs to the respective levers, being selected at such a distance from the safety pin, that upon withdrawal of the removable pin, and rocking said levers towards the opposite side of the safety pin, the said springs are subjected to a load of the same order as that to which the springs are subjected when the levers are in operating position.

3,273,677
INTERNAL-EXPANSION BRAKE SYSTEM WITH REINFORCED BRAKE-SHOE EXTENSIONS
Carl Press, Offenbach, Germany, assignor to Alfred Teves Maschinen- und Armaturenfabrik KG, Frankfurt am Main, Germany, a German company
Filed Sept. 2, 1964, Ser. No. 393,976
Claims priority, application Germany, Sept. 3, 1963, T 24,627
1 Claim. (Cl. 188—78)

A drum-type brake system, comprising:

a brake drum rotatable about an axis and having a generally cylindrical internal brake surface centered thereon;

support means surrounded by said surface;

a pair of generally segmental brake shoes juxtaposed with diametrically opposite portions of said surface and movably disposed on said support means, said brake shoes being generally elongated and having two pairs of corresponding extremities, said brake shoes each including

a respective arcuate backing member generally parallel to the respective portion of said surface,

a respective brake lining affixed to each of said backing members and disposed between said surface and the respective backing member, and

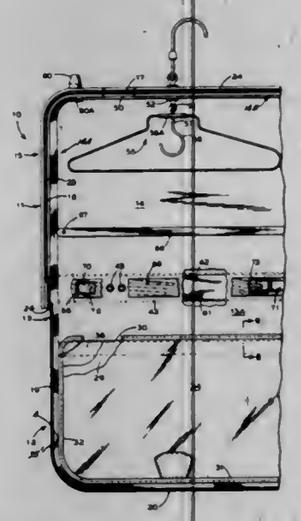
a pair of ribs extending inwardly along said backing members and transversely thereto;

coupling means interconnecting one of said pairs of extremities of said brake shoes in force-transmitting relationship;

abutment means on said support means interposed between the other pair of extremities and having a pair of abutment faces respectively engageable thereby and fixed with respect to said support for selective immobilization of said other extremities of said brake shoe, said abutment means having a guide surface generally transverse to said faces, said brake shoes being formed with respective, generally coplanar extension plates at said other extremities substantially perpendicular to said faces and projecting

therebeyond toward one another, said extension plates being parallel to said guide surface and slidably engageable thereby while being secured to the respective backing members, said extensions having interfitting formations at their proximal ends,

actuating means at said abutment means and interposed between said other extremities for shifting said brake shoes into engagement with said brake surface, said actuating means including an actuating lever of U-shape configuration extending through said support means having a generally planar portion transverse to said extension plate and disposed therebetween for shifting said brake shoes, one of said formations being constituted as tongue passing with clearance through said planar portion of said lever, the other of said formations having a cutout receiving said tongue, said abutment means being recessed to provide a pair of lateral guide surfaces bracketing said extension plates and preventing them from shifting parallel to the axis of rotation of said drum, said actuating lever being formed with a pair of flanks extending perpendicularly to said planar portion and parallel to said extension plates on opposite sides thereof in the region of interengagement of said formations; and



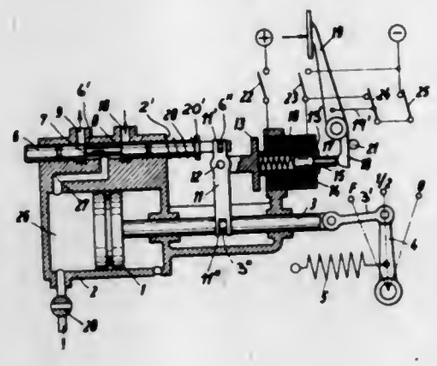
resilient means drawing said brake shoes toward one another and floatingly mounting said brake shoes on said support means.

3,273,678

FOLDABLE LUGGAGE BAG

Richard Koret, Bedford Hills, N.Y., assignor to Koret, Inc., New York, N.Y., a corporation of New York

Filed Sept. 3, 1963, Ser. No. 306,203
9 Claims. (Cl. 190—43)



4. A foldable luggage bag comprising in the open, extended condition thereof, a continuous, longitudinally extending substantially rectangular flexible wall, said flexible wall comprising in longitudinal succession a garment holding section, a fold section and a compartment section, said garment holding and compartment sections being foldable about said fold section into opposed relation, a U shaped wall member having an end wall portion and parallel side wall portions, the bottom edges of the wall portions of said U shaped wall member being secured to corresponding edge portions of said garment holding section wall portion, said U shaped wall member providing the bottom and end walls of said luggage bag in the folded, closed condition thereof, a flexible walled compartment on the compartment section of said longitudinally extending wall, said compartment including upstanding parallel side walls and parallel end walls, a top wall and a bottom wall, said compartment side and end walls being of substantial depth and projecting into the garment holding portion of said bag defined by said U shaped member and the garment holding section of said longitudinal flexible wall when said bag is in its folded, closed condition, the flexible side and end walls of said compartment being reducible in depth to conform to the bulk of the contents of said compartment.

3,273,679

AUTOMATIC CONTROLS FOR FLUID PRESSURE CLUTCH OPERATOR

Edmond Uher, Cap d'Antibes, France, assignor to Beltomatic Patentverwertungsanstalt, Vaduz, Liechtenstein, a corporation of Liechtenstein

Filed Aug. 10, 1964, Ser. No. 388,623
Claims priority, application Germany, Aug. 9, 1963, U 10,041
1 Claim. (Cl. 192—.052)

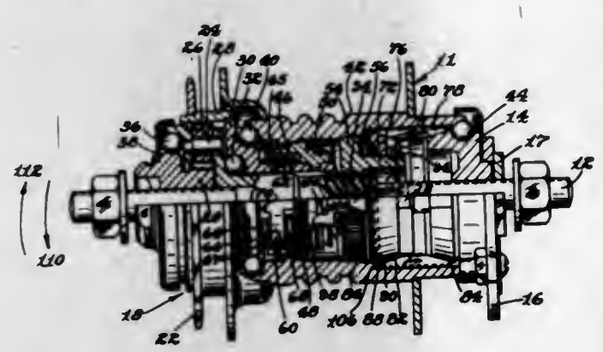
In a vehicular-clutch system for an automotive vehicle provided with an engine, a variable-speed transmission coupled with said engine, a clutch interposed between said transmission and said engine and having an actuating element for shifting said clutch between a first position wherein said transmission is decoupled from said engine and a second position wherein said transmission is fully coupled with said engine, and operator-controlled accelerator means for selectively varying the speed of said engine, the improvement which comprises:

(a) servomotor means operatively connected with said actuating element for shifting the latter between said first and second positions through at least one intermediate position wherein said clutch partially couples said engine with said transmission but normally maintaining said element in said first position in an operative condition of said engine;

(b) first operating means connecting said accelerator means with said servomotor means for controlling same in dependence upon the actuation of said accerelator means and energizing said servomotor means to shift said element to said second position upon actuation of said accelerator means to increase the speed of said engine;

(c) second operating means responsive to the speed of said vehicle and connected with said servomotor means for controlling same in dependence upon a speed of the vehicle and energizing said servomotor means to shift said element at least into said intermediate portion upon the speed of said vehicle exceeding a predetermined minimum; and

(d) third operating means connected with said transmission and said servomotor means for temporarily operating same to shift said element toward said first position upon actuation of said transmission to alter the transmission ratio thereof,



said servomotor means comprising a fluid-responsive piston-and-cylinder arrangement and valve means for regulating the flow of a medium to and from said arrangement, said valve means including a shiftable valve member for regulating the flow of said medium to said arrangement, said first operating means including a connecting member interposed between said accelerator means and said valve member for shifting the latter upon actuation of said accelerator means by the vehicle operator, and electromagnetic means co-operating with said connecting member and energizable to shift said valve member in a sense tending to operate said piston-and-cylinder arrangement so that said element is displaced toward said first position, said second operating means includes an electric circuit connected with said electromagnetic means and having at least one switch in circuit therewith, and governor means responsive to the speed of said vehicle for operating said switch upon the speed of said vehicle exceeding said predetermined minimum, said circuit including a further switch in series with the first-mentioned switch and constituting part of said first operating means, both of said switches being normally closed with said first-mentioned switch being opened by said governor means upon the speed of the vehicle exceeding said predetermined minimum and said further switch being opened by said acelerator means upon actuation thereof by the vehicle operator.

3,273,680

HUB AND BRAKE FOR VELOCIPEDES AND THE LIKE

Edwin Elliott Hood, Elmira, N.Y., assignor to The Bendix Corporation, Elmira, N.Y., a corporation of Delaware

Filed May 6, 1965, Ser. No. 453,717
9 Claims. (Cl. 192—6)

7. In a hub for driving and braking velocipedes and the like comprising:

a non-rotating axle;

a hub having a clutch surface formed thereon;

a screw-shaft means journalled on the axle;

a driving clutch means threaded on the screw-shaft adapted to engage the hub clutch surface;

axially-moveable brake expander means;

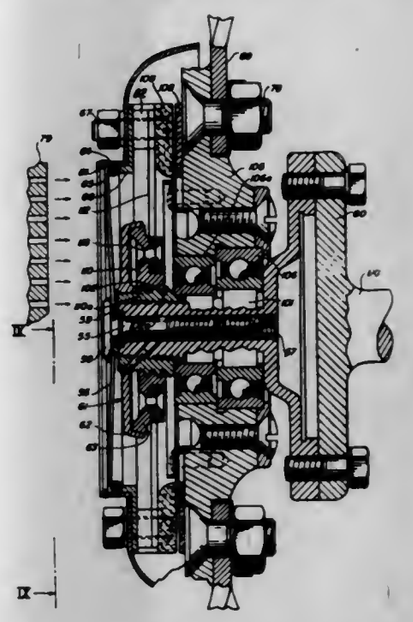
fixed brake expander means;

shoe brake means mounted between the brake expander means;

said driving clutch means having an axially-extending cylindrical portion;

said moveable brake expander means journalled on said cylindrical portion;

retarder means adapted to engage the moveable expander means and the driving clutch means for causing the aixal movement of the driving clutch means on the screw-shaft means; and



the moveable expander member having its transverse end adjacent the driving clutch means adapted to be engaged by the driving clutch means for braking the hub.

3,273,681

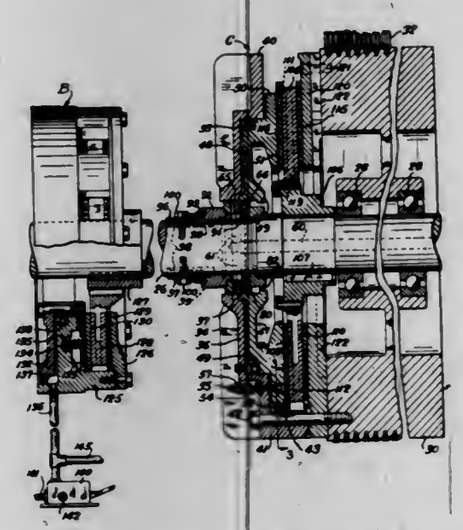
THERMOSTATIC TORQUE RESPONSIVE CLUTCH

Gerd Wolfgang Seifert, Seestrasse 190, Unterschondorf, Germany

Filed Jan. 13, 1965, Ser. No. 425,146
Claims priority, application Germany, Jan. 15, 1964, S 89,070; Apr. 18, 1964, S 90,623
10 Claims. (Cl. 192—54)

1. A clutch assembly for intermittently operating a cooling unit for an internal-combustion engine, comprising a drive shaft provided with male threads and powered by said engine; a nut on said shaft limitedly rotatable and axially displaceable with reference to said shaft, said nut having female threads mating with said male threads for axially displacing said nut from a normal position toward an off-normal position upon relative rotation of said nut and said shaft in a predetermined direction; a rotary body concentric with said shaft; force-transmitting means including an axially yieldable resilient linkage connecting said body with said nut at least in positions other than said normal position for joint rotation therewith; a driven member coaxial with said shaft and said body, said driven member being coupled with said cooling unit, said driven member and said body being provided with confronting annular contact surfaces spaced from each other in said normal position of said nut and bearing upon each other with increasing pressure upon progressive displacement of said nut toward said off-normal position for frictional entrainment of said driven member with a torque depending upon the axial position of said nut; and control means responsive to changes of ambient temperature in the vicinity of said engine for exerting upon said nut an axial force for shifting said nut into and out of said normal position with reference to said shaft, said threads having a pitch angle large enough to enable relative axial displacement of said nut and said shaft by said force.

3,273,682



SEAL FOR FLUID OPERATED CLUTCH

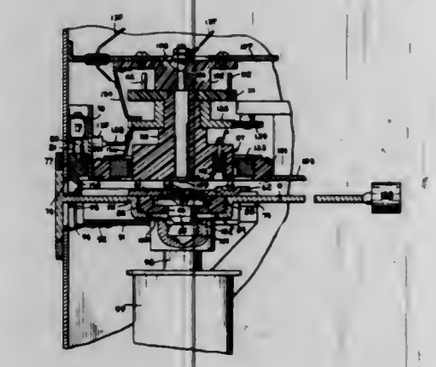
Alfred W. Schultz, Cleveland Heights, Ohio, assignor to The Cleveland Crane & Engineering Company, Wickliffe, Ohio, a corporation of Ohio

Filed July 10, 1964, Ser. No. 381,675
3 Claims. (Cl. 192—85)

2. In a press or the like, a shaft adapted to actuate the press, a rotary drive element rotatably supported on said shaft, fluid operated clutch means to drivingly connect the shaft to said drive element including fluid motor means comprising cylinder and piston members concentric with said shaft, means to direct fluid into said

fluid motor means, first and second annular abutment means having axially tapered surfaces concentric and rotatable with said shaft, first and second annular sealing members in sealing engagement with said cylinder and piston members, respectively, and concentric with said shaft, said first and second sealing members being freely movable circumferentially and axially relative to said shaft and their respective cylinder and piston members and being independently axially movable relative to each other, said sealing members having axially tapered an-

nular surfaces complementary with the tapered surfaces of said abutment means, said sealing members being movable toward and away from one another into and out of engagement with said abutment means, said axially tapered surfaces of said abutment means and said sealing members having a large taper angle for effecting a radial force component which is substantially less than the axial force component when said first and second members are forced apart and into sealing engagement with said abutment means by fluid directed into said fluid motor means.



3,273,683

AUTOMATIC PARKING AREA MECHANISM

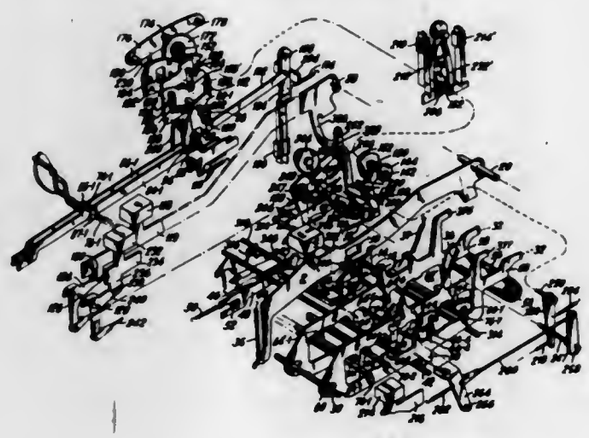
Morris Goodman, 30 W. Court St., Indianapolis, Ind.

Original application Oct. 8, 1962, Ser. No. 229,082, now Patent No. 3,241,755, dated Mar. 22, 1966. Divided and this application Mar. 9, 1966, Ser. No. 532,959

8 Claims. (Cl. 194—4)

1. Means for reading a discoid, electrically-conductive token having an orienting depression in one face and having a radial tab, comprising a housing, a slide having an upwardly-presented surface formed with a well therein, said slide being supported for movement between an outer position in which said well is exposed outside said housing and an inner position in which said well is disposed wholly within said housing, a dielectric element loosely received in said well, a platform member movably supported relative to said dielectric element and formed to provide an upwardly-presented surface having an upward orienting projection, means supported from said slide and cooperating with said platform member, when said slide is in its outer position, to support said platform member with its said surface substantially flush with said slide surface to receive a token with said upward orienting projection entered in said orienting depression, a contactor ring mounted in said housing above said slide and concentrically registering with a token supported on said slide when said slide is in its inner position, means in said housing and engageable with said dielectric element, when said slide is in its inner position, to lift said dielectric element to move the tab of a token supported thereon into electrical contact with said ring, said ring being made up of a series of conductor pads separated by rectifier wafers, a collar concentric with said ring and mounted for rotation about the axis of said ring, a brush carried by said collar to sweep said ring, and means for rotating said collar step-by-step to move said brush, at predetermined uniform time intervals from one pad to the next and to turn said collar through one complete revolution in twenty-four hours.

3,273,684



INPUT-OUTPUT TYPEWRITER HAVING DOUBLE SHIFT MEANS

Jun Oshiba, Mitsuro Isobe, Junichi Umeda, and Kunio Kaneko, all of Tokyo, Japan, assignors to Nippon Electric Company, Limited, Minato-ku, Japan, a corporation of Japan

Filed May 24, 1965, Ser. No. 457,975

Claims priority, application Japan, May 25, 1964, 39/29,261

8 Claims. (Cl. 197—19)

1. An input-output typewriter comprising:

a plurality of letter keys, each being assigned with a first-letter-position letter, a second-letter-position letter, and a third-letter-position letter and being accompanied by a first-letter-position encoding-member group complying with a letter code combination allotted to said first-letter-position letter according to a first manner of allotment and a second-letter-position encoding-member group complying with a letter code combination allotted to said second-letter-position letter according to a second manner of allotment;

each of said letter keys as is assigned with a third-letter-position letter to which a letter code combination is allotted according to said first manner of allotment, being accompanied by a first-code-family third-letter-position encoding member group complying with the last-mentioned letter code combination and by a first code-family-shift operating member;

each of said letter keys as is assigned with a third-letter-position letter to which a letter code combination is allotted according to said second manner of allotment, being accompanied by a second-code-family third-letter-position encoding-member group complying with the last-mentioned letter code combination and by a second code-family-shift operating member;

first-letter-position shift-key means for shifting, when touched, the typewriter mechanism into a first-letter position where all the first-letter-position encoding-member groups are brought into cooperative relation with the respective letter keys;

second-letter-position shift-key means for shifting, when touched, said typewriter mechanism into a second-letter position where all the second-letter position encoding-member groups are brought into cooperative relation with the respective letter keys;

third-letter-position shift-key means for shifting, when touched, said typewriter mechanism into a third-letter-position where all the third-letter-position encoding-member groups are brought into cooperative relation with the respective letter keys and where all the first and the second code-family-shift operating members are brought into cooperative relation with the respective ones of said letter keys;

a code-family-shift indicator-activator, responsive to said first-letter-position and said second-letter-position shift-key means and to said first and said second code-family-shift operating members and capable of being put into a first-code-family position, when the same is not in such a code-family position, by a touch given to said first-letter-position shift key means and by said first code-family-shift operating member activated, while said typewriter mechanism is in said third-letter position, by a touch given to such one of said letter keys as is accompanied thereby, and being put into a second-code-family position, if the same is not in such a code-family position, by a touch given to said second-letter-position shift-key means and by said second code-family-shift operating member activated, while said typewriter mechanism is in said third-letter position, by a touch given to such one of said letter keys as is accompanied thereby;

at least one code contact for producing signals in succession, each representing one of the letter code combinations, a first-code-family shift code combination for use in indicating that the following at least one signal is one representing the letter code combination allotted to a letter according to said first manner of allotment, and a second-code-family shift code combination for use in indicating that the following at least one signal is one representing the letter code combination allotted to a letter according to said second manner of allotment;

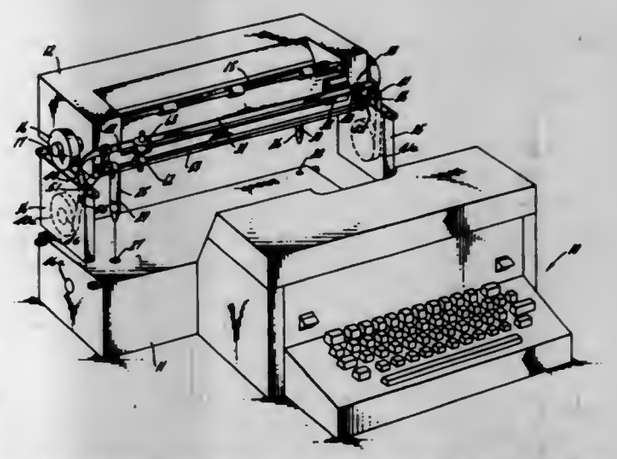
a letter code-contact activator, responsive to said code-family-shift indicator-activator, for coupling, while said code-family-shift indicator-activator is in said first-code-family position, all said first-letter-position and said first-code-family third-letter-position encoding-member groups with said code contact, and for coupling, while said code-family-shift indicator-activator is in said second-code-family position, all said second-letter-position and said second-code-family third-letter-position encoding-member groups with said code contact;

a code-family code-contact activator, responsive to change of said code-family position of said code-family-shift indicator-activator, for causing, when said code-family-shift indicator-activator is put into said first-code-family position, said code contact to produce the signal representing said first-code-family shift code combination, and for causing, when said code-family-shift indicator-activator is put into said second-code-family position, said code contact to produce the signal representing said second-code-family shift code combination;

an encoder trigger responsive to a touch given to one of said letter keys while said typewriter mechanism is in one of said first-letter and said second-letter positions, for making the corresponding one of the accompanying first-letter-position and second-letter-position encoding-member groups activate said code contact through said letter code-contact activator, thereby causing said code contact to produce the signal representing the desired letter code combination;

and an encoder-trigger controller, responsive to said third-letter-position shift-key means, for suppressing the operation of said encoder trigger in case said typewriter mechanism is in said third-letter position;

said first and said second code-family-shift operating members cooperating, in case said typewriter mechanism is in said third-letter-position, with said code-family-shift indicator-activator and also with said encoder-trigger controller, to cause said encoder-trigger controller to temporarily put said encoder-trigger into operation when a touch is given to such one of said letter keys as is accompanied by the third-letter-position encoding-member group of the same code family as the code-family position of said code-family-shift indicator-activator, and to change the code-family position of said code-family-shift indicator-activator and thereafter cause said encoder-trigger controller to temporarily put said encoder-trigger into operation when a touch is given to such one of said letter keys as is accompanied by the third-letter-position encoding-member group of the code family different from the code-family position of said code-family-shift indicator-activator.



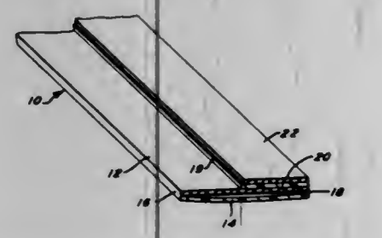
3,273,685

METHOD AND APPARATUS FOR JUSTIFYING RIGHT HAND MARGINS

Theodore B. Holliday, 248 Arlington Ave., Elmhurst, Ill.

Filed June 27, 1963, Ser. No. 291,194

2 Claims. (Cl. 197—84)



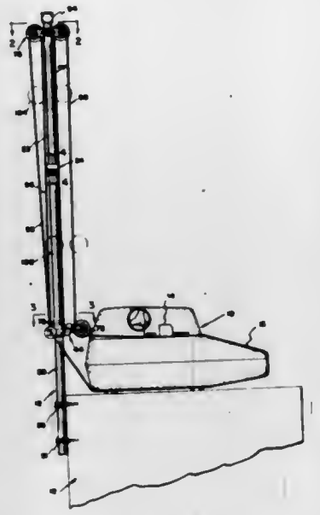
1. A typewriter assembly to justify right-hand margins of paper which includes, in combination, a key section linked to character bars, a carriage joined to the key section, said carriage adapted to fix a paper against horizontal movement, a contact point spaced laterally of the paper, a supply reel of flexible, deformable ribbon on one end of the typewriter, a holder for said supply reel on said one end of the typewriter, a take-up reel for the ribbon on the other end of the typewriter, a holder for

said take-up reel on said other end of the typewriter, means to move the ribbon towards the take-up reel after a character has been impressed as a raised impression at the contact point, means to ink the raised impressions, a guide bar attached to the typewriter, a clamp slidably positioned on the bar adapted to fix the ribbon towards the take-up reel, another clamp slidably positioned on the bar, said other clamp adapted to engage and hold the ribbon at a position removed from the last impression so that said other clamp is adapted to pull and stretch the ribbon towards the supply reel, and a roller slidably joined to the guide bar to press the stretched ribbon against a sheet of paper and transfer the impressions from the ribbon to the paper.

3,273,686
IMPRESSION RIBBON AND METHOD OF MAKING SAME

Walter Ploeger, Jr., North Bellmore, N.Y., assignor to Filmon Process Corp., New York, N.Y., a corporation of New York

Filed Aug. 10, 1964, Ser. No. 388,490
8 Claims. (Cl. 197—172)

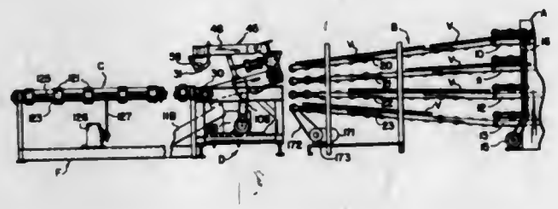


1. An impression ribbon comprising a first layer of material adapted to have a transfer medium thereon, a second layer of material impervious to the transfer medium on said first layer, said second layer overlying said first layer, said first and second layers being of substantially the same width and joined together by a fused joint only along their longitudinally extending side edges, a third layer of material adapted to have a transfer medium thereon, said third layer being approximately one half the width of said first layer, said third layer overlying one longitudinal half of said first layer, a fourth layer of material interposed directly between said first and third layers, said fourth layer having a width slightly greater than the width of said third layer, said fourth layer being impervious to the transfer mediums on said first and third layers, said fourth layer overlying said one longitudinal half of said first layer, said third and fourth layers being joined to said first and second layers only by a fused joint along the longitudinally extending coextensive side edges, with all of said layers being made from a pliable material, and the longitudinally extending side edge of said fourth layer which is not joined to the third layer projecting beyond the adjacent longitudinally extending side edge of the third layer.

3,273,687
TAPE HANDLING DEVICE

Paul E. Becking, Lake Orion, Mich., assignor to Dura Corporation, Oak Park, Mich., a corporation of Michigan

Filed July 9, 1963, Ser. No. 293,822
5 Claims. (Cl. 197—180)

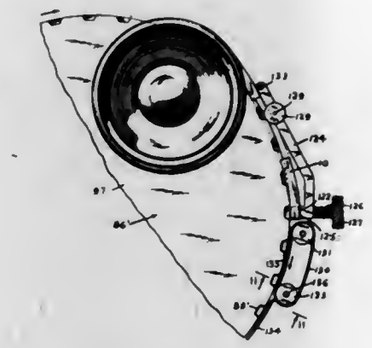


1. In combination with an automatic writing system including, in a common casing, a writing unit and coded tape feed mechanism for imparting movement to an endless band of coded tape; an endless band of coded tape drivably associated with said coded tape feed mechanism and adapted to be driven substantially horizontally through the coded tape feed mechanism; and a separate vertically extending coded tape supporting device associated with said automatic writing system for supporting said endless band of coded tape, said tape supporting device being completely separate from and extending upwardly above the components of said automatic writing system within the common casing, a support for said automatic writing system, mounting means for said tape supporting device mounting said tape supporting device in spaced relationship to said automatic writing system said mounting means connecting said tape supporting device to said support for said automatic writing system in spaced and operatively oriented relationship to said common casing, a first pulley means on said tape supporting device located in general vertical alignment with said automatic writing system opposite said coded tape feed mechanism, a second pulley means on said tape supporting device located vertically above said first pulley means and said automatic writing system, and said endless band of coded tape extending through said coded tape feed mechanism and around said first pulley means in a first elongated loop elongated in a generally horizontal direction and extending around said first pulley means and said second pulley means in at least one other elongated loop elongated in a generally vertical direction.

3,273,688
VENEER DRYER FEEDER

Roger H. Foltz, Jr., Painesville, Ohio, assignor to The Coe Manufacturing Company, Painesville, Ohio, a corporation of Ohio

Filed Jan. 22, 1964, Ser. No. 339,485
15 Claims. (Cl. 198—20)



1. In equipment for feeding veneers to power driven conveyor means operating to move veneers thereon at a predetermined speed, feed means locatable adjacent to one end of conveyor means to be fed, said feed means comprising roll means located one above the other, power means for driving at least one of said roll means, power driven conveyor means at the side of said feed means opposite to the side locatable adjacent to the conveyor means to be fed for conveying veneers lengthwise of said roll means with their one ends between said roll means, and means adapted for periodically actuating said feed means in timed relation to the operation of the conveyor means to be fed to cause said feed means to feed veneers on said conveyor means the ends of which are between said roll means to the conveyor means to be fed.

3,273,689
APPARATUS FOR LOADING OBJECTS INTO AN INDEX TABLE

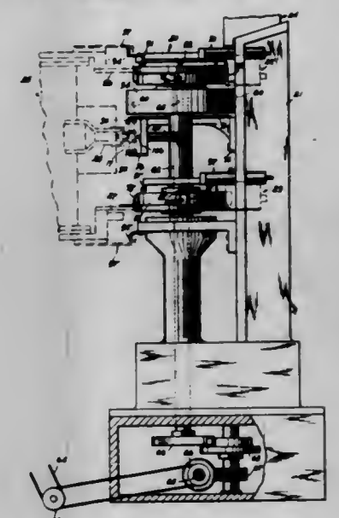
Fred C. Gleason, Cannondale, Conn., and Edward E. Byrnes, South Bend, Ind., assignors to American Home Products Corporation, New York, N.Y., a corporation of Delaware

Original application June 29, 1962, Ser. No. 206,480, now Patent No. 3,212,668, dated Oct. 19, 1965. Divided and this application July 9, 1965, Ser. No. 484,146
2 Claims. (Cl. 198—24)

1. Apparatus for positioning a series of generally elongate objects of predetermined cross-sectional dimensions, said apparatus comprising:

(1) a substantially vertical chute adapted to permit passing of the elongate objects axially therethrough said chute comprising walls forming an upper end and a lower discharge end comprising an unyielding bottom member for totally arresting axial movement of objects reaching said end, and a lateral opening in one of said unyielding walls of said chute above said bottom member to permit lateral exiting therefrom of an arrested object;

(2) means in communication with the upper end of the chute for furnishing elongate objects axially and seriatim thereto;



(3) a rotatable circular index table mounted for rotation on a substantially vertical axis, said index table having a plurality of pockets therein located in the periphery thereof, each of said pockets having a lateral opening therein, said table being rotatable with respect to said discharge end of said chute for causing seriatim aligned communication of each of the lateral openings in said pockets with the lateral opening in said discharge end of said chute; and

(4) means for urging a totally arrested object in said discharge end of said chute laterally through the lateral opening in said chute and into one of said pockets of said index table via said lateral opening in said pocket, said means comprising an opening in another wall of said chute, an elongate lever arm having a pusher element mounted at one end region thereof, means pivotally mounting said elongate lever arm at the other end region thereof for movement in a direction wherein said pusher element extends through the opening in said other wall of said chute and toward said opening in said one of said walls of said chute, resilient means biasing said lever arm intermediate said end regions thereof toward said direction, a cam follower mounted on said lever arm for movement therewith in the same general direction as said pusher element moves, said cam follower bein positioned on said lever arm and proportioned for entry into the lateral opening in one of said pockets each time the lateral opening of another of said pockets is in alignment with the lateral opening in said chute whereby said biasing means are permitted to urge said lever arm in said direction.

3,273,690
APPARATUS FOR FEEDING SETS OF PARTS

Jack J. Monahan, Allentown, Pa., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York

Filed June 4, 1964, Ser. No. 372,618
5 Claims. (Cl. 198—25)

1. An apparatus for feeding sets of parts to be assembled comprising:

a rotary work table,

sets of holders mounted at spaced angular positions on the work table,

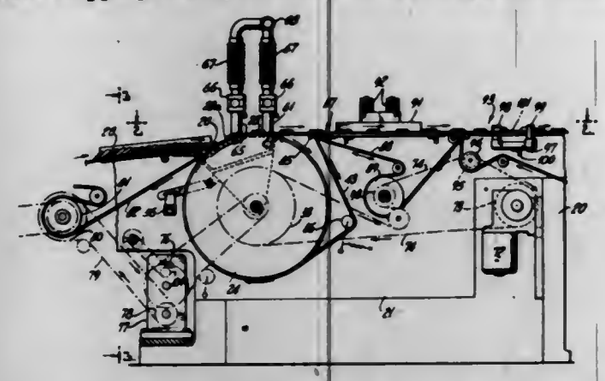
a plurality of rotary transfer devices, one for each of the parts, mounted adjacent the work table on a common axis parallel to the axis of the work table,

each transfer device having part receiving means located thereon at spaced angular positions,

means for supplying parts singly to the part receiving means,

means to drive the work table and the transfer devices in synchronism so that each set of parts is brought into mutual alignment with, and adjacent to, a set of holders, and

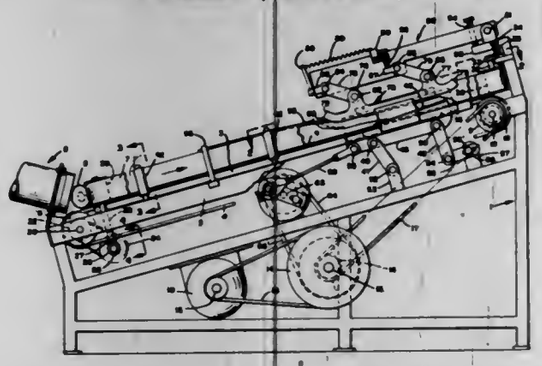
means operable when a set of parts is so aligned to transfer the said set of parts to the aligned set of holders.



3,273,691
PRODUCT FEEDING APPARATUS

Arthur J. Griner, Wykoff, N.J., assignor to National Biscuit Company, a corporation of New Jersey

Filed Jan. 6, 1964, Ser. No. 335,996
13 Claims. (Cl. 198—34)



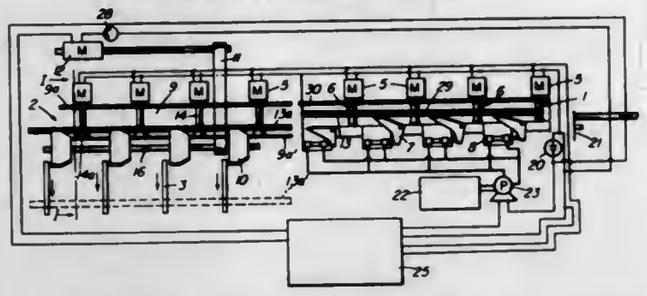
1. In product feeding apparatus, in combination, an elongated frame, conveying means supported by said frame and adapted to present a plurality of parallel massed columns of flattened articles, a cross shaft secured in said frame, a hollow drum rotatably mounted on said shaft and adapted to be peripherally engaged by said parallel columns of articles, vacuum means operable through orifices in the periphery of said drum to clutch said articles successively from said columns to said periphery in circumferentially staggered spaced relation second conveying means to strip said articles from said drum

against final resistance of said vacuum clutching means, a third conveyor adapted to receive said articles from said stripping conveyor means in said staggered relation

and to move the same toward a delivery station, means to drive said conveyors and said drum, and means associated with said third conveyor for guiding said staggered articles into single line delivery relation.

3,273,692
FREESTONE DRUPE PITTER AND METHOD
Carl T. Petersen, Lafayette, and Etheridge R. McClelland, Hayward, Calif., assignors to Filper Corporation, San Ramon, Calif., a corporation of California
Filed Jan. 6, 1965, Ser. No. 423,788
7 Claims. (Cl. 198—34)

1. The method of spacing adjacent pairs of generally spherical drupes of different sizes in a row thereof while moving said row in one direction longitudinally thereof from a feeder to a pitting mechanism that includes the steps of:



(a) rollably supporting said drupes in said row on a surface extending between said feeder and said mechanism for movement of the drupes of adjacent pairs toward and away from each other on said surface;

(b) supporting said surface at an upward incline from said feeder to said mechanism of approximately an angle relative to horizontal sufficient to cause said drupes to roll down said surface solely under the influence of gravity in the absence of any obstruction to such rolling;

(c) rotating said drupes on said surface about generally horizontally extending axes normal to said row, and carrying said drupes on said surface longitudinally of said row toward said pitting mechanism by moving said surface upwardly longitudinally of said row from said feeder to said mechanism at a rate of speed sufficient to overcome the said influence of gravity whereby the drupes of said row will not only be carried up said surface, but upon engagement between trailing and leading drupes of an adjacent pair thereof on said surface during their said upward movement with said surface, the movement of said trailing drupe will be immediately retarded under said influence of gravity for spacing it from the leading drupe;

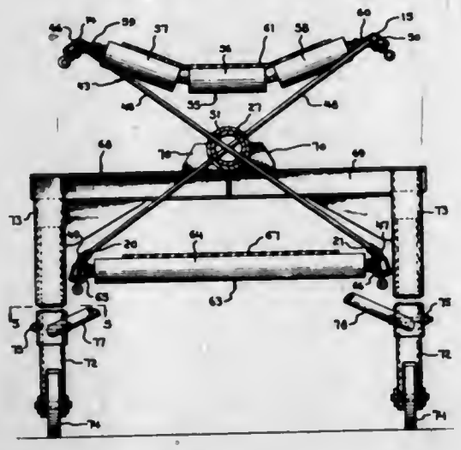
(d) holding said drupes in said row with the latter extending longitudinally of said incline during said movement of said drupes.

3,273,693
TRANSFER APPARATUS
Walter vom Dorp, Rheydt, Germany, assignor to Mannesmann-Meer Aktiengesellschaft, Dusseldorf, Germany, a German company
Filed Sept. 20, 1963, Ser. No. 310,293
9 Claims. (Cl. 198—127)

1. Apparatus to transfer rolled mill stock to a cooling bed comprising a source of energy,

a supply conveyor energized by the source of energy and adapted to transport rolled mill stock away from a mill, and

a bed to cool said stock, in combination with apparatus to deflect rolled mill stock out of the mill run-out line as it moves along the supply conveyor,



means connecting the source of energy to the deflecting apparatus,

a delivery conveyor to receive rolled mill stock from the supply conveyor,

drive means connecting the source of energy to the delivery conveyor, and

transfer devices associated with the delivery conveyor to remove rolled mill therefrom and to transfer the stock to said cooling bed.

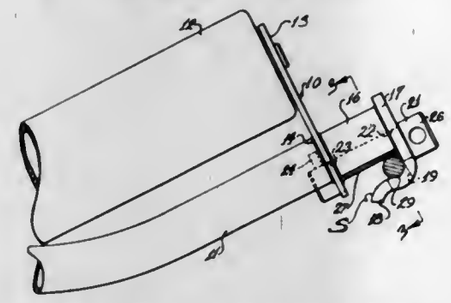
3,273,694
PORTABLE CONVEYOR
Clarence A. Joslin, Chicago, Ill., assignor to Goodman Manufacturing Company, Chicago, Ill., a corporation of Illinois
Filed Sept. 21, 1964, Ser. No. 397,911
9 Claims. (Cl. 198—129)

1. In a conveying structure,

elongated compression tube means, said means having a terminal at each end,

a pulley associated with each terminal,

an endless conveyor belt reeved about the two pulleys,



upper and lower flexible strand means disposed at levels respectively above and below the compression tube means and substantially parallel with it

roller means carried by the flexible strand means and effectively supporting the conveyor belt along substantially the entire length of the compression tube means,

the strand means being connected respectively between the terminals, and

means for stretching the strand means to simultaneously apply compression in the compression tube means and tension in the strand means to furnish support for the belt.

3,273,695
PROCESS AND APPARATUS FOR LOCKING MEMBERS TO CABLES AND THE LIKE
Paul Hamaker, George C. Morgan, and Jeff R. Powell, Jr., all of Birmingham, Ala., assignors to Transall, Inc., a corporation of Alabama
Filed July 29, 1964, Ser. No. 385,860
2 Claims. (Cl. 198—192)

1. For use as a clamp for securing a cable,

(a) a plate having a laterally directed cable engaging flange on one side thereof,

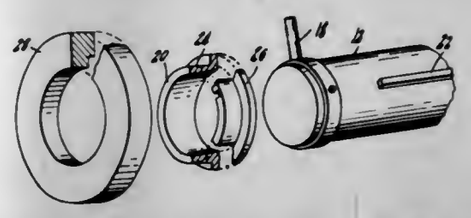
(b) there being a slot in said flange adjacent the juncture of said flange and said plate,

(c) cable engaging bearing points on the flange adjacent opposite ends of the slot and disposed to be engaged by the cable,

(d) a second plate parallel to and spaced from said first plate and said flange a distance sufficient to permit the cable to be passed therebetwen thereby to be positioned at the juncture of the first plate and said flange and over the slot,

(e) a cylindrical cable locking pin member having a substantially flat surface on one side located intermediate the ends thereof and a generally cylindrical surface on the other side thereof opposite said flat surface,

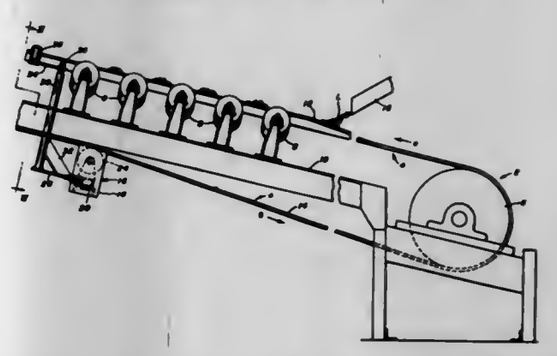
(f) there being a curved cam-like surface joining said flat surface and said cylindrical surface,



(g) said pin member having its cylindrical ends rotatably mounted in aligned holes in said first and second plates and with its intermediate portions extending across said flange and the slot therein,

(h) said intermediate portion of the pin member being so dimensioned and positioned that when said flat surface is rotated to face said slot the cable may be inserted between the flat surface of the pin and said flange and when the flat surface is rotated to face away from the slot on the cable is forced into the slot and into biting, locking engagement with the said bearing points, and

(i) means for rotating said pin.

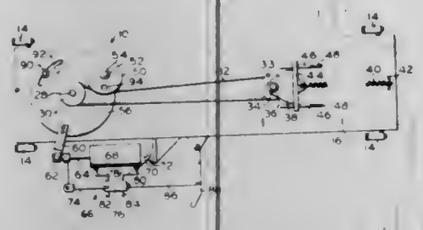


3,273,696
BELT POSITIONING DEVICE
Robert E. Thurston, Amherst, N.H., assignor to Improved Machinery Inc., Nashua, N.H., a corporation of Delaware
Filed Jan. 27, 1965, Ser. No. 428,320
5 Claims. (Cl. 198—202)

1. Apparatus for controlling the position of a traveling belt transversely on guide rolls and like supports against which the belt is trained in a partial wrap having, in combination, a support roll assembly comprising a support shaft rotatable on an axis, said shaft having a series of circular bearing surfaces disposed in parallel planes with parallel axes each tilted with respect to and intersecting the axis of said support shaft, and with parallel transverse diameters perpendicularly intersecting said shaft axis, a series of rolls having belt engaging peripheral surfaces freely rotatable on said bearing surfaces in said parallel planes, said supporting shaft and bearing surface supported rolls having a neutral angular position on said

support shaft axis in which said transverse diameters perpendicularly intersecting the support shaft axis are transverse to the roll engaging wrap portion of said belt so that the extent of peripheral surface of each said roll engaging said belt having an axial movement in one direction is balanced by an equal extent of peripheral surface engaging said belt having an axial movement in the opposite direction, said supporting shaft and bearing surface supported rolls having alternative angularly disposed belt shifting positions at each side of said intermediate neutral position.

3,273,697
APPARATUS AND METHOD FOR CENTERING A CONVEYOR BELT
Frank A. Kvaternik, Eveleth, Minn., assignor to United States Steel Corporation, a corporation of Delaware
Filed Feb. 8, 1965, Ser. No. 430,863
8 Claims. (Cl. 198—202)

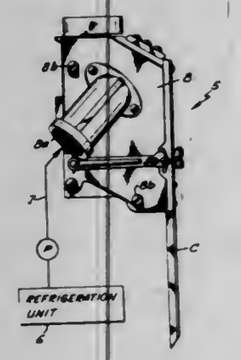


1. Apparatus for centering a conveyor belt mounted on a pulley and having a conveying run and a return run with directions of travel respectively toward and away from said pulley, said apparatus comprising a belt-training idler in rolling contact with said return run, an idler support holding said idler rotatable about an axis substantially parallel to the plane of travel of said return run at the place of said rolling contact, a stationary frame having pivot means for rotatably supporting said idler support on a second axis substantially perpendicular to said plane of travel of the return run, means disposed adjacent an edge of said conveying run for sensing the movement of said edge thereagainst, and means connecting said sensing means to said idler support so that the movement of said edge of the conveying run against said sensing means causes said idler and said idler support to pivot about said second axis so as to move laterally said return run in the opposite direction of said lateral movement of the conveying run.

3,273,698
ECCENTRIC PULLEY DRIVE

Kenneth M. Allen and Chester H. Harper, Newberg, Oreg., assignors to Allen-Harper, Inc., Newberg, Oreg., a corporation of Oregon

Filed June 1, 1964, Ser. No. 371,289
10 Claims. (Cl. 198—220)

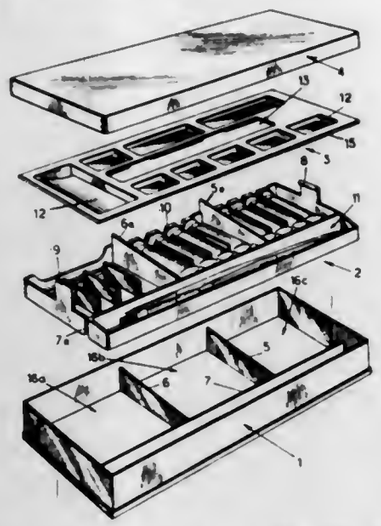


1. In combination,
a conveyor bed mounted for back-and-forth movement,
a driven pulley connected to the conveyor bed,
a drive pulley rotated continuously,
an endless belt extending around and between the pulleys in a tensioned condition,
an eccentric pulley,
and adjustable means carrying the eccentric pulley for moving the eccentric pulley from a retracted position out of driven engagement with the belt to an operating position deflecting a course of the belt and driven by the belt.

3,273,699
METHOD AND APPARATUS FOR PREVENTING LEADING OF SPACEBANDS IN LINE-CASTING MACHINES

George L. Curle, 4324 Zenith Ave. S., Minneapolis, Minn.

Filed Mar. 12, 1965, Ser. No. 439,153
9 Claims. (Cl. 199—62)

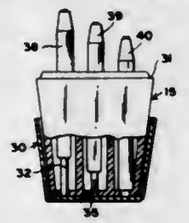


1. The method of substantially preventing leading of the spacebands in a line-casting, type-forming machine which utilizes a conventional spaceband box with discharge chute, said method consisting in
substantially enclosing the front and rear walls of said spaceband box to form an air circulating chamber therein,
introducing into said chamber a flowing, chilled gaseous medium such as air having an entering temperature about in the range of 28 to 32° F.,
through the inherent nature of the air circulating chamber formed with substantial enclosures on the front and rear walls of the spaceband box and the normal entrance and discharge apertures, causing said chilled gaseous medium to thoroughly contact and chill the spacebands contained within and moving through said chamber whereby the same, before successive dropping through the discharge chute, are chilled to a temperature resistant to an accumulation of metal thereon in the subsequent conventional casting of line type.

3,273,700
COMPACT PAINT BOX FOR PAINTING WITH WATER COLORS

René Paul Moreau, Chantilly, Henri Charpentier and Pierre Ricart, Bury, and Pierre Boutevin, Mouy, France, assignors to Société Anonyme dite: Société Anonyme des Anciens Etablissements J. M. Paillard

Filed Jan. 6, 1964, Ser. No. 335,856
Claims priority, application France, Jan. 11, 1963, 921,193, Patent 1,355,592; Mar. 29, 1963, 929,841, Patent 1,360,379
2 Claims. (Cl. 206—1.7)

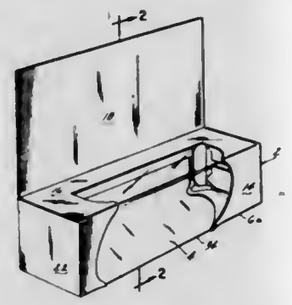


1. A paint box comprising at least two separable receptacles, one of which is a tray dimensioned to be a close sliding fit within the other, each receptacle being divided into a plurality of compartments, the compartments of said other receptacle being separated from each other by partition means and the compartments of said tray being separated from each other by means which define channels positioned to receive the partition means in said other receptacle, at least some of the compartments in said tray being dimensioned to receive paint tubes, said partition and channel defining means being of substantially equal depth, so that substantially the full height of said partitions is received within said channels when said tray is fitted into said other receptacle, said box comprising also a plate dimensioned to fit within said other receptacle, said plate being formed with a plurality of depressions separated by double walls which define channels positioned to partially receive the channel-defining means on said tray when said plate is positioned within said other receptacle above said tray, and to partially receive said partition means when said plate is positioned in said other receptacle in the absence of said tray.

3,273,701
DISPLAY CONTAINER

Jerome Friedman, 19 The Genada, Roslyn Heights, N.Y.

Filed Mar. 31, 1965, Ser. No. 444,265
11 Claims. (Cl. 206—45)

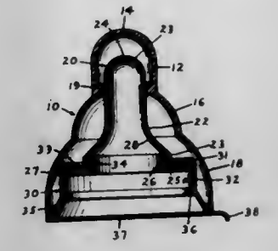


1. In a box structure of the character described, an upright open top box member having a plurality of holes through its bottom wall, said holes being in a predetermined spaced relation from each other, structure within the box member dividing it into open-top vertical compartments; said holes being communicative with one compartment respectively, a separate tray member having said box member therewithin and parallel pins extending from the floor wall of the tray member, through said holes and into said compartments respectively; the lengths of certain of said pins being different than the lengths of other of said pins; the tray member when separated from the box member, being adapted to be placed inverted on the box member as a cover over its mouth.

3,273,702
DISPLAY CONTAINER

Charles E. Palmer, Somers, Conn., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Filed Mar. 6, 1964, Ser. No. 349,974
14 Claims. (Cl. 206—45.31)



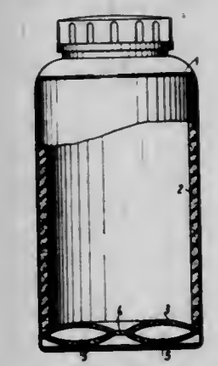
1. A partially erected window container comprising a frame member of relatively rigid and opaque sheet material, said frame member being cut and scored to define two adjacent portions hingedly connected along a longitudinally extending weakening line, said two adjacent portions being folded about said weakening line into generally flattened, overlying relationship, said frame member having end closure portions hingedly connected to the ends of said two adjacent portions and a window aperture extending across said weakening line into said two adjacent portions; means engaging said two adjacent portions to each other along an engagement line spaced from said weakening line, said window aperture in said two adjacent portions terminating inwardly from said engagement line; and a window member of semi-rigid, transparent synthetic plastic sheet material extending beyond the margins of said window aperture interiorly of said frame and secured thereto, said window member having a fold therein along a line adjacent to and aligned with said weakening line in said frame member, portions of said window member about said fold substantially superfically conforming to corresponding portions of said frame member, portions of said two adjacent portions of said frame member and of said window member intermediate said engagement line and said weakening line being movable away from each other to form a compartment therebetween in the erected position, said end closure portions being foldable to close the ends of said compartment and to lock said container in erected position.

3,273,703
PRESTERILIZED DISPOSABLE NIPPLE ASSEMBLY

Rexford C. Stribley, Mason, Ingham, Mich., assignor to American Home Products Corporation, New York, N.Y., a corporation of Delaware

Filed Sept. 11, 1963, Ser. No. 308,206
3 Claims. (Cl. 206—46)

1. A sterilized, disposable nipple assembly adapted for use on a baby feeding container which comprises a snap-on nipple positioning and retaining cap, adapted to be pressure seated on the neck of a liquid feeding container, a feeding nipple positioned in said cap and retained thereby, a flexible nipple cover surrounding the nipple and cap having an upper closed dome portion, an intermediate body portion flaring downwardly from the lower edge of the dome portion and a lower skirt portion flaring downwardly from the lower edge of the



intermediate portion, said cover having a nipple locking means at the joint of the dome and intermediate portions in engagement with the nipple and a tear-off bottom sealed to the bottom edge of the skirt, sealing the nipple and cap in said cover.

3,273,704
CONTAINER FOR THE PREPARATION OF BATH SALTS

Ernst Rüdiger, Schonburgstrasse 12, Berlin 42, Germany

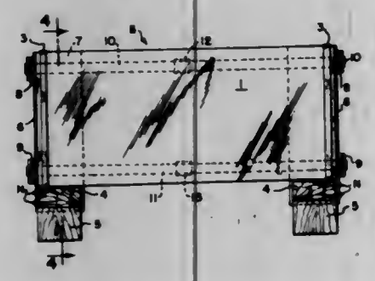
Filed July 7, 1965, Ser. No. 470,123
Claims priority, application Germany, Feb. 16, 1965, R 39,914; Mar. 30, 1965, R 30,320
11 Claims. (Cl. 206—47)

2. A container for preparing at least one dose of a bath salt comprising, in combination, a bottle; at least one porous solid substance attached therein, said substance being impregnated with and when said bottle is vigorously shaken, yielding liquid ingredients of a bath salt; and a closure for said bottle; said substance, upon partially filling said bottle with a salt, closing and repeated shaking, releasing its impregnants are absorbed by said salt thus forming a dry bath salt; the intensity and number of shakes determining the quantity of impregnants released and thus the number of doses of said bath salts which can be prepared.

3,273,705
FASTENER

Frederic L. Rieger, Dayton, and Paul H. Hamisch, Jr., Xenia, Ohio, assignors to The Monarch Marking System Company, Dayton, Ohio, a corporation of Ohio

Filed July 22, 1963, Ser. No. 296,664
3 Claims. (Cl. 206—56)

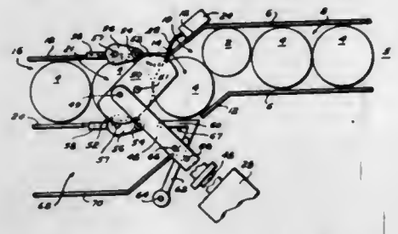


3. A fastening device comprising,
a needle tapering to a point at one end and having a recess at the other end,
a flexible strand having one end integrally connected to said needle intermediate its ends and forming an acute angle with the recessed end portion of said needle, and

an eyelet integral with the other end of said strand and having its axis lying in a plane common to said

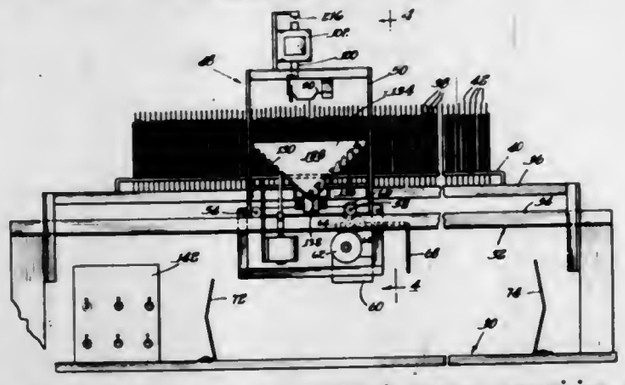
needle, said strand having sufficient resilience to maintain the defined orientation of the eyelet and needle.

3,273,706
GLASS PALLET PACKAGE
Albert J. Bundy, Kingsport, Tenn., assignor to American Saint Gobain Corporation, Kingsport, Tenn., a corporation of Delaware
Filed Nov. 27, 1963, Ser. No. 326,470
1 Claim. (Cl. 206—62)



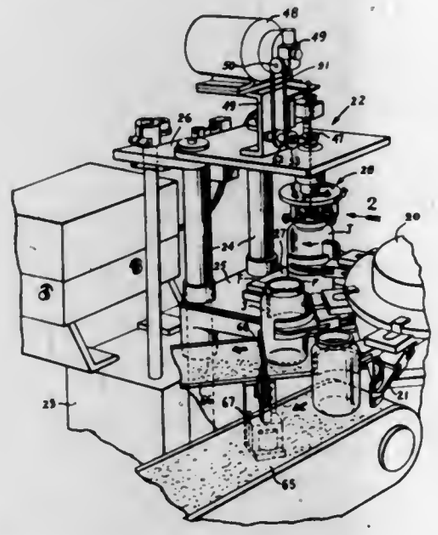
A pallet package of sheet glass comprising a bundle of flat glass sheets in closely packed side-by-side arrangement with the flat surfaces upright and secured in a container having two end caps only, an end cap over each of two opposite ends of the bundle, each end cap comprising an attached cross rail in transverse position with respect to the sheets of the bundle on which the ends of the bundle rest with the sheets in edge-bearing contact with each rail, each end cap having an end and sides which cover and bear against the end and a part of the sides of the bundle, metal bands surrounding the bundle and both end caps which hold the sheets together and provide the only means which hold the end caps in pressed contact with the ends of the bundle, and elevating means on the cross-rails which hold the bundle sufficiently above a floor or the like for the insertion thereunder of the fork of a lift truck.

3,273,707
PRODUCTION OF LOW SILICA IRON SUPERCONCENTRATES
Peter D. R. Maltby, Ottawa, Ontario, Canada, assignor to Her Majesty The Queen, in right of Canada as represented by the Minister of Mines and Technical Surveys
No Drawing. Filed May 20, 1963, Ser. No. 281,816
2 Claims. (Cl. 209—39)



1. A method of producing iron superconcentrates which comprises grinding an ore concentrate consisting essentially of specular hematite having a silica content of more than 1%, to a particle size of minus 100 to minus 325 mesh, subjecting said ground ore body to a froth flotation treatment with a cationic collector to remove silica therefrom and produce a wet flotation concentrate containing in the order of 0.10% silica, subjecting said flotation concentrate while still wet to a wet magnetic separation treatment in a magnetic field having an intensity in the range of 3000 to 7000 gauss to produce a magnetic separation concentrate from said ore body containing not substantially less than 99% iron oxide and not substantially more than 0.05% silica.

3,273,708
OBJECT SEPARATING APPARATUS
Lloyd N. Shuford and Carroll B. Messer III, Lynchburg, Va., assignors to Simplimatic Engineering Co., Lynchburg, Va.
Filed Dec. 29, 1964, Ser. No. 421,974
22 Claims. (Cl. 209—74)



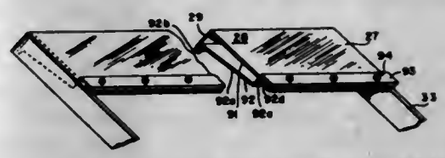
1. Apparatus for separating bodies of a first type from bodies of a second type comprising an inlet station, a separating station communicating with said inlet station, and first and second outlets communicating with said separating station, means for pressure-feeding a line of said bodies from said inlet station through said separating station and normally to said second outlet, means for sensing the presence at said separating station of a body of said first type to be separated from said line, means actuated by said sensing means for inhibiting the movement of a given body in advance of said body to be separated and positioning said given body so that a line between the effective horizontal centers of the bodies in said line immediately in advance of and behind the body to be separated is spaced from the effective horizontal center of the body to be separated and is on the other side of said last mentioned center from said first outlet, whereby the pressure-feeding action of said line of bodies on said body to be separated cams the latter out of said line and toward said first outlet.

3,273,709
DOCUMENTARY STORAGE AND RETRIEVAL SYSTEMS
Henry N. Staats, Deerfield, Ill., assignor to Recall, Inc., Chicago, Ill., a corporation of Delaware
Original application Sept. 29, 1960, Ser. No. 59,207, now Patent No. 3,176,841, dated Apr. 6, 1965. Divided and this application July 29, 1964, Ser. No. 385,954
5 Claims. (Cl. 209—81)

3. A card storage and retrieval system comprising a plurality of file cards each having code means exposed along the edge thereof and coded according to information on said card, frame means, card storage means on said frame means having a succession of stalls for respectively supporting said file cards vertically on edge in parallel array spaced perpendicularly of their faces with said coded edges all exposed in the same direction, carriage means, search means on said carriage means selectively comparable with the code means on said cards, means movably supporting said carriage means from said frame means, means acting between said carriage means and said frame means to cause said carriage means to traverse said frame means selectively to bring said search means into corporation with said card coded edge portions to locate a file card in said storage means, ejection means on said carriage means operatively connected to said search means and controller thereby for moving a selected file card from rest position in a stall, file card return means on said carriage means, means on said carriage means for sensing a vacant stall as said carriage traverses, and means on said carriage means operatively connected to and controlled by said sensing means for returning a file card to a vacant stall in said storage means during said traverse.

3,273,710
BOTTLE GAUGING
Richard L. Early and Thomas B. Sorbie, Toledo, Ohio, assignors to Owens-Illinois Inc., a corporation of Ohio
Continuation of application Ser. No. 42,837, July 14, 1960. This application Dec. 4, 1963, Ser. No. 329,342
15 Claims. (Cl. 209—88)

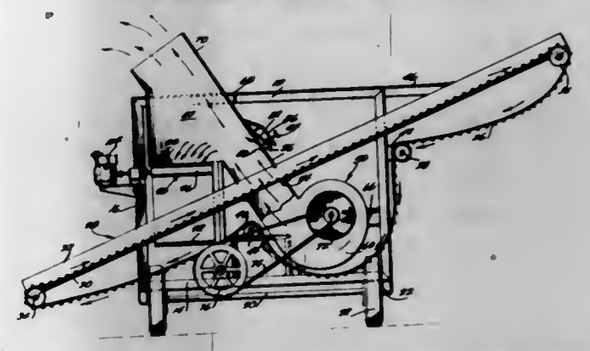
9. The method of inspecting the finish of a hollow container which comprises



scanning the top surface of the finish of the container to ascertain variations in the vertical position of various portions of the top surface of the finish,

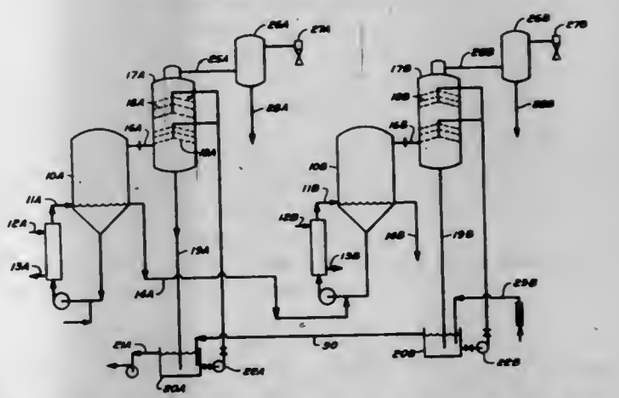
continuously sensing for a warp or dip condition wherein the vertical variation is greater than a predetermined standard in a unit peripheral distance of the finish, for a cocked finish condition wherein the vertical variation between the maximum and minimum exceeds a predetermined maximum, and for an over or under height condition wherein the vertical variation from an intermediate position exceeds a predetermined value,

and rejecting the container when any one of the aforementioned conditions exists.



3,273,711
SHUFFLE FEED SORTER WITH SLIVER EJECTION
Traver J. Smith, San Jose, Calif., assignor of one-half interest to Genevieve L. Magnuson, and one-half interest to Genevieve I. Magnuson, Robert Magnuson and Louis J. Fox, trustees of the estate of Roy M. Magnuson
Filed Oct. 12, 1965, Ser. No. 495,134
4 Claims. (Cl. 209—98)

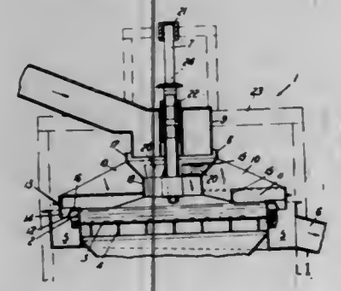
2. A shuffle feed structure comprising a frame, a first set of transversely disposed inclined shuffle members carried by said frame, a second set of transversely disposed inclined shuffle members carried by the frame and interposed between the shuffle members of the first set in alternating relation therewith, each shuffle member comprising a tube having spaced-apart top and bottom walls joined together at their rearward edges and having their front



edges connected in spaced-apart relation by a front wall providing the article advancing face of a shuffle member, and means for effecting relative reciprocation between the respective sets of shuffle members.

3,273,712
STONE SEPARATOR
Bert L. Spafford, Rte. 3, Rhinelander, Wis. 54501
Filed July 10, 1964, Ser. No. 381,659
5 Claims. (Cl. 209—147)

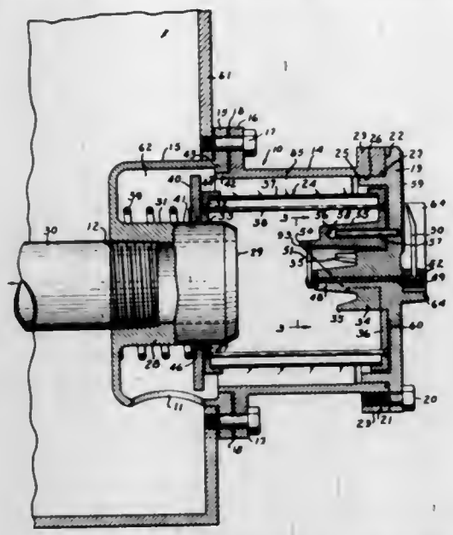
1. A separator for relatively light and heavy objects such as potatoes and stones, a framework of generally box-like configuration, a transverse extending inclined conveying means mounted on said framework for conveying mixed objects thereon, fan means on said framework for producing an air stream, said conveying means carrying said mixed objects over said air stream whereby the lighter objects will be entrained in the air stream and the heavier objects carried beyond the air stream to the end of the conveying means, and means for receiving said lighter objects, said receiving means being disposed in the bottom of an expansion chamber for the air stream thereby discharging the lighter objects from the slowed air stream.



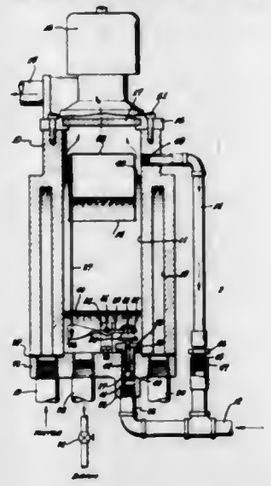
3,273,713
REMOVAL OF FLUORINE COMPOUNDS FROM PHOSPHORIC ACID
William R. Parish, Gretna, La., assignor to Swift & Company, Chicago, Ill., a corporation of Illinois
Filed Apr. 9, 1963, Ser. No. 271,718
7 Claims. (Cl. 23—153)

1. In the multi-stage method for concentrating "wet-process" phosphoric acid wherein said acid is concentrated under vacuum in a primary concentrator to pro-

duce vapors containing water vapor and fluorine compounds mainly in the form of HF and SiF_4, wherein said vapors are contacted with a primary fluorine-compound-absorbing liquor to absorb said compounds in said primary liquor, and wherein said acid is transferred to a secondary concentrator,, an improvement for avoiding precipitation of silica during recovery of fluorine compounds from said vapors, said improvement comprising the steps of: adding HF to said primary fluorine-compound-absorbing liquor in quantities sufficient to provide an excess of HF in said primary liquor after absorption of said vapors whereby precipitation of silica is avoided; further concentrating said acid under vacuum in said secondary concentrator to produce additional vapors containing a stoichiometric excess of HF over SiF_4; contacting said additional vapors with a secondary fluorine-compound-absorbing liquid whereby an excess of HF is absorbed by said secondary liquor; and transferring a portion of said secondary liquor to said primary liquor to serve as a source of HF for said primary liquor.



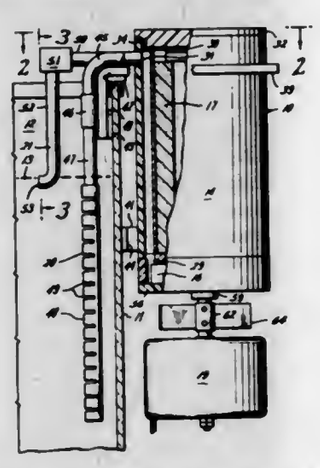
3,273,714
CIRCULAR JIGS
Norman Cleaveland, Kuala Lumpur, Malaya, assignor to Pacific Tin Consolidated Corporation, New York, N.Y., a corporation of Maine
Filed May 28, 1962, Ser. No. 198,289
Claims priority, application Great Britain, Sept. 8, 1961, 32,368/61
5 Claims. (Cl. 209—456)



1. A jig for mineral dressing comprising:
a circular jig bed basket;
means for pulsating water through said basket;
means for delivering a feed of solid particles onto the central portion of said basket whereby a bed of solid particles is established on said basket; and
skimming means rotatably mounted around said delivery means above said basket, said skimming means comprising arm means extending substantially from said delivery means to the periphery of said basket, and blade means attached to said arm means, the lower edge of said blade means extending at least to the top of said basket and being shaped to contour the major portion of the surface area of the bed between said delivery means and the periphery of said basket and maintain a uniform bed depth by distributing feed evenly over the contoured surface of said bed basket.

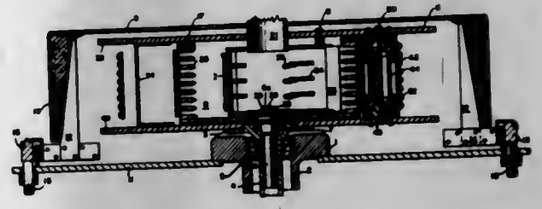
3,273,715
FLUID FILTERS
Nils O. Rosaen, Bloomfield Hills, Mich., assignor to The Rosaen Filter Company, Hazel Park, Mich., a corporation of Michigan
Filed Apr. 27, 1962, Ser. No. 190,764
27 Claims. (Cl. 210—90)

1. A fluid filter for mounting in association with a fluid reservoir of a hydraulic system comprising a housing, two openings formed through the wall of said housing, one an inlet and the other an outlet for the fluid of the system, one of said openings adapted to be open to the fluid of said reservoir and the other opening adapted to be connected to a conduit in said system, a filter cartridge chamber in said housing, an axially movable filter cartridge mounted within said chamber, guide means carried by said housing for supporting said cartridge for axial movement in said housing whenever the pressure differential across the cartridge exceeds a predetermnied value, a valve including a fixed valve part and a movable valve part cooperating to block flow from said reservoir to said cartridge chamber whenever the cartridge is removed and a single spring means associated with said movable valve part and said cartridge for controlling both movement of said filter cartridge and for urging said valve to closed position.



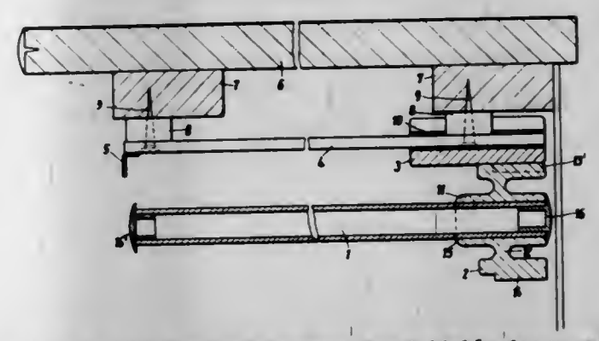
3,273,716
LIQUID PETROLEUM FUEL CLEANER
Kenneth K. Kennepohl, 46151 N. Sierra Highway, Lancaster, Calif.
Filed Jan. 6, 1964, Ser. No. 335,824
4 Claims. (Cl. 210—120)

1. An eliminator for impurities in liquid petroleum fuel comprising a housing having a conversion chamber therein, said housing including means to convert said liquid fuel to gas in said chamber, said chamber having a supply port, a discharge means at the top to discharge said gas, a return port adjacent the top and a drain port at the bottom, said ports opening into said chamber, a liquid petroleum fuel supply line connected to said supply port having an inflow check valve therein, a return line connected between said return port and said supply line at a point upstream from said inflow check valve and an outflow check valve in said return line, a valve seat in said chamber at a location controlling said inflow port, and a valve operating device comprising an arm mounted in said chamber and having a valve element on said arm, said valve element being at a location adapted to seat on said seat, a float in said chamber and a float arm on said float connected to said arm, said float establishing a level of said liquid petroleum in said chamber, said float having a location in the upper half of the chamber adjacent said return port, said float being adapted to shift said valve element alternatively to open and closed positions in response to the change of level of said liquid petroleum, whereby to precipitate relatively non-volatile substances from said liquid petroleum fuel prior to the passage of said fuel in a gaseous state from said discharge means.



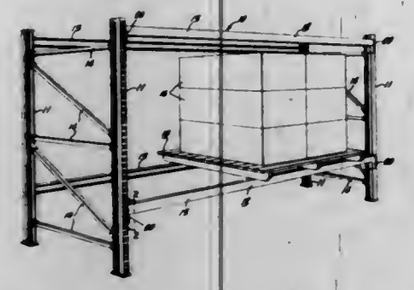
3,273,717
COMBINATION FILTER AND AERATOR
Howard M. Canterbury, Houston, Tex., assignor to W. F. Wilson, Houston, Tex.
Filed Oct. 2, 1963, Ser. No. 313,260
12 Claims. (Cl. 210—169)

1. A combination filter and aerator for an aquarium or the like, comprising a sealed housing, means for mounting the housing in an upright position exteriorly of the aquarium, means dividing the housing into a filter chamber above a pump chamber, a cap removably disposed over the upper end of and sealing the filter chamber, a filter in the filter chamber, an inlet to and outlet from the upper end of the filter chamber, a suction tube and a discharge tube for connecting the aquarium with the inlet and outlet, respectively, means connecting the filter chamber and pump chamber, said filter being disposed across the path of flow from the inlet to the pump chamber, means including a by-pass conduit within the filter chamber connecting the pump chamber with the outlet, and an impeller in the pump chamber for drawing aquarium water from the suction tube through the filter and into the pump chamber and then forcing it from said pump chamber into the by-pass conduit for return to the aquarium through the discharge tube.



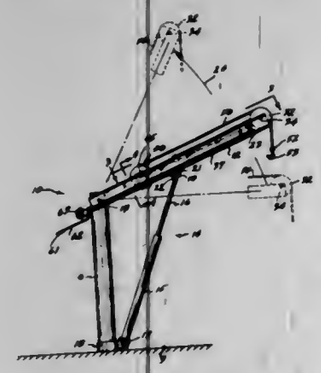
3,273,718
HEAVY DUTY CENTRIFUGAL SEPARATORS
Ray E. Riethmann, Arvada, Joseph R. Grout, Wheat Ridge, and Norman O. Peck, Arvada, Colo., and William H. Peck, Sr., Tulsa, Okla.
Filed Aug. 6, 1963, Ser. No. 300,348
4 Claims. (Cl. 210—370)

1. In a centrifugal separator, the combination of a carrier rotatable on a vertical axis, a basket disposed concentrically in and rotatable relative to said carrier, said basket including a set of vertically spaced rings, pairs of vertical rollers rotatably mounted in said carrier at the outside of said basket, a set of vertically stacked endless belts passing around each pair of said rollers, said belts having inner reaches in engagement with said basket rings and closing the spaces between said rings, a hollow impeller rotatable with and supported by said carrier centrally in said basket, a material delivering chute communicating with the upper portion of said hollow impeller, said impeller having a closed bottom and including a plurality of vertically spaced horizontal plates and vertical side plates at perimetric edges of said horizontal plates, said horizontal plates being provided with vertically aligned central openings below said material delivering chute, a plurality of deflectors secured to said horizontal plates and projecting inwardly into said openings whereby to deflect and spread material delivered by



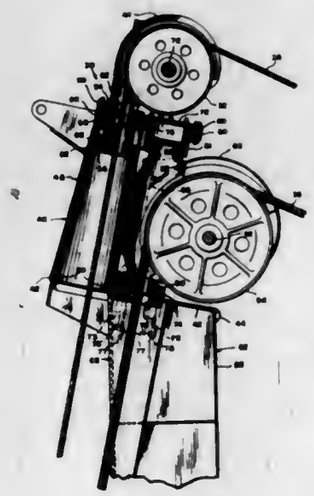
said chute downwardly through the impeller, said side plates having spaced apart vertical side edges defining discharge gaps at the perimeter of the impeller whereby material spread downwardly through the impeller by said deflectors may be discharged substantially uniformly through said gaps against the rings of said basket and the inner reaches of said belts, vertically elongated flexible flaps provided at said vertical side edges of said vertical plates of said impeller and extending outwardly therefrom toward said basket to assist in directing material discharged through said gaps against said basket and belts, and means for rotating said carrier and said basket at relatively different speeds.

3,273,719
RACK FOR TOWELS, PAPERS, FILMS, AND THE LIKE
Fritz Hoffmann, Steinenbronn, near Stuttgart, Germany, assignor to Robert Krause KG Zweigniederlassung Weilheim-Teck, Weilheim an der Teck, Germany
Filed June 24, 1964, Ser. No. 377,667
Claims priority, application Germany, June 26, 1963, H 49,549; June 20, 1964, K 53,266
19 Claims. (Cl. 211—94)



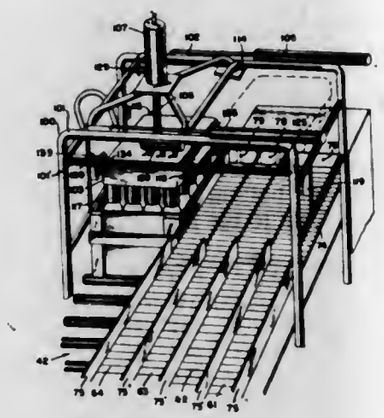
1. A rack arrangement for supporting foldable sheet material, especially towels, films and papers, which includes: substantially horizontal rail means, shoe means displaceably mounted on said rail means, carrier means positively connected to said shoe means, and substantially horizontal supporting bar means connected to and carried by said carrier means, said carrier means having a rectangular cross section transverse to the longitudinal extension of the supporting bar means connected thereto, and having two adjacent sides of said cross section provided with dovetail-shaped protrusions while the remaining two adjacent sides of said cross section are provided with dovetail-shaped recesses.

3,273,720
STORAGE RACKS
Edward A. Seiz, 136 E. 3rd St., Lansdale, Pa.
Filed Oct. 16, 1964, Ser. No. 404,219
4 Claims. (Cl. 211—148)



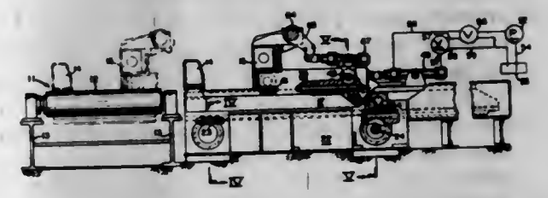
1. A storage rack comprising a plurality of uprights and having a plurality of load support beams each of which is connected at opposite ends to one of said uprights by a coupling means, at least one of said uprights having at least one longitudinally extending flange and web, a longitudinally extending protrusion on said flange, said protrusion having a plurality of rearwardly facing spaced slots therein, said web having at least one set of longitudinally spaced apertures therein, at least one of said coupling means comprising an angle member having a pair of angularly spaced legs merging into a junction, one of said legs having a plurality of fingers extending therefrom and spaced longitudinally therealong, said fingers being dimensioned and positioned so as to register with said slots and engage the peripheral edges thereof, the other of said legs having at least one pin connected to said leg, projecting therefrom, and positioned thereon so as to register with a selected aperture in said web, said fingers and said pin, when engaged in said upright, providing load bearing support for said beams, and a latch mounted on said angle, said latch comprising a spring having a slot therein, said spring normally biased against the leg of said angle containing said pin, a bolt engaging the slot in said spring and alignable with a hole in said leg, said bolt having an axial length, when in registry with said hole and said coupling means is in a mounted position on said upright, to allow registry of said bolt in another selected aperture of said web and engagement thereof on an upper peripheral edge of said aperture.

3,273,721
HYDRAULICALLY POWERED PORTABLE LIFTING APPARATUS
James L. Brunton, 20924 Avis Ave., Torrance, Calif.
Filed Jan. 15, 1965, Ser. No. 425,816
1 Claim. (Cl. 212—35)



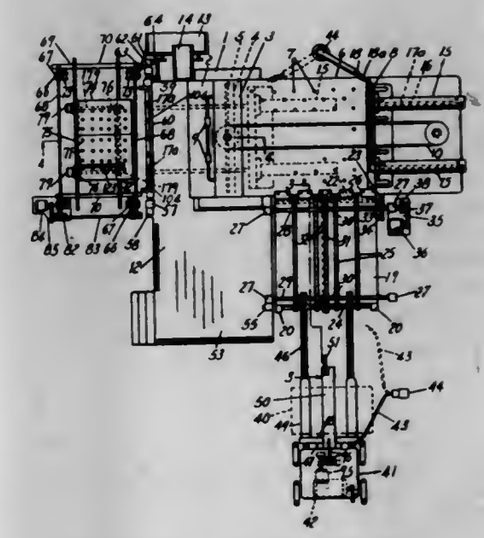
A hydraulically powered portable lifting apparatus comprising:
(a) a rigid post member adapted at one end thereof to be pivotally mounted upon a support means for receiving the same;
(b) a rigid boom member attached at the opposite end of said post and adapted to be moved pivotally about said point of attachment with said post;
(c) boom lift means including a hydraulic actuator having one end thereof pivotally affixed to said post and the opposite end thereof pivotally affixed to said rigid boom member intermediate the ends thereof,
(1) said boom means being raised and lowered by actuation of said hydraulic actuator;
(d) a first pair of pulleys pivotally mounted on a common axis adjacent the opposite end of said boom in a fixed relationship with respect to said boom;
(e) a second hydraulic actuator including a cylinder housing a movable piston having a shaft affixed thereto and extending through one end of said cylinder;
(f) attaching means securing the other end of said cylinder to said boom;
(g) a second pair of pulleys pivotally mounted on a common axis and secured to the terminal end of said shaft and being movable with respect to said boom as said shaft moves upon application of fluid under pressure thereto;
(h) said cable being passed over said pulleys and having one end fixed with respect to said boom and the other end free and extending from said first pair of pulleys for lifting loads;
(i) means for applying fluid under pressure to said hydraulic actuator thereby to cause said second pair of pulleys to move away from said first pair of pulleys and said cable to move in a lifting direction in response to application of fluid under pressure to said actuator; and
(j) a pair of U shaped guide brackets affixed to said terminal end of said shaft and movable therewith,
(1) the arms of said brackets engaging said boom to retain said pairs of pulleys in aligned relationship with said boom.

3,273,722
TOWER TOP FOR LOGGING SPAR
Reid G. Priest and Dean K. McCurdy, Port Angeles, Wash., assignors, by direct and mesne assignments, to Hyster Company, Portland, Oreg., a corporation of Nevada
Filed Oct. 28, 1963, Ser. No. 319,219
2 Claims. (Cl. 212—70)



1. A tower top and fairleader assembly for a generally vertically disposed portable logging spar, comprising:
(a) a main tower top housing mounted on the top of said spar including a first tubular section being open at both its upper and lower ends;
(b) a base section extending generally outwardly at a right angle to said first tubular section and having a cable opening therein;
(c) a top support section extending generally outwardly at a right angle to said first tubular section and having a bearing cage means detachably mounted therein generally coaxially with said cable opening in said base portion;
(d) a first block means with tubular stem means pivotally mounted and received within the upper portion of said first tubular section;
(e) a second generally tubular block support section pivotally supported by said bearing cage and by bearing means concentrically disposed around said cable opening for pivoting in non-concentric but generally parallel relation to said first block means; and
(f) said housing with said first and second tubular block sections being mounted at an angle on said vertically disposed spar so that said block sections pivot at an angle to said spar, the lower open end of said first tubular section located generally outside the vertical plane of the walls of said spar, said angular mounting of said tubular sections permitting cables to pass downwardly from said housing and the topmost portion of said spar outside said spar.

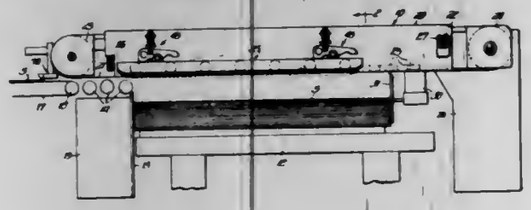
3,273,723
PACKING MACHINE
John Moritz Andersen, Bergen, Norway, assignor to A/S Hansa Bryggeri, Bergen, Norway
Original application May 22, 1959, Ser. No. 815,022, now Patent No. 3,130,528, dated Apr. 28, 1964. Divided and this application Apr. 27, 1964, Ser. No. 362,876
8 Claims. (Cl. 214—1)



1. An article gripping mechanism comprising a substantially rigid body portion; elastic means connected to said body portion and in the unstressed condition, having a configuration complementary to the configuration of the article portion to be gripped and having a substantially uniformly different dimension than the article portion; means to supply fluid under pressure to expand said elastic means into gripping engagement with the article; said body portion having a seat; said elastic means having a sealing portion in engagement with said seat, normally forming a fluid tight seal; said body portion and said sealing portion permitting relative movement therebetween responsive to a predetermined amount of expansion of said elastic means to produce fluid leakage; separate sensing means responsive to said leakage to control the operation of said article gripping mechanism.

3,273,724
APPARATUS FOR HANDLING METALLIC WORKPIECES
Karl Ernst Buechting, Bethel Boro, and Joseph Paul McHale, Bethel Park, Pittsburgh, Pa., assignors to United Engineering and Foundry Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed June 16, 1964, Ser. No. 375,502
Claims priority, application Great Britain, July 1, 1963, 25,980/63
5 Claims. (Cl. 214—1)

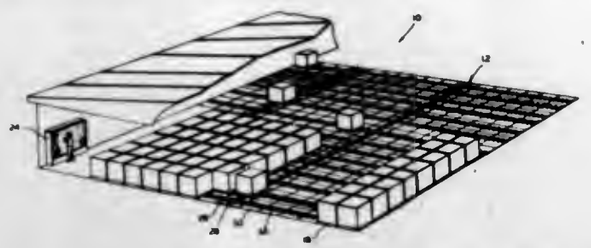
1. In combination with a means for supporting a workpiece, an apparatus for engaging and moving a worpiece supported by said workpiece supporting means comprising:
a first head having a surface adapted to engage one surface of the workpiece,
movable supporting means for said first head,
a second head having a surface adapted to engage a second surface of a workpiece,
a carriage to which said second head is secured for movement therewith,
said carriage adapted to be supported by said movable supporting means and movable relative thereto,
means for moving said movable supporting means relative to said workpiece supporting means to move said heads relative to a workpiece supported by said workpiece supporting means, and
means carried by said movable supporting means for moving said second head relative to said first head.



3,273,725
PAPER TRIMMING AND PILING APPARATUS
Frederick B. Curtenius, 1537 Long Road, and Robert W. Polderman, 2504 Russet Drive, both of Kalamazoo, Mich.
Filed July 15, 1963, Ser. No. 295,016
17 Claims. (Cl. 214—1.6)

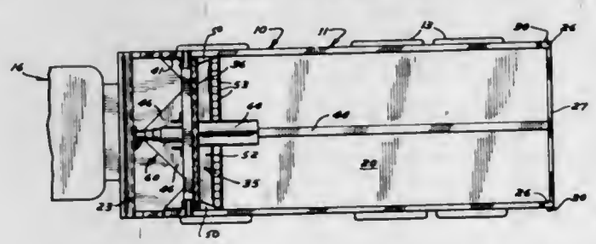
11. Paper trimming and piling apparatus comprising,
a paper trimmer mounted in an elevated position so that its table is above the surrounding floor more than the height of a shipping stack of paper on a shipping and handling skid,

a narrow operators platform positioned in front of said trimmer and above the floor at a normal level relative to the trimmer table,
power actuated transfer means at one side of said trimmer arranged to lift a stack of untrimmed paper and transfer a trimmer load pile from the top of the stack to the table of the trimmer,
ejector means arranged to push a trimmed pile of paper off of the front edge of the trimmer table,
a vertically reciprocable piler positioned on the opposite side of said platform from said trimmer and movable from pile receiving lever at the level of the trimmer table downwardly to deposit trimmed piles of paper on a handling skid or a partially formed stack of piles on the skid,
and a bridge plate movable from an unobstructing position relative to said platform to a bridging position across the platform in plie supporting and transfer position between the table of the trimmer and the raised position of said piler.



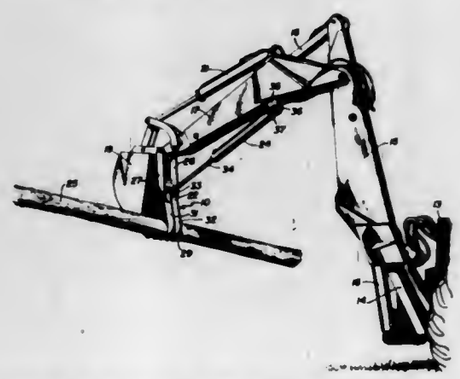
3,273,726
BRAKE FOR METAL SHEET CONVEYOR
Dario Buccicone, Gary, Ind., assignor to Bucciconi Engineering Co., Inc., Gary, Ind., a corporation of Indiana
Filed Oct. 31, 1963, Ser. No. 320,359
2 Claims. (Cl. 214—6)

1. In a sheet handling mechanism, an overhead electromagnetic conveyor, means for delivering sheets to the undersurface on the overhead conveyor for advance thereby, a movement retarding device between the entrance and discharge ends of the overhead conveyor which device comprises an elongate bar positioned along the side of the overhead conveyor and generally parallel with the sheet engaging bottom face thereof, said bar being mounted for vertical movement on a pair of parallel links, each of said links being pivotally connected to said bar intermediate the ends thereof, a pivotal connection between one end of each link and a support member which is fixed relative to said overhead conveyor, a hanger bar pivotally connected to each of said links between the pivotal connections thereof with the bar and the fixed support member and a resilient sliding connection between said hanger bar and said fixed support member whereby said bar is normally held in an uppermost position spaced above the bottom face of the electromagnetic conveyor, and electromagnets operative to pull the bar down against the upper surface of a sheet carried on the overhead conveyor.



3,273,727
LOAD HANDLING APPARATUS
Cyril B. Rogers, Niles, and Mac R. Doolittle, Lansing, Mich., assignors to Clark Equipment Company, a corporation of Michigan
Filed July 8, 1964, Ser. No. 381,025
7 Claims. (Cl. 214—16)

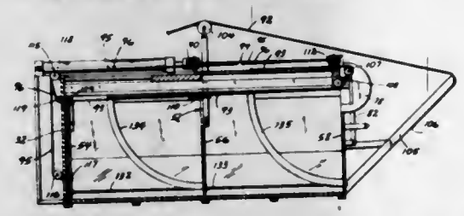
1. A load handling apparatus comprising a floor, a pallet for use in conjunction with said floor, means for providing a fluid film between said pallet and said floor, and means for propelling said pallet over said floor, said propelling means including an electric linear motor having primary windings and secondary windings, one of said windings being located in said floor in a particu-



lar pattern, the other of said windings being located on the underside of said pallet and including portions at right angles to each other.

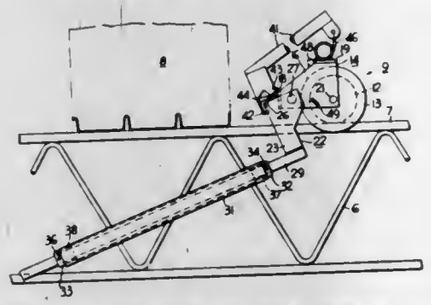
3,273,728
REAR UNLOADING BOX
Elgin L. Kelso, Benson, Minn., assignor to Tyler Corporation, a corporation of Minnesota
Filed Nov. 5, 1964, Ser. No. 409,255
9 Claims. (Cl. 214—82)

1. An unloading box comprising a bottom panel, a pair of side wall panels spaced apart and attached to said bottom panel at opposite sides thereof, a rear opening in said box, a platen slidably mounted in said box for movement from the front to the rear thereof, said platen including a pair of side wing members hingedly attached thereto and extending outwardly and rearwardly therefrom, said side wing members being adapted to engage the side panels of said box and scrape the sides of said box as said platen moves from the front to the rear thereof, and a plurality of individual bottom panel scraper members hingedly attached adjacent the lower portions of said platen and adapted to engage the bottom of said box as said platen is moved from the front to the rear.



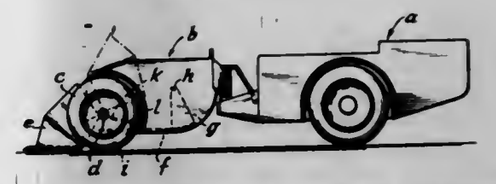
3,273,729
CLAMPING DEVICE
Vaino J. Holopainen, East Sullivan, N.H., assignor to Channel Construction, Inc., East Sullivan, N.H., a corporation of New Hampshire
Filed Jan. 4, 1965, Ser. No. 423,188
5 Claims. (Cl. 214—138)

1. Clamping device for use with a vehicle, comprising (a) a dipper stick having an actuating cylinder for changing its aspect relative to the vehicle,



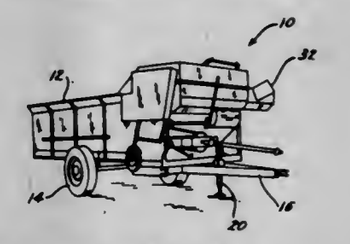
(b) a bucket pivotally attached to one end of the dipper stick, and an actuating cylinder for changing the aspect of the bucket relative to the dipper stick,
(c) a clamping arm pivotally mounted adjacent the bucket for hinged movement about substantially the same axis as the bucket, and
(d) an actuating cylinder operatively connected between the dipper stick and the arm to bring about pivotal movement of the bucket and arm toward and away from one another.

3,273,730
SCOOP CONVEYOR APPARATUS
Joseph A. Moore, Boone, Iowa, assignor of forty-five percent to Vern T. Pritchard, Boone, Iowa
Filed Jan. 27, 1965, Ser. No. 428,487
14 Claims. (Cl. 214—146)



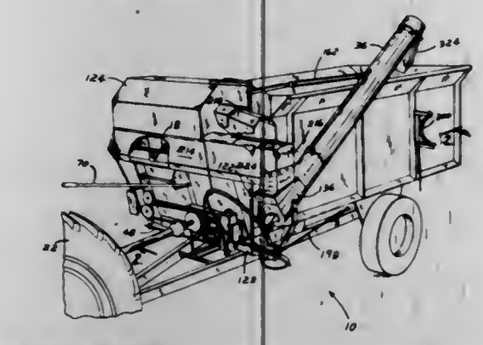
1. In a material scoop conveyor, comprising in combination,
a vehicle,
a scoop mounted on said vehicle, said scoop being so positioned on said vehicle such that the longitudinal axis of said scoop extends transversely of the line of travel of said vehicle, and said scoop having an outlet opening at one end and an inlet opening on one side, said one side being outwardly of said vehicle,
unloading means on said scoop movable along the longitudinal axis of said scoop to discharge material through said outlet opening, and said unloading means includes a plurality of paddles disposed in spaced relationship along the length of said scoop when said unloading means is in a loading position and positioned at said one end of said scoop when in an unloading position, said paddles adapted to discharge material from said scoop upon being moved from said loading position to said unloading position.

3,273,731
DEVICE FOR LIFTING AND TRANSPORTING ROOF DECKING
Clarence P. Brahm, 5000 N. 132 St., and Alfred K. Jensen, 5001 N. 132 St., both of Butler, Wis.
Filed Mar. 10, 1964, Ser. No. 350,745
5 Claims. (Cl. 214—390)



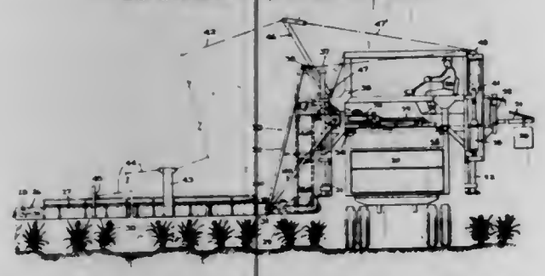
1. A device in combination with spaced roof trusses for lifting and transporting roof decking resting on the spaced roof trusses comprising: a carriage; means supporting said carriage and contacting the surface of the roof trusses and capable of movement along said roof trusses; load engaging means connected to said carriage for selective movement relative thereto above and below the contact point between said support means and said truss surface, said load engaging means adapted for engagement with the underside of said decking, and means for selective movement of said load engaging means relative to said carriage to raise the decking from the surface of said trusses for movement therealong.

3,273,732
SELF-LOADING VEHICLE AND DUMP GATE THEREFOR
Alfred Trieschmann, Philippsthal, Germany, assignor to Vereinigte Kaliwerke Salzdetfurth AG., a corporation of Germany
Filed Nov. 23, 1964, Ser. No. 413,007
Claims priority, application Germany, Nov. 25, 1963, V 24,919
7 Claims. (Cl. 214—518)



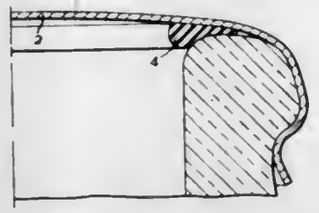
1. A material loading and unloading machine comprising in combination, a body unit defining a receptacle for receiving said material; a bucket member pivotally mounted at one end of said unit for loading material into said receptacle; a slideable closure means for closing a material discharge aperture in the bottom of said unit, said slideable closure means including a first part for closing said aperture in a first position of said closure means, and a second part connected to said first part for closing said aperture in a second position of said closure means; and driving means for moving said closure means from said first to said second position whereby to transfer material from said one end toward the other end of said unit and for further moving said closure means to a third position in which the aperture is open to permit discharge of the material.

3,273,733
GRAIN WAGON
Dorland H. Schuler, Griswold, Iowa
Filed June 11, 1964, Ser. No. 374,455
11 Claims. (Cl. 214—519)



1. In a grain wagon, comprising,
a floor terminating at one end of said wagon in a trough,
an endless conveyor movable around said floor and being defined by a pair of chains on each side of said floor and slats extending therebetween in spaced relationship along the length of said chains,
means for moving said conveyor around said floor for carrying grain material on said floor into said trough,
means for removing grain from said trough, and
a plurality of laterally and longitudinally spaced apart guide cleaning means in engagement with each of said chains adjacent said trough end of said floor to direct the return chain under said floor upwardly at an angle to the floor whereby grain will fall from said slats and said grain will fall from said chains between said spaced apart guide cleaning means into the trough.

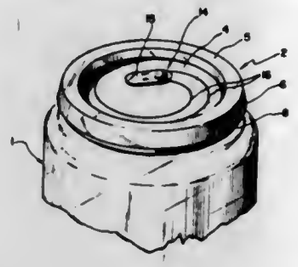
3,273,734
FEED MIXING AND BLENDING MACHINE
Dorland H. Schuler, Griswold, Iowa
Filed Sept. 26, 1963, Ser. No. 311,748
8 Claims. (Cl. 214—521)



8. A feed wagon;
a conveyor disposed on the floor of said wagon for moving feed to one end of said wagon, said floor conveyor disposed lengthwise of said wagon,
a vertical disposed conveyor at said one end of said wagon in communication with said floor conveyor to move said feed upwardly from the floor of said wagon,
a third conveyor horizontally disposed and extending transversely of said wagon along said one end and below the upper end of said vertical conveyor to receive feed from said vertical conveyor and more it to one side of said wagon, and
a discharge opening in the outer end of said third conveyor at the side of said wagon, and
a fourth conveyor in communication with the discharge opening of said third conveyor,
a support arm pivotally connected on a vertical axis to one end of said wagon at an outer corner of said wagon and adapted to pivot outwardly of said wagon in a horizontal plane between positions extending towards the opposite end of said wagon from said outer corner to positions extending forwardly of said one end of said wagon, and
said fourth conveyor pivotally secured to said arm for pivotal movement in horizontal and vertical planes.

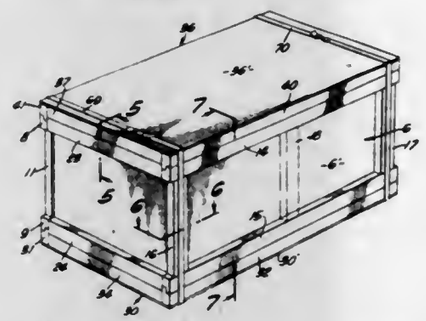
3,273,735
VERTICAL LIFT
George Chi-Chu Kuo, Honolulu, Hawaii, assignor to Castle & Cooke, Inc., Honolulu, Hawaii, a corporation of Hawaii
Filed Nov. 30, 1964, Ser. No. 414,691
18 Claims. (Cl. 214—522)

10. A vertical lift conveyor for elevating a plurality of loose articles from a lower feeding station to an upper discharge station, a first and a second pair of endless chains adapted to travel in the same direction, the first pair of endless chains forming a closed path entirely within the closed path formed by the second pair of endless chains, the ascending portions of said first pair being parallel to and spaced from the plane of the ascending portions of the second pair, the remaining portions of said pairs being in the same planes, a plurality of sets of load-carrying supports carried by said pairs of endless chains, each set including a load-carrying member supported at opposite ends by said first and second pairs of endless chains respectively, and a spill-preventing member supported at opposite ends entirely by said first pair of endless chains, said sets being spaced from each other when ascending between the portions of the pairs of endless chains in spaced planes and adjacent each other when carried between the portions of the pairs of endless chains in the same planes, each spill-preventing member arranged to precede a corresponding load-carrying member of a set as said sets are driven in the same direction and having its trailing edge adjacent the leading edge of the load-carrying member such that said spill-preventing member occupies a load-supporting position at the loading station as the immediately preceding load-supporting member begins its ascent between the portion of the pairs of endless chains in the spaced planes and means for continuously driving said pairs of endless chains in the same direction.



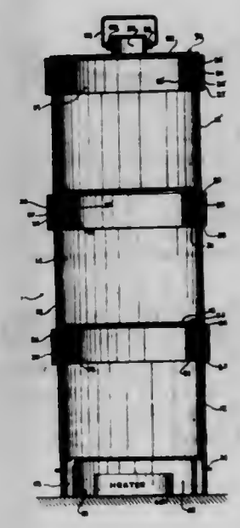
3,273,736
CROWN CLOSURES
Leslie Lister and Arthur Thompson, Banbury, England, assignors to Aluminium Laboratories Limited, Montreal, Quebec, Canada, a corporation of Canada
Filed Apr. 17, 1963, Ser. No. 273,640
Claims priority, application Great Britain, Apr. 19, 1962, 15,365/62
3 Claims. (Cl. 215—40)

1. An apparatus comprising, in combination, a standard bottle having a neck terminated at a standard mouth configuration including radiused surface joining the conventional top end sealing surface and the substantially cylindrical inside surface of the bottle neck, and a crown closure secured to said bottle over said mouth comprising an aluminum shell having a thickness of between 0.010 and 0.013 inch (0.252–0.325 mm.) including a top portion and a fluted skirt, an annular gasket formed of flowed-in plastic material and having a weight of not less than 160 mgms. (in the uncured state) and a width of from 0.08 to 0.14 inch (2.0–3.5 mms.), bonded to the underside of said top portion, the inside diameter and width of the gasket being such that the gasket seals against an annular portion of said radiused surface of the standard bottle, the inner diameter of said gasket being substantially equal to, or less than, the inner diameter of said inner surface of said bottle neck.



3,273,737
CONTAINER AND CLOSURE
James W. Davie, Monroeville, Pa., assignor to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Oct. 14, 1964, Ser. No. 403,898
3 Claims. (Cl. 215—46)

1. In combination,
a container
having a substantially rigid neck portion terminating in an annular bead provided with an annular upper sealing surface, an outwardly and downwardly disposed outer sealing surface, an inwardly and downwardly disposed shoulder surface, inclined downwardly at a relatively small angle from a horizontal plane with a rounded corner connecting said outer sealing surface with said shoulder surface,
a metal closure
having a recessed scored central panel with a pull tab affixed thereto within the scoring to provide an opening device, a peripheral sealing gasket retaining channel, and an unscored depending skirt of substantially uniform length, said skirt being necked in against said container shoulder surface in a substantially permanent sealed relationship, said central panel being adapted to

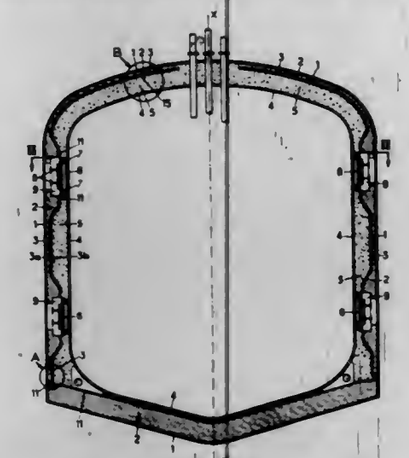


be substantially entirely removed on opening said container without removing the remainder of said closure; and
an adhesively retained annular sealing gasket
having a portion thereof disposed in said gasket retaining channel and retained between said channel and said upper sealing surface, and having a generally wedge-shaped portion thereof retained between said closure skirt and said outer sealing surface, said sealing gasket adapted to remain intact on opening said container; and the assembly having an internal pressure less than atmospheric pressure.

3,273,738
KNOCKDOWN CONTAINER CONSTRUCTION
Elias Blanco, 8262 Fountain Ave., Los Angeles, Calif.
Filed Nov. 23, 1964, Ser. No. 413,030
2 Claims. (Cl. 217—12)

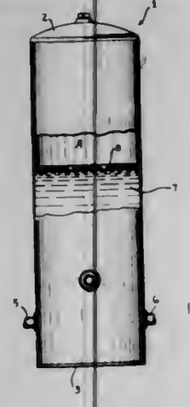
1. A rectangular container adapted to be rapidly assembled and disassembled comprising a first pair of substantially identical sections including walls and a frame for each wall on one side thereof, certain walls having at least two parallel spacers and two parallel cleats at right angles to said spacers, said cleats being spaced from the edges of the walls of said side sections and having continuous rabbets therein, a second pair of substantially identical sections including walls and a pair of identical cleats on one side of each wall of said sections and spaced from the edges of the walls of said end sections and having continuous rabbets therein, and a third pair of substantially identical sections, each of said third pair of sections having walls and two pairs of parallel cleats on one side of said walls at the edge portions of said walls, each of said cleats having continuous rabbets therein, rabbets being provided in said cleats of said first and second pairs of sections facing toward the interior of said container, and the rabbets in said third pair of sections facing away from the interior of said container, said opposing rabbets being adapted to interlock when said container is assembled.

3,273,739
DOUBLE STACKED ROCKET FOOD DISHES
Tohchung Wei, 169 E. Broadway, New York, N.Y.
Filed Aug. 5, 1963, Ser. No. 299,799
13 Claims. (Cl. 220—4)



1. A sealed stacked container assembly, comprising a plurality of cylindrical containers disposed in an axially aligned stacked array, each of said containers having a cylindrical wall with a closed circular bottom wall and open top, a first two cylindrical, radially spaced, concentric, cylindrical flanges depending from said bottom wall, three radially spaced concentric other flanges disposed at the open top of each container, and a radial annular wall supporting and securing said other flanges to the cylindrical wall of the container, all of said flanges being axially aligned with each other and with the axis of said cylindrical wall, the first two flanges of each upper container in said array interfitting in and between the three spaced other flanges at the top of the next lower container in said array to define four annular sealing surfaces between said flanges, the bottom wall of the upper container and the radial, annular wall of the lower container.

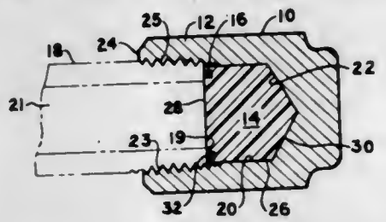
3,273,740
TANK FOR LIQUEFIED NATURAL GAS AND OTHER PRODUCTS STORED AT LOW TEMPERATURES
Pierre Herrenschmidt, Neuilly-sur-Seine, France, assignor to Societe anonyme des: Ateliers et Chantiers de la Seine Maritime
Filed Sept. 3, 1963, Ser. No. 306,250
Claims priority, application France, May 7, 1963, 933,980, Patent 1,364,070
8 Claims. (Cl. 220—15)



1. A tank for transporting fluids at low temperatures comprising an inner casing made of a metal which is resilient at said temperatures, a relatively rigid outer casing, an intermediate deformable casing between said inner and outer casing, interfitting relatively slidable tongue and groove means extending through said intermediate casing, said tongue means being attached to one of said inner and outer casings and said groove means to the other so as to guide said inner casing as it expands

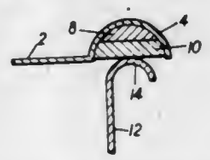
and contracts relative to the outer casing, and solid insulation between said intermediate casing and one of said

inner and outer casings and pulverulent insulation between said intermediate casing and the other of said inner and outer casings.



3,273,741
AIR BARRIER MEANS FOR HYDRO-PNEUMATIC TANK
Stuart F. Faunce, Fanwood, N.J., assignor to John Wood Company, New York, N.Y., a corporation of Delaware
Filed May 4, 1962, Ser. No. 192,491
7 Claims. (Cl. 220—26)

7. A pressure water reservoir comprising an integral tank; a free floating substantially rigid air barrier means within said tank and adapted to float on the top surface of water within said tank; said free floating air barrier means being comprised of a float formed of expanded polystyrene which has a specific gravity of less than 1, said float having a transverse central web portion, and a multiplicity of spaced apart intersecting ribs extending from each side of said transverse central web portion, said spaced apart intersecting ribs forming a multiplicity of pockets open at their outer faces on each side of said float.

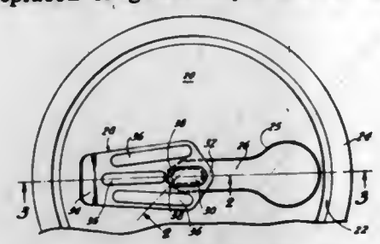


3,273,742
END CLOSURE ASSEMBLY
Emery J. Zahuranec, Bedford, and Zoltan Szohatzky, Cleveland, Ohio, assignors to Crawford Fitting Company, Cleveland, Ohio, a corporation of Ohio
Filed June 2, 1964, Ser. No. 372,015
7 Claims. (Cl. 220—39)

1. An end closure assembly for a threaded mating member having an axial fluid passageway therein and a radial end sealing face transverse to the axis of the passageway, comprising a cap member having thread means for engagement with the threaded mating member, said cap member having means for advancing the cap member along the threads of the mating member, said cap member further having a generally cylindrical cavity concentric with said thread means and having a closed inner end wall, a generally cylindrical plug member separate from said cap member and snugly and slidably received in said cavity, said plug member having an inner end surface substantially complementary with said closed inner end wall of said cap member, said closed inner end wall including inclined wall means to center the axis of said cap member relative to the axis of said plug member, the outer end of said plug member having a radially extending surface

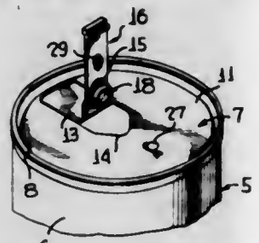
generally complementary with the sealing face of the mating member and recessed to define a sealing cavity opposed to the sealing face of the mating member when the end closure assembly is operatively connected with the mating member, sealing means received within the sealing cavity and, in the undeformed state, extending axially slightly beyond said radially extending surface of the plug, thereby providing adequate seal compression and effecting a proper fluid seal between the sealing face of the mating member and the radially extending surface of the plug when the end closure assembly is operatively associated with the mating member.

3,273,743
SEALING
John Cameron McColl, Childwall, Liverpool, England, assignor to Rubbarite Limited, Liverpool, England, a British company
Filed Nov. 14, 1963, Ser. No. 323,706
Claims priority, application Great Britain, May 17, 1963, 19,634/63
4 Claims. (Cl. 220—46)



1. The combination of a container lid having a peripheral curl of substantially semi-circular transverse cross-section and a sealing member disposed within said curl, said sealing member comprising a first layer composed of a resiliently deformable material having a bulk density of from 1½ to 2 lbs. per cubic foot and a second layer composed of a resiliently deformable material having a bulk density of from 30 to 45 lbs. per cubic foot, said sealing member being applied to said lid by pressing said member into said curl so that the first layer conforms to the contour of the curl and the second layer wedges in place in the opening of the curl.

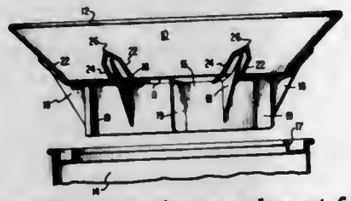
3,273,744
CONTAINER OPENING DEVICES
Ermal C. Fraze, 355 W. Stroop Road, Dayton, Ohio
Filed Mar. 2, 1964, Ser. No. 348,618
8 Claims. (Cl. 220—54)



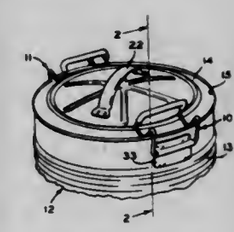
1. In the structure of a container wherein a metal wall of the container is scored along a line to form a tear strip and a hollow rivet is formed in the tear strip in overlapping engagement with a tab for use of the tab as a lever to initiate severance of the tear strip at a particular

region near one end of the tear strip, the improvement comprising:

said rivet being elongated in plan towards the particular region and the overhanging metal of the rivet also being displaced longitudinally towards the particular region with consequent greater overhang of the bead in the portion of the joint between the tab and the tear strip where maximum stressing of the joint between the tear strip and the tab is created by the lever action.



3,273,745
VENTED EASY OPENING CONTAINER
Frederick J. Stec, Oak Lawn, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed July 1, 1964, Ser. No. 379,481
5 Claims. (Cl. 220—54)

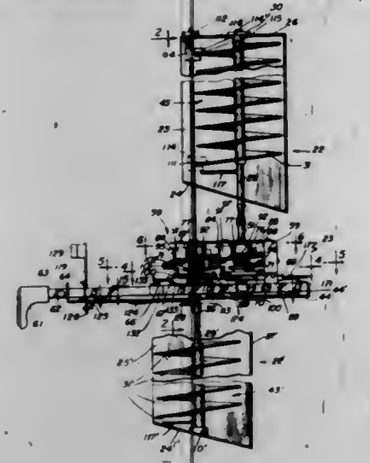


1. In a container for packaging a liquid under pressure, a panel having an integral removable portion defined by weakening lines formed in said panel and a vent opening aligned with said removable portion for first venting the container and a pull tab for facilitating the removal of said removable panel, said pull tab being formed of a resilient plastic and including an elongated strap-like body, a connector on said body adjacent one end permanently securing said pull tab to said removable portion, said body having at the other end thereof a grip portion, said body further having an intermediate depending plug projecting through said panel opening and engaging said panel around said opening to seal said panel and said body being bonded to said panel adjacent said plug to prevent accidental displacement of said plug, said removable portion having a starting end, an opening in said removable portion adjacent said starting end, and said connector being in the form of a plug passing through said removable portion opening and interlocked with said removable portion.

3,273,746
PAINT CAN BIB
Harold D. Andrews, Jr., 1207 Westwood Drive, Valdosta, Ga.
Filed June 2, 1964, Ser. No. 372,024
12 Claims. (Cl. 220—90)

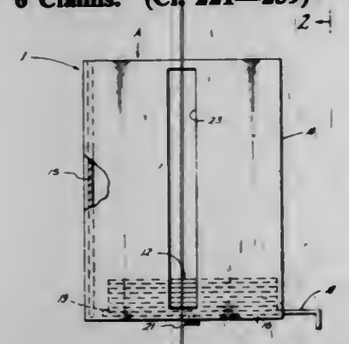
1. A brush holder and wiper atachment for paint cans comprising: an annular body having an axial passage dimensioned to receive a paint brush or the like, said body including an upper substantially funnel-shaped drain portion, an intermediate portion providing an internal circular shelf the upper face of which merges into the inner face of the drain portion at its lower end, the inner edge of the shelf circumscribing a paint brush passage aperture, a cylindrical baffle portion depending from the bottom of said shelf and concentric with the brush aperture, supports extending axially between and connecting the outer faces of the drain portion and the baffle, said supports being spaced apart circumferentially around said body and extending radially therefrom, and the radially outermost faces of the supports being upwardly and outwardly divergent from the lower end portion of the cylindrical baffle to their points of juncture with said drain portion, portions of said radially outermost faces being spaced sufficiently from said body to permit paint or the like to flow freely between the outside of the holder and the surrounding mouth edge of a paint can or the like.

3,273,747
COMBINED LATCH AND HANDLE STRUCTURE
Anthony C. Kalz, St. Louis, Mo., assignor to Schlueter Manufacturing Company, St. Louis, Mo., a corporation of Missouri
Filed Mar. 27, 1964, Ser. No. 355,347
12 Claims. (Cl. 220—95)



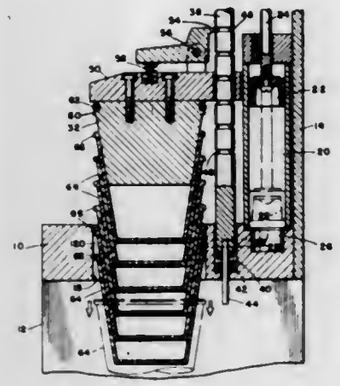
1. In a combined latch and handle structure:
(a) a container including a top wall and a side wall, the top wall being provided with an opening,
(b) a lid closing the opening,
(c) a latch handle including an inturned pivot portion and a grip portion interconnected by a substantially 5-shaped arm,
(d) means pivotally mounting the pivot portion to the side wall,
(e) a keeper shoulder on the container,
(f) the 5-shaped arm having a reverse portion that fits over and engages the keeper shoulder to maintain the latch handle selectively in a clamp position, and
(g) the 5-shaped arm having another portion that overlies the lid to hold the lid in place when the latch handle is in the clamp position.

3,273,748
HELIX ARTICLE VENDOR
Le Roy F. De Shon, Park Forest, and Mahlon Wesley Kenney, Oak Park, Ill., assignors to The Seeburg Corporation, Chicago, Ill., a corporation of Delaware
Filed Oct. 28, 1964, Ser. No. 407,140
4 Claims. (Cl. 221—75)



1. In a vending machine, a storage and releasing mechanism comprising:
a frame member;
a helical member rotatably journaled in the frame member for rotation about its longitudinal axis, the said helical member providing a continuous spiral surface upon which vendible articles may be disposed;
an actuating member journaled for rotation in the frame member, the said actuating member being

adapted to impart rotational movement to the helical member;
index means on the actuating member, the said index means being adapted to rotate therewith;
latching means pivotally mounted on the frame member between a first position and a second position, the said latching means being adapted to engage the index means and to control the rotation thereof, whereby movement of the latching means from its first to its second position frees the index means for rotation through a portion of an arc of substantially 180° and movement of the latching means there-

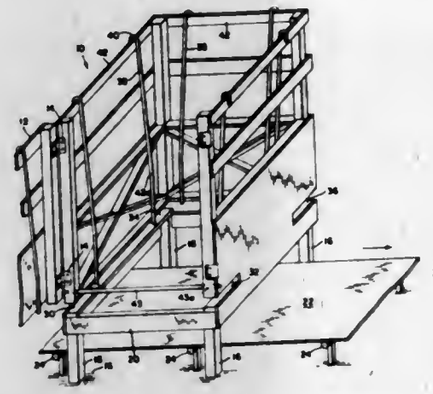


after from its second position to its first position frees the index means for rotation through the remainder of the arc of substantially 180°;
spring means adapted to be wound whereby to exert rotational force on the index means;
means adapted to wind the spring means; and
latch-releasing means adapted after winding of the spring means to move the latching means to its second position and thereafter to its first position, whereby the latching means releases the index means in two steps for rotation thereof by the spring means through an arc of substantially 180°, so as to dispense a vendible article from the helical member.

3,273,749
TONGUE BLADE DISPENSER
Stanley E. Thompson, 202 S. 4th St., Richmond, Tex.
Filed July 28, 1965, Ser. No. 475,346
6 Claims. (Cl. 221—239)

1. A dispenser for holding stacked tongue blades, comprising:
(a) a housing for receiving stacked tongue blades,
(b) said housing having substanitally parallel container walls and having a bottom attached to said container walls,
(c) gripping means attached to said parallel walls at one end thereof and spaced above said bottom to provide an opening,
(d) a dispenser plate supported by said bottom of said housing and disposed for receiving a stack of the tongue blades thereon and adapted to be moved back and forth from a retracted position to an extended position,
(e) means with said plate for engaging the lowermost of the tongue blades for moving same with said plate as it is laterally moved toward said opening, and
(f) said plate being movable upwardly when in said extended position to engage the upper surface of the lowermost tongue blade with said gripping means for holding the lowermost tongue blade to prevent retraction thereof upon a return of said plate to said retracted position.

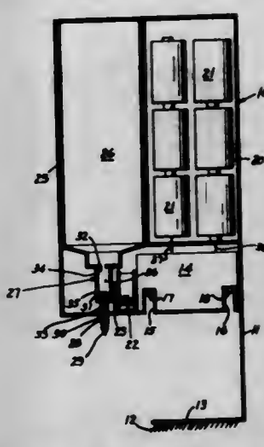
3,273,750
FLUID PRESSURE CUP DISPENSER
Robert E. Davy, La Mesa, Calif., assignor to Coroga Co., Anaheim, Calif.
Filed Feb. 1, 1965, Ser. No. 429,507
7 Claims. (Cl. 221—278)



1. A cup dispenser for dispensing individual cups from a tightly interfitted uniform stack of cups, the structure comprising:
a frame having a cylindrical throat through which the stack of cups passes, said throat being dimensioned so that the rims of the cups are gripped firmly, and an axial length sufficient to hold the rims of at least two of the stacked cups simultaneously whereby a portion of said throat defines, with said rims, a closed annulus;
ejecting means for supplying a pulse of compressed air into said annulus, whereby the cups are separated and one is ejected;
and indexing means for advancing the stack of cups a distance equal to the axial spacing of the cup rims, after each cup is ejected.

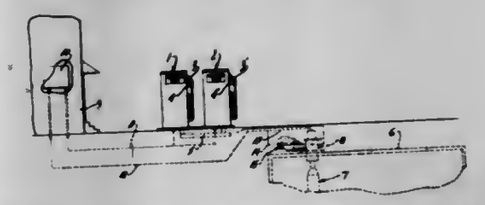
3,273,751
PALLET DISPENSER
Arnold D. De Wees, 1730 Ebers St., San Diego, Calif.
Filed Aug. 26, 1964, Ser. No. 392,359
4 Claims. (Cl. 221—281)

1. A device for sequentially dispensing pallets from a vertical stack thereof onto a moving conveyor belt or platform, said device comprising:
a frame constituting an enclosure designed to receive said stack of pallets, said frame being of substantially rectangular cross-section considered in a horizontal plane, said frame having at least one side which can be selectively opened so that said stack of pallets may be placed therein;
a pair of rotatable shafts lying in a horizontal plane near the lowermost portion of said enclosure, said shafts being disposed in spaced-apart parallel relationship with their axes aligned in the direction of movement of said conveyor belt onto which the pallets stacked in said enclosure are to be sequentially dispensed;



a pair of sprocket wheels carried on each of said shafts, the sprocket wheels on each shaft being spaced apart by a distance less than one dimension of each pallet comprising said stack;
each sprocket wheel including a plurality of radially-projecting fingers, the number of fingers on each sprocket wheel being identical and with corresponding fingers of all four sprocket wheels lying in the horizontal plane of said shafts at a given point in each cycle of shaft rotation, the corresponding fingers of said sprocket wheels when in the said horizontal plane engaging an undersurface of the lowermost pallet in said stack and supporting such pallet thereon;
means for producing a rotation of each of said shafts in opposite directions so as to bring about a disengagement between the said sprocket wheel fingers

and the lowermost one of said pallets, whereupon the latter is released to fall upon said moving conveyor belt, said last-mentioned means comprising:
a first pair of worm gears mounted on corresponding ends of each of said shafts, said worm gears being threaded oppositely to one another;
a control shaft rotatably carried by said housing and extending in a direction transverse to the direction of each of said first-mentioned pair of shafts but parallel to the horizontal plane of the latter;
a second pair of worm gears carried by said control shaft and designed to respectively mesh with said first pair of worm gears, said second pair of worm gears also being threaded oppositely to one another;
whereupon manual actuation of said control shaft to produce a limited rotation thereof will act to turn said pair of shafts in opposite directions and thus bring about a disengagement between the fingers of the sprocket wheels mounted thereon and the undersurface of the lowermost pallet in said stack, thereby achieving the dispensing objective of said device.

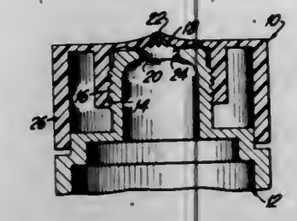


3,273,752
PHOTO-ELECTRIC CONTROLLED DISPENSER
Geza E. Horeczky, 661 Via Santa Ynez, Pacific Palisades, Calif.
Filed Feb. 11, 1965, Ser. No. 431,884
8 Claims. (Cl. 222—52)

4. A container having an orifice with a central axis, and means for opening and closing said orifice comprising a pellet of magnetizable material having greater lateral dimensions than the orifice and freely movable both laterally and axially relative to the orifice, whereby the pellet may close the orifice by resting in the same in the absence of a magnetic field sufficient to move the pellet away from the orifice, and may be moved away from the

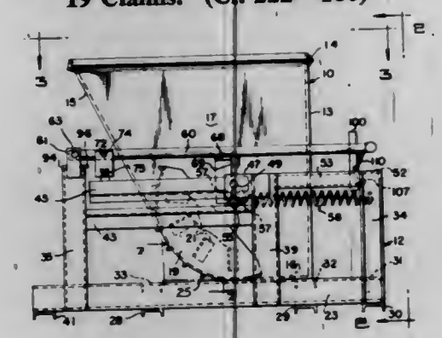
orifice to open the same when in the presence of a sufficient magnetic field to cause said movement.

3,273,753
PUMPING SYSTEM AND LEAK DETECTION UNIT CONTROL THEREFOR
Irving A. Johnson and Stephen Stasenko, Erie, Pa., assignors to A. O. Smith Corporation, Milwaukee, Wis., a corporation of New York
Filed Mar. 25, 1965, Ser. No. 442,593
18 Claims. (Cl. 222—52)



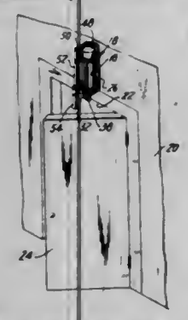
1. In a pumping system having a pressurized discharge line and an electrical control circuit for actuating a pumping means to discharge fluid through the line, a volume sensitive leak detector comprising,
a chamber connected to the pressurized line and having a member movably mounted to respond to the volume of fluid therein and having means urging said member against the force of the line pressure, and
a control means having a circuit enabling means adapted to be connected in the control circuit and operably associated with said member to dispose the enabling means in the enabling position with a selected amount of fluid within the chamber and to dispose the enabling means to a disabling position in response to selected volumetric reduction as a result of fluid discharged from said chamber whereby said control means is insensitive to pressure changes and sensitive to volumetric changes to control the pumping means.

3,273,754
ONE-PIECE CLOSURE FOR COLLAPSIBLE CONTAINERS
Donald C. Lindley, Greenlawn, N.Y., assignor to Leonard H. King, Valley Stream, N.Y.
Filed Dec. 28, 1964, Ser. No. 421,185
11 Claims. (Cl. 222—92)



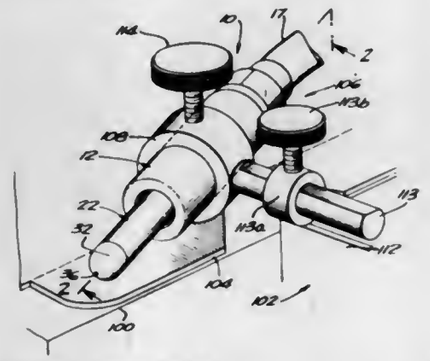
1. A resilient one-piece closure member for a collapsible tube having a dispensing orifice and external threads thereabout, said closure member comprising a cap member having internal threads adapted to mate with the external tube threads, said cap member comprising a top surface and an inwardly facing concave central portion pro-

vided with at least one slot extending partially through said top surface, an annular area surrounding said concave central portion, said annular area being adapted to



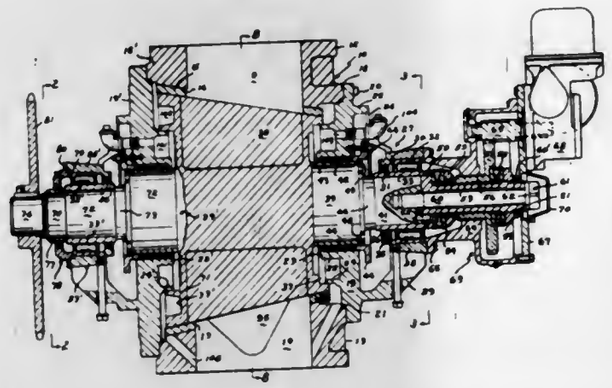
be upwardly displaced by the peripheral portion of the tube dispensing orifice when said closure member is rotated and axially displaced with respect to the collapsible tube.

3,273,755
SELF-DUMPING BUCKET WITH BRAKE
Robert D. Shomo, Taylor, Mich., assignor of thirty-three and one-third percent to Ernest S. Shomo, Taylor, Mich., and thirty-three and one-third percent to Claude R. Boyd, Dearborn, Mich.
Filed Apr. 1, 1964, Ser. No. 356,547
19 Claims. (Cl. 222—166)



17. A dumping hopper device including:
a frame;
hopper means mounted on said frame for rotation relative thereto;
braking means for closely controlling the rotation of said hopper; and,
means including shaft means mounted on said hopper means;
means mounting said shaft means for rotation and translation relative to said frame; and, means mounted on said frame for controlling the translation of said shaft means relative to said frame.

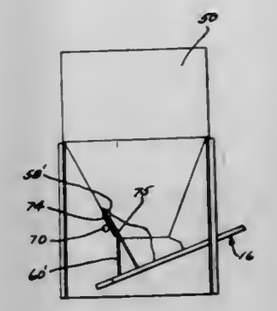
3,273,756
DEVICE FOR THE AUTOMATIC TREATMENT OF THE AIR IN AN ENCLOSED SPACE HAVING A DOOR
Larry W. Levy, 2930 Rockaway Ave., Oceanside, N.Y., and Harry M. Durst, 552 Brookside Ave., Freeport, N.Y.
Filed Feb. 9, 1965, Ser. No. 431,281
10 Claims. (Cl. 222—180)



1. A device of the character described comprising, in combination, a pressurized spray dispenser including a container and a member projecting therefrom and movable to open and shut the outlet valve thereof, said member resiliently biased to normally maintain said member in valve-closing position, with a structure for supporting said spray dispenser for actuation by a moving door, said structure including means securable on a structural surface adjacent a door opening for securing and holding said spray dispenser and a member actuating bar pivotally supportable by one end in position to overlie and engage against said movable member, said actuating bar adapted to have its other end extending substantially to a level with the edge of said door opening when said holding structure is secured on said structural surface, said bar having a stiffly resilient strip secured thereto at its other end and projecting therefrom to overlap said door opening when said holding means is secured in said position and to be engaged by said door in its movement in one direction for initially pressing said bar against said member to move said member into valve opening position and to be offset by further movement of said door to permit the movement of the door past it.

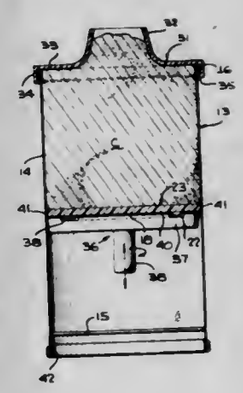
3,273,757
FLUID DISPENSER WITH SUPPORT THEREFOR
Lenard E. Moen, 422 Ocean View Ave., Whittier, Calif.
Filed Oct. 30, 1964, Ser. No. 407,834
11 Claims. (Cl. 222—185)

1. A dispenser comprising:
a rigid-walled body having an internal chamber for containing a liquid to be dispensed and an opening in one end,
a rigid-walled actuator barrel having one end extending into said body through said opening and pivotally mounted on said body for lateral deflection of said barrel relative to the body,
means sealing said one end of said barrel to said body,
said barrel having a central passage communicating at one end to said chamber and opening at its other end to the exterior of the barrel through a dispensing port in the tip of the barrel,
a valve seat within said barrel tip about said passage and in close proximity to said port,
a valve including a stem extending from said chamber through said barrel to said barrel tip, whereby said stem has an inner end located in said chamber and an outer end located within said barrel tip, and an obturator on the outer end of said stem within said barrel tip engageable with said valve seat to close said passage,
means pivotally mounting the inner end of said valve stem on said body whereby said valve is adapted to deflect laterally with said barrel, and
means coacting between said body, said barrel, and said valve for yieldably retaining said barrel and valve in a normal angular position relative to said body and said obturator in seating contact with said valve seat when said barrel and valve occupy said normal position and effecting relative axial movement of said barrel and valve to unseat said obturator from said seat in response to lateral deflection of said barrel and valve from said normal position,
valve operating means within said passage and operatively connected between said barrel and obturator for affecting engagement of said obturator with said seat to close said passage when said barrel occupies a given normal position relative to said body and effecting relative separation of said valve seat and obturator to open said passage in response to lateral deflection of said barrel from said normal position.



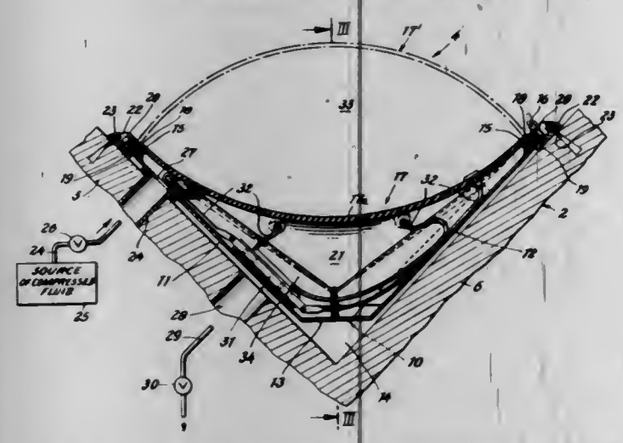
3,273,758
ROTARY VALVE
James R. Starrett, Springfield, Ohio, assignor to The Bauer Bros. Co., Springfield, Ohio, a corporation of Ohio
Filed Feb. 28, 1964, Ser. No. 348,157
15 Claims. (Cl. 222—194)

1. A material handling valve comprising a shell forming a tapered passage opening from either end of said shell, a mating tapered rotor housed in such shell, shaft means projecting relative either end of said rotor, means anchored to one end of said shell forming a seal about the projected end of said shaft means adjacent the rotor portion of minimal cross-sectional dimension, means forming an axial extension of the end of said shaft which projects relative said seal, means indexing said extension to said shaft accommodating their relative axial displacement but preventing their relative rotation, a single accessible element engaging to said shaft and holding said axial extension from axial displacement relative to said shaft, means rotatably mounting about said axial extension and contained against endwise movement relative thereto, and relatively fixed nut-like means in connection with said sealing means threadedly related to the means about said axial extension whereby on rotation of said latter means there is produced thereby an axial movement of said axial extension and said shaft due to the containment of said extension to said shaft by said single element and means forming a seal about the opposite extremity of said shaft means forming a closure element for asid shell which on release thereof and release of the single element said shaft means forming a closure element for said shell without disturbing the first mentioned sealing means or said axial extension.



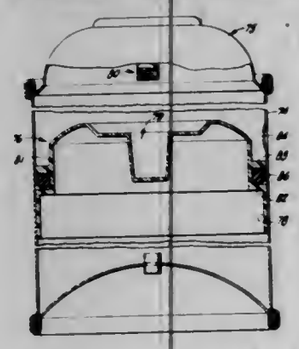
3,273,759
BIN AND CHAIN FEED SYSTEM
Preston D. Rigterink, Holland, Mich., and Richard A. Haggard, Nacogdoches, Tex., assignors to Big Dutchman, Inc., a corporation of Michigan
Filed Apr. 29, 1964, Ser. No. 363,535
4 Claims. (Cl. 222—202)

1. A feed hopper mechanism for an animal feed system, comprising: a walled vessel forming a hopper having a bottom discharge outlet; a boot structure on the bottom of said hopper, having convergent walls extending downwardly from said hopper outlet to direct feed therefrom into a conveyor means positioned immediately beneath the said boot; an elongate flexible panel having a free length extending downwardly into said boot and terminating near the lower end thereof and directly above said conveyor means; vibrator means on the exterior of



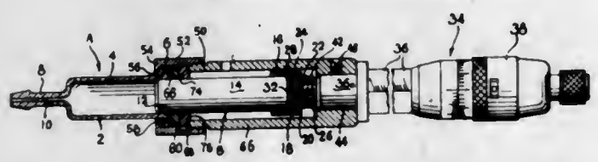
said hopper mechanism and arranged to impart vibrations to said panel; said panel when vibrated flexing increasingly along its free length such that the bottom end thereof moves in a sweeping motion between the converging walls of the boot directly above said conveyor means and in the direction of motion thereof to cause particulate matter within the boot to be imparted simultaneously with a vertical and lateral motion serving to break up bridging of the particulate matter.

3,273,760
CONTAINER WITH EXPELLING MEANS FOR USE IN MANNED SPACE SHIPS
Henry E. Frankenberg, Berwyn, Ill., assignor to Continental Can Company, Inc., New York, N.Y., a corporation of New York
Filed Nov. 6, 1962, Ser. No. 235,668
12 Claims. (Cl. 222—386)



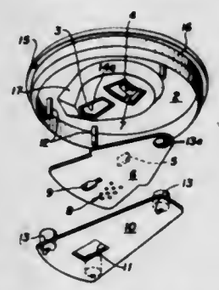
1. A container comprising an imperforate cylindrical metallic body having an upper end and a lower end, a metallic closure at each of said ends, interlocking means securing said closures to the body, at least said closure at said upper end being openable, an expelling plate located internally of said body, said expelling plate being movable toward said upper openable closure whereby the contents of said container may be expelled through the upper end of the body originally closed by said openable closure, an imperforate overcap removably secured to one of said ends in overlying relationship with one of said closures, and said lower closure being provided with a score line to facilitate severance of a portion of the closure from the container body.

3,273,761
AGITATOR FOR GRANULAR MATERIALS AND THE LIKE
Peter Langen, Walberberg, Germany, assignor to Franz Clouth Rheinische Gummiwarenfabrik Aktiengesellschaft, Cologne-Nippes, Germany
Filed Oct. 13, 1964, Ser. No. 403,527
Claims priority, application Germany, Dec. 2, 1963, C 31,559
13 Claims. (Cl. 222—386.5)



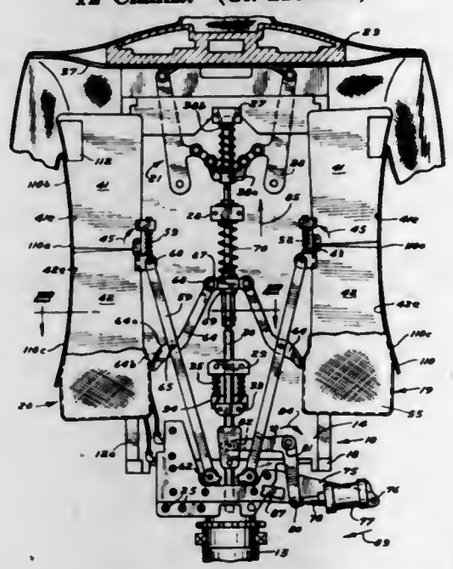
1. For use in a container for comminuted material having at least one pair of mutually inclined side walls bounding a container corner zone in which the material tends to agglomerate, an agitator for said corner zone comprising a rigid carrier having two mutually inclined sections bounding a section corner zone, a flexible diaphragm having edge portions sealingly secured to the corresponding sections and extending across said section corner zone to define with the carrier a fluid-receiving chamber, and means for admitting a fluid into said chamber to flex the diaphragm; and means for securing said sections to the inner faces of said mutually inclined side walls of a container, so as to overlie said container corner zone, whereby said agitator breaks up eventual agglomeration of material in said section corner zone when said diaphragm is flexed in response to admission of fluid into said chamber.

3,273,762
PRESSURE CAN CONSTRUCTION INCLUDING FREE PISTON
Paul J. O'Neill, Jr., San Rafael, Calif., assignor to Union Machine Company, San Francisco, Calif., a corporation of California
Filed June 28, 1965, Ser. No. 467,651
3 Claims. (Cl. 222—389)



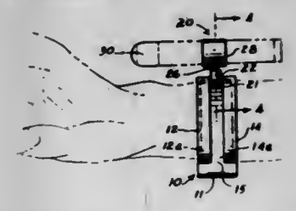
1. In combination with the container body of a pressurized dispenser having cylindrical sidewalls, a free piston comprising:
a generally cylindrical skirt slidably received on said side walls,
an annular ring integral with said skirt and extending radially inwardly from one end thereof to define an axially directed shoulder,
a piston head including a cylindrical portion of less diameter than said skirt and integrally secured to said ring,
an O-ring seal positioned on said shoulder in sealing engagement with said side walls,
the annular space between said portion and said side walls being substantially unobstructed from said shoulder along the entire axial extent of said head to permit said O-ring to be inserted axially through said space and onto said shoulder.

3,273,763
MICROMETER BURET
Roger Gilmont, Douglaston, N.Y., assignor to Roger Gilmont Instruments, Inc., Great Neck, N.Y., a corporation of New York
Filed Jan. 22, 1965, Ser. No. 427,326
19 Claims. (Cl. 222—390)



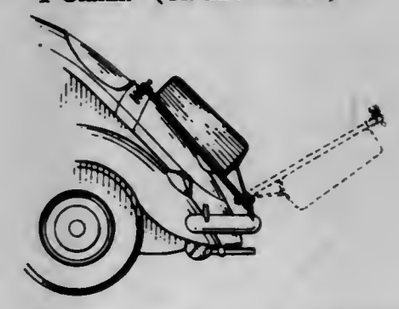
1. A buret comprising a reservoir body having an inner chamber with an aperture therethrough communicating with said chamber, a plunger slidable in said chamber operatively toward and away from said aperture, a positioning element operatively connected to said plunger for moving the latter, and mounting means for connecting said positioning element and said reservoir body; the improvement which comprises a gasket of chemically resistant material sealingly received over said plunger so that the latter is slidable therethrough, said gasket having a first surface directed toward said reservoir body, a first O-ring of rubber-like material sealingly engaged between said first gasket surface and said reservoir body, a second O-ring of rubber-like material sealingly received over said plunger on the other side of said gasket from said reservoir so that said plunger is slidable therethrough, and means for retaining said second O-ring in position.

3,273,764
POWDERED OR GRANULAR MATERIAL DISPENSING DEVICE
Albert J. Kurtz, 62 Belvedere St., San Rafael, Calif.
Filed Nov. 16, 1964, Ser. No. 411,237
4 Claims. (Cl. 222—480)



1. A device for dispensing powdered or granular material and the like from a container comprising:
a first flat stationary upper member secured to an outer surface of said container and communicating with the interior thereof;
said first member having an aperture therethrough, said aperture being completely surrounded by a peripheral raised wall positioned on the interior surface of said member;
a second flat stationary lower member fixedly positioned against the interior surface of said first member and in parallel spaced relation thereto;
said second member having an aperture therethrough, said aperture being in alignment with the aperture in said first member, said aperture in said second member being surrounded by a peripheral raised wall positioned on that surface of said second member facing said first member;
a movable member pivotally mounted between said first and said second stationary members in spaced relationship thereto and in sliding relationship with said raised walls in said first and second stationary members;
said movable member having an aperture therethrough positioned so as to come into alignment with said apertures in said first and second stationary members when said movable member is in a first or pouring position;
said movable member having a plurality of holes therethrough positioned so as to come into alignment with said apertures in said first and second stationary members when said movable member is in a second or sprinkling position;
said movable member having a solid section positioned so as to close off said apertures in said first and second stationary members when said movable member is in a third or closed position;
means for moving said movable member alternately between said first and second positions and said third position;
whereby said material in said container may be alternately poured, sprinkled or shut off from said container while said material is prevented from moving into the said space between said stationary and said movable members.

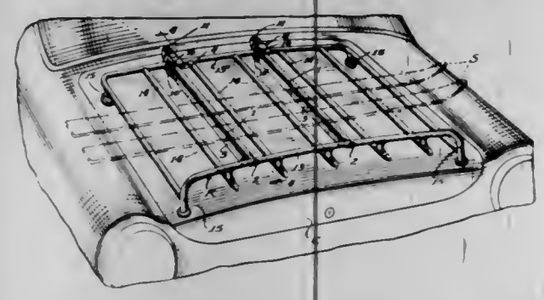
3,273,765
SHIRT BUCK APPARATUS
Calvin E. Piilola, Minneapolis, Minn., assignor to The Unipress Company, Incorporated, Minneapolis, Minn., a corporation of Minnesota
Filed Mar. 22, 1965, Ser. No. 441,680
12 Claims. (Cl. 223—57)



1. In a shirt buck assembly including a shirt buck frame elongated in a vertical direction and having a vertical axis, an elongated wing support arm on each side of said axis, each arm having an upper end portion and a lower end portion, means for pivotally connecting said lower end portions to the frame, and means movably mounted on the frame and pivotally connected to the support arms for selectively moving said upper end portions horizontally away from one another and toward one another, the improvement being a wing assembly for each support arm conprising an upper wing plate having a generally straight lower edge and a lower transverse inner corner portion, a lower wing plate having a generally straight upper edge and an upper transverse inner corner portion, means for pivotally connecting said corner portions together to permit movement of the upper plate relative the lower plate about a horizontal axis, said upper and lower edges lying in substantially the same plane, means attached to one of said plates for pivotally mounting the last mentioned plate on the upper end portion of the adjacent support arm and means connected to at least one of said plates for resiliently urging the one of said plates relative the other plate to a position that said upper edge abuts against said lower edge.

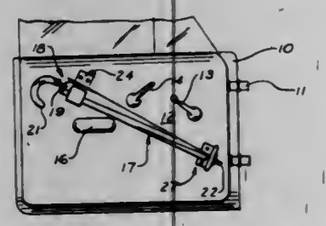
3,273,766
WRIST ARTICLE RETAINING DEVICE
Frank P. Cosentino, 2106 35th St., Astoria 5, N.Y.
Filed Nov. 2, 1964, Ser. No. 408,043
4 Claims. (Cl. 224—28)

2. An article retaining device for the wrist of a wearer, including:
(a) a semi-rigid and flexible band adapted to fit about the wrist of a wearer,
(b) and a pair of spaced and parallel guide bars affixed to said band, said guide bars being undercut,
(c) and a plurality of article retaining clamps adjustably positioned about said band, and fitting at least partially within said undercut portion of said guide bars and extending above,
(d) and a threaded member at least partially threaded within each of said clamps and extending therefrom to bear against said band thereby locking said clamps in position between said band and said undercut portions of said guide bars,
(e) each of said clamps having a spring-like portion to retain an article, said spring-like portion being affixed to the side of said threaded member away from said band, whereby rotation of said spring-like member will rotate said threaded member thereby locking or releasing said clamp.



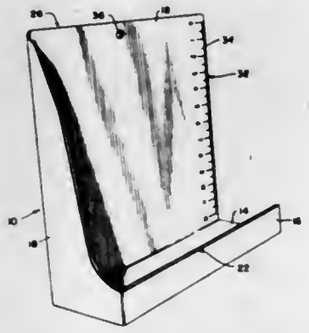
3,273,767
LUGGAGE RACK
Robert L. Moore, Orange County, Fla. (7100 Autumvale Drive, Orlando, Fla.)
Filed Feb. 24, 1965, Ser. No. 434,952
1 Claim. (Cl. 224—42.01)

A detachable luggage rack for a Volkswagen vehicle comprising; an inverted U-shaped tubular element having divergent legs having no interconnection other than the bight of the U-shaped element, support means on each leg extending at right angles thereto to mount luggage thereon, clamping means at the end of each leg to clamp the



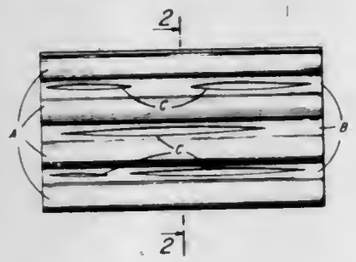
legs to the tubular section of the Volkswagen bumper, attachment means at the bight of the U-shaped member to secure it to an air-intake grill of the Volkswagen, said clamping means upon partial unclamping also serving as a pivotal connection of the rack about the tubular section of the bumper to permit opening of the underlying vehicle door and access to the interior, said bight portion also serving as a handle means for hand carrying the rack upon removing said rack from the vehicle.

3,273,768
SKI CLAMP FOR AUTOMOBILE LUGGAGE RACKS
Frederick L. Duer, 2810 Madison St., Bellwood, Ill.
Filed Oct. 19, 1965, Ser No. 497,876
5 Claims. (Cl. 224—42.1)



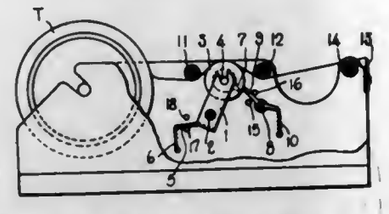
1. In combination with a luggage rack having relatively spaced side rails:
(a) an elongated body the length of which approximates the distance between said side rails;
(b) one end of the body being detachably and pivotally engageable with one of the side rails for transverse spanning of the rack;
(c) a locking bracket pivotally mounted on the opposite end of the body; and,
(d) a catch member endwise pivotally connected to said bracket inwardly of its pivotal mounting on the opposite body end and extending outwardly therefrom.

3,273,769
UMBRELLA HOLDER FOR AUTOMOBILES
Marilyn J. Miller, 1440 W. 56th Ave., Gary, Ind.
Filed Oct. 6, 1965, Ser. No. 493,364
2 Claims. (Cl. 224—42.45)



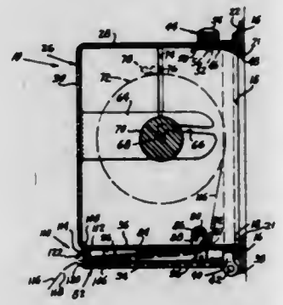
1. Apparatus for attachment to an automobile door hinged at the leading edge for receiving and retaining an umbrella having a handle end and an elongated generally cylindrical tip opposite the handle end comprising a handle receiver of generally J-shaped configuration for receiving and supporting the handle portion of the umbrella, said handle receiver including at least one fastener receiving opening for attachment of the handle receiver to said car door and a tip receiver having a frame portion defining a fastener receiving opening for attachment of the tip receiver to said car door in a position spaced from the handle receiver and adjacent the leading edge of said door, said tip receiver having a retainer portion carried by the frame portion, said retainer portion being a disc of resilient material defining a central opening of a diameter slightly less than the diameter of the cylindrical tip on the umbrella and a plurality of radially extended slots through said disc projecting from the central opening outwardly a distance less than the radius of said disc, thereby defining resilient fingers between the slots for resilient frictional engagement with said umbrella tip.

3,273,770
SCHOOL BOOKS CARRIER
Leon A. Miller, Chicago, Ill., assignor to Henest Corporation, Chicago, Ill., a corporation of Illinois
Filed July 7, 1965, Ser. No. 469,994
10 Claims. (Cl. 224—46)



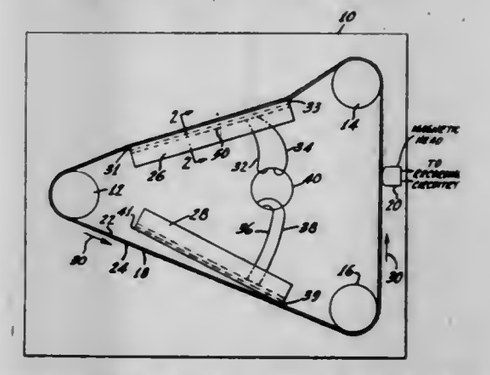
1. A carrier for school books and the like comprising a unitary member of sheet-like material having a generally rectangular-shaped backer wall, a rectangular shaped bottom wall along the width thereof and an upstanding front wall of limited height spaced forwardly of the backer wall, and a side wall on one side of the member formed with the side edges of said front and bottom walls and extending along the side of the backer wall to short of its upper edge, the side wall being of a width less than the spacing of the front wall from the backer wall and having an inclined planar edge portion lying in a plane including the upper edges of said front and backer wall, the member thereby being adapted to be inverted and rested by said upper edges of the front and backer walls and planar edge portion on a horizontal surface so as to stably support the backer wall in an inclined plane and function as a book rest and writing surface.

3,273,771
FILAMENTARY MATERIAL
Albert G. Beaumont, Kenilworth, England, assignor to Courtaulds Limited, London, England, a British company
Filed May 10, 1963, Ser. No. 279,508
Claims priority, application Great Britain, May 14, 1962, 18,380
2 Claims. (Cl. 225—3)



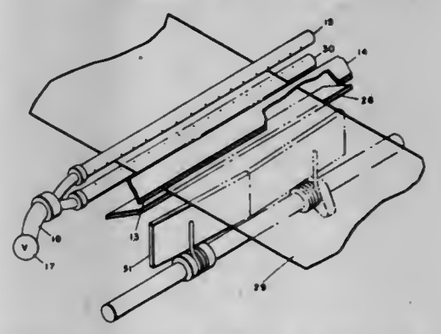
1. A method of making filamentary material comprising combing an array of collateral filaments each of less than 80 denier with webs connecting adjacent filaments, the thickness of said webs being substantially less than the diameter of said filaments, which comprises moving the array longitudinally into contact with an endless assembly of points moving in the same direction as and more quickly than the array, whereby the points pierce and slit lengths of the webs.

3,273,772
DEVICE FOR SEVERING FIXED LENGTH OF TAPE
Jitsuji Nakajima, Ibaraki, Hiromi Hayashi, Kyoto-ku, and Kenji Onishi, Ibaraki, Japan, assignors to Nitto Electric Industrial Co., Ltd., Ibaraki, Japan
Filed July 14, 1964, Ser. No. 382,509
Claims priority, application Japan, July 17, 1963, 38/38,770
2 Claims. (Cl. 225—12)



1. A device for drawing a fixed length of an adhesive tape from a supply roll and severing it, said device being adapted to receive and rotatably support a roll of adhesive tape, said device comprising a cutter blade, a freely rotatable roller positioned substantially midway between the tape roll position and the cutter blade and adapted to have the tape run over it, a lever pivoted on said device having said roller mounted on a free end thereof and movable through a fixed angle when a pulling force is exerted on the tape, lever stop means engaged by the lever for limiting the angular movement of said lever to a fixed amount between a first and a second position, a pawl operatively associated with said roller and projecting therefrom, pawl stop means engageable by said pawl when said lever is in said second position to stop the rotation of said roller, a further rotatable means mounted between the cutter blade and said lever and engageable by the end of the tape remaining when the drawn off length is severed and spring means coupled to said lever urging said lever toward said first position so that said pawl can disengage from said pawl stop means when the tension on the tape is released, the said further roller rotating backward to allow movement of said roller and said lever under the action of said spring.

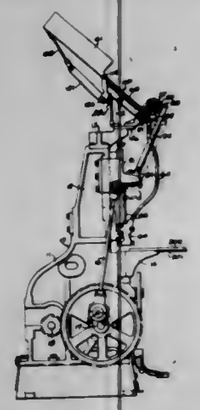
3,273,773
DISPENSER FOR ROLL PAPER
Harold R. Eder, 1234 Seminole St., Clearwater, Fla.
Filed May 26, 1965, Ser. No. 458,863
9 Claims. (Cl. 225—17)



1. A dispenser for a roll of paper comprising
frame means for attachment to a wall providing an upper edge and a lower edge;
a rectangularly shaped casing having an upper wall, a forward wall, a bottom wall, and two lateral walls, carrying means for rotatably mounting a roll of paper within said casing, said bottom wall of said casing being formed with a transverse slot;
means pivotally mounting said bottom wall of said casing on said lower edge of said frame means;
means releasably connecting said upper wall of said casing and said upper edge of said frame means;
grasping and severing means secured on said bottom wall comprising
plate means mounted on and underlying said bottom wall,
means biasing said plate means downwardly,
rigid frame means positioned adjacent and underlying said plate means and cooperating with said plate means for providing an area of discharge for said paper,
actuator means movably mounted on said bottom wall adjacent said area of discharge above said plate means for engaging said plate means for selectively precluding upward movement of said plate means.

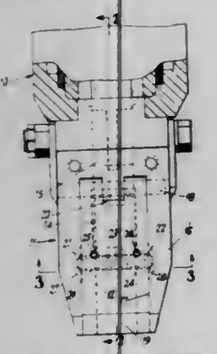
3,273,774
ELECTROSTATIC WEB FEEDING APPARATUS
Richard C. Hansen, Collingswood, N.J., and Martin L. Levene, Elkins Park, Pa., assignors to Radio Corporation of America, a corporation of Delaware
Filed Sept. 27, 1962, Ser. No. 226,554
16 Claims. (Cl. 226—50)

1. Apparatus for feeding a tape along a path comprising at least one pair of drive units having surfaces extending longitudinally along said path and having a heel and a toe at opposite ends thereof, said pair of drive units being spaced from each other along said path with said heel and toe ends of different ones of said pair of units disposed successively along said path, said heel end of each of said pair of units being closer to said path than said toe end thereof, and means for electrically energizing said pair of drive units for alternately attracting said tape thereto.



3,273,775
APPARATUS FOR FEEDING THIN FILM TO CUTTING KNIVES
Larry D. Cook, Dallas, Tex., assignor to Hercules Incorporated, a corporation of Delaware
Filed Dec. 2, 1964, Ser. No. 415,311
1 Claim. (Cl. 226—97)

Apparatus for feeding a film through a set of cutting knives which comprises an upper perforated air pipe having a deflector plate associated therewith, a lower perforated air pipe having a deflector plate associated therewith, said upper and lower deflector plate being mounted



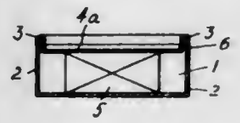
at an angle relative to each other, with a small gap therebetween and said perforated air pipes being mounted with perforations positioned to project air onto the deflector plates, whereby a venturi effect is created between the plates, means for supplying air to said perforated pipes, and means for interrupting the flow of air from the perforated pipes at predetermined intervals.

3,273,776
NAILING MACHINE
Boyd Bryson, Wayne, N.J., assignor to William S. Doig, Inc., Haverstraw, N.Y.
Filed Mar. 31, 1965, Ser. No. 444,291
2 Claims. (Cl. 227—109)

1. In a nailing machine, the combination comprising, feed mechanism having means for controlling the feed of nails, a plurality of selectively adjustable feed governing means capable of cyclically performing successive governing operations differing from each other in accordance with the selective adjustment of each, means for selectively rendering one of said governing means operative with relation to said controlling means by its attachment to said machine in substitution for another of said governing means, and means for actuating the selected feed governing means, said nail feed controlling means comprising a hopper, means for agitating said hopper, a plurality of nail guide tracks extending between said hopper and said feed governing means, said guide tracks each defining a slot for the passage of nails or the like fasteners, said guide tracks comprising two groups of a plurality of guide tracks each, and means for separately adjusting the width of the slots of each of said groups to simultaneously accommodate nails of two different sizes.

3,273,777
EASY CLEAR GUIDE BODY
Albert G. Juilfs, George C. Juilfs, and Carl T. Becht, all of Cincinnati, Ohio, assignors to Senco Products, Inc., Cincinnati, Ohio, a corporation of Ohio
Filed Mar. 11, 1964, Ser. No. 351,027
6 Claims. (Cl. 227—123)

1. In a fastening device including a drive track, a driver, means for reciprocating said driver in said drive track, and means for successively feeding a plurality of fasteners into position to be driven by said driver; an improved guide body comprising:

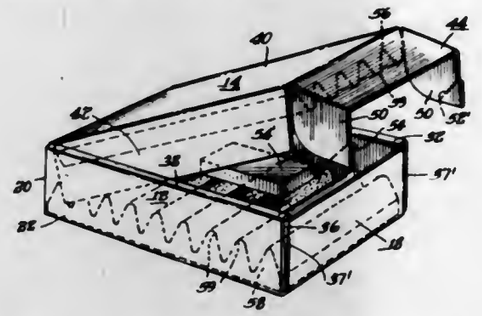


(a) A body portion defining at least one wall of said drive track;

(b) Fastener feed stop means in fixed association with said body portion, said fastener feed stop means comprising a depending abutment centrally located with respect to said drive track;

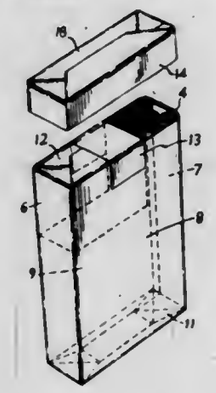
(c) A nose piece hingedly secured to the fastening device and movable from a closed position defining at least a portion of another wall of said drive track to an open position permitting expulsion of a partially driven fastener through said wall of said drive track; and

(d) Means releaseably holding said nose piece in said closed position.



3,273,778
PACKING CARTON
Lauritz Moritz, 18 Chrysanderstrasse, Hamburg-Bergedorf, Germany
Filed Dec. 14, 1964, Ser. No. 418,146
Claims priority, application Germany, Dec. 17, 1963, M 46,872
3 Claims. (Cl. 229—5.5)

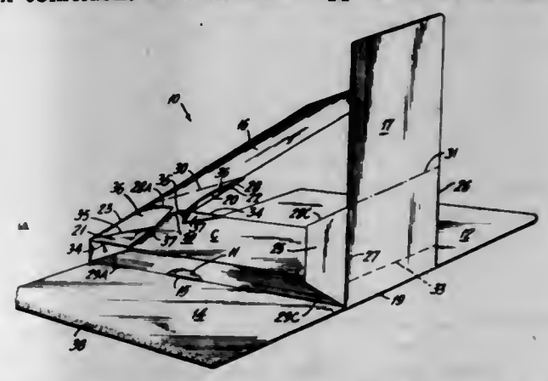
1. A container for packaging articles having a bottom wall, side walls, end walls and an open top, said open top having a removable cover to close said open top, each said side wall having a permanently formed crimp constructed from said side wall as an extension thereof at the open end of said container, each said crimp being formed at the time said container is constructed and before the container is filled, each said crimp rising in a first direction upwardly with the side wall, each said crimp then turning in a second direction inwardly of the container, substantially normal to the first direction, each said crimp then turning downwardly in a third direction, substantially normal to said second direction and opposite to said first direction, said removable cover lying in a substantially single plane beneath the bottom edge of the crimp and above the packaged article, said removable cover having at least one upwardly extending flanged portion and at least one downwardly extending bent-off portion separate from said flanged portion, said bent-off portions and said flanged portions interspersed about the periphery of the cover so as to wedge said removable cover above a packaged article, and between said crimps, of said container.



3,273,779
FOLDED BOX
Laurie G. Mykleby, Chicago, Ill., assignor to Republic Packaging Corporation, Chicago, Ill., a corporation of Delaware
Filed Feb. 12, 1965, Ser. No. 432,218
2 Claims. (Cl. 229—14)

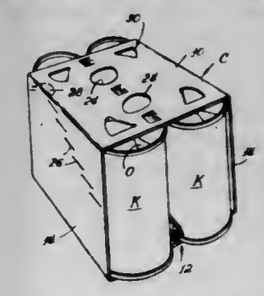
1. In a folded box having two separable box sections, means for locking said box sections together comprising: closely spaced walls on one of said sections defining at least one tab-receiving space therebetween, said one section having an opening on the outside of the box section communicating and in alignment with said tab-receiving space, one of said walls having a flap-receiving recess opening on said tab-receiving space, said other box section having a tab-forming extension extendable into said tab-receiving space, said tab-forming extension having a fold line along which a part of the tab-forming extension can be folded back on either side thereof to form a folded back flap, said flap when folded on either side of the tab-forming extension being opposite said flap-receiving recess when the tab-forming extension is substantially fully inserted into said tab-receiving space, said folded flap when

folded back on one side of said tab-forming extension springing away from the plane of the tab-forming extension into said flap-receiving recess permanently to hold the tab-forming extension in said tab-receiving space, and said flap when folded on the other side of the tab-forming extension being releasably frictionally engageable with the other of said walls.



3,273,780
PACKINGS
John Walker Chalmers, Deptford, London, England, assignor to The Molins Organisation Limited, London, England, a British company
Filed Mar. 30, 1964, Ser. No. 355,780
Claims priority, application Great Britain, Apr. 26, 1963, 16,542/63
3 Claims. (Cl. 229—37)

1. A container formed from a strip of sheet material and a rectangle of sheet material, said strip being caused to adhere along one edge of said rectangle with the length of said strip less than the length of said edge, comprising a tubelike body formed from the combined strip and rectangle and having a seam transverse to said edge, a sealed bottom opposite said edge formed by folding the end of the tube and an incomplete top formed by folding said strip.



3,273,781
MAILING WRAPPER
James C. Mills, Miami Shores, Fla. (2451 Brickell Ave., Miami, Fla. 33129)
Filed Feb. 25, 1964, Ser. No. 347,230
1 Claim. (Cl. 229—40)

A wrapper for a flat bulk item of rectangular shape and of a given length and width but of varying thickness, said wrapper comprising a flat blank sheet including a rectangular body panel of a length and width substantially equal to that of said bulk item and adapted to receive said bulk item thereon, foldable top, bottom and end panels extending from the respective edges of said body panel, each of said end panels having a pair of oppositely disposed foldable tabs extending from the top and bottom edges thereof respectively, each of said tabs comprising inclined, outwardly convergent end edges, said end panels being adapted to be folded against the ends of said bulk item with the outer end portions thereof folded about transverse fold lines coincident with the top end edges of said bulk item toward each other in overlying relation and over the top surface of said bulk item while said tabs are foldable about reentrant fold lines converging to an apex coincident with the outer opposite ends of the said

transverse fold lines of the end panels to provide a double thickness of said folded tab portions between an overlying portion of said end panels and a top corner surface portion of said bulk item and a single thickness of said folded tab portions adjacent side surface portions of said bulk item, and said top and bottom panels being adapted to be folded to bring the lower portions thereof into contact with the sides of said bulk item and the opposite ends thereof into contact with said folded tabs and to bring the upper portions thereof into overlapping relation over the overlying end portions of said end panels, and means for securing said overlapping top and bottom panels together.

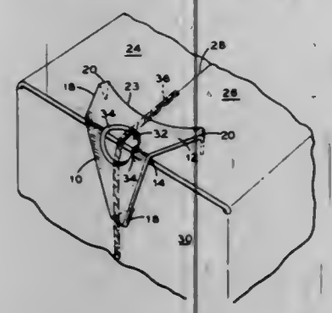
3,273,782
CAN CARRIER
Francis A. Chidsey, Jr., Devon, Pa., assignor to Container Corporation of America, Chicago, Ill., a corporation of Delaware
Filed June 10, 1965, Ser. No. 462,944
5 Claims. (Cl. 229—40)

1. In a sleeve-type, wraparound, carrier carton for enclosing a plurality of cylindrical articles having chimed, recessed ends, the combination comprising:

(a) opposed pairs of top and bottom end walls and side walls hingedly attached to form a tubular structure open at the ends;

(b) a plurality of can retaining tabs cut from at least one of said end walls and folded inwardly therefrom into approximately parallel relation with said one end wall for engagement with the recessed ends of adjacent articles to prevent movement of the articles out of the open ends of the tubular structure;

(c) each of said tabs having a periphery defined by a single, first hinge line and a continuous cut line

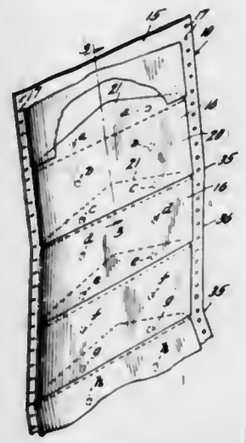


extending from one end of the hinge line around the free edge of the tab to the opposite end of the hinge line;

(d) each of said tabs being connected to said one end wall by a generally triangular connecting panel hinged on one side edge to said tab along the entire length of said first hinge line and hinged on its opposite side edge to said one end wall along a second hinge line diverging from and having a length approximately equal to said first hinge line;

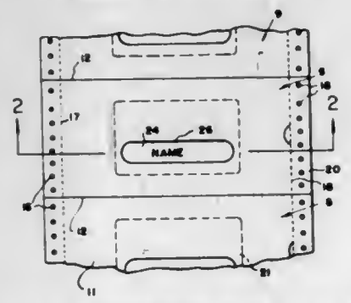
(e) said connecting panel being disposed to extend substantially normal to and between said one wall and said tab to space the latter inwardly from the former and thereby urge the latter into firm engagement with the recessed end of an adjacent cylindrical article;

(f) said connecting panel presenting a free end edge extending vertically between the hinge lines of said connecting panel which free end edge is disposed for engagement with the inside surface of the chime of said article.



3,273,783
CARTON SEAL
Edgar Boone, 15 Walt Whitman Road, Huntington Station, Long Island, N.Y.
Filed June 11, 1964, Ser. No. 374,435
2 Claims. (Cl. 229—47)

1. A seal for closing a carton having a bisected freed top side, said seal comprising two wings integrally attached at an approximate right angle juncture, the first of said wings terminating in a tip which is bent inwardly with respect to the angle to form a prong, the second of said wings having opposed angularly related ends each of which terminates in a tip which is bent inwardly with respect to the angle to form a prong whereby a carton may be releasably sealed by application of the seal over an edge with a tip of the second wing secured to each half of the freed top side and the first wing secured to a second side of the carton at right angles to the freed side by puncturing said sides with the prongs of the seal, said seal having an aperture at the right angle juncture of said wings the material of said seal being thick enough for the aperture to create vertical shoulders at each side of said aperture thereby to form a channel over which a cord may extend without danger of lateral displacement.



3,273,784
ENVELOPE ASSEMBLIES
Virgil V. Porter, Richmond, Calif., assignor to Moore Business Forms, Inc., Niagara Falls, N.Y., a corporation of Delaware
Filed May 8, 1963, Ser. No. 278,834
1 Claim. (Cl. 229—69)

A continuous train of envelopes for passage through a business machine for imprinting prior to sealing the envelopes, each envelope unit comprising solely a completed envelope having front and back panels connected along three adjoining side edges, and a sealing flap hingedly connected along the fourth edge of said front panel and adapted to lie during travel of the web substantially in the plane of said front panel, but in use to be folded along the hinge line to overlap an upper portion of the back panel to be secured thereto; a flexible carrier web to which successive envelope units are temporarily secured, and means for securing each envelope unit to said web with a portion of the back panel and the inward side of the flap alongside and in contact with a face of said web and the remainder of the back panel overlying the flap of the succeeding envelope; said securing means com-

prising a series of dots of adhesive occurring at intervals along said face of the web and alternately uniting points on the said inward side of the flaps of the envelope and points on the back panel wherein the dots on the flaps are near the hinge and the back panel extends toward and substantially adjacent to the hinge lines sufficiently to underlie the points of impingement of the dots of adhesive on the inner face of the flaps to prevent contact of these dots with the contents of the envelope.

3,273,785
SELF-MAILER
Irving C. Beckman and Alex Morrell Beerbohm, Huntington Woods, Mich. (Both of 30105 Stephenson Highway, Madison Heights, Mich.)
Filed Mar. 25, 1965, Ser. No. 442,663
2 Claims. (Cl. 229—69)

1. A continuous burstable printing form for permitting high speed computerized printing of small or wallet size stiff plastic card components thereof, such as are conventionally used as identification and credit cards; with the form being burstable into individual card containing self mailers;

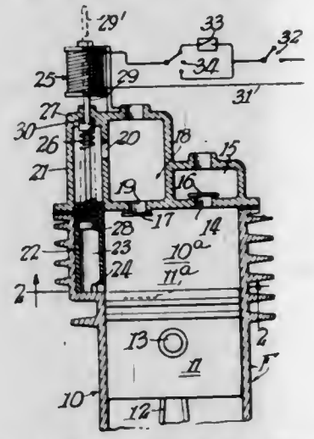
said form comprising long continuous registered upper and lower webs of paper or light card stock;

the webs having horizontal tear lines uniformly spaced along the form and extending from one vertical continuous edge to the other to enable the form to be burst on such tear lines into rectangular individual two ply card mailers;

there being horizontally arranged adhesive spots in each individual mailer between but also adjacent the horizontal tear lines and spaced inwardly from the horizontal edges of said mailer for removably sealing together the plies thereof adjacent the tear lines;

the remaining or vertical edges of the mailer, transverse to the tear lines, also being sealed, whereby the mailer is sealed completely on all its edges while still part of the form;

each mailer, while still a part of the form, containing as a component, between its sealed together plies and adhesively but removably secured therein, one small or wallet size stiff heavy stock rectangular printable plastic card such as is conventionally used as an identification or credit card; the length and width of each mailer being considerably greater than the length and width of the card thereof, with the card being so positioned that all four edges of the card are well spaced from all four edges of the mailer;



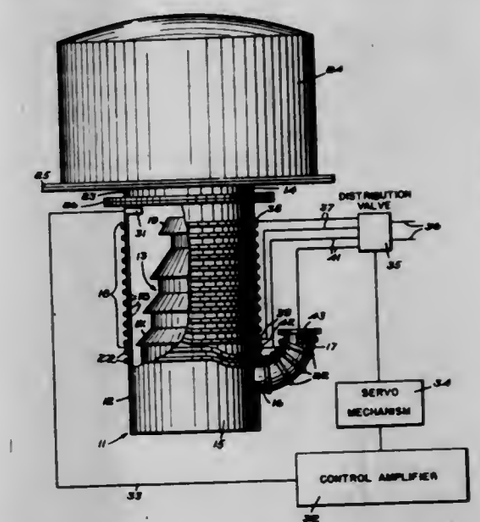
and with all cards being uniformly spaced and in alinement in the form for printing continuously;

the upper web having uniformly spaced alined window openings, one at each card to enable the exposed parts of the cards to be printed through the openings;

with each opening being smaller than the card beneath it so that edges of the card are covered and protected by the upper web;

the adhesive spots being between the horizontal edges of the card and the horizontal edges of the mailer; the mailer also having at each vertical edge a vertical line of uniformly and closely spaced holes.

3,273,786
FLOW REGULATOR FOR PISTON-EQUIPPED CYLINDER
Alwin B. Newton, 136 Shelbourne Drive, York, Pa.
Filed Feb. 1, 1963, Ser. No. 255,491
4 Claims. (Cl. 230—23)

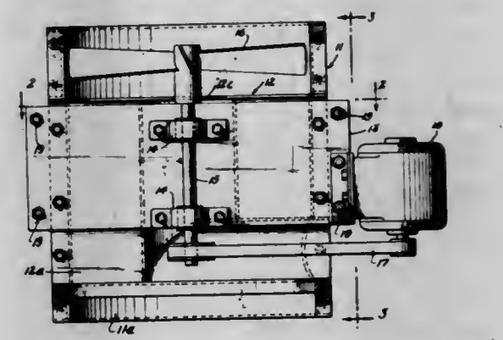


2. In a device of the character described, a pair of adjacent cylinders each containing a piston for reciprocation therein, a crankshaft for driving said pistons in out-of-phase relationship, an opening in the common wall between said pair of cylinders, a movable element mounted within said opening and having its opposite sides shaped to fit closely to said pistons when adjacent thereto, means for positioning said element within said opening to vary the effective size of said opening, and means in said element for flowing fluid therethrough into said cylinders.

3,273,787
HIGH VACUUM SYSTEM METHOD AND APPARATUS
Hans Georg Nöller, Walberberg, and Werner G. Bächler, Cologne, Germany, assignors to Leybold Holding Aktiengesellschaft
Filed May 7, 1964, Ser. No. 365,752
Claims priority, application Germany, May 31, 1963, L 45,001
16 Claims. (Cl. 230—101)

1. A high vacuum apparatus comprising in combination:

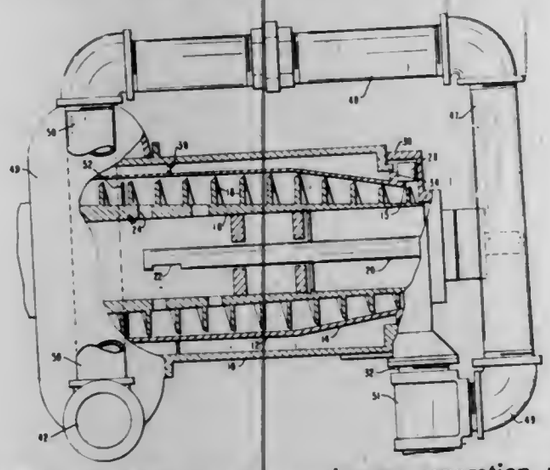
(a) a diffusion vacuum pump comprising a pump housing, a boiler section in said pump housing and adapted to heat a pumping fluid, an inlet and an exhaust port in said pump housing, a plurality of vertically stacked pumping jet assemblies positioned in said pump housing above said boiler section, said jet assemblies adapted to accept a vapor stream evaporating from said boiler section and to direct it in a downward direction, an inner wall in said pump housing adapted to intercept the directed vapor stream from said jet assemblies, an auxiliary cooling means in heat exchanging relationship with said pump housing and adapted to cool that portion of said inner wall which intercepts the vapor stream directed from the lowest one of said jet assemblies,



a primary cooling means in heat exchanging relationship with said pump housing and adapted to cool that portion of said inner wall which intercepts the vapor stream directed by at least one upper one of said jet assemblies, and means for independently controlling said primary and auxiliary cooling means;

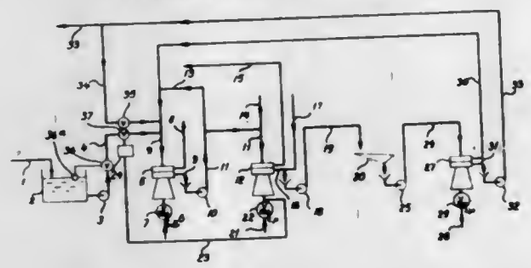
(b) a vacuum chamber having a volume whose magnitude is at least eight times the magnitude of the cross sectional area of said inlet port of said pump housing where the cubic units of the vacuum chamber volume are the same as the square units of the inlet port cross sectional area; and

(c) connection means connecting said inlet port of said pump housing with said vacuum chamber so as to provide for gas communication therebetween.



3,273,788
FAN ASSEMBLIES
Charles Waddell Coward, Jr., Mount Laurel Township, N.J. (R.D. 1, Box 64, Moorestown, N.J.)
Filed Jan. 11, 1965, Ser. No. 424,484
25 Claims. (Cl. 230—117)

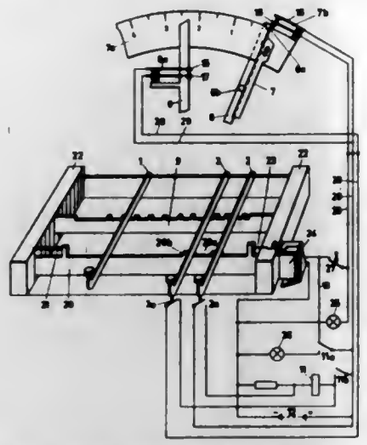
1. In a fan assembly consisting of a cylindrical housing to confine and direct the air and having installed within said cylindrical housing a fan wheel attached to a shaft



and said shaft being attached to a drive system, said fan wheel, shaft and drive system combination being supported by a plate extending from within said cylindrical housing to the exterior wall of said housing, said cylindrical housing being removably attached to said support plate at the point where said cylindrical housing and said support plate intersect and said support plate extending beyond said exterior wall of said cylindrical housing for a finite distance, said support plate thereby supporting the combination of the fan wheel, shaft, and drive system, independently of the support of the cylindrical housing, said support plate also maintaining a fixed relationship between the combination of fan parts.

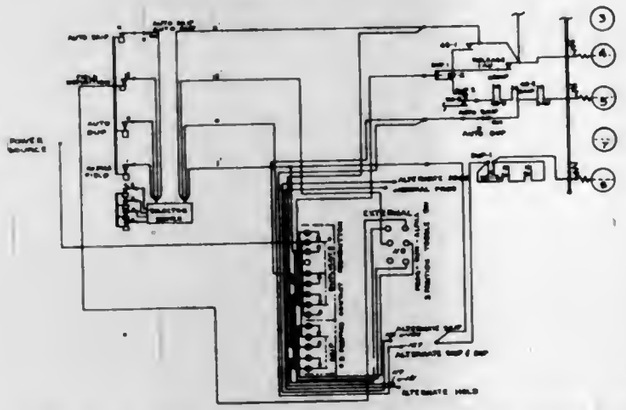
3,273,789
SOLID BOWL CENTRIFUGE WITH AIR CIRCULATION CONTROL
Richard A. Koffinke, Walpole, Mass., assignor to Bird Machine Company, South Walpole, Mass., a corporation of Massachusetts
Filed May 22, 1963, Ser. No. 282,354
11 Claims. (Cl. 233—7)

1. In a centrifuge for the continuous separation of solids and liquids from slurry, comprising
an outer housing including a central casing portion, a solids collection chamber and solids discharge outlet portion at one end of the casing, and a liquid collection chamber and liquid discharge outlet portion at the other end of the casing,
a solid-walled bowl mounted for rotation about a central axis in said housing and adapted continuously to receive slurry to be separated, the slurry upon rotation of said bowl forming an annular pool therein,
a conveyor member mounted within said bowl for concentric rotation therewith at a speed different from the bowl to work solids from the pool of slurry toward a first end of the bowl for discharge therefrom into said solids collection chamber of said housing,
solids discharge means at that end of the bowl over which solids are conveyed from said bowl to said solids collection chamber and outlet, and
liquid outlet means at the other end of the bowl, located within the liquid collection chamber of said housing and over which liquid flows from the annular pool in said bowl to said liquid collection chamber and outlet,
said liquid outlet means being disposed at a larger radius of said bowl than said solids discharge means;
that improvement comprising
a gas recirculation pipe,
said pipe being connected at one end and opening into said liquid outlet outside of the confines of said bowl and near said liquid collection chamber in an area of said outlet substantially liquid-free and open to the pressure of gas in said liquid collection chamber,
said pipe being connected at its other end and opening into a portion of said housing remote from said liquid collection chamber and outside of the confines of said bowl in an area open to gas pressure in said housing relatively lower than the gas pressure in said liquid collection chamber,
whereby gas flow in the direction from said liquid collection chamber toward the area of relatively lower pressure in said housing occurs substantially wholly in said recirculation pipe.



3,273,790
METHOD AND APPARATUS FOR CENTRIFUGAL SEPARATION OF SUSPENSIONS
Bengt Ingmar Dahlberg, Tullinge, Sweden, assignor to Aktiebolaget Separator, Stockholm, Sweden, a corporation of Sweden
Filed June 4, 1964, Ser. No. 372,519
Claims priority, application Sweden, June 12, 1963, 6,456/63
4 Claims. (Cl. 233—18)

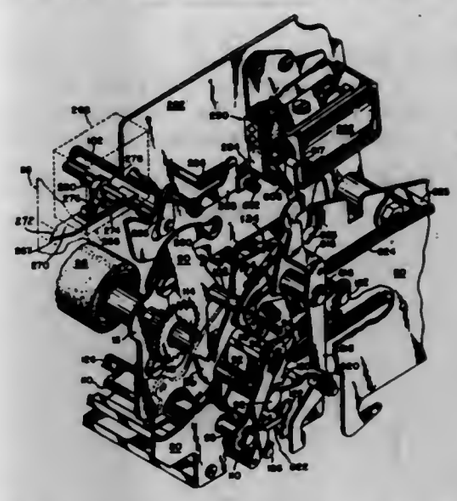
1. In the centrifugal separation of a suspension of solids in a liquid, the method comprising the steps of feeding the suspension to a separating zone of a first locus of centrifugal force and there separating the suspension into liquid and sludge, discharging the separated liquid from said locus while separately discharging a relatively low concentration of said sludge through nozzles from a sludge chamber of the locus surrounding said zone, feeding discharged sludge from said first locus to a separating zone of a second locus of centrifugal force and there separating it into liquid and sludge, discharging said second-separated liquid from the second locus while separately discharging a relatively high concentration of said second-separated sludge through nozzles from a sludge chamber of the second locus surrounding said zone thereof, supplying a measuring liquid separately and at a constant rate under pressure to said sludge chamber of the second locus by way of a closed path, whereby the pressure in said path increases with increased concentration of the sludge in said sludge chamber of the second locus, and varying the proportion of solids in said suspension fed to the first locus in response to changes in the pressure in said path to counteract variations in the concentration of said sludge discharged from the second locus.



3,273,791
CONTROL APPARATUS FOR TYPE SETTING MACHINES
Leon Starck, Frankfurt am Main, Germany, assignor to Linotype G.m.b.H., Frankfurt am Main, Germany
Filed Oct. 28, 1963, Ser. No. 319,933
Claims priority, application Germany, Oct. 26, 1962, L 43,294
24 Claims. (Cl. 234—7)

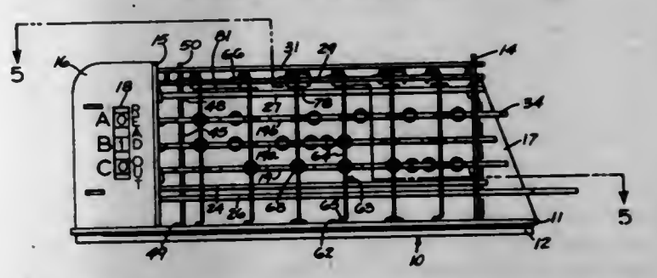
14. Composing apparatus comprising, in combination, selector means for composing a line of matrices and space bands; operating means for causing an operation permissible only with a justifiable line of matrices and space bands; operating means for causing an operation perfor registering the total of the widths of all selected matrices and space bands; and control means automatically actuated by said registering means to render said

operating means inoperative when said registering means register a total of matrix widths and space band widths corresponding to a non-justifiable line whereby an undesired operation with said non-justifiable line is prevented.



3,273,792
MULTI-SELECTOR UNIT FOR AN IBM KEY PUNCH MACHINE
Ralph E. Smith, Park Ridge, Ill., assignor to Cam Corporation, Greensboro, N.C., a corporation of North Carolina
Filed July 31, 1964, Ser. No. 386,611
15 Claims. (Cl. 234—18)

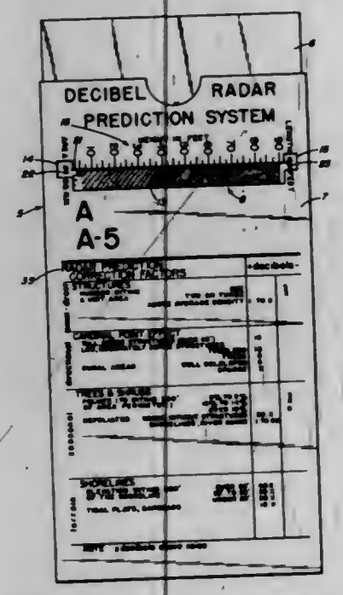
12. In a card punching machine having means for shifting between numeric and alphabetic coding, and selection means for either combined skipping and duplicating or column by column positioning, the combination with said machine of an attachment having means interposed in said selection means for either skipping and duplicating, operation or skipping operation, means for selectively locking in the numeric or alphabetic coding position, and means for successive repetition of a selected alternate program position out of a plurality of programming positions.



3,273,793
ACCOUNTING MACHINE PERFORATOR CONTROL SYSTEM
Neal Hepuer, Birmingham, Mich., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Apr. 7, 1965, Ser. No. 446,280
10 Claims. (Cl. 235—60.51)

1. In a cyclically operable accounting machine, supporting means, a platen mounted on said supporting means for movement between a retracted record sheet receiving position and a printing position, means operable to move said platen between said positions, a sheet marker operable to mark a sheet to designate a line of printing thereon, and a control member operatively connected to said marker to control actuation thereof

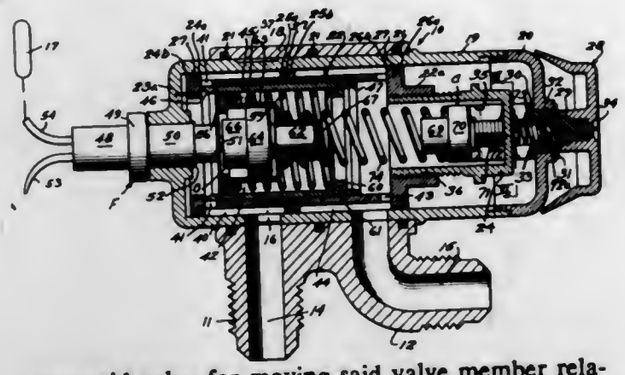
and to said operable means for actuation by the latter, said control member movable by said operable means to an effective position on movement of said platen to said sheet receiving position and movable by said marker to an ineffective position on movement of the platen to printing position.



3,273,794
MECHANICAL BINARY DIGITAL COMPUTER
Irving J. Lieberman, West Orange, and William H. Duerig and Charles D. Hogan, Montclair, N.J., assignors to E. S. R., Inc., Orange, N.J., a corporation of New Jersey
Filed Oct. 21, 1963, Ser. No. 317,503
6 Claims. (Cl. 235—61)

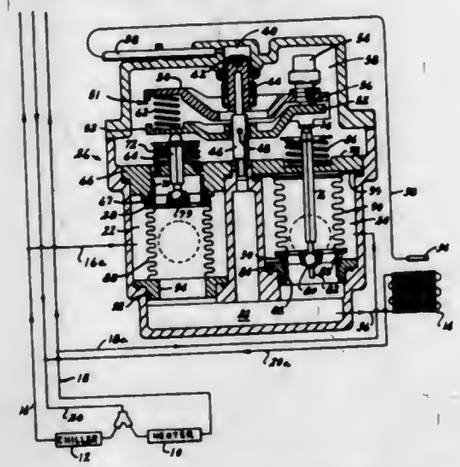
1. A mechanical binary digital computer comprising at least one flat generally rectangular plate having a first stable position and a second stable position; set means, having a first set position and a second set position; reset means, having a first reset position and a second reset position; two pairs of logic tabs extending from a lateral edge of said plate; at least two rotatably mounted rods, each said rod disposed in cooperative relationship with one of said two pairs of logic tabs, so as to be opposite the first logic tab of its respective said pair of logic tabs when said plate is in said first stable position and opposite the second logic tab of said respective pair of logic tabs when said plate is in said second stable position; spring means, continually urging said rods toward said respective logic tab opposite each said rod; hollow tubes, mounted on one logic tab of each said pair of logic tabs, extending from said plate beyond said logic tab; clocking means, adapted to rotate said rods away from said plate beyond said hollow tubes when said plate is being driven from said first stable position to said second stable position and from said second stable position to said first stable position and allowing said rods to rotate toward said respective logic tabs opposite each said rod when said plate is not being driven; and driving means, adapted to drive said plate from said first stable position to said

second stable position when said set means is in said first set position and to drive said plate from said second stable position to said first stable position when said reset means is in said first reset position.



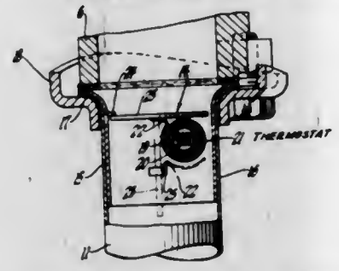
3,273,795
CALCULATOR FOR THE DECIBEL RADAR PREDICTION SYSTEM
John J. Evans, Riverdale, Md., assignor to the United States of America as represented by the Secretary of the Navy
Filed Jan. 27, 1959, Ser. No. 789,458
4 Claims. (Cl. 235—89)

1. A calculator for the Decibel Radar Prediction System comprising an elongated, open-ended envelope, at least one window in said envelope representing a surface material composition category, an offset aperture at each end of said window and communicating therewith, height indicia inscribed along the top edge of the window, a slide slidably disposed in said envelope, a graph inscribed on said slide so as to be visible through said window, said graph being comprised of a series of curved lines representing the radar return value in decibels, decibel indicia arranged around said graph so as to be visible through said window and area indicia inscribed along one side of said graph so as to be visible through one of said apertures whereby a predicted omni-directional decibel return for a selected structure will appear opposite the height marking representing the height of the structure when the area indicia representing the area of the structure is aligned with the top edge of said window.



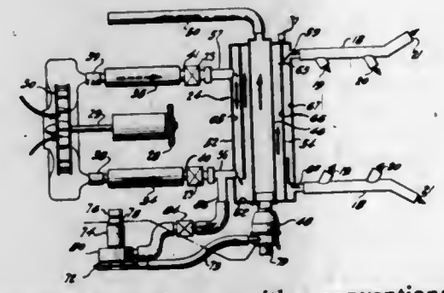
3,273,796
HEATING AND COOLING ZONE VALVE BY-PASS
Carl C. Bauerlein, Clearwater, Fla., assignor to The Dole Valve Company, Morton Grove, Ill., a corporation of Illinois
Filed Mar. 23, 1964, Ser. No. 353,854
16 Claims. (Cl. 236—1)

1. A fluid control valve comprising:
a valve body having a chamber formed therein defined by an elongated chamber wall having spaced inlet and outlet ports opening through said chamber wall at opposite ends thereof,
a valve member slidable along said chamber wall between said ports and having portions cooperable with each of said ports to control fluid flow therethrough,
temperature responsive actuating means positioned within said chamber and connected to said valve member for shifting said valve member to a flow controlling position adjacent one or the other of said ports as a function of the temperature of fluid at said inlet port,
spring means biasing said valve member in one direction,
means energizable as a function of temperature remote



from said valve for moving said valve member relative to said ports,
whereby said last-named means in conjunction with said spring means will cause said valve member to cover and uncover only that port to which said valve member is adjacent as a function of temperature in a region remote from the valve, and
manual means for moving said valve member and said chamber wall relative to said last-named means.

3,273,797
AIR CONDITIONER VALVE
Darwin R. Grahl, Lincoln Park, Mich., assignor to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Filed Feb. 19, 1965, Ser. No. 433,900
6 Claims. (Cl. 236—1)



1. In combination: a valve body defining a cold fluid inlet chamber, a hot fluid inlet chamber, and outlet chamber means; a first valve seat located between the cold inlet chamber and the outlet chamber means; a second valve seat located between the hot inlet chamber and the outlet chamber means; a first valve element movable toward and away from the first valve seat to control flow therepast; a second valve element movable toward and away from the second valve seat to control flow therepast; means mounting said first valve element comprising a first pressure-balancing bellows having one of its ends sealed to the valve body and having its other end sealed to the valve element; said bellows having its interior surface exposed to one of the cold inlet chamber and outlet chamber means, and its exterior surface exposed to the other of said cold inlet chamber and outlet chamber means; means mounting said second valve element comprising a second pressure-balancing bellows having one of its ends sealed to the valve body and having its other end sealed to the second valve element; said second bellows having its interior surface exposed to one of the hot inlet chamber and outlet chamber means, and its exterior surface exposed to the other of said hot inlet chamber and outlet chamber means; the first bellows having substantially the same effective area as the first valve seat, and the second bellows having substantially the same effective area as the second valve seat.

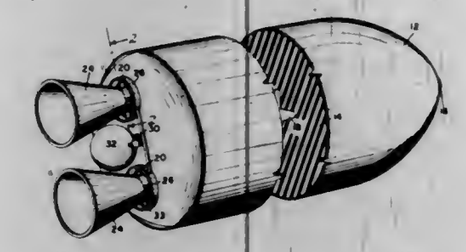
3,273,798
EXHAUST MANIFOLD HEAT VALVE
Dan B. Kuiper, Grand Rapids, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed May 4, 1964, Ser. No. 364,678
1 Claim. (Cl. 236—93)

A valve device adapted to be located in an exhaust passage of an internal combustion engine for controlling the flow of engine exhaust gases through said passage in response to engine operating temperature, said exhaust passage comprising two axially adjacent conduits separably joined in abutting relation, said valve device comprising a casing adapted to be inserted into one of said conduits, said casing having a flange adapted to extend between said conduit ends, a generally plate-shaped valve, a thermostatically responsive spirally wound element, and a post fixed to the inner spiral terminus of said element and at one end to a side of the casing, said valve being fixed to the outer spiral terminus of said element for movement therewith about said inner terminus between first and second positions respectively generally normal to and parallel with the axis of said casing in response to spiral winding and unwinding of said element with change in temperature, said casing having first and second stops formed therein, said first stop preventing movement of said valve beyond said position generally normal to the axis of said casing and said second stop preventing movement of said valve beyond said position generally parallel with the axis of said casing.

3,273,799
AUTOMOTIVE BOOSTER HEATER
Gordon J. Fairbanks and Kurt Staiger, Indianapolis, Ind., assignors to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia
Filed Feb. 10, 1964, Ser. No. 343,606
21 Claims. (Cl. 237—2)

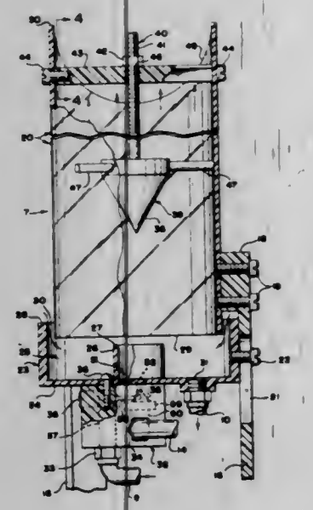
1. A booster heater for use with a conventional vehicle cab heater system having means for heating air including the vehicle engine, means for distributing the heated air to the vehicle cab, and means for forcing the heated air through the heating and distributing means to the vehicle cab; said booster heater comprising a burner; a heat exchanger for the burner having an inlet for connection to said heating means and an outlet for connection to the distributing means of said vehicle; means providing unheated air to said burner heat exchanger; valve means between the unheated air providing means and said burner heat exchanger operable to permit the unheated air to pass to said burner heat exchanger only when the pressure output of the vehicle air forcing means at said valve means is less than the pressure output of said unheated air providing means at said valve means; and temperature responsive means for controlling the operation of said burner to control the temperature of the air passing to the vehicle cab.

3,273,800
REMOTE POWDER FEED FOR FLAME SPRAYING TORCH
Don L. Keys, Huntington, John P. Broderick, Bayside, and Frank G. Lohnes, Glen Cove, N.Y., assignors to Eutectic Welding Alloys Corporation, Flushing, N.Y., a corporation of New York
Filed Oct. 23, 1964, Ser. No. 406,137
17 Claims. (Cl. 239—85)



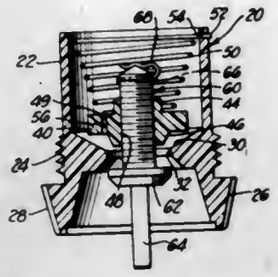
1. A remote powder feed support for suspending a powder container and its feed tube above a flame spraying torch to which said feed tube is connected, said support comprising a holder, the base of said holder having container coupling means for mounting said powder container with its discharge end downwardly disposed, tube attaching means in said base for connection to said feed tube, a passageway in said base connecting said container coupling means to said tube attaching means for permitting powder in said container to flow into said tube, connecting means at the top of said holder for suspending said holder above said torch, said holder being shaped to extend around said container, and one side of said holder being open to permit said container to be directly inserted and removed from said holder whereby the replacement of said container is facilitated.

3,273,801
ROCKET ACCELERATION AND DIRECTION CONTROL BY FLUID INJECTION
Verbon H. B. Wilhite, Brigham City, Utah, assignor to Thiokol Chemical Corporation, Bristol, Pa., a corporation of Delaware
Filed Aug. 30, 1962, Ser. No. 220,378
5 Claims. (Cl. 239—265.23)



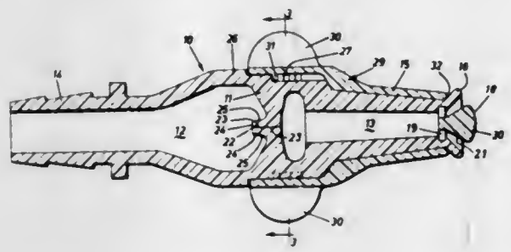
1. A control for a rocket engine having a vessel closed at its forward end and having a plurality of nozzles at its

opposite end located in equally spaced relation to each other around a central axis and at equal distances from the axis, a propellant in said vessel, each of said nozzles having a throat through which the combustion products of said propellant pass, and means for each nozzle for producing a nonstructural throat therein and at different areas of the throat of the nozzle comprising a plurality of spaced ducts leading into said structural throat in a plane located between the smallest diameter of said nozzle throat and a place upstream therefrom, a



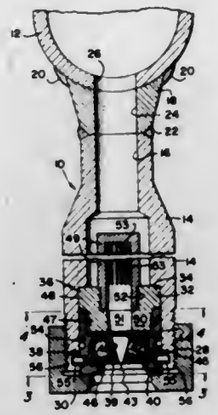
source of noncombustible fluid, means for delivering fluid from said source to the ducts in the throats of said nozzles to impinge the exhaust gases passing therethrough, and an adjustable valve in each of the ducts in each of said nozzles for varying the rate of flow therethrough from zero to maximum rate whereby to produce nonstructural throats eccentric to the structural throats in said plurality of nozzles and produce nonstructural throats concentric with the structural throats in said plurality of nozzles.

3,273,802
APPARATUS FOR CORROSION TESTING
Richard O. Hull, Jr., Bay Village, Ohio, assignor, by mesne assignments, to The G S Equipment Company, Cleveland, Ohio, a corporation of Ohio
Filed May 26, 1964, Ser. No. 370,153
10 Claims. (Cl. 239—338)



10. A mist generating device comprising a vertically elongated tube of corrosion-resistant material, a generally conical deflector mounted in said tube out of contact with the inner walls of the tube, means for supporting said deflector in a series of positions adjusted axially of said tube, an annular liquid trap mounted below said tube and spaced therefrom to define an annular air opening, and a central aspirator nozzle for creating a corrosive mist and directing it upwardly toward said deflector from the central part of said trap.

3,273,803
ADJUSTABLE SPRAY NOZZLE INSERT
Lewis E. Crowley, 1540 N. Hudson St., Los Angeles, Calif.
Filed Oct. 29, 1964, Ser. No. 407,401
5 Claims. (Cl. 239—457)

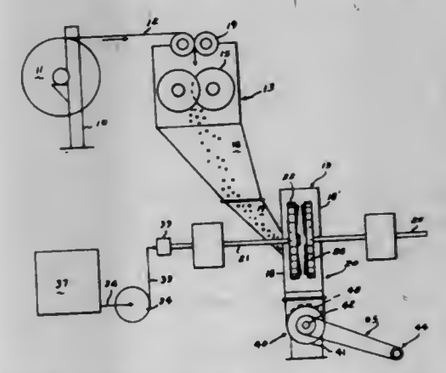


1. An insert for a spray nozzle which comprises: a tubular body member disposed so as to be inserted and secured in a spray nozzle; an annular valve seat internally disposed in the body member intermediate the ends thereof, said valve seat having a centrally disposed opening therethrough; a polygonal wafer valve disposed in the body member so as to be seated on the valve seat and provide a fluid flow passage around the wafer valve and through said opening; a core member adjustably mounted on the wafer valve and extending through said opening; and a collar mounted on the core member and disposed so as to be moveable from a position within said opening to a position externally thereof upon adjustment of the position of the core member relative to the wafer valve.

3,273,804
VALVE
Wilfred W. Wilson, Woodbridge, Ontario, Canada, assignor to The Amara Company Limited, Ontario, Canada
Filed Dec. 9, 1964, Ser. No. 417,008
12 Claims. (Cl. 239—569)

1. A valve comprising a housing, said housing defining a chamber through which a fluid may be passed, a valve member positioned within and extending across said chamber, said valve member being adapted to control the flow of fluid through the chamber defined by said housing and comprising a deformable wall having a slit extending therethrough, the slit in said deformable wall communicating on both sides of said deformable wall with the chamber defined by said housing and itself being defined by facing surfaces, means actuable by the pressure of fluid in the chamber defined by said housing for holding said surfaces together, whereby when said means are under the influence of such fluid pressure the slit in said deformable wall is normally closed; and means for deforming said deformable wall against the influence of such fluid pressure to open the slit in said deformable wall and permit fluid to pass through the slit in said deformable wall.

3,273,805
PRESSURIZED FLUID NOZZLE ASSEMBLY
Thomas E. Hall, Allentown, Pa., assignor, by mesne assignments, to Ingersoll-Rand Company, New York, N.Y., a corporation of New Jersey
Filed Oct. 2, 1964, Ser. No. 401,156
6 Claims. (Cl. 239—590.3)

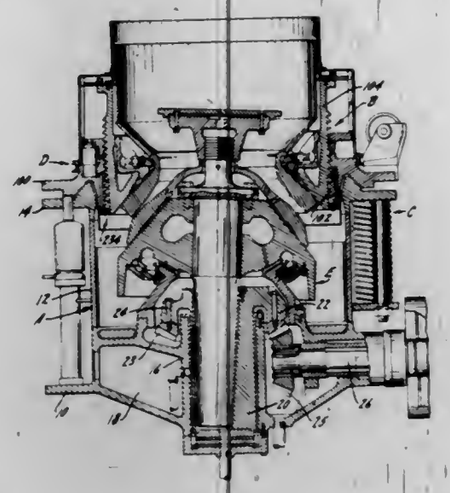


1. A pressurized fluid nozzle assembly comprising:
(a) a conduit means connected to a source of pressurized fluid,
(b) a hollow, opened ended housing connected at one end to said conduit means and communicating with the latter to receive the pressurized fluid, said housing including an outwardly opening socket at its other end,
(c) a cylindrical assembly member inserted within and slidably and removably seated within said socket,
(d) stop means formed in said housing interiorly thereof and contacting said cylindrical assembly means to limit inward movement of said assembly member in said socket,
(e) a nozzle means having a fluid flow path therethrough and including a discharge orifice adapted to discharge a non-circular spray, said element being carried within said cylindrical assembly member so as to receive and conduct the pressurized fluid, as a spray, into the atmosphere
(f) a first hollow positioning means carried by and extending laterally outwardly of said cylindrical assembly member,
(g) a second positioning means formed on the other end portion of said housing and comprised of a lateral recess receiving said first positioning means and coacting therewith to fix the cylindrical assembly member in a predetermined angular position within said housing,
(h) holding means secured to the housing and bearing on said cylindrical assembly member to hold said assembly member and said nozzle in said housing, such that the non-circular spray from said discharge orifice is angularly oriented in relation to the fluid conduit means.

3,273,806
TREATMENT OF PHOSPHORS
Yonesaku Aoki and Masayuki Emoto, Kitatama-gun, Tokyo-to, and Tetsuro Tanaka, Hachioji-shi, Tokyo-to, Japan, assignors to Kabushiki Kaisha Hitachi Seisakusho, Tokyo-to, Japan, a joint-stock company of Japan
Filed Sept. 11, 1962, Ser. No. 222,918
Claims priority, application Japan, Sept. 11, 1961, 36/32,159
9 Claims. (Cl. 241—20)

1. A method of treating phosphor materials, which comprises pulverizing a phosphor material to the ultimate size desired, subsequently subjecting said phosphor material thus pulverized to a dispersion treatment for substantially 30 minutes in a solution containing beside solvent at least one dispersing agent selected from the group consisting of inorganic dispersing agents, anionic and non-ionic surface-active agents, allowing the dispersed phosphor particles to settle for not more than 24 hours, separating and removing fine phosphor particles of a size of 0.5 micron and less, then drying the remaining phosphor.

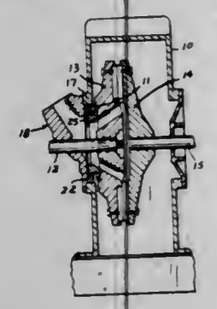
3,273,807
REFINER SYSTEM
James Howard Wright, Springfield, Ohio, assignor to The Bauer Bros. Co., Springfield, Ohio, a corporation of Ohio
Filed Aug. 5, 1963, Ser. No. 300,038
12 Claims. (Cl. 241—42)



1. A refiner system including, means for supporting fibrous material in web form, a shredder and a disc refiner arranged in succession to immediately follow said support means, means for guiding said web material to said shredder for reduction thereby to flake form, means for transmitting the flakes to said disc refiner for fluffing thereby to expose their individual fibers, means in connection with said disc refiner for spraying a fiber conditioning fluid so as to produce an intimate contact thereof with the individual fibers as they are exposed within said disc refiner, and means for conveying the so conditioned fluffed fibers from said disc refiner arranged to compress and produce a soft plug thereof in movement from said disc refiner in a manner to inhibit flow of air to or from said disc refiner.

6. A refiner system including a housing having an inlet for delivery of pulp thereto, opposed relatively revolvable discs in said housing for receiving the pulp and fluffing it therebetween, means in connection with one of said discs for delivering a spray of pulp conditioning fluid in a path generally tangential to the disc operating surfaces to thereby contact and coat individual fibers in the process of their exposure during the fluffing operation and means defining an outlet from said housing for delivery of conditioned fiber solids therefrom exclusive of excess conditioning fluid.

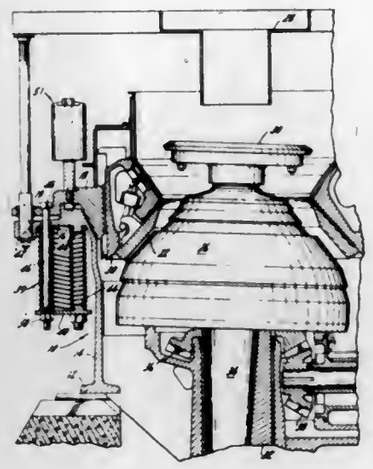
3,273,808
SEAL FOR GYRATORY CRUSHERS
Hansjörg Balmer, Langenthal Bern, Switzerland, and Rudolph J. Gasparac, Milwaukee, Wis., assignors to Nordberg Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Original application Nov. 14, 1961, Ser. No. 152,222, now Patent No. 3,140,839, dated July 14, 1965. Divided and this application Apr. 8, 1964, Ser. No. 358,264
4 Claims. (Cl. 241—215)



1. In a gyratory crusher, a main frame, a gyratory head positioned in the main frame, a bowl mounted in the main frame defining a crushing cavity with the head and constructed to be adjusted vertically to vary the size of the crushing cavity, and a seal between the bowl and main frame including generally concentric cylindrical surfaces

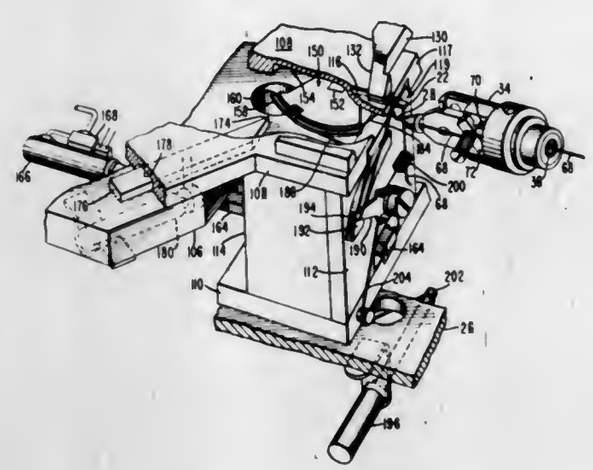
on the bowl and main frame, a seal ring between the surfaces bearing on each and connected to one, means for biasing the seal ring toward one extreme position of move-

ment, and means for engaging the seal after a predetermined amount of adjustment of the bowl to overcome the biasing means so that the seal ring thereafter moves with the bowl.



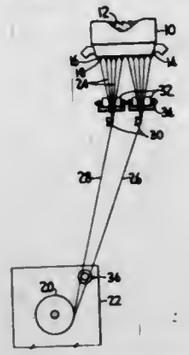
3,273,809
REFINER SEAL
Anton J. Horstman, Houghton, Mich., assignor to Bauer Bros. Co., Springfield, Ohio, a corporation of Ohio
Filed Apr. 22, 1963, Ser. No. 274,516
11 Claims. (Cl. 241—244)

1. A seal device to form a bridge between a fixed and a relatively rotating conduit member including an apertured means for application at the exit from said fixed member, the aperture defining surface portion of which is convergent in the direction of said rotating member, and apertured means fixed to said rotating member, about the entrance thereto, a surface portion of which mates with and positions in adjacent relation to said convergent surface whereby relative rotation of the mating surfaces will produce forces which operate to eject material attempting to flow therebetween in the course of flow through said conduit members.



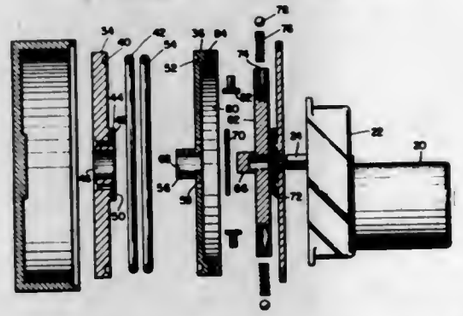
3,273,810
CRUSHER CLEARING SYSTEM
Rudolph J. Gasparac, Milwaukee, Arnold P. Szaj, Hales Corners, and Wolfgang Turnwald, Milwaukee, Wis., assignors to Nordberg Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin
Filed Dec. 26, 1963, Ser. No. 333,429
6 Claims. (Cl. 241—290)

1. In a crusher, a main frame, a bowl releasably mounted on the main frame, springs urging said bowl toward said frame, a portable jacking assembly removably mounted on the bowl, said jacking assembly supported by said bowl, and means in said jacking assembly engaging the main frame so that upon actuation of the assembly, the bowl will be raised relative to the main



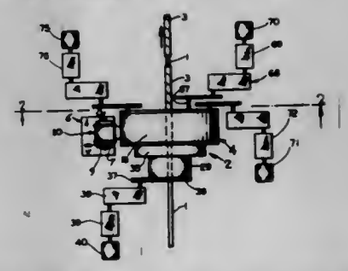
frame and against the urging of said springs so that the crushing cavity may be cleared.

3,273,811
COIL WINDING MACHINE
Lawrence E. Mueller, Livonia, Mich., assignor to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed May 6, 1963, Ser. No. 278,046
7 Claims. (Cl. 242—9)



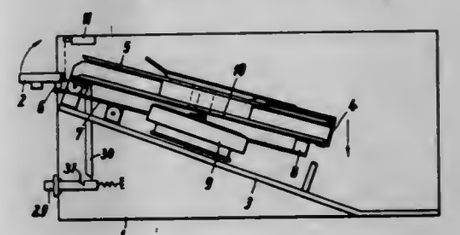
6. In a coil winding machine having a wire threaded needle revolvable through a cycle of operation between start and stop positions to wind a length of wire about a core piece, a wire handling mechanism comprising a hook mounted for movement from a retracted position at one side of the axis of revolution of the needle to a wire severing station on the other side of the axis of revolution of the needle, said hook engaging and pulling a loop of the wire including a coil side leg and a needle side leg to the wire severing station, a cutter at the wire severing station, a releasable clamp member operable following the pulling of the loop by said hook to engage and hold the needle side leg of the loop, and a back-up member movable with said hook to said wire severing position in registry with said cutter.

3,273,812
METHOD FOR FORMING AND WINDING GLASS STRANDS
Adrien R. Lacasse, Shelby, N.C., assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 13, 1962, Ser. No. 237,251
1 Claim. (Cl. 242—42)



A method of forming a plurality of untwisted strands and winding said strands on a single tube so that said strands can be unwound from said tube as separate strands which comprises,
drawing a multiplicity of individual filaments from a molten glass body,
grouping said filaments together to form a pair of spaced strands,
advancing said strands in overlying spaced relation to each other and in converging planes to a traversing station, which planes intersect at a point of take-up on a winding tube,
separately traversing said strands at said traversing station in opposite directions and in parallel planes as said strands are wound on said tube,
said strands being separately traversed at said traversing station so that said strands are deposited on said tube in continuously varying lateral spaced relation to each other with one strand alternately overlapping and crossing over the other of said strands at a substantial angle and alternately being spaced from the other strand,
and maintaining substantially the same tension on both strands as they are wound on said tube.

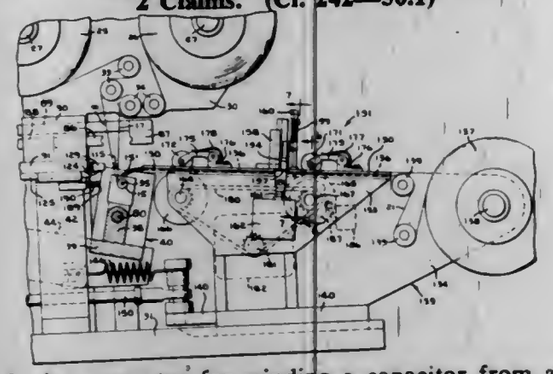
3,273,813
ANTENNA DRIVE MECHANISM
Michael P. George, 161 Concord Ave., Lexington, Mass.
Filed Dec. 22, 1964, Ser. No. 420,397
6 Claims. (Cl. 242—54)



1. A power drive mechanism for a telescopic antenna, comprising
(a) a pulley formed with a peripheral groove,
(b) power means for selectively rotating said pulley in either of two rotary directions,
(c) a pair of resilient annular members mounted to said pulley in registered opposition adjacent the opening of said groove to restrict the size of said opening,
(d) a housing enclosing said pulley and having an opening formed therein generally tangential to said pulley, and
(e) a flexible rod extending through said housing and having one end connected to said antenna and the other end secured to said pulley, said rod having a diameter larger than the restricted groove opening.

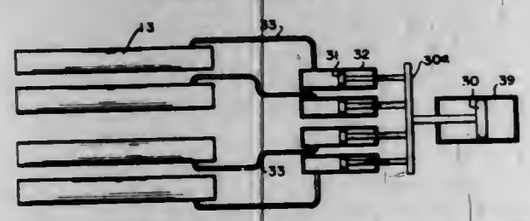
3,273,814
ROTATING DISPENSING APPARATUS
Donald F. Prusak and Theodore E. Crawford, Milwaukee, Wis., assignors to Dowsmith Inc., Milwaukee, Wis., a corporation of Delaware
Filed Apr. 1, 1964, Ser. No. 356,602
6 Claims. (Cl. 242—55)

1. A material dispensing system for continuous supplying a flexible elongated element, comprising
a plurality of concentrically and rotatably mounted reels and adapted to rotate relative each other to wind,
a flexible elongated element on said reels with adjacent reels being conversely wound,
means to unwind the element internally of the innermost reel, and
means to stop rotation of an outermost of said reels while maintaining rotation of the inner of said reels for attaching of an additional length of said element to the outermost end of the element.



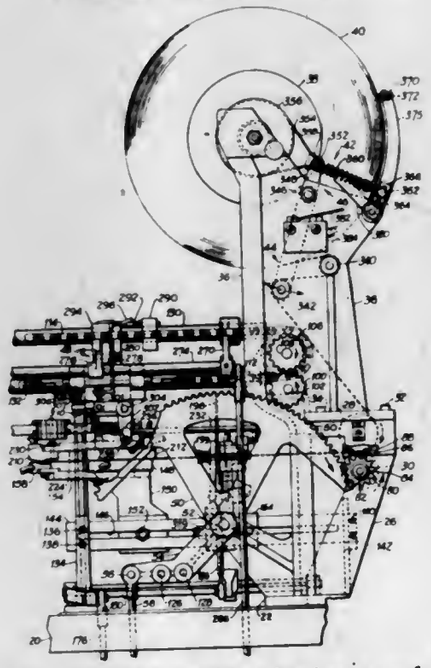
3,273,815
TAPE RECORDER
Eduard Schüller, Wedel, Holstein, Germany, assignor to Telefunken Patentverwertungsgesellschaft m.b.H., Ulm (Danube), Germany
Filed Feb. 20, 1964, Ser. No. 346,338
Claims priority, application Germany, Feb. 20, 1963, T 23,501
17 Claims. (Cl. 242—55.12)

1. In a tape recorder, the combination which comprises:
(a) a housing having an opening at the front through which tape reels can be inserted and removed;
(b) turntable means in said housing;
(c) guide means arranged in said housing and being in alignment with said opening to receive tape reels inserted therethrough;
(d) positioning means associated with said guide means for making the end position of a reel inserted through said opening onto said guide means a position in which such reel is in alignment with said turntable means;
(e) closure means for closing said opening; and



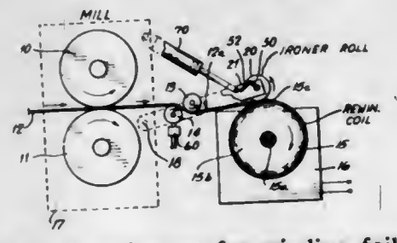
(f) moving means operative by the closing movement of said closure means for bringing a reel held by said guide means in said end position and said turntable means into engagement with each other.

3,273,816
APPARATUS FOR WINDING WEBS AND INSERTING TABS THEREBETWEEN
William J. Fanning, Melrose Park, Ill., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York
Filed May 25, 1964, Ser. No. 369,826
2 Claims. (Cl. 242—56.1)



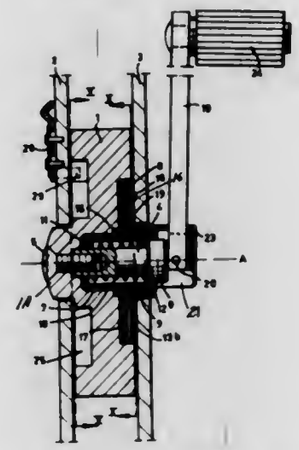
1. An apparatus for winding a capacitor from a pair of metallized webs and for inserting a section of a dielectric tape between the trailing end portions of the metallized webs which comprises:
means including a rotatable arbor for winding a pair of webs into a roll;
a carrier having a guide for supporting a tape for intermittent movement along a predetermined path into engagement with the bite of the roll and one of the webs extending therefrom;
means for moving said carrier from a retracted position to an advanced position with said tape guide adjacent to said arbor and the roll thereon;
a first means on said carrier for advancing the tape a predetermined distance along said guide;
means on said carrier for shearing the tape in said guide to sever a section thereof;
a second means on said carrier for advancing the severed section of tape from said guide into engagement with the bite of the roll and the web;
means for severing the webs adjacent to the said arbor and the roll thereon; and
control means for effecting the operation of said winding means, said web severing means, said tape shearing means, said first and said second tape advancing means, and said carrier moving means in a predetermined timed relation to one another.

3,273,817
COLLAPSIBLE MANDREL
Pierre M. Damiron, Paris, France, assignor to Wean-Damiron S.A., Paris, France
Filed June 22, 1964, Ser. No. 376,873
Claims priority, application France, July 2, 1963, 940,052
7 Claims. (Cl. 242—72)



1. An expandable mandrel comprising an elongated central shaft formed with a plurality of longitudinal recesses radially spaced around the periphery thereof; an elongated member disposed to slide within each of said recesses toward and away from the axis of said shaft; a liquid tight inflatable envelope located in each of said recesses between the bottom of said recess and the member, the volume of said envelopes being equal; an auxiliary hydraulic compressor operatively connected to each of said envelopes to supply pressurized liquid to said envelope for inflation thereof; and an actuating means for simultaneously actuating each of said auxiliary compressors to simultaneously supply fluid to each of said envelopes.

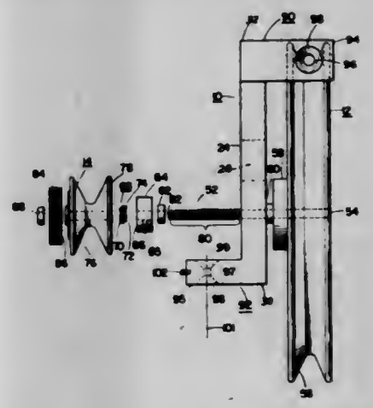
3,273,818
WEB FEED
Bert Harold Wallace, Uniondale, N.Y., assignor to American Machine & Foundry Company, a corporation of New Jersey
Filed Aug. 29, 1963, Ser. No. 305,350
3 Claims. (Cl. 242—75.43)



1. A cigar web feed machine having a reel mounting a web of tobacco material, a lever having a first end, a second end and a pivot intermediate said ends, a roller mounted on said lever near said first end, means for directing said web around a portion of the surface of said roller, a brake band on said reel, said band having an end connected to said second end, means for sensing the diameter of said web of material, and a tension spring having a first end connected to both said second end of said lever and to said end of said band and a second end connected to said sensing means.

3,273,819
FOIL ROLLING APPARATUS
Olivo G. Sivilotti, Kingston, Ontario, Canada, assignor to Aluminium Laboratories Limited, Montreal, Quebec, Canada, a corporation of Canada
Filed Nov. 12, 1964, Ser. No. 410,650
7 Claims. (Cl. 242—78.1)

1. In high speed equipment for winding foil and including rotatable means for accepting wound layers of foil, motive means for rotating said rotatable means so as to wind said foil thereon to constitute a reel of layers, an ironer-roll rotatably adapted to ride against the outermost layer of foil on said reel, and foil winding deceleration means for decelerating said rotatable means and thereby said reel, the improvement comprising means responsive to said foil winding deceleration means for decelerating said ironer-roll.

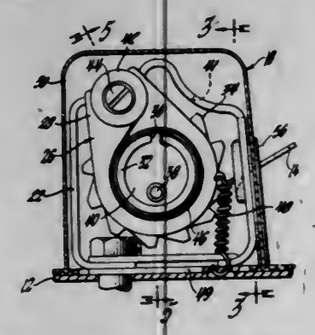


3,273,820
TAPE REEL
André Quenot, Besancon, Doubs, France, assignor to Firm of Etablissements Quenot & Cie, Besancon, France
Filed Oct. 8, 1964, Ser. No. 402,535
Claims priority, application France, May 12, 1964, 974,249
6 Claims. (Cl. 242—84.8)

1. A drum system comprising a rotary tape-carrying drum provided with an axial blind recess opening in one side, two flanges between which the drum is revolvably carried, a sleeve slidingly and revolvably fitted in the recess in the drum and provided with an inturned end, a rod coaxially rigid with the drum extending through the sleeve, a head of a larger diameter rigid with said rod and located inside said sleeve, a spring engaging the transverse surface of said head facing the rod and urging the inturned end of the sleeve against the bottom of the recess, a disc coaxially rigid with the sleeve engaging a transverse surface of the drum and forming a clutch therewith, parallel outer extensions of the sleeve at the end thereof opposed to its inturned end, a pin perpendicular to the axis of the sleeve fitted between said extensions, and a crank including an end fitted eccentrically on said pin and adapted to rock round said pin between a position for which it urges the disc rigid with the sleeve into clutching engagement with the drum to thereby operatively connect the crank with the drum, and a position for which the clutch is disengaged upon outward shifting of the sleeve by the crank end against the action of the spring.

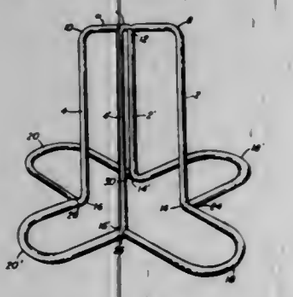
3,273,821
ICE FISHING REEL
William M. Miller, Spencerville, Ind.
Filed Jan. 27, 1964, Ser. No. 340,346
5 Claims. (Cl. 242—106)

5. A fishing reel comprising: a frame; means for mounting said frame on a support; said frame having a tubular bearing therein, said bearing being substantially transverse to said frame; a first pulley having a means for storing fishing line thereon; a shaft having an axis and first and second ends, said first pulley being coaxially secured to said shaft at said first end thereby preventing independent rotation of said first pulley and said shaft, said shaft being rotatably supported in said bearing, said shaft having a threaded shaft portion adjacent said second end extending from said second end toward said frame, said frame spacing apart said first pulley and said shaft portion, said first pulley being rotatable in a first direction to dispense fishing line and in a second direction to store fishing line, a ring having at least one end surface, said ring being coaxially secured to said shaft thereby preventing independent rotation of said shaft and said ring, said ring being spaced from said first pulley by said frame, said end surface facing away from said frame; a second pulley having means for storing cord and at least one pulley end surface, said pulley being coaxially supported on said shaft adjacent said ring, said ring and pulley end surfaces facing each other, said second pulley being rotatable in said second direction to dispense cord and in said first direction to store cord, said second direction being opposite said first direction, said second pulley having a diameter substantially smaller than said first pulley whereby withdrawal of a predetermined length of said actuating cord from said second



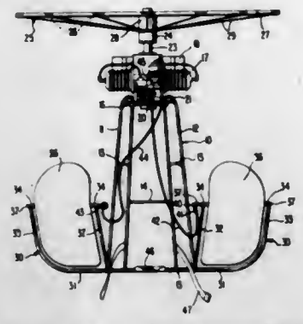
pulley winds a substantially greater length of said fishing line upon said first pulley; a thumb screw threadedly mounted on said shaft portion adjacent said second pulley, said thumb screw being rotatable into a first position securing said second pulley to said ring by means of frictional forces between said thumb screw and said second pulley and frictional forces between said second pulley and said ring thereby preventing said second pulley from rotating independently of said first pulley, said thumb screw being rotatable into a series of second positions permitting rotation of said second pulley independently of said first pulley, said rotation being selectively impaired by varying the frictional forces between said thumb screw and said second pulley and between said second pulley and said ring to a different degree at each of said second positions thereby forming a clutch by which said first pulley may be selectively permitted to rotate freely and independently of said second pulley, permitted to rotate with a selected frictional impairment independently of said second pulley and prevented from rotating independently of said second pulley.

3,273,822
SEAT BELT RETRACTOR
Richard L. Merrell, Simsbury, and Angelo J. Misenti, Bristol, Conn., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 15, 1964, Ser. No. 359,829
1 Claim. (Cl. 242—107.4)



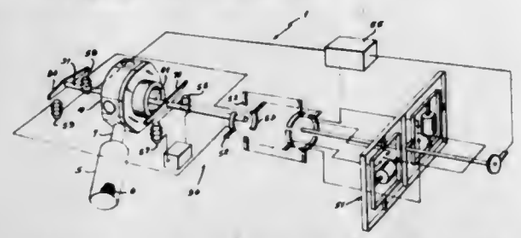
An inertia operated seat belt retractor adapted to be mounted in a motor vehicle comprising a housing,
a U-shaped yoke member having an arcuate surface portion extending between a pair of transversely extending arms,
a support member secured to said vehicle within said housing for supporting said U-shaped yoke member

and including an arcuate surface portion in sliding engagement with the arcuate surface portion of said yoke member,
a hollow reel rotatably journalled between the arms of said yoke member,
a seat belt retaining pin supported within said reel between a pair of spacers,
said spacers engaging the inner surface of said hollow reel to maintain said pin substantially immovable in a direction transverse to the axis of said reel,
said pin being movable parallel to the axis of said reel for reception by a loop formed in one end of a seat belt to couple the seat belt to the reel,
said support member and said housing being provided with aligned openings,
a non-metallic guide member mounted in said opening and including a slot for receiving said seat belt,



a spool rotatably supported in said yoke,
a flat spring having one end secured to said spool and the other end secured to said reel and normally being wound on said spool but adapted to be backwound on said reel when said reel is rotated in an unwinding direction,
a pair of toothed wheels rotatable with said reel,
a plurality of apertures formed in said support member located in the path of arcuate movement of said yoke member for receiving a portion of said toothed wheels to prevent rotation of said wheels in response to a predetermined sliding movement of said yoke member,
a coil spring connected between each of said arms and said support member for normally, yieldingly biasing said toothed wheels out of engagement with said support member to permit free rotation of said reel in a winding and unwinding direction.

3,273,823
DISPENSING DEVICE
William Taylor, Jr., 2215 W. Indiana Ave., Elkhart, Ind.
Filed Mar. 24, 1964, Ser. No. 354,354
4 Claims. (Cl. 242—129)

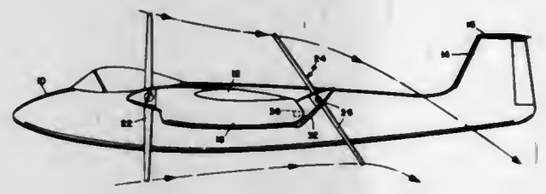


1. A dispensing package for coiled material which comprises two U-shaped elements, each element having a pair of substantially vertical medial members joined together by an upper apex member and a pair of U-shaped base members lying in a plane substantially at right angles to the plane of said medial members at a radial angle thereto.

3,273,824
SINGLE PASSENGER AIRCRAFT
Walter K. Owens, 4324 Creighton Road, Pensacola, Fla.
Filed Feb. 4, 1965, Ser. No. 430,282
10 Claims. (Cl. 244—4)

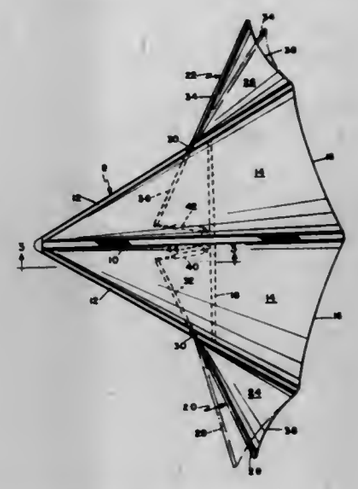
1. An aircraft of the single passenger type comprising a supporting framed adapted to be mounted bodily upon and secured to the body of the passenger, an overhead power plant on said frame having a hinged connection therewith near the back of the frame and including an engine and a substantially vertical axis propelling rotor driven by the engine, a control element connected with the power plant near the front thereof and operable to tilt the power plant upon the axis of the hinged connection, a pair of vertically swingable control elements pivoted to said frame and arranged adjacent the opposite sides thereof directly below said rotor and in the path of the downward airstream produced by the rotor and a control handle element connected with each of said control elements for operating the latter independently, one of said control handle elements including a power plant throttle control.

3,273,825
GUIDANCE SYSTEMS
Vernon H. Kerner, St. Louis County, Mo., assignor to Emerson Electric Co., a corporation of Missouri
Filed Oct. 30, 1961, Ser. No. 148,443
7 Claims. (Cl. 244—14)



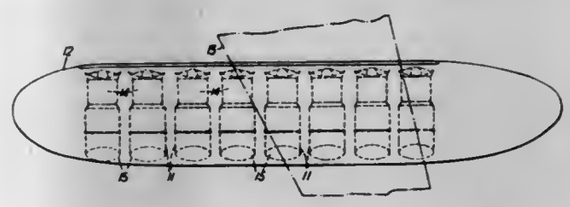
1. A guidance system adapted for use with a source of gas independent of the main propulsion system of a missile, comprising a hollow shell in the form of a manifold the interior of which communicates with said source of gas, said manifold having a plurality of ports therethrough through which said gas can escape; throttle means adjacent and associated with said manifold, for selectively blocking ports in said manifold; a hollow body having paired nozzles, the nozzles in a pair being directed in diametrically opposite directions from one another and said nozzles communicating discretely with one of said manifold ports arranged to be selectively blocked by said throttle means, said throttle means being positioned between said manifold ports and said nozzles, and power means connected to move said throttle means with respect to said ports in such a way that restriction of the effective area of a port communicating with one nozzle of a pair is accompanied by expansion of the effective area of a port communicating with the other nozzle of the pair, whereby the total effective gas escape area of the ports, hence the total flow of gas, remains constant, and the radial forces produced by an equal flow of gas from the nozzles of a pair are cancelled.

3,273,826
VARIABLE AIRFOIL HIGH-LIFT SLAT AND SLOT FOR AIRCRAFT
Charles E. Jackson, Fort Worth, Tex., assignor to General Dynamics Corporation, Fort Worth, Tex., a corporation of Delaware
Filed Mar. 3, 1965, Ser. No. 436,780
4 Claims. (Cl. 244—42)



2. A composite airfoil structure defining a wing configuration having a leading edge, said structure comprising:
a primary supersonic fixed wing structure having a thin leading edge and a bi-segmented auxiliary airfoil compenent longitudinally movably superimposed upon said primary wing, and of substantially the same configuration as said primary wing leading edge, said auxiliary airfoil having a variable geometry nose portion and a trailing portion, said nose portion rotatable with respect to said trailing portion about a pivot in response to a programed outward and downward trajectory movement of said pivot point in respect to said fixed wing structure, said nose portion rotation and auxiliary airfoil trajectory movement increasing both chord length and camber of said auxiliary airfoil structure and simultaneously the chord and camber of said composite airfoil structure through relocation of impinging airstream pressure peaks and stagnation points.

3,273,827
PROPELLER-ROTOR HIGH LIFT SYSTEM FOR AIRCRAFT
Peter F. Girard, La Mesa, Calif., assignor to The Ryan Aeronautical Co., San Diego, Calif.
Filed Apr. 27, 1964, Ser. No. 362,691
5 Claims. (Cl. 244—42)



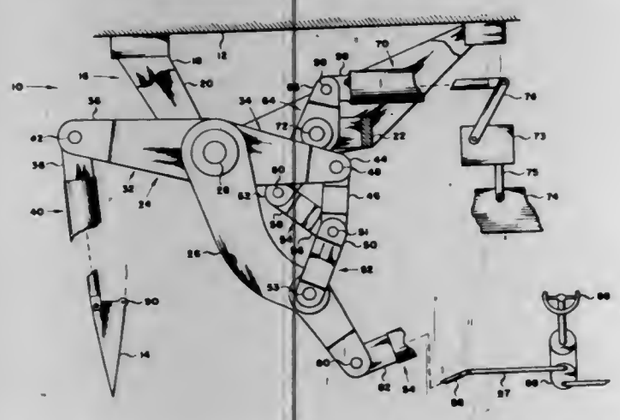
1. In an aircraft having a driven primary propulsion propeller, high lift means, comprising:
a bladed rotor mounted on the air craft rearwardly of said propeller to intercept substantially all the air flow from the propeller and being rotatable to retard the propeller airflow;
said rotor being pivotally mounted to swing about an axis extending substantially parallel to the pitch axis of the aircraft;
and means to move said rotor between a first position with the rotational axis thereof parallel to the rotational axis of said propeller and a second position with the rotor axis inclined to the propeller axis.

3,273,828
DOUBLE DELTA FLEXIBLE WING
Harry A. James, San Diego, Calif., assignor to The Ryan Aeronautical Co., San Diego, Calif.
Filed Aug. 7, 1964, Ser. No. 388,124
7 Claims. (Cl. 244—43)

1. A flexible wing, comprising:
a primary wing having a longitudinal keel, leading edge members extending angularly rearwardly from the forward end of said keel on opposite sides thereof, and flexible wing panels secured to and between said keel and said leading edge members;
a pair of secondary wings mounted on the rear portions of said leading edge members outwardly thereof;
and actuating means operable to laterally extend and retract said secondary wings selectively.

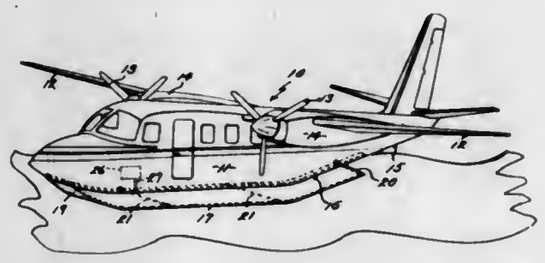
3,273,829
AIRCRAFT
Paul Maxwell Lawrence Elstone, Winscombe, England, assignor to Hawker Siddeley Aviation Limited, Kingston-upon-Thames, England, a British company
Filed Dec. 17, 1962, Ser. No. 246,870
Claims priority, application Great Britain, Dec. 18, 1961, 45,372/61
8 Claims. (Cl. 244—54)

1. A pod structure for attachment to an aircraft to give it a short take-off and landing capability, comprising a pod floor, opposite side walls and a top wall all defining internal pod chambers, openings in said opposite side walls communicating with said chambers, a plurality of jet lift engines each having an air intake end and a gas effluent exit end and being mounted in said chambers at intervals along the pod in the fore-and-aft direction, each engine being disposed with its longitudinal axis substantially horizontal and across the direction of flight and having its intake end directed toward a first of said side wall openings at one side of the pod and its exit end directed toward a second side wall opening at the opposite side of the pod, and a jet nozzle mounted on the exit end of each engine and disposed to direct the engine jet efflux out through said second side wall opening, each said jet nozzle comprising means to turn the jet efflux through an appreciable angle with respect to the engine axis so as to deflect the



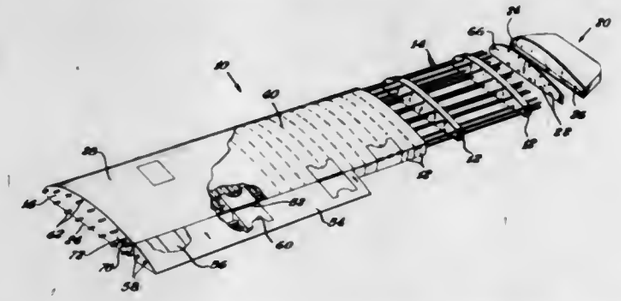
efflux downwardly in the short take-off and landing condition, and said nozzle means being angularly adjustable about said axis of the respective engine to direct the jet efflux rearwardly.

3,273,830
THIXOTROPES AS BRAKING MEDIUM FOR CATAPULT BRAKE
James E. Scholl, Fairfax, Va., assignor to the United States of America as represented by the Secretary of the Navy
Filed Mar. 31, 1965, Ser. No. 444,477
8 Claims. (Cl. 244—63)



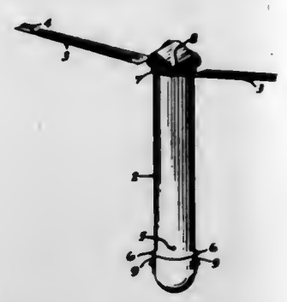
1. A catapult launcher comprising
a cylinder;
a piston which moves forward within said cylinder and which is actuated by the pressure produced within said cylinder by the introduction of pressure fluid therein, said piston being provided with means for moving a load positioned externally of said cylinder;
a braking medium reservoir in said piston, said reservoir culminating in means defining a forwardly facing opening in said piston;
a tapered spear fixedly mounted within said cylinder and adapted to engage said opening of said piston and therethrough said reservoir near the end of the piston stroke;
a thixotropic material within and filling said reservoir, said thixotropic material being in the gelled state when the piston is at rest;
whereby the action of said spear contacting said thixotropic material will brake the piston at the end of its stroke.

3,273,831
CONTROL MECHANISM FOR AIRCRAFT
Richard L. Vernon, Glendale, and Harold E. Hoben, Northridge, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.
Filed July 29, 1963, Ser. No. 298,366
10 Claims. (Cl. 244—83)



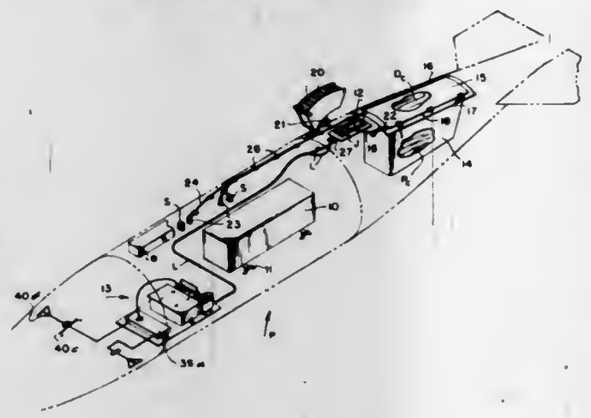
1. In an aircraft having a flap having a neutral and a deflected position, an aircraft control mechanism comprising:
(a) a control surface having a neutral position, a droop position, a maximum up deflected position, and a maximum down deflected position;
(b) a member for positioning said control surface between the control surface neutral and maximum up or down deflected positions;
(c) a mechanism operatively inter-connecting said control surface and said positioning member,
said inter-connecting mechanism including means for moving said control surface from the neutral position or the droop position to said deflected position when said positioning member is moved a fixed amount; and
(d) a means for operating the flap from a neutral to a deflected position and for operating the control surface to a droop position, the operating means including a linkage which does not change the maximum control surface up and down deflected positions when the control surface is either in the neutral or the droop position.

3,273,832
INFLATABLE PONTOON FOR AIRCRAFT
Edgar L. Keedy, Rte. 1, Box 242, Woodstock Road, Gates Mills, Ohio
Filed Sept. 24, 1964, Ser. No. 398,940
3 Claims. (Cl. 244—105)



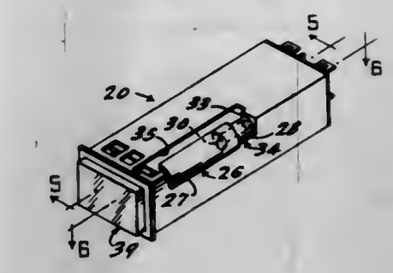
1. In combination with an airborne vehicle having an airfoil surface on the normal underside thereof, a gas inflatable hull having means connecting it with said vehicle, means for inflating said hull and extending it into water engaging position spaced beneath said airfoil surface, said hull having a rigid ski-type lower surface, means for collapsing said hull and retracting it to said airfoil surface, and said hull in collapsed condition having airfoil compatability with said airfoil surface.

3,273,833
AIRFOIL STRUCTURE
Leo J. Windecker, Midland, Tex., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
Filed Jan. 21, 1965, Ser. No. 438,143
36 Claims. (Cl. 244—123)



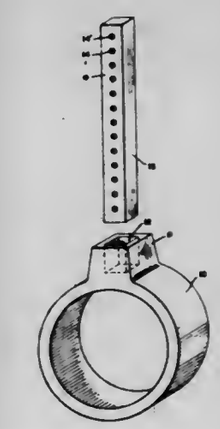
1. An aircraft airfoil structure which comprises a core consisting of a structurally rigid foam, a multiplicity of elongated spars running longitudinally through bores in said core from end to end thereof, said spars being spaced apart and disposed between ⅜ inch and one inch from the outer surface of said core and being continuously bonded to the walls of said bores along the length of the spars extending through said bores, and a skin, said skin covering said core and being integrally bonded thereto.

3,273,834
AIR DROP AUTOROTATING GYROPLANE DROP CHUTES
Bernal L. Bower, 8336 Creighton Ave., Los Angeles, Calif.
Filed Apr. 4, 1961, Ser. No. 131,945
18 Claims. (Cl. 244—138)



10. The combination in an autorotating airdrop chute of a flexible blade, a blade tip balance weight, a container with said blade fastened rigidly thereto, said blade having negative blade section camber.

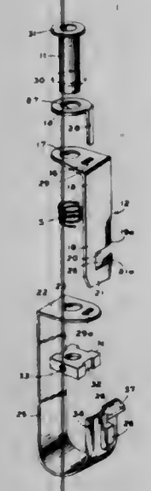
3,273,835
SELF-EJECTING EMERGENCY CHUTE RECOVERY SYSTEM
Lloyd J. Holt, Ridgecrest, and Harry L. Myers, China Lake, Calif., assignors to the United States of America as represented by the Secretary of the Navy
Filed May 19, 1964, Ser. No. 368,723
5 Claims. (Cl. 244—138)



5. In a pod recovery system:
a pod;
an electrically operable pod mounting means adapted to releasably mount said pod on an airborne vehicle and release said pod in response to a flow of electrical current;
a source of electrical current;
means including a plurality of normally open switches connecting said source of a current with said mounting means;
switch closing means connected between said pod mounting means and said source of electrical power;
first means adapted to activate said switch closing means in response to destruct signals transmitted to vehicle;
second means adapted to activate said switch closing means in response to power failure occurring aboard said vehicle;
means adapted to transmit a beacon signal from said pod in response to an activation of said second means;
a parachute connected with said pod; and
means adapted to deploy said parachute in response to a release of said pod by said mounting means.

3,273,836
PANEL MOUNTED INSTRUMENT
Don M. Hallerberg, San Pedro, Calif., assignor to Master Specialties Company, Gardena, Calif., a corporation of California
Original application July 29, 1963, Ser. No. 298,090. Divided and this application Aug. 26, 1965, Ser. No. 482,879
2 Claims. (Cl. 248—27)

1. A device for mounting in an opening in an instrument panel comprising, a thin walled housing forming an internal chamber having an open front end, a stationary abutment on the outer external surface of said housing adjacent its front end, a lead screw secured in said internal chamber adjacent said wall of said housing, said housing having a recessed area in its sidewall opposite said lead screw, an abutment member comprising a sector of an element whose center is located on the center of said lead screw threadably engaging said lead screw, said abutment member being shaped to lie totally within the recessed area of said housing when in one angular position on said lead screw, and to project out of said recessed area when rotated to another angular position on said lead screw, and said abutment member being movable lengthwise of said housing while projecting out of said recessed area in said housing upon rotation of said lead screw to clamp an instrument panel between said abutment member and said stationary abutment, the wall of said recessed area being engaged by said abutment member during movement thereof towards clamping position.



3,273,837
PLASTIC PIPE HANGER
Clarence C. Willert and Russell F. Henriksen, Walnut Creek, Calif., assignors to Willert and Henriksen, Walnut Creek, Calif.
Filed June 23, 1965, Ser. No. 466,260
8 Claims. (Cl. 248—59)

1. A hanger for light-weight plastic pipe comprising: an annular plastic member for placement about the circumference of said pipe, said annular member having an inside diameter slightly larger than the outer diameter of the pipe for a loose slidable fit therebetween to allow for

thermodynamic expansion and contraction of the pipe, a plastic rod having at least one pair of flat parallel sides, a series of spaced apart apertures through said rod along said pair of flat sides, and a recess in said annular member mating with the cross sectional area of said rod, said rod and annular member being initially separate but formed from plastic that is mutually chemically bondable at ambient temperature.

3,273,838
PIPE HANGER
Walter H. Fletcher, Lincoln Park, and Lloyd E. Mylne, Dearborn Heights, Mich.; Carl M. Weideman, administrator of the estate of Walter H. Fletcher, deceased
Filed July 21, 1965, Ser. No. 473,721
24 Claims. (Cl. 248—62)

1. In a pipe hanger for suspending a pipe from the threaded lower end of a rod or the like, the combination comprising

a tubular collet having enlarged ends and adapted to be telescoped over the threaded lower end of a rod or the like,

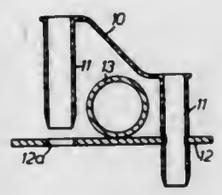
a first member rotatably mounted on said collet intermediate the enlarged ends of said collet and having a free end adapted to partially encircle a pipe and extending upwardly,

a second member rotatably mounted on said collet intermediate the enlarged ends of said collet with the free end thereof projecting downwardly adjacent the free end of said first member,

means interlocking the free ends of said first and second members,

a nut adapted to be threaded on the threaded lower end of a rod or the like,

and a lock member rotatably mounted on said collet intermediate the ends of said collet and having a portion projecting adjacent said nut for preventing rotation of said nut after it has been threaded on a rod or the like,



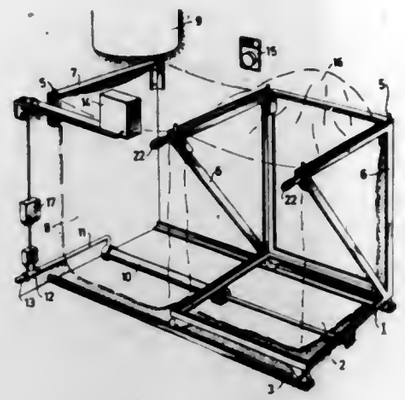
whereby the assembly of said collet, first member, second member and lock member may be mounted on the threaded lower end of a rod or the like by telescoping the collect over the rod and said nut may be threaded on the lower end of a rod to support the pipe from the rod,

said first member may be positioned beneath a pipe to partially encircle the pipe,

and the second member may be thereafter rotated and interlocked with the first member by said interlocking means,

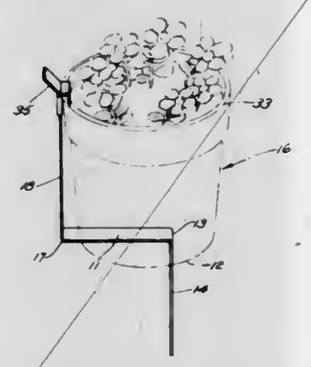
and said lock member may thereafter be moved to engage the nut and prevent its rotation.

3,273,839
FASTENING DEVICES
Alan James Bennett, Pontypridd, Glamorgan, Wales, assignor to Tinnerman Products, Inc., Cleveland, Ohio, a corporation of Ohio
Filed July 30, 1964, Ser. No. 386,243
2 Claims. (Cl. 248—73)



1. A fastening device for mounting an article on a support member having a pair of spaced, substantially circular apertures therein comprising, a flexible strap adapted to be brought into overlying engagement with said article, an elongated, hollow pin integrally attached to each of the opposed ends of said strap and extending normally therefrom adapted to be inserted through the apertures in said support member, said pins being of a substantially identical construction and comprised of a resilient polymeric material, each of said pins having a substantially uniform wall thickness throughout a major portion of its axial length with a substantially smooth, uninterrupted outer surface throughout such length prior to insertion through the respective of said apertures, each of said pins having a smooth, uninterrupted inner surface which is free of any internal support means, each of said pins being circular in transverse section with the diameter being constant throughout its axial extent and having a dimension which is designed to be greater than the corresponding transverse dimension of the respective of said apertures, the resiliency of the polymeric material of said pins being such that when inserted through said apertures, the wall of each of said pins is circumferentially deformed inwardly to provide a reduced diameter neck portion and enlarged portions on either side thereof adapted to travel progressively upwardly along the axial extent of each of said pins as they are moved downwardly through the respective apertures; and the material of each of said pins passed which the neck portion and enlarged portions have traveled being adapted to resiliently return to the original constant diameter of said pins prior to insertion through said apertures, whereby the confronting marginal edges of said apertures are held in frictional engagement within the neck portion and between the enlarged portions of the respective pins in any selective axial position thereof, thereby to retain the strap in frictional engagement around said article for holding the same against said support member.

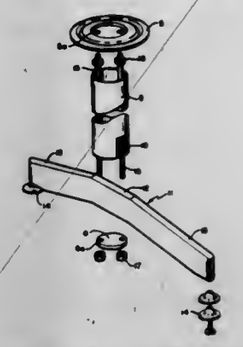
3,273,840
GARBAGE CONTAINER STRUCTURE, IN PARTICULAR FOR GARBAGE CHUTE
Per Olov Oberg, Hagersten, Sweden, assignor to Handelsaktiebolaget Sanera, Mariehall, Sweden
Filed July 21, 1964, Ser. No. 384,178
8 Claims. (Cl. 248—98)



1. Container construction comprising a displaceable carriage, a container supported on said carriage, said carriage being movable from a first operative position for the container to a second inoperative position for the container, a second container, and frame means having a stationary position as said carriage is moved between

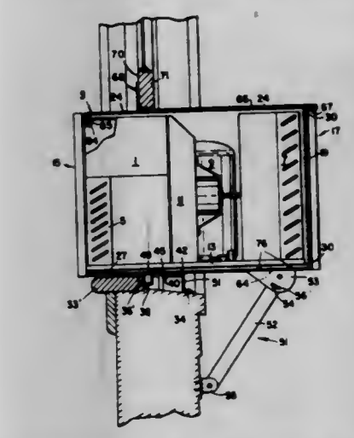
said first and second postions, said container being supported by the carriage and the frame means for being in

folded inoperative position with said carriage in its first position and being unfolded to an operative position with the carriage in said second position.



3,273,841
DEVICE FOR HOLDING FLOWER RECEPTACLE IN UPRIGHT POSITION
John G. Cota, 68 Academy Ave., Providence, R.I.
Filed Apr. 23, 1965, Ser. No. 450,385
3 Claims. (Cl. 248—154)

1. A device for holding a receptacle in upright position on the ground comprising a member of one piece of flat sheet material having a receptacle bottom engaging portion for engagement with the receptacle to be held in position, a leg extending in one direction from one end of said portion and at generally right angles thereto for insertion into the ground, and an arm extending in the opposite direction from the other end of said portion at generally right angles thereto to be positioned along the outside of the receptacle and to a height greater than said receptacle, and means at the upper end of said arm for extending over and engaging the upper edge of said receptacle to hold it in engagement with said bottom engaging portion.

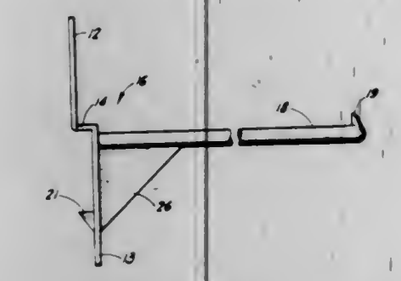


3,273,842
PEDESTAL BASES
Roy F. McMahan, Jr., Harrods Creek, Ky., assignor, by mesne assignments, to American Metal Products Company, Detroit, Mich., a corporation of Michigan
Continuation of application Ser. No. 424,288, Jan. 8, 1965, which is a continuation of application Ser. No. 217,771, Aug. 17, 1962. This application Oct. 21, 1965, Ser. No. 506,438
23 Claims. (Cl. 248—188.7)

1. A pedestal base comprising a floor-contacting assembly including a bottom compression plate, a pedestal member supported at its lower end on said floor-contacting assembly and upstanding therefrom, a top compression plate supported at the upper end of said pedestal member, a pair of separate tie rods extending between said plates,

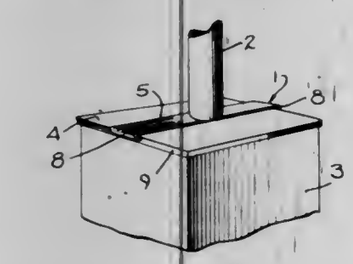
and means coupling respective ones of said tie rods to said plates to draw them together and compress said pedestal member therebetween to form said pedestal base.

3,273,843
MOUNTING MEANS FOR AIR CONDITIONING UNITS
William W. Bell, Jr., Marcellus, and David E. MacLeod, Syracuse, N.Y., assignors to Carrier Corporation, Syracuse, N.Y., a corporation of Delaware
Filed Dec. 14, 1964, Ser. No. 417,875
10 Claims. (Cl. 248—208)



1. In a structure for positioning an air conditioning unit having a housing in the window opening a building having a movable sash-type closure for said opening, the combination of means for releasably holding said housing in a first position in said opening, a part of said housing projecting outdoors through said opening, gauge means temporarily attachable to said housing and cooperable with said sash-type closure to place said housing in a substantially level position in said window opening, and brace means connectable between the outdoor part of said housing and the outside of said building to fix said housing in said substantially level position and permit removal of said gauge means.

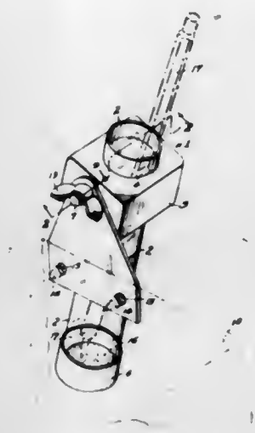
3,273,844
DISPLAY HOOK
Richard J. Hodson and Max Myers, Deming, N. Mex., assignors to Auburn Rubber Company, Inc., Deming, N. Mex., a corporation of New Mexico
Filed Dec. 14, 1964, Ser. No. 417,887
2 Claims. (Cl. 248—217)



1. A one-piece plastic display bracket for mounting of items upon a wall of limited unit structural strength comprising a horizontal portion having a length substantially equal to the thickness of a wall upon which the bracket is to be mounted and adapted to fit in a horizontal wall slot, a flat upper plate extending upwardly from the rear edge of said horizontal portion for flat engagement with a

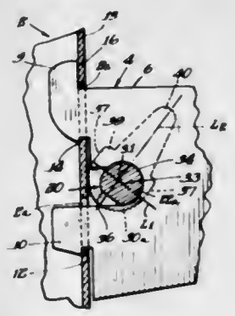
back wall surface, a lower flat plate depending from a front edge of said horizontal portion for flat engagement with a front wall surface and having substntially the same wall contact area as said upper plate, a three-dimensional triangular porjection from said lower plate directed rearwardly thereof with said projection having a pointed outer end with a thin upper edge and lateral sides tapering out-

wardly from said edge and a rear surface tapering outwardly from said point to a substantial lateral base dimension at said lower plate for piercing a wall to lock the bracket thereto, and a rigid horizontal bar extending substantially perpendicularly outward from said lower plate at the top thereof with said bar having an upturned outer end for carrying items mounted on a wall by the bracket.



3,273,845
BRACKET ADAPTED TO ATTACH A DISPLAY POLE TO A CONTAINER
Paul H. Jepsen, New Canaan, Conn., assignor to Snyder & Black & Schlegel, White Plains, N.Y., a corporation of New York
Filed Nov. 12, 1964, Ser. No. 410,516
2 Claims. (Cl. 248—226)

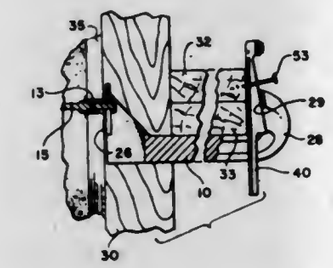
1. A bracket adapted to attach an advertising display pole to a container comprising a strip of flexible material formed with a pair of elongated flat portions, a U-shaped portion intermediate said flat portions, said U-shaped portion having a pair of legs extending substantially perpendicularly from said repsective flat portions on one side of said strip, and clip-on end portions extending from the opposing side of said strip from said flat portions whereby the U-shaped portion is adapted to fit inside and support a hollow display pole and said clip-on portions are adapted to snap over the opposing edges of a container to thereby interconnect said pole and container.



3,273,846
DRAFTSMAN'S PENCIL HOLDER AND THE LIKE
Baltzar Leo De Maré, 627 W. Belair Ave., Aberdeen, Md.
Filed Nov. 12, 1965, Ser. No. 507,594
10 Claims. (Cl. 248—226)

1. A pencil holder for attachment to a drawing board comprising in combination, a container for holding pencils therein, a bracket for attachment to a drawing board, there being a mounting bore at its upper end, adjustable means for mounting said container to said bracket whereby said container may be pivoted and held at a con-

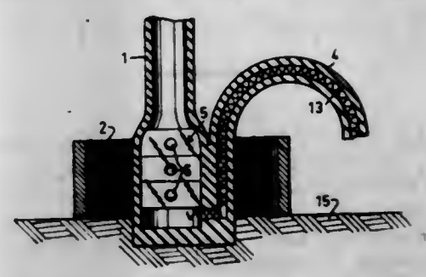
venient angle relative to said drawing board and means housed in the lower end of said container for protecting the points of pencils when in said container.



3,273,847
BRACKET CONSTRUCTION
Marvin A. Berman, Highland Park, Ill., assignor to Capitol Hardware Mfg. Co., Inc., Chicago, Ill., a corporation of Illinois
Filed May 16, 1963, Ser. No. 280,929
2 Claims. (Cl. 248—243)

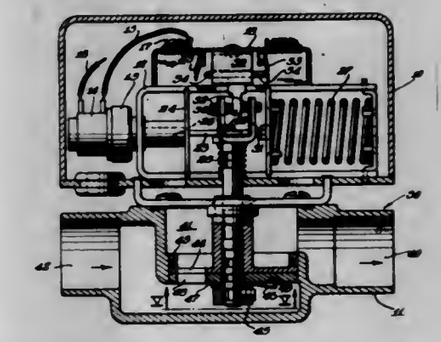
1. In combination with a vertically oriented thin-walled bracket body having a generally vertical rear edge with vertically spaced hooked extensions adapted to pass through corresponding openings in an upright to hold the bracket in a forwardly extending position on the upright, the rear portion of the bracket plate being provided with a generally circular opening extending over an arc greater than 180 degrees, there being a 180-degree bearing section of the opening on the front side of said opening facing the rear edge of the bracket body, said opening having a cam member-receiving mouth extending between said vertical edge and said opening, which mouth has a width substantially less than the diameter of the cam member-receiving opening, one edge of said mouth being tangent to said circular opening and the opposite edge thereof being parallel to said one edge and spaced a distance therefrom less than the diameter of said opening, a cam member rotatably mounted in said opening about a transverse horizontal axis and having a head portion with a cylindrical surface having a diameter approximately equal to the diameter of, and making rotatable engagement with the bearing section of said circular cam member-receiving bracket opening, said cylindrical surface having only a single flat thereon which enables the cam member to be slipped into said cam member-receiving opening through said mouth thereof in one angular position of the cam

member where rotation thereof from said position will lock the cam member in said opening and move the flat in a direction toward the rear edge of the bracket body, said head portion of the cam member having a curved surface portion which is eccentrically related to said cylindrical surface and which projects beyond the rear edge of the bracket body in progressively varying degrees as the cam member is rotated over a range of angular positions about said axis, said flat on said cylindrical surface being spaced from said 180-degree bearing section of said bracket opening over said range of angular positions of said cam member so the full useful bearing surface of said opening is utilized.



3,273,848
TIE-ROD BRACKET FOR CONCRETE FORMS
Helen M. Allen, 1724 Morocco Drive, San Jose, Calif., and Avery J. Austin, 19314 69th Place W., Lynnwood, Wash.
Filed June 21, 1963, Ser. No. 289,512
5 Claims. (Cl. 249—219)

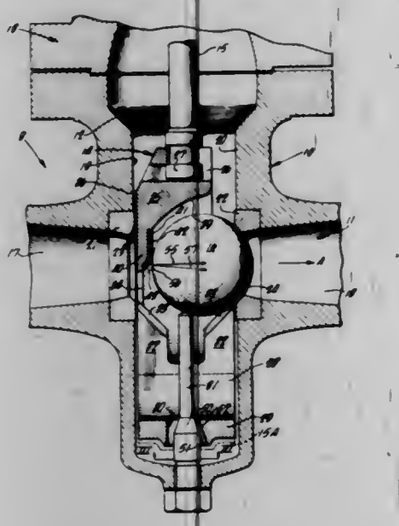
1. A rigid metal bracket comprising:
(a) a first member formed to define an upstanding tie rod end wall formed with a tie rod head-receiving opening, a horizontal rest portion longer than the distance between the lower end of said tie rod end wall and said tie rod head-receiving opening and extending rearwardly from said tie rod end wall, an outer upturned holding end formed to include an upstanding tongue means and holding means facing said tie rod end wall and positioned above the level of said horizontal rest portion; and
(b) a U-shaped second member closed at its lower end and closed at its upper end by a rearwardly offset cross connecting member, said second member being mounted upon the horizontal rest portion of said first member and vertically movable with respect thereto, U-shaped portion of said outer wall means having wedge means facing the outer upturned holding end of said first member, said wedge means being positioned to bear against said holding means and being sloped upwardly and forwardly to cause said second member to move toward the tie rod end wall of the first member when said second member is forced upwardly, said cross connecting member being configurated to interlock with said tongue means while permitting said tongue means to be received within the opening formed by the U-shape of said outer wall means.



3,273,849
APPARATUS FOR CONTROLLING THE MOISTURE CONTENT IN LIQUID-ABSORBING SUBSTANCES
Thure Henning Hansson, Ernst Ahlgrensgatan 2B, Malmo, Sweden
Filed Apr. 29, 1963, Ser. No. 276,493
11 Claims. (Cl. 251—4)

1. A moisture responsive valve comprising an elastic fluid conduit, expansible means adjacent to a substantial portion of said conduit and being expandable upon absorption of liquid, means to limit the expansion forces substantially to those effecting collapse of said conduit,

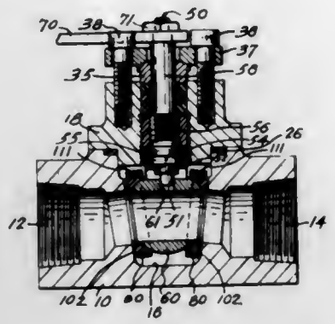
whereby absorption of liquid by said expansible means effects collapse of said conduit and arrests fluid flow therethrough.



3,273,850
ZONE VALVE
Lawrence A. Kolze, Bensenville, Ill., assignor to The Dole Valve Company, Morton Grove, Ill., a corporation of Illinois
Filed Oct. 9, 1963, Ser. No. 314,912
10 Claims. (Cl. 251—11)

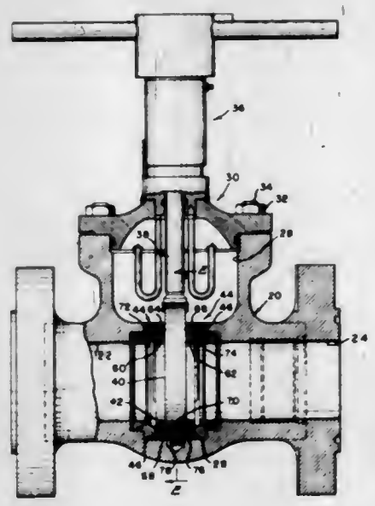
1. A fluid control valve comprising:
(a) a valve body having an inlet and an outlet and a port communicating said inlet with said outlet,
(b) a shaft journaled for rotary movement within said body having a valve disc mounted thereon and rotatable therewith and overlying said port,
(c) an aperture in said disc positionable in registry with said port to permit maximum fluid flow through said valve, whereby rotation of said disc to move said aperture out of registry with said port will decrease the flow of fluid through said valve,
(d) a radially extending lever connected to said shaft for rotation therewith,
(e) a rectilinearly movable element pivotally connected to a free end of said lever, whereby rectilinear movement of said element will effect rotary movement of said shaft,
(f) a motor mounted on said body and having an element extensible therefrom upon energizing thereof where said extensible element abuts said rectilinearly movable element whereby movement of the said extensible element imparts rectlinear movement to the said rectilinearly movable element,
(g) an electric switch having a plurality of contacts and a switch finger whereby movement of the switch finger opens and closes the said contacts,
(h) an adjustable mechanical linkage between the said switch finger and the said lever whereby extensible and retractable movement of the said extensible element imparts movement to the said switch finger through cooperation of the said rectlinearly movable element, the said lever, and the said mechanical linkage, and
(i) an electric circuit comprising the said motor and a pair of contacts of the said electric switch and connected to an electric power source, whereby current

flow in the electric circuit energizes the motor causing the said extensible element to extend and whereby the electric switch controls the current flow in said circuit in response to extension of the said extensible element.



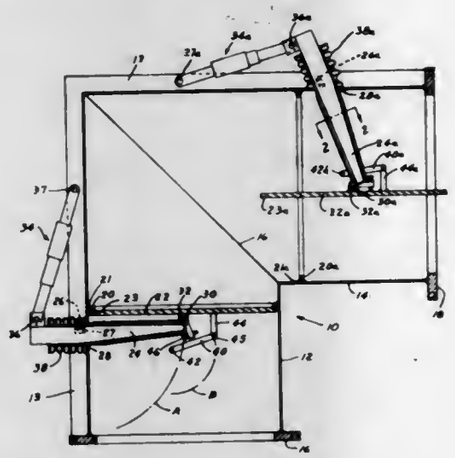
3,273,851
BALL VALVE HAVING URGING MEANS ACTING NORMAL THERETO
Francis Clifford Rosch, Jr., Bridgeport, and Clyde Kenneth Hines, Southport, Conn., assignors to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Filed May 23, 1963, Ser. No. 282,621
9 Claims. (Cl. 251—124)

1. In a valve having a casing defining a fluid flow passage therethrough and a recess intersecting the flow passage, said passage defining inlet and outlet openings to the recess, an annular valve seat peripherally of one opening, a ball disposed in the recess, and selectively operable means carrying the ball and movable reciprocably in the recess essentially along a line parallel to the valve seat for moving the ball along said line toward and away from closure relation with the valve seat, the improvement comprising means acting on the ball substantially normal to the valve seat in response to operation of the selectively operable means to move the ball toward the valve seat for urging the ball into intimate sealing contact with the valve seat.



3,273,852
BALL VALVE CONSTRUCTION
Roger Louis Ripert, Roxboro, Quebec, Canada, assignor to Velan Engineering Companies, Quebec, Quebec, Canada
Filed May 14, 1964, Ser. No. 367,427
5 Claims. (Cl. 251—171)

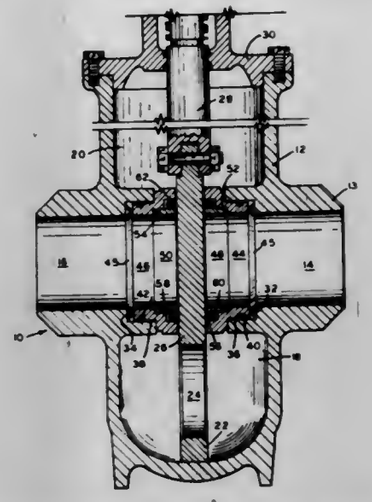
1. A ball valve construction comprising a main valve housing having an open-topped inner valve chamber with opposed converging sealing seat surfaces and aligned fluid passages extending from the exterior of said housing to said valve seat surfaces, a ball valve having an opening therethrough mounted within said valve chamber for rotary movement between an open and closed position between a pair of opposed annular seal seats slidably fitting against said chamber sealing surfaces and adapted to cooperate with said valve and surfaces to form a pressure seal, a seal seat pressure member having at least a resilient portion and being mounted within said chamber to span the upper surface of said ball valve and having end portions engaging the upper side surfaces of said opposed seal seats, a valve bonnet mounted on said housing sealing off said valve chamber open top and a valve spindle mounted for restricted rotational and reciprocal movement within said bonnet, said valve spindle having an end portion extending within said valve chamber and operatively engaging said ball valve for rotational movement relative to said annular



seal seats and also to engage said seal seat pressure member for restricted reciprocal movement simultaneously with said ball rotational movement to urge said seal seats along said chamber sealing seat surfaces in the direction of convergence when said ball valve is rotated to closed position and to release said seal seat pressure means when said ball valve is rotated to the opposite open position.

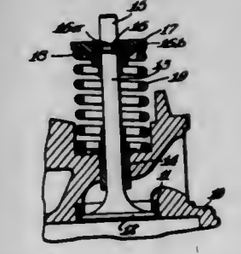
3,273,853
COMPOSITE METAL-RUBBER INSERT FOR GATE VALVE
Eldert B. Pool, Palos Park, Ill., and Joseph R. Kertis, Hammond, and James A. Hollingsworth, Gary, Ind., assignors to Rockwell Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Nov. 27, 1963, Ser. No. 326,426
3 Claims. (Cl. 251—175)

3. A valve comprising a body having flow passages intersecting at their inner ends an enlarged central cavity, a flow controlling gate movable into and out of said cavity between closed and open positions, removable annular wear rings carried by said body and surrounding the inner ends of said flow passages, a composite metal-elastomer sealing insert removably mounted in said cavity between said wear rings, said inert having a resilient bridge portion, said bridge portion having an upper surface against which said gate seals when said gate is moved to closed position, a metallic reinforcement member bonded to the lower surface of said bridge portion and extending completely across said cavity between said wear rings to hold said wear rings in position throughout opening and closing movements of said gate, and said reinforcement member being formed on essentially the same radius as said wear rings to thereby engage said wear rings around a substantial portion of their periphery, and mean providing pressure equalizing passages in said bridge portion.



3,273,854
ELBOW VACUUM VALVE
Austin U. Bryant, Walnut Creek, Calif., assignor to Grove Valve and Regulator Company, Oakland, Calif., a corporation of California
Filed Sept. 10, 1963, Ser. No. 307,963
4 Claims. (Cl. 251—228)

1. A valve comprising:
a valve body including a flow passageway,
a valve seat in said body,
a valve closure plate,
an actuator arm; a first pivotal connection between said body and said actuator arm enabling said arm to swing in a plane transverse to said valve seat,
a second pivotal connection between said actuator arm and said closure plate,
a shorter control arm pivotally connected between said valve body and said closure plate to swing in a plane parallel to said actuator arm,
adjustment means for varying the spacing between said first and second pivotal connections, and
means for pivoting said actuator arm to swing said pivotal connection from a first position wherein said closure plate engages said valve seat and a second position retracted therefrom.

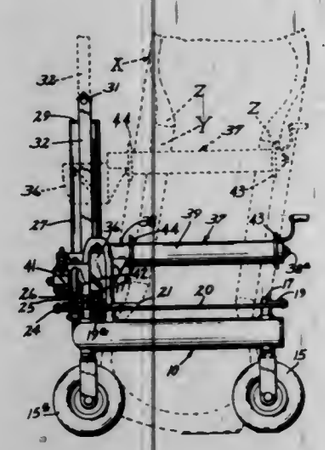


3,273,855
VALVE SEAT FOR GATE VALVES
Russel L. Wells, 7322 E. 22nd Place, Tulsa, Okla.
Filed July 11, 1963, Ser. No. 294,414
4 Claims. (Cl. 251—328)

1. A gate valve, the combination comprising:
a body having a substantially circular passageway therethrough;
a valve chamber intersecting said passageway;
a reciprocable slab gate member located in said valve chamber, said gate member provided with a passage alignable with the said circular passageway in the open position and a solid portion to cover said passageway in the closed position;
facing annular recesses surrounding said passageway;
a seat member in each of said recesses, each of said seat members formed of an annular ring having a primary seating face for sealed contact with said gate member and an annular groove in said ring opening at said primary seating face and toward said gate member, said seat member including an integral lip member ring therein which extends partially into said groove; and

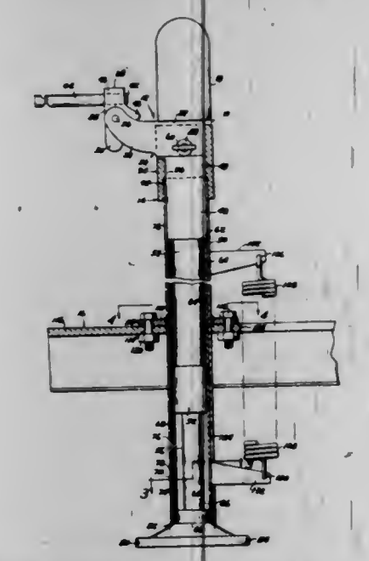
a deformable sealing member bonded to and covering said lip ring and a dimension whereby said sealing member is contactable against said gate member to form a secondary seating face against said gate member.

3,273,856
VALVE STEM RETAINER LOCK
Max J. Tauschek, South Euclid, Ohio, assignor to TRW Inc., a corporation of Ohio
Filed Dec. 26, 1963, Ser. No. 333,484
12 Claims. (Cl. 251—337)



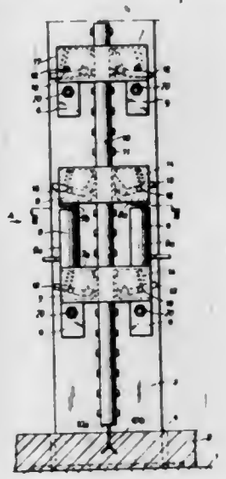
1. A valve spring retainer lock which comprises a one-piece metal tube having at least three slots extending inwardly a given distance from one end thereof and providing therebetween at least three expansible and contractible arcuate segments, said segments having inner peripheral gripping walls which are of a constant diameter along substantially their entire axial length which is equal to the inner diameter of said tube at said given distance from said one end thereof and external tapered walls diverging to the free ends of the fingers, the ends of the fingers having inturned ribs beyond the gripping walls adapted for locating the lock axially on a stem.

3,273,857
EARTH-MOVER TIRE TRANSPORTER
Charles E. Branick, % Branick Mfg. Co., Box 1937, Fargo, N. Dak.
Filed Apr. 20, 1965, Ser. No. 449,520
5 Claims. (Cl. 254—2)



1. In a device of the class described,
(a) mobile frame structure including a rear frame member and laterally spaced opposite side frame members which cooperate to define a forwardly opening tire-receiving mouth,

(b) a horizontally disposed lifting arm secured to the intermediate portion of said rear frame member and projecting forwardly therefrom and adapted to be received within the central opening of a tire casing received within said mouth when the axis of said tire casing opening is generally parallel to the axis of said lifting arm,

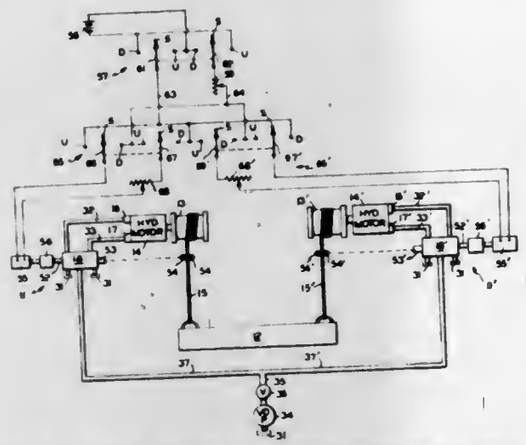


(c) means mounting and guiding said arm for raising and lowering movements,
(d) means for imparting raising movements to said arm, and
(e) means associated with said arm for imparting rotary movements to a tire casing suspended therefrom.

3,273,858
TRAILER TONGUE ELEVATOR
Franklin Woods Coburn, 81 S. Edgewood Drive, Grosse Pointe Shores, Mich.
Filed July 16, 1964, Ser. No. 383,020
4 Claims. (Cl. 254—86)

1. A trailer tongue elevator comprising
a hydraulic lifting jack including a manually-operated hydraulic pump, a hydraulic fluid reservoir, and a hydraulic reciprocatory motor hydraulically connected to said pump and reservoir,
said motor having a lifting cylinder and a supporting plunger movably mounted in said cylinder for relative reciprocation therebetween and extending downwardly from said cylinder,
a ground-engaging structure mounted on the lower portion of said plunger,
and a trailer tongue adapter structure including a jack holder connected to said jack and also including attachment means for securing said jack holder to a trailer tongue,
said jack holder including an outer tubular member surrounding said cylinder and also including means for securing said cylinder to said outer tubular member, said securing means including a sleeve connected to the upper portion of said outer tubular member and also connected to the upper portion of said cylinder, said sleeve having an opening therein and said pump being disposed above said cylinder and extending outwardly therefrom through said opening.

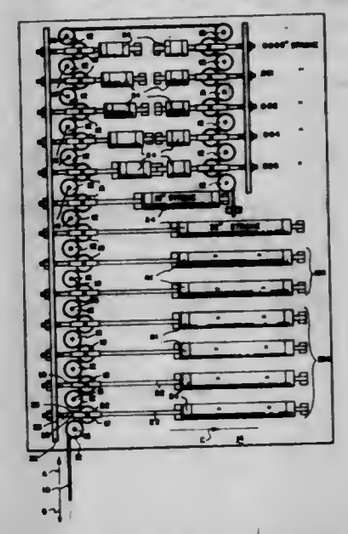
3,273,859
DEVICE FOR THE STEPWISE ELEVATION OF AT LEAST ONE STRUCTURAL MEMBER OR THE LIKE
Ernst Wälli, 3 Alpenstrasse, Arbon, Thurgau, Switzerland
Filed Oct. 28, 1964, Ser. No. 407,009
Claims priority, application Switzerland, Oct. 31, 1963, 13,381/63
15 Claims. (Cl. 254—109)



1. Device for the stepwise elevation of at least one member to be raised along a column serving as a terminal anchoring for said member, comprising at least one guide means and at least two pawl mechanisms, means for anchoring said guide means with the member to be raised, lifting means for moving said guide means, said pawl mechanisms being provided with pawl means automatically engageable with said guide means, means mounting a first of said two pawl mechanisms to said lifting means and means selectively anchoring the second of said two pawl mechanisms at different elevational positions along the column.

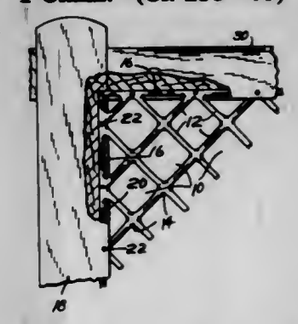
3,273,860
HYDRAULIC SYSTEM
Charles O. Weisenbach, Watertown, N.Y., assignor to The New York Air Brake Company, a corporation of New Jersey
Filed Mar. 4, 1965, Ser. No. 437,167
6 Claims. (Cl. 254—184)

1. A hoisting system comprising
(a) a plurality of winches, each adapted to reel in and pay out a cable;
(b) reversible hydraulic motors, one connected to drive each winch and each having a pair of ports, the motor causing the winch to reel in cables when one port is pressurized and to pay out cable when the other port is pressurized;
(c) a hydraulic reservoir;



(d) a discharge pressure compensated variable delivery hydraulic pump having an inlet port connected with the reservoir and to discharge port;
(e) a plurality of control valves, each connected with the two ports of one hydraulic motor and with both the discharge port of the pump and the reservoir;
(f) each control valve including a valve member movable in opposite directions from a neutral position in which it prevents communication between the pump and reservoir and hydraulically locks the associated hydraulic motor, movement of the valve member in one direction serving to open progressively flow paths between one motor port and the pump and between the other motor port and the reservoir, and movement of the valve member in the opposite direction serving to open progressively flow paths between said one motor port and the reservoir and between the said other motor port and the pump;
(g) a reversible electric motor associated with each control valve;
(h) feedback means associated with each winch and each including a rotary element which is driven at a velocity that varies with the velocity of the cable;

(i) actuating means associated with each control valve and operatively connected with the valve member and the associated rotary feedback elements and electric motor, each said actuating means being responsive to the speeds and directions of movement of the rotary feedback element and electric motor for positioning the valve member so as to maintain a predetermined proportionality between said speeds and a predetermined relationship between said directions of movement;
(j) electrical circuit means for energizing the electric motors;
(k) common control means associated with the circuit means for simultaneously and uniformly varying the speeds of all electric motors and for simultaneously reversing the directions of operation of all motors; and
(l) a plurality of independent control means associated with the circuit means, each independent control means serving to vary the speed of only one electric motor.

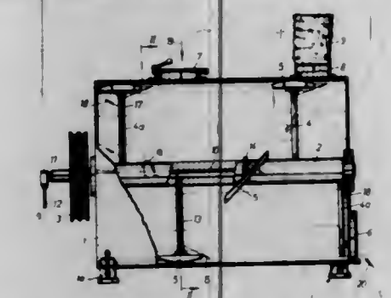


3,273,861
PRECISION POSITIONING DEVICE
Richard W. Schuff, 5026 E. Cherry Lynn Road, Phoenix, Ariz.
Filed July 6, 1964, Ser. No. 380,583
5 Claims. (Cl. 254—189)

1. In a precision positioning device the combination of: a frame; a flexible cable having one end fixed with relation to said frame; a plurality of spaced first means over which said cable is engaged; a plurality of spaced second means over which said cable is engaged, said first and second means alternately disposed between each other; actuators connected to said second means and disposed to move said second means relative to said first means for causing movement of said flexible cable relative to said

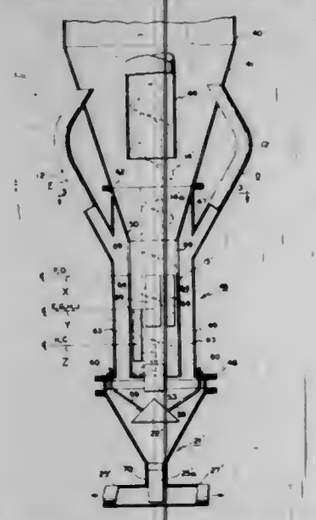
frame; and fixed stop means disposed precisely to limit movement of said actuators and said second means; a card having indicia portions thereon; switch means responsive to said indicia portions; said actuators operable in response to operation of said switch means.

3,273,862
PLASTIC PANELS FOR PLAY YARDS
Francis A. Miller, Leominster, Mass., assignor to Joseph P. Miller Co. Inc., Leominster, Mass., a corporation of Massachusetts
Substituted for abandoned application Ser. No. 178,435, Mar. 8, 1962. This application May 26, 1964, Ser. No. 371,875
1 Claim. (Cl. 256—73)



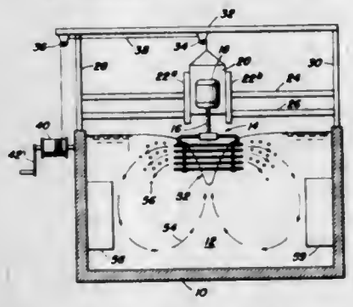
A panel comprising a molded plastic flexible reticulate one-piece member including a continuous surrounding edge bead and a plurality of mutually spaced runners connected to the edge bead and extending therefrom across the panel to other parts of the edge bead,
each runner intersecting certain other runners, the corners formed by intersecting runners and by runners and the edge bead being rounded, said rounded corners providing additional strength against rupture, the runners and edge bead being integral.

3,273,863
MIXING APPARATUS
Wilhelm Lodige, 9c Elsener Strasse, Fritz Lodige, 9b Elsener Strasse, and Josef Lucke, 13 Im Lohfeld, all of Paderborn, Germany
Filed Apr. 21, 1965, Ser. No. 449,818
Claims priority, application Germany, Apr. 24, 1964, L 47,681
7 Claims. (Cl. 259—9)



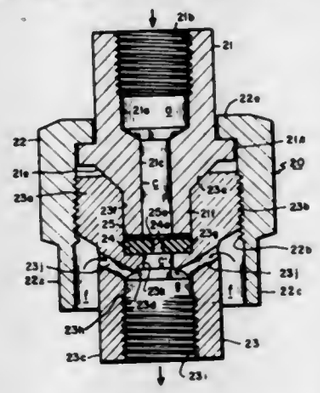
1. A mixing apparatus comprising, in combination, a cylindrical container having a closeable inlet opening

in its upper part and a closeable outlet opening in its lower part, a rotatable drive shaft extending coaxially through said container and having a central bore extending lengthwise therethrough, radially-extending supporting arms on said shaft, said supporting arms having a central bore extending lengthwise therethrough and said bores communicating with the central bore of said drive shaft, mixing means at the outer ends of said supporting arms, said mixing means extending with their outer



edges close to the inside wall of said container, nozzle means in the rear side of said arms for ejecting a jet of fluid, said nozzle means being arranged in a pipe socket at the rear side of said arms as to the direction of rotation and communicating with the central bore in said supporting arm and being arranged with their bore at an angle of about 45° both to the inner surface of said container and to the direction of rotation of said mixing means and being directed towards the outlet opening of said container.

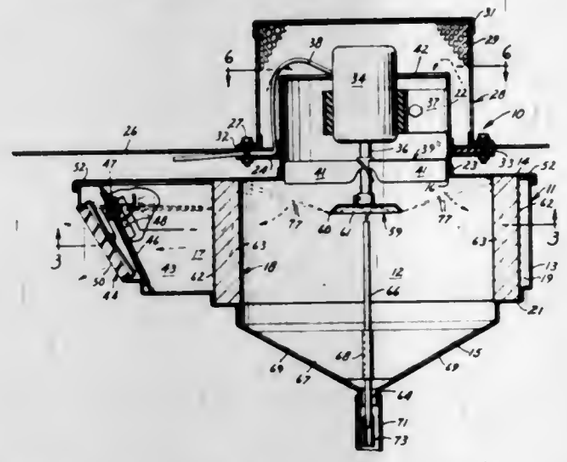
3,273,864
SOLIDS BLENDING APPARATUS
Frederick M. Thomson, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Mar. 9, 1965, Ser. No. 438,276
6 Claims. (Cl. 259—97)



1. A solids return and unloading apparatus for a solids blender having a vessel for the retention of solids to be blended, a co-axially disposed screw conveyor for solids recycle and a plurality of principal gravity-flow solids draw-offs opening into the periphery of said vessel proportioned to deliver substantially equal volumes of solids to be blended from said vessel during a given interval of time comprising, in combination, a tubular conduit enclosing the lower material input end of said screw conveyor at close clearance and defining therewith a receiver for solids to be recycled, solids throughput openings cut through the wall of said tubular conduit in open communication with individual ones of the lower ends of said principal gravity-flow solids draw-offs, individual extension gravity-flow solids draw-offs connected in open communication with said lower ends of said principal gravity-flow solids draw-offs disposed substantially co-parallel with the axis of said conveyor screw, and solids discharge means in open communication with the lower ends of said extension gravity-flow solids draw-offs.

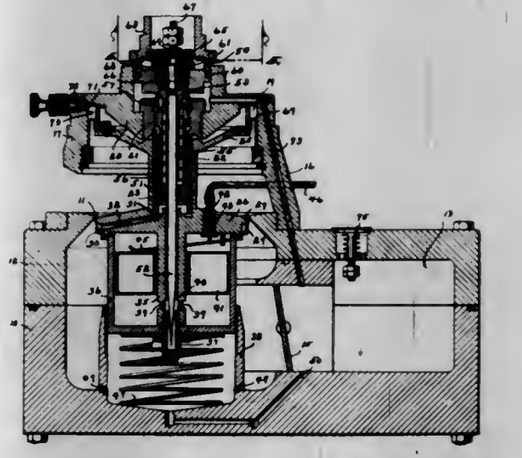
3,273,865
AERATOR
Douglas F. White, Bedminster, N.J., assignor to American Radiator & Standard Sanitary Corporation, New York, N.Y., a corporation of Delaware
Filed June 23, 1964, Ser. No. 377,350
16 Claims. (Cl. 259—108)

1. An aerator for aerating a liquid in a container exposed to the air comprising a plurality of apertured laminae having surface portions, spider means connected to at least one of the outermost apertured laminae, means for connecting each one of the remaining laminae to said outermost apertured lamina whereby said laminae are supported in parallel, axially-spaced and aligned relationship so that the apertures of said laminae define a central unobstructed cylindrical open-ended cavity, and means for rotating said spider means and thereby said laminae about a common axis of rotation at high speed so that a shear force is exerted on the liquid between the surface portions of said laminae to establish a vortex of liquid in the region defined by the apertures of said laminae, said vortex providing a constantly changing interface of air and liquid.



3,273,866
CONSTANT FLOW AERATOR AND SIPHON BREAKER
Leslie E. Lancy, Ellwood City, Pa., assignor to Lancy Laboratories, Inc., Zelienople, Pa., a corporation of Pennsylvania
Filed Mar. 12, 1963, Ser. No. 264,614
12 Claims. (Cl. 261—19)

5. A compact unitary device for aerating and supplying a conditioning liquid from a source at a substantially constant flow rate and in an aerated condition to a liquid body to be conditioned which comprises, a pair of interfitting liquid inlet and outlet body parts having cooperating portions for aligning them in a liquid-flow relation with each other, means removably-securing said body parts in an aligned assembled relation, said body parts defining a forwardly-extending venturi bore and a recessed portion within said venturi bore, said inlet



body part having an inlet chamber for supplying liquid from the source into and along said venturi bore, an outlet chamber in said outlet body part for supplying liquid to the liquid body to be conditioned, flow control means operatively-positioned in said recessed portion for supplying the liquid at a substantially constant flow rate to said outlet chamber irrespective of the pressure of the liquid introduced into said inlet chamber, a vacuum chamber associated with a forward end of said venturi bore, and air passageways inclining forwardly-inwardly through and open at their back ends outwardly from said outlet body part and open at their front ends inwardly to said vacuum chamber for aerating the liquid flowing into said outlet chamber and preventing a back-flow of the liquid from the liquid bath through the device.

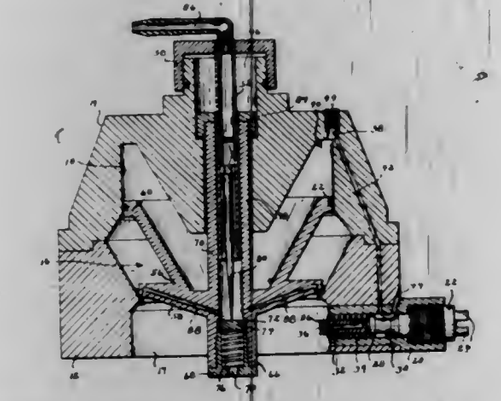
3,273,867
EVAPORATIVE AIR COOLER AND WASHER
John C. Enblom, Rochester, Minn., assignor to Crenlo, Inc., Rochester, Minn., a corporation of Minnesota
Filed Sept. 18, 1963, Ser. No. 309,628
3 Claims. (Cl. 261—29)

1. An air conditioner assembly comprising:
(a) a housing having a peripheral side wall portion, a top wall portion and a bottom wall portion,
(b) said housing further defining a gas inlet port in said top wall portion and a gas outlet port in said side wall portion,
(c) said bottom wall portion defining a drain opening,
(d) a generally tubular filter element having a vertical axis and mounted in said housing between said inlet and outlet ports and in spaced relation to said side wall portion with the opposite ends of said filter element disposed in sealing engagement with said top and bottom wall portions respectively,
(e) a vertical drive shaft journalled for rotation substantially on the axis of said filter element and having its lower end disposed intermediate the ends of said filter element,
(f) a generally horizontally disposed spreader pan having a generally circular outer edge and a concave undersurface and rigidly secured at its center to the lower end of said drive shaft for common rotation therewith,
(g) power head means for rotating said drive shaft,
(h) a reservoir for liquid coolant remote from said housing,
(i) means including a pump and a conduit extending upwardly through said drain opening for delivering a stream of liquid coolant from said reservoir and axially against said spreader pan under surface, whereby liquid coolant striking said concave spreader pan surface is driven centrifugally outwardly against said filter element responsive to rotation of said drive shaft and spreader pan, and
(j) a drain tube extending from said drain opening to said reservoir, said conduit extending longitudinally within said drain tube from said reservoir into said housing,
(k) and means for imparting movement to air from said inlet port through said filter element and outwardly through said outlet port.

3,273,868
CARBURETOR FOR INTERNAL COMBUSTION ENGINES
Glenn R. Morton, 7025 Sarpy Ave., Omaha, Nebr.
Filed Sept. 15, 1964, Ser. No. 396,532
17 Claims. (Cl. 261—39)

1. In a carburetor for internal combustion engines,
a lower carburetor housing having a top opening,
an upper housing spaced apart from said lower housing,
a vertically movable carburetor bowl in said lower housing,
a means for yieldingly holding said carburetor bowl in an upward position of its movement,
a vertically slidable spool having a lower skirt secured to said carburetor bowl and an upper skirt vertically slidable in said upper housing,
means for connecting the inside of said carburetor bowl to a source of liquid combustible fuel,
a needle valve seat associated with said carburetor bowl,
a fuel passageway in the said lower skirt of said spool having one end operatively communicating with said needle valve seat and its other end exiting at the periphery of said lower skirt,
a tapered needle valve associated with said needle valve seat,
means for holding said needle valve at least in one direction,
a valve having one side communicating with the inside of said lower carburetor housing and its other side adapted to be in communication with the intake manifold of an internal combustion engine,
and a valve adjustable passageway having one end communicating with the outside atmosphere and its other end communicating with the inside of said upper housing above the upper skirt of said spool.

3,273,869
CARBURETOR MEANS FOR INTERNAL COMBUSTION ENGINES
Glenn R. Morton, 7025 Sarpy Ave., Omaha, Nebr.
Filed Aug. 19, 1963, Ser. No. 302,925
10 Claims. (Cl. 261—40)



1. In a carburetor means for internal combustion engines,
a carburetor housing having an upper bore and a lower compartment area;

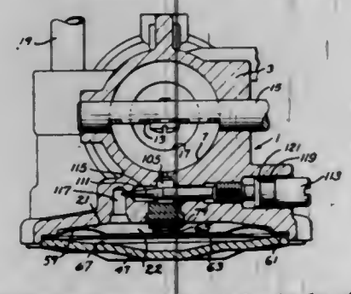
said lower compartment area adapted to be in communication with the intake manifold of an internal combustion engine,

throttle valve means slidably mounted in the bore of said housing and adapted to adjustably restrict the entrance to said lower compartment area,

an air inlet port communicating with the inside of said carburetor housing at a point located above the entrance to said lower compartment area,

a passageway means in said carburetor housing having one end communicating with the lower compartment area of said carburetor housing and its other end communicating with the upper bore of said carburetor housing and above said throttle valve means,

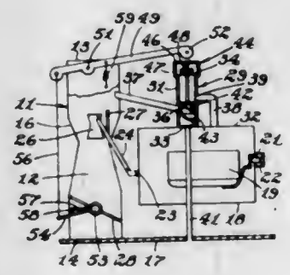
a manually adjustable valve means imposed in said passageway means, a conduit means having one end adapted to be in communication with a source of ignitable fluid, and its other end in communication with the lower area of said carburetor housing,



a valve seat imposed in said conduit means,

means mounting a reciprocating needle valve extending into said valve seat,

and a means associated with said throttle valve means for progressively moving said needle valve in a direction away from said valve seat when said throttle progressively moves upwardly;



said manually adjustable valve means being also in communication with the outside atmosphere and capable at one position of its movement of permitting outside air to pass into the passageway in which it is imposed.

3,273,870
CARBURETOR
Eldon A. Johnson, deceased, late of St. Louis County, Mo., by Dolores Johnson, administratrix, St. Louis County, Mo., assignor to ACF Industries, Incorporated, New York, N.Y., a corporation of New Jersey
Filed Jan. 11, 1965, Ser. No. 424,856
5 Claims. (Cl. 261—41)

1. A carburetor comprising a body having a fuel and air mixture conduit, said body having, a fuel chamber and a fuel inlet passage extending to said fuel chamber, an inlet valve in said fuel passage, a diaphragm formed of flexible material extending across said chamber, said diaphragm having; a center hole and an annular preformed loop molded therein concentric with said hole, a plate secured to one surface of the diaphragm and having a button projecting through said hole in said diaphragm, valve operating means including an arm connected to said inlet valve and operable by said button for operation of said inlet valve in response to movement of said diaphragm to regulate delivery of fuel through said fuel passage to said chamber, said body having a fuel passageway formed between said fuel chamber and said fuel and air mixture conduit for transfer of fuel from said chamber to said mixture conduit, a gasket secured to said diaphragm at its margin, a cover plate clamped against the peripheral margin of said diaphragm and engaging said gasket outwardly of said loop to hold said diaphragm in position in said chamber, a portion of said cover plate constituting a stop engageable by said diaphragm plate to limit outward movement of said diaphragm plate and outward flexing of said diaphragm and, means adhesively bonding said diaphragm plate and said gasket to said diaphragm.

3,273,871
CARBURETOR VAPOR VENTING DEVICE
Albert H. Winkler, Elmira, N.Y., assignor to The Bendix Corporation, Elmira Heights, N.Y., a corporation of of Delaware
Filed Mar. 22, 1963, Ser. No. 267,254
5 Claims. (Cl. 261—43)

1. A carburetor for an internal combustion engine, comprising:

a mixture passage;

a fuel reservoir;

means for supplying fuel from the reservoir to the mixture passage in accordance with the quantity of air flow through the mixture passage;

a throttle valve in the mixture passage, said throttle valve adapted for movements between closed and opened positions for controlling the fuel-air mixture discharged from the mixture passage;

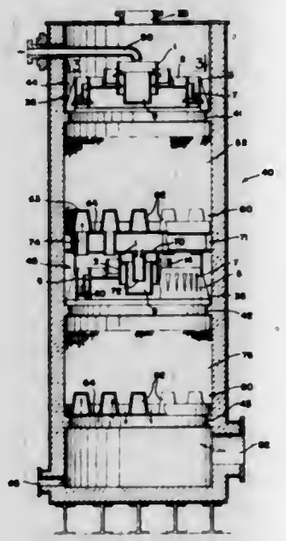
a source of vacuum;

a housing member;

a first port in the housing, including a valve member, communicating with the atmosphere;

a second port in the housing communicating with the mixture passage;

means for communicating between the reservoir and the housing;

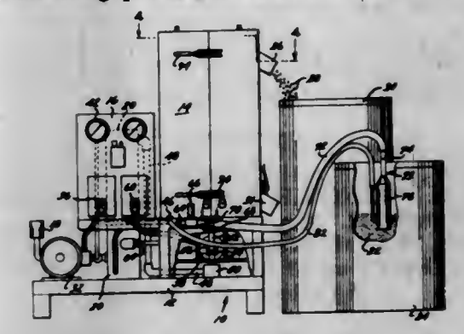


a suction actuated member slidably supported in the housing, said suction actuated member adapted to open one of the ports and to concomitantly close the other of the ports;

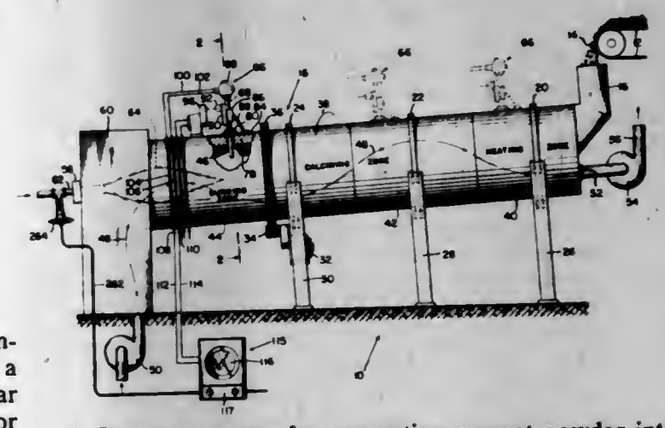
means communicating vacuum from the source of vacuum to the housing with a predetermined value of communicated vacuum adapted to motivate the suction actuated member;

means for asserting a biasing force on the suction actuated member in opposition to the force exerted by the predetermined value of communicated vacuum whereby said member opens the first port and closes the second port; and,

throttle control means for overcoming the biasing force on the suction actuated member whereby said member closes the first port and opens the second port when the throttle valve is opened a predetermined amount and the vacuum from the source of vacuum is below the predetermined value and insufficient to motivate said member, said control means including a loose lever means and a pick-up lever means for engaging said loose lever means.



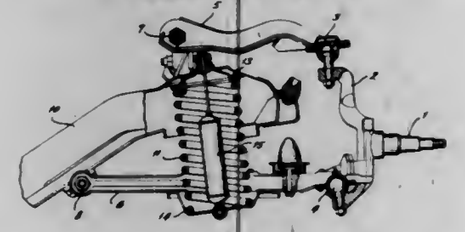
3,273,872
DISTRIBUTOR PLATE
John S. Eckert, Silver Lake, Ohio, assignor to The United States Stoneware Company, Tallmadge, Ohio, a corporation of Ohio
Filed Jan. 28, 1963, Ser. No. 254,189
9 Claims. (Cl. 261—96)



1. A distributor plate which comprises at least two concentric circular weir walls, each wall having therein a series of downwardly narrowing openings, an annular floor between the walls and contacting each, with the floor contacting the first wall below the openings therein and contacting the second wall at a position between the tops and the bottom of the openings therein whereby when liquid is on the floor the bottoms of the downwardly narrowing openings restrict and regulate the amount of liquid which flows through the first wall while liquid is simultaneously flowing through the upper parts of the openings in the second wall.

3,273,873
APPARATUS FOR DRY HEAT PRE-EXPANSION OF EXPANDABLE POLYSTYRENE AND LIKE PRODUCTS
Ivan J. Stanchel, 10740 Cumpston St., North Hollywood, Calif.
Filed Nov. 13, 1962, Ser. No. 237,081
3 Claims. (Cl. 263—26)

1. Apparatus for expanding polystyrene beads comprising: a housing in which said beads are expanded, said housing having an encompassing sidewall, a closed top and a closed bottom wall; an outlet port in said housing adjacent its top through which the expanded beads are discharged; an inlet port in said bottom wall through which unexpanded beads enter said housing; air distribution means located in said housing for establishing a dry-heat zone therein and for suspending said beads within said housing; an agitator rotatably mounted in said housing superjacent said material inlet port for moving said beads in suspended condition through said dry-heat zone to said outlet port; means for rotating said agitator, said air distribution means connected to said agitator adjacent the lower end thereof for rotation therewith and directing pre-heated moisture free air into unexpanded beads entering said housing, a second supply of pre-heated air, and an aspirator connecting said inlet port and said second air supply to a supply of unexpanded beads for drawing said beads into said housing.



3,273,874
CONTROLLING APPARATUS
Ernest Hucke, Glenside, Pa., assignor to Honeywell Inc., a corporation of Delaware
Filed Dec. 12, 1963, Ser. No. 330,166
2 Claims. (Cl. 263—33)

1. In an apparatus for converting cement powder into cement clinker which comprises a cement powder drying kiln having a silicon carbon wall, a driving means operably connected to rotate the kiln, a cement powder supply duct communicating with one end of the kiln, means for introducing a flow of air into the other end of the kiln, a burner for introducing a flame into the last-mentioned end of the kiln to heat the air and cement clinker, an outlet at the last-mentioned end of the kiln to remove clinker therefrom, the improvement comprising a self-cleaning temperature-sensing probe having a hollow elongated well portion operably mounted on the outer wall of the kiln and for physical surface-to-surface non-rotatable sliding contact with a silicon carbon wall portion of said kiln that forms an opening therein, a potentiometric measuring and indicating means comprising a temperature-sensing element positioned in the well to sense the temperature through an inner closed end thereof, a controller operably connected with the temperature-sensing element to produce a control signal whose magnitude is varied in accordance with changes occurring in the temperature sensed by the probe, electromechanical means operably connected with the well portion, to intermittently move the probe and its temperature-sensing element through the wall portion toward and away from the center of the kiln toward an in-kiln position in which a tip of the inner closed end of the well and a portion of its side wall extending therefrom are exposed to the atmosphere within the kiln and an out-

of-kiln position in which only the tip is exposed to the cement powder being processed into clinker while the kiln is being moved by the kiln rotating means, and said controller being operably connected to the burner to transmit the control signal thereto to alter the intensity of the flame thereof in accordance with the magnitude of the signal when the well and its temperature-sensing element is positioned in its out-of-kiln position.

3,273,875
SHOCK SPRING KIT FOR FRONT SUSPENSION
Janis Dumpis, St. Ann, Mo., assignor to Champ-Items, Inc., St. Louis, Mo., a corporation of Missouri
Filed Dec. 11, 1963, Ser. No. 329,707
5 Claims. (Cl. 267—8)

1. The combination with a telescoping type of shock strut having a cylindrical body with a closed lower end, a lower end support on said body of a width to project outwardly of said body, a neck of smaller diameter than said body between said lower end support and the closed lower end of said body, a reciprocating stem smaller in diameter than said cylindrical body and projecting axially of said cylindrical body opposite from said lower end support, and an upper end support on said stem wider than said stem, of

(a) a coil spring with an internal diameter to slip freely over said cylindrical body from said stem end,

(b) a spring seat for one end of said coil spring mounted on said stem,

(c) a cup having a circular spring seat for the other end of said coil spring disposed around and in spaced relation to the cylindrical body of said shock strut, said cup being apertured to surround said neck, and

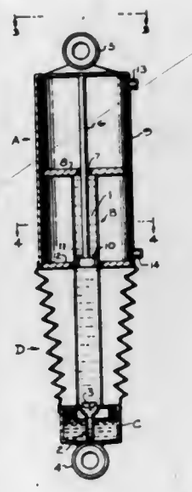
(d) wedging means for said cup engaging said lower end support and clamping said cup in position on said shock strut with the inside of said cup pressed axially of said shock strut against the bottom of said cylindrical body to firmly position said cup with respect to said shock strut and provide a stable spring seat.

3,273,876
ADJUSTABLE SHOCK ABSORBER AND AUTOMATIC CONTROL MECHANISM THEREFOR
Jerry M. Hannan, San Rafael, Calif.
Continuation of application Ser. No. 393,024, Aug. 31, 1964. This application July 1, 1965, Ser. No. 471,786
18 Claims. (Cl. 267—11)

1. The combination with a hydraulic shock absorber including:

(a) a cylinder filled with liquid;

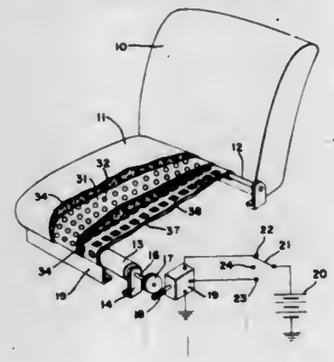
(b) a piston having bleed passages therein and being slidable in said cylinder;



(c) a piston rod secured to said piston and having its free end projecting from one end of said cylinder;

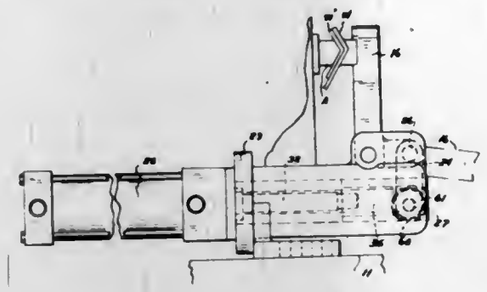
(d) means for receiving any excess fluid from said cylinder as said piston rod moves into said cylinder and for returning it as the rod is moved out of the cylinder; and

(e) attaching means at the free end of said rod and at the end of said cylinder disposed opposite to the end from which said rod extends for securing said shock absorber to two relatively moving parts of a vehicle; of



(f) an air-receiving cylinder having a diameter greater than the diameter of said hydraulic cylinder; said air cylinder having an end slidably receiving said hydraulic cylinder and having its other end secured to said piston rod;

(g) the end of said hydraulic cylinder received in said air cylinder having an outer diameter equal to the inner diameter of the air cylinder and being slidable in the air cylinder and functioning as a second piston to divide the air cylinder into two compartments; and



(h) ports at the ends of the air cylinder and communicating with said compartments, whereby air entering one of said compartments will enlarge it and cause movement of said second piston in said air cylinder toward the end of said air cylinder that slidably receives said hydraulic cylinder for increasing the effective length of said hydraulic shock absorber, and air entering the other compartment will cause the said second piston to move toward the opposite end of said air cylinder for decreasing the effective length of said hydraulic shock absorber.

3,273,877
SEAT STRUCTURE
Rodger E. Geller and Harry Otto Waag, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 26, 1965, Ser. No. 450,923
3 Claims. (Cl. 267—89)

1. Seat structure for vehicle installation, comprising, in combination, transverse support means including opposite elevated portions, a bottom diaphragm portion that extends across said support means, a polymer foam means on said bottom diaphragm portion, a further perforated diaphragm portion embedded in said polymer foam means and also extending across said support means, and rotatable means at one of said elevated support portions through which both said diaphragm portions are secured as a "winding" device for the purpose of adjusting firmness of said polymer foam means with said diaphragm portions.

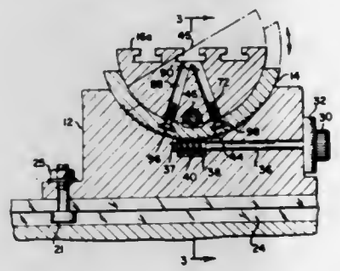
3,273,878
POWER CLAMP
Leland F. Blatt, Grosse Pointe Woods, Mich. (24121 Mound Road, Warren, Mich.)
Filed Mar. 11, 1964, Ser. No. 351,005
4 Claims. (Cl. 269—32)

1. A unitary clamping means including a horizontally arranged rectangular cross-sectional tube having a closed end and an open end;

a tube rod in said tube passing through its closed end;

pneumatic means unitary with said tube and having a piston rod connected to said tube rod for moving the tube rod along its axis and the axis of the tube;

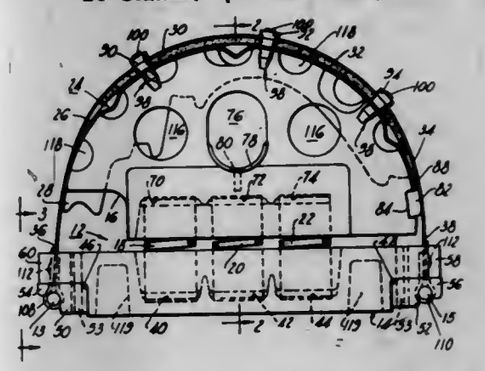
a carrier secured to said tube rod adjacent the open end of the tube and disposed in the tube for reciprocating movement therein;



a clamp;

means pivotally connecting the carrier to the clamp;

said carrier being of rectangular cross-section and substantially completely filling said tube to provide an air cushion in said tube to the side of said carrier between the carrier and the closed side of the tube; and



friction reducing guide rollers on and carried by said carrier enabling frictionless reciprocation of said carrier in said tube.

3,273,879
COMPOUND SINE PLATE
Olaf J. Floren, 8331 West Ave., E–12, Lancaster, Calif.
Filed Sept. 13, 1963, Ser. No. 308,891
6 Claims. (Cl. 269—61)

1. A universal holder for supporting a work-piece during processing comprising: a base block defining a concave spherical surface; a concave-convex spherical shell mating in said concave spherical surface of said base block; means for clamping said shell to said base block in various locked positions of angular displacement of said shell about one axis of rotation; a first gearing means for driving said shell about said one axis of rotation; a spherically convex work-holder mating within the concave surface of said shell; means for clamping said work-holder to said shell in various locked positions of angular displacement about an other axis which is in space quadrature with said one axis; and a second gearing means for driving said work-holder about said other axis.

3,273,880
BRAKE SHOE AND LINING HOLDING FIXTURE
Alfred Wesstrom and John K. Nice, South Bend, Ind., assignor to The Bendix Corporation, South Bend, Ind., a corporation of Delaware
Continuation of application Ser. No. 246,261, Dec. 20, 1962. This application June 4, 1964, Ser. No. 372,654
10 Claims. (Cl. 269—254)

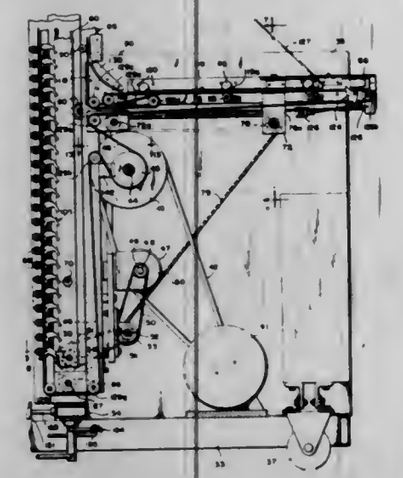
5. A holding fixture for use in bonding brake lining to a brake shoe comprising:

a base member;

an upper member having a portion adapted to support a brake shoe and associated brake lining;

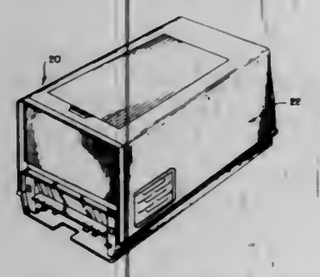
a pressure member provided with end portions secured to said base member, at least one of which end portions is readily detachable from said base member to permit movement of said pressure member relative to said base member for loading and unloading said brake shoe and associated lining relative to said upper member supporting the same; said upper member and said pressure member being so positionable one with respect to the other as to receive said brake shoe and associated lining therebetween;

and resilient means operatively connected to said base member and said upper member for urging the same apart to load said pressure member and compress said lining against said shoe.



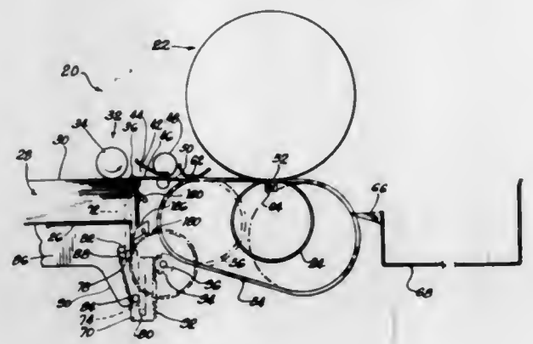
3,273,881
WELDING CRUTCH
Jeffrey N. Kiefer, 1836 Da Cola Shores Road, Conesus, N.Y.
Filed Nov. 19, 1963, Ser. No. 324,612
10 Claims. (Cl. 269—321)

1. A welding crutch comprising an elongated arm including a laterally directed portion on one end adapted to be engaged by a portion of a worker's body such as his arm or leg for the purpose of applying axial thrust to said arm, said elongated arm including guide means adapted to support and slidingly engage a length of welding rod with said rod generally paralleling said arm and projecting outwardly beyond the other end of said arm, said elongated arm further including gripping means adapted to grip said rod and to prevent axial shifting of said rod relative to said arm, whereby the extended end of said rod, secured to a patching plate behind a hole in



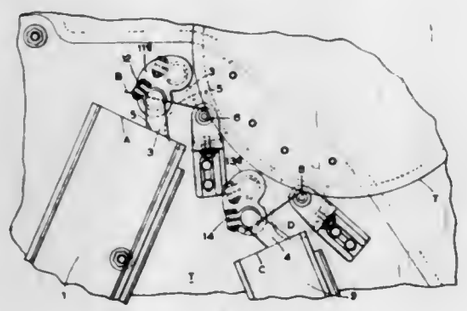
a piece of sheet metal or the like, may have axial thrust applied thereto through said arm to pull said patching plate into light frictional engagement with the rear surfaces of said piece of sheet metal while said workman utilizes his two hands to support a torch and a fusing metal rod to tack said patching plate to said piece of sheet metal to close said hole.

3,273,882
SHEET COLLATING DEVICE
Bernard A. Pearson, Seattle, Wash., assignor to Norfin, Inc., Seattle, Wash., a corporation of Washington
Filed May 23, 1963, Ser. No. 282,692
15 Claims. (Cl. 270—58)



1. In combination, a pair of laterally spaced endless conveyor tapes having gradually diverging generally horizontal travel courses and gradually diverging upward travel courses, said tapes being closer together at the lower ends of their upward travel courses than at the divergent ends of their horizontal travel courses, guide means for guiding said tapes in converging courses from the divergent ends of their horizontal courses to the lower ends of their upward travel courses, means for moving said tapes along said courses in the direction of divergence of the horizontal and upward travel courses, and means for holding a thin flexible sheet against said tapes to convey it and at the same time laterally tension it by said tape divergence.

3,273,883
PAPER FEED APPARATUS HAVING STACK SELECTING MEANS
Roger Baronnie, Park Ridge, Ill., assignor to SCM Corporation, New York, N.Y., a corporation of New York
Filed May 1, 1964, Ser. No. 364,249
5 Claims. (Cl. 271—9)



1. Apparatus for storing and feeding paper sheets comprising a paper storage compartment having a floor and an exit slot, feeding means normally adapted to engage and move through said slot the topmost one of a first stack of paper supported on said floor, shelf means movably mounted for supporting a separate second stack of paper within said compartment above said first stack, said shelf means being movable to selectively position said second stack in position to be engaged by said feed means or permit said feed means to engage said first stack.

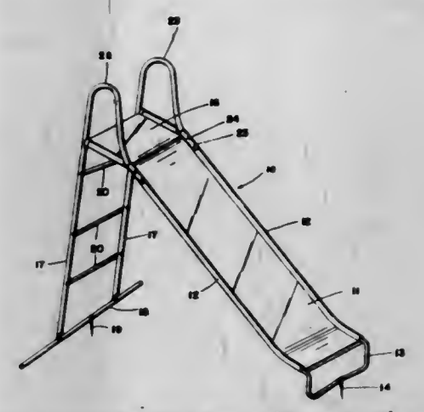
3,273,884
AUTOMATIC STOP MECHANISM FOR ARRESTING MANUAL RAISING OF FEED TABLES
George J. Zahradnik, North Riverside, Ill., assignor to A. B. Dick Company, Niles, Ill., a corporation of Illinois
Filed May 27, 1964, Ser. No. 370,584
15 Claims. (Cl. 271—22)

2. In a mechanism for handling sheets, the combination comprising a table for holding a stack of the sheets, means supporting said table for raising and lowering movement, a manually rotatable shaft having an operative connection to said table for raising said table, a stop ratchet wheel on said shaft, a stop pawl movable against said ratchet wheel for arresting the raising movement thereof, an element engageable by and movable upwardly with the top of the stack on said table, and means operable by upward movement of said element for moving said stop pawl into engagement with said ratchet wheel.

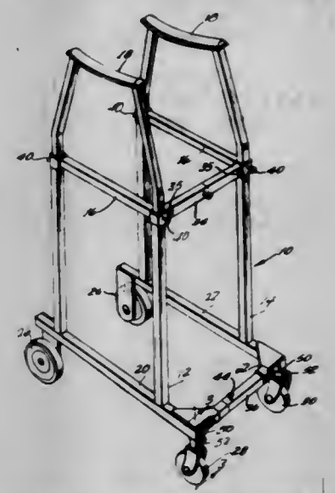
3,273,885
MECHANISM FOR SEPARATING SHEETS OF FLEXIBLE MATERIAL FROM A PACK OR STACK THEREOF
Dennis Stanley Silver, London, England, assignor to Purdy Machinery Company Limited, London, England
Filed June 22, 1964, Ser. No. 376,961
11 Claims. (Cl. 271—27)

1. A labelling machine including a stationary magazine for holding a pack of labels, a surface arranged to circulate uniformly for receiving labels uniformly and

transferring them to a position at which they are to be applied to objects, a picking head mounted to oscillate to-and-fro along a predetermined path between a first limit position of travel adjacent the magazine at which the picking head picks a label from the pack, and a second limit position of travel adjacent the surface at which the picking head delivers the label to the surface, retaining means for causing each label to adhere to said picking head at said magazine and for releasing the label for attachment to said surface, and a driving means for imparting oscillating movement to said picking head between said first and second limit positions, said driving means comprising, an eccentric device mounted to rotate uniformly about a fixed axis, a linkage means for connecting said eccentric device to said picking head to convert the rotary movement of said eccentric device into oscillating movement of said picking head, said eccentric device defining two dead center positions during each revolution at which the said linkage means and the picking head momentarily stop while reversing their direction of travel, the movement of said picking head being directly, positively responsive, through the said linkage means to the movement of the said eccentric device and the said first and second limit positions of the picking head occurring when the eccentric device is at the dead center positions.



3,273,886
REVERSE TRANSPORT FOR FLEXIBLE SHEETS
Ruel E. Taylor, Jr., South Windham, Maine, assignor to S. D. Warren Company, Boston, Mass., a corporation of Massachusetts
Filed Dec. 9, 1964, Ser. No. 417,182
6 Claims. (Cl. 271—45)

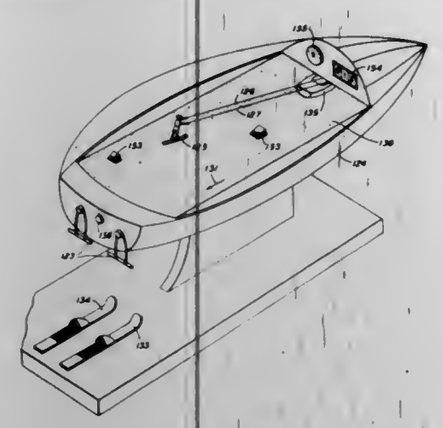


1. A reverse transport for flexible sheets comprising a first tape transport having a bottom run extension along which sheets delivered by said first tape transport travel without underlying support, a second tape transport having a top run underlying said bottom run and converging therewith to place said top and bottom runs in substantially the same plane at the end of said extension, said top run traveling in the direction opposite to the direction of said bottom run, and means located in the region near said end of said extension for transferring said flexible sheets traveling in one direction with said bottom run to said top run of said second tape transport to be traveling in the opposite direction on said top run of said second tape transport.

3,273,887
PLAY SLIDE
Daniel P. Grudoski, Hartstown, Pa., assignor to Blazon, Inc., Akron, Ohio, a corporation of Ohio
Filed Apr. 14, 1964, Ser. No. 359,570
4 Claims. (Cl. 272—56.5)

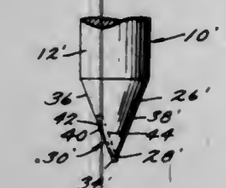
1. A play slide comprising an inclined bed portion and an integrally formed, substantially horizontal platform portion, a pair of ladder rails, first means connecting said ladder rails to one end of said platform portion, said ladder rails having end portions that extend in the direction of said inclined bed portion, second means connecting said end portions to said bed portion at the juncture between said bed portion and its integrally formed, substantially horizontal platform portion, said first and second connecting means being the only connection between said rails and said platform and bed portions.

3,273,888
ADJUSTABLE INVALID WALKER
Charles Lester Burns, Rte. 3, Unionville, Mo.
Filed Dec. 16, 1964, Ser. No. 418,694
4 Claims. (Cl. 272—70.4)



1. An adjustable invalid walker comprising a left frame and a right frame of complementary construction, including a pair of fore and aft supporting wheels and an arm pad on each frame, the forward pair of said wheels being swivel mounted, the rear pair of said wheels being fixedly mounted, means adjusting the height of the arm pad on each frame, means mounting said frames for horizontal movement relative to each other for varying the width between the frames, means mounting said frames for pivotal movement relative to each other whereby the tops of said frames can move toward each other and the bottoms of said frames can move apart and alternatively the tops can move away from each other and the bottoms toward each other, means for securing said frames in selected positions of said horizontal movement, and means for securing said frames in selected positions of said pivotal movement.

3,273,889
GAME APPARATUS FOR SIMULATING SKIING
Robert L. Brass, Colts Neck, and Alexander Feiner, Holmdel, N.J., assignors to Orbicon, Ltd., New York, N.Y., a corporation of New York
Original application Dec. 6, 1961, Ser. No. 157,354, now Patent No. 3,159,400, dated Dec. 1, 1964. Divided and this application Apr. 8, 1964, Ser. No. 358,327
10 Claims. (Cl. 273—1)



1. A game comprising an endless moving surface, an elongated member positioned on said surface, means in-

cluding at least one of said surface and said elongated member for causing said member to be subjected to a varying amount of frictional resistance depending on the direction of motion of said member relative to the direction of motion of said surface, a control element,

indirect mechanical linkage means coupling said control element to said elongated member and including at least one cross-coupling member, and means for imparting to said cross-coupling member a motion independent of said control element.

3,273,890
GOLF TEE HAVING WRITING MATERIAL PROTRUDING FROM THE LOWER PORTION THEREOF
William J. Williams, P.O. Box 279, Owensboro, Ky.
Filed July 2, 1965, Ser. No. 469,296
8 Claims. (Cl. 273—33)

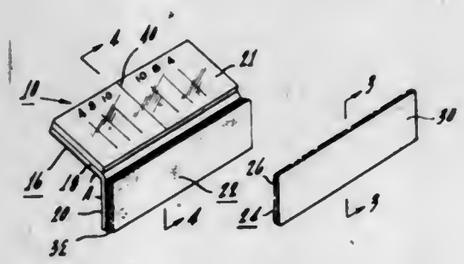
1. A golf tee comprising: an elongated body region; means defining a golf ball support at one end of said elongated body region; means defining a tapered region adjacent and leading to the other end of said elongated body region, the smaller diameter end of said tapered region being farthest from said other end; and a piece of writing material mounted in said tapered region, part of the exterior of said piece of writing material being exposed in said tapered region whereby said piece of writing material can be rubbed against a score card to record scores; the tapered region being defined by a generally frustoconically curved outer peripheral surface, and said piece of writing material comprising a rod of pigment and binder having the longitudinal axis thereof canted with respect to the longitudinal axis of said golf tee thereby exposing said rod above said tapered region smaller diameter end.

3,273,891
GOLF CLUB ATTACHABLE MIRROR DEVICE FOR DETERMINING PUTTING DISTANCES
Earl D. Grim, Jr., 6 Chestnut Terrace, Cherry Hill Township, Camden County, N.J.
Filed Aug. 13, 1963, Ser. No. 301,707
1 Claim. (Cl. 273—163)

A golf practice device adapted to be demountably attached to a substantially smooth continuous surface on the head of a golf club on any material without any alteration of said golf club, said continuous surface being other than the ball striking surface of said head, said device comprising, in combination:

an integral bracket comprising two planar parts disposed to form a dihedral angle therebetween,

a mirror on one of said planar parts,



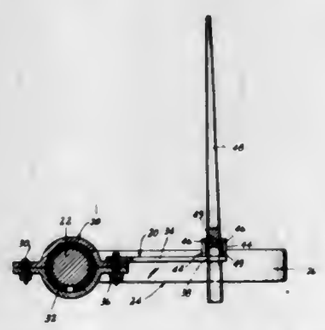
first and second detachably interlockable bracket mounting materials,

said first material comprising an adhesive for mounting it on the other of said planar parts,

said second material comprising an adhesive for mounting it on said continuous surface,

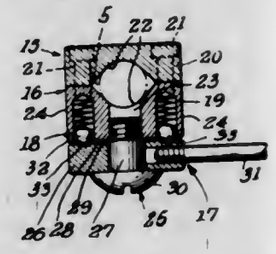
said first and said second materials being adapted to stick to each other, whereby said bracket can be adhered to said head,

said dihedral angle being such that said mirror makes an angle of substantially 225° with said striking surface when said bracket is adhered to said head,



lines on said mirror, said lines being calibrated to indicate the distance said golf ball is from said mirror when said golf ball, at a distance from said mirror, is viewed in said mirror, said lines being disposed in pairs symmetrically about a center line, each pair of symmetrically disposed lines being spaced to indicate a different distance said golf ball is from said mirror when the image of said golf ball in said mirror is included between a respective pair of lines,

numbers associated with said pairs of lines and corresponding to said distances, and



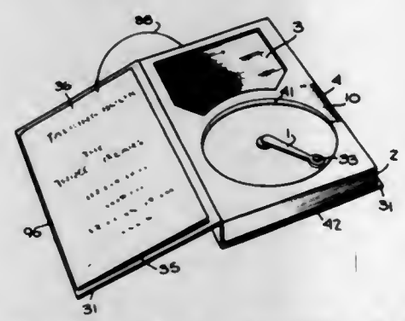
said second material being completely removable from said continuous surface of said head so that said golf club is preserved in its original condition when said material is removed therefrom, whereby said golf club may be any conventional club suitable for use in games wherein alterations in a club are forbidden.

3,273,892
GOLF PUTTER SIGHTING ATTACHMENT
Ray E. Nolting, Rte. 3, Box 400, Chesterfield, Mo.
Filed Jan. 6, 1964, Ser. No. 335,827
1 Claim. (Cl. 273—163)

In combination, a putting aid for attachment to a putter comprising a bracket including means for gripping a putter shaft, a pointer, and linkage depending from said bracket, said pointer being pivotally suspended from the lower end of said linkage, said linkage having attached to its lower end means supporting opposed trunnions, said trunnions being spaced from the linkage, said pointer including means pivotally receiving said trunnions, said trunnions and linkage being formed to permit said pointer to pivot from horizontal use position to vertical inoperative position, said pointer having a portion which extends rearwardly of the trunnions and is adapted to bear against the linkage when such pointer is in its horizontal use position.

3,273,893
PUTT-ALIGNING DEVICE
John B. Duncan, Woodland Hills, Calif., assignor of one-third to James D. Easton, Van Nuys, Calif.
Filed Aug. 11, 1964, Ser. No. 388,897
1 Claim. (Cl. 273—163)

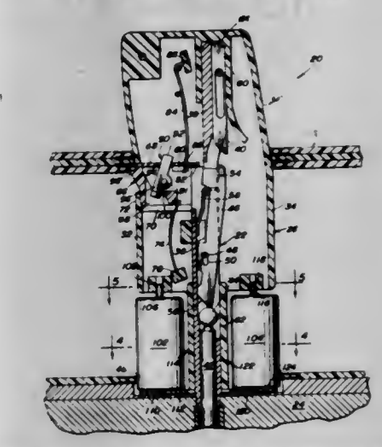
In a putt-aligning device having a mounting body adapted to encircle the shank of a putter and be clamped thereto,



(a) a shoulder extending from a face of said body,

(b) a pointer unit rotationally mounted on said shoulder and provided with an elongated indicator that extends radially from the axis of said shoulder, and

(c) detent means interengaging the body and pointer unit to releasably engage the latter and retain the same in a selected set angular position relative to the shank on which the body is clamped,

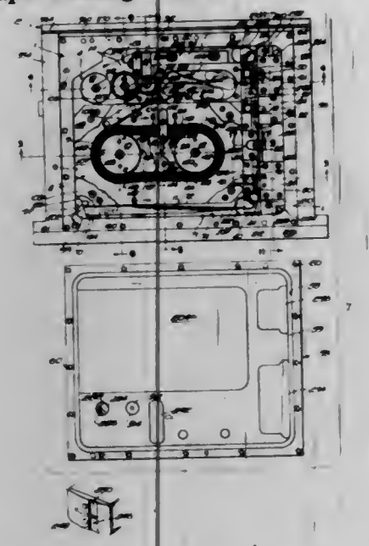


(d) said detent means comprising a plurality of seats formed in the pointer unit adjacent the shoulder and at least two spring-biased balls carried by the body and directed to enter said seats according to the selected angular position above mentioned.

3,273,894
TALKING BOOK APPARATUS
Phillip E. Clawson, San Leandro, Calif., assignor to Nial K. Castle and Kay Janet Castle
Filed July 5, 1963, Ser. No. 292,981
14 Claims. (Cl. 274—9)

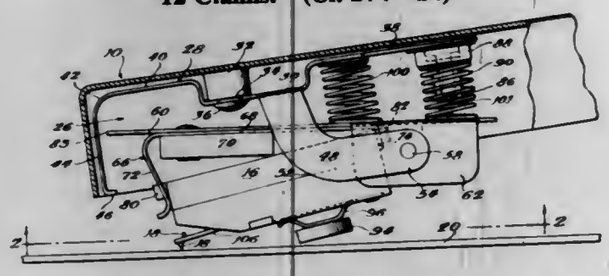
1. A talking book apparatus comprising: a generally flat housing having upper and lower covers hinged thereto, said housing and covers being configured to simulate a book; a booklet having a plurality of pages mounted on the inner face of said upper cover and having a story printed thereon; a record in said housing having said story recorded thereon in voice pronounciation of the words printed in said booklet; means in said housing for reproducing the sound recorded on said record; and manually operable drive means for said record and reproducing means accessible to an operator from the top of said housing and only when said upper cover is open whereby an operator may manipulate said booklet pages while reading the story material thereon and simultaneously operate said record and reproducing means to reproduce the recorded sound of said story material in synchronism with the reading thereof.

3,273,895
ADAPTER SPINDLE FOR RECORD CHANGERS
Richard W. Simpson, Stevensville, Mich., assignor to V-M Corporation, Benton Harbor, Mich., a corporation of Michigan
Filed Nov. 22, 1963, Ser. No. 325,690
18 Claims. (Cl. 274—10)



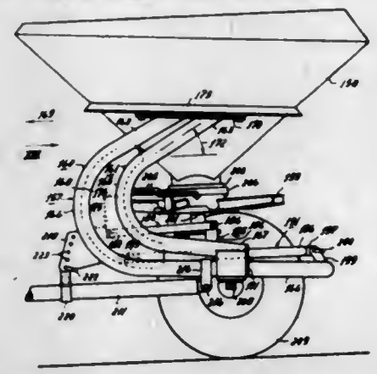
1. In an adapter spindle of the type designed to slip over a small diameter center spindle of a record changer for supporting a stack of large centerhole records and for dropping such records one at a time to a turntable for playing, which small diameter center spindle is of the type having record ejecting means embodied therein, the improvement comprising, in combination, an adapter housing having an aperture in one side thereof, record feeding means mounted in said housing and movable horizontally so as to project outwardly of said housing through said aperture, said horizontally movable record feeding means consisting of a single record supporting shelf member and a single separator blade member disposed above said shelf, said shelf being slidably mounted in said housing for movement between a normal extended operative position wherein it is adapted to support a stack of records on said adapter spindle and a retracted inoperative position, said separator blade being slidably mounted in said housing above said shelf for movement between a normal retracted inoperative position and an extended position wherein it is adapted to project between the lowermost and the next-to-lowermost records in a stack of records supported on said adapter spindle, said blade being positioned in the path of movement of said ejecting means of said small diameter spindle so as to be engageable and movable thereby to its extended position, and reverse motion translating means interconnecting said blade and said shelf for moving said shelf to its retracted position when said blade is moved by said ejecting means to its extended position.

3,273,896
TAPE RECORDER AND TAPE STORAGE MAGAZINE THEREFOR
Paul F. Maeder, Rumford, East Providence, R.I., assignor, by mesne assignments, to Leesona Corporation, Warwick, R.I., a corporation of Massachusetts
Original application Feb. 17, 1960, Ser. No. 9,264, now Patent No. 3,155,335, dated Nov. 3, 1964. Divided and this application May 10, 1963, Ser. No. 279,397
4 Claims. (Cl. 274—11)



1. A transducing head for a data storage mechanism having a tape contacting surface, said surface having a recess extending across its face transversely to the direc-

tion of tape travel, the walls of said recess forming with the tape a fluid flow passage, one side of which is formed by the tape, the leading end of said one side with respect to the movement of the tape forming with a first wall of said recess adjacent said leading end a first angle, the trailing end of said one side with respect to the movement of the tape forming with a second wall of said

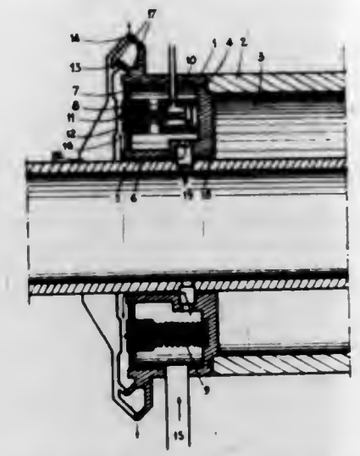


recess adjacent said trailing end a second angle which is substantially smaller than said first angle whereby said passage diverges in the direction from the trailing end to the leading end thereof and the flow of fluid from the trailing end of said passage to the leading end thereof caused by said tape movement creates a suction on said tape.

3,273,897
PHONOGRAPH WITH NOVEL TONE ARM AND PICKUP CARTRIDGE ASSEMBLY
Gerrald K. Farrington, Niles, and Harold F. Mosier, Jr., Buchanan, Mich., assignors to Electro-Voice, Incorporated, Buchanan, Mich., a corporation of Indiana
Filed June 13, 1963, Ser. No. 287,545
12 Claims. (Cl. 274—24)

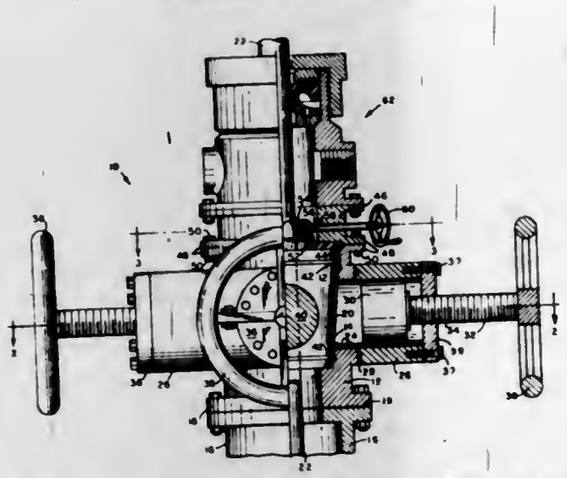
10. An assembly adapted to be mounted on the tone arm of a phonograph for reproducing grooved records comprising a carriage and a pickup cartridge mounted on the carriage having a stylus adapted to follow a record groove extending from the cartridge, said carriage including a bracket adapted to be mounted in a fixed position on the phonograph tone arm, an elongated plate mounted on the bracket for pivotal movement relative to the bracket about an axis disposed in a plane parallel to the plane of the record groove when the tone arm is in playing position, the axis of elongation of the plate being disposed normal to the pivotal axis, the cartridge being mounted on the side of the plate adapted to confront the record and on one side of the pivotal axis with the stylus disposed in a plane normal to the pivotal axis and depending from the cartridge for engaging a record, stop means operatively associated with the carriage and the bracket for limiting pivotal movement of the plate between two limits, the second limit positioning the cartridge closer to the carriage than the first limit, means operative between the bracket and the plate for establishing a torque about the pivotal axis in a direction toward the first limit, said torque exerting a force component on the stylus varying from a value less than the tracking force of the cartridge when the plate is disposed in the position of the first limit to a value greater than the tracking force of the cartridge when the plate is disposed in the position of the second limit, a pad mounted on the cartridge between the stylus and the pivotal axis and extending to the side of a plane passing through the pivotal axis and the tip of the stylus opposite from the plate, said pad being adapted to engage the surface of a record when the plate of the carriage is disposed in the position of the second limit and the stylus being adapted to engage the surface of the record when the plate is disposed in the position of the first limit, said stylus also being adapted to engage the surface of the record when the plate is disposed between the first and second limits and the torque exerted on the plate exerts a force component on the stylus approximately equal to the tracking force of the cartridge.

3,273,898
IMPLEMENTS FOR SPREADING POWDERED OR GRANULAR MATERIALS
Cornelis van der Lely, Zug, Switzerland, and Ary van der Lely, Maasland, Netherlands, assignors to C. van der Lely N.V., Maasland, Netherlands, a Dutch limited-liability company
Filed Oct. 25, 1963, Ser. No. 318,968
Claims priority, application Netherlands, Nov. 7, 1962, 285,225; June 5, 1963, 293,680; Sept. 6, 1963, 297,620
18 Claims. (Cl. 275—8)



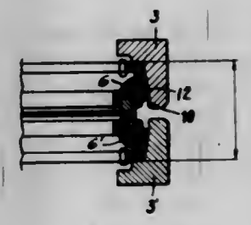
5. An implement for spreading powdery or granular material comprising a frame, a hopper for said material mounted on the frame, a rotary spreading member on the frame below said hopper, said hopper having a discharge opening communicating with said spreading member, said frame being substantially C-shaped in side elevation with its open ends facing rearwardly to permit discharge of material of said spreading member over a wide area without interference from said C-shaped frame, the hopper and the spreading member being swingably related to each other through hinge means on the C-shaped frame to increase the distance between the discharge opening of the hopper and the spreading member and permit cleaning of the spreader.

3,273,899
ROTARY SEAL WITH CONTINUOUS GAS FLOW-EXCLUSION OF INGRESS
Edmond P. Warnery, Boulogne, Seine, France, assignor to The Compagnie Francaise Thomson-Houston, Paris, France, a corporation
Filed Apr. 2, 1963, Ser. No. 270,073
Claims priority, application France, Apr. 12, 1962, 894,202, Patent 1,331,393
18 Claims. (Cl. 277—3)



1. A rotary-seal arrangement interposable between two adjacent, relatively rotatable members defining an interior space to be protected against ingress of foreign

materials, said arrangement comprising means defining a fluid-flow passage from said interior space to the exterior, cooperating sealing means respectively carried by said members and relatively displaceable towards and away from each other so as positively and selectively to seal off, and to open, said passage, means connected with said interior space for applying a gaseous fluid under pressure, thereto, means operable in the absence of rela-

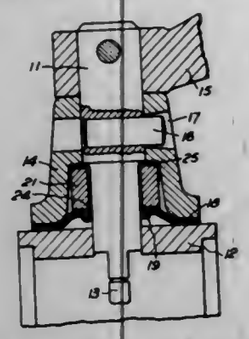


tive rotation between the members to displace said cooperating sealing means toward one another positively to seal off said passage, and means operable during relative rotation between the members to displace said sealing means away from each other to permit continuous discharge of said gaseous fluid through the passage, said gaseous fluid constituting the sole sealing medium operative during relative rotation of said members.

3,273,900
PACKING DEVICE WITH ROTATABLE PLUG
Frederick A. Street, Tulsa, Okla., assignor of twenty-five percent to Head & Johnson, Tulsa, Okla., a partnership composed of James R. Head and Paul H. Johnson
Filed Mar. 18, 1963, Ser. No. 265,789
9 Claims. (Cl. 277—9)

1. A packing device adaptable for packing a shaft comprising, in combination:
a body portion having an axial opening therein, said body portion having at least two ram openings therein intersecting said axial opening;
packing rams slidably positioned in said ram openings;
a plug member encompassed by said body portion having its external configuration adaptable for rotatably engaging said axial opening of said body portion, said plug member having an axial opening adaptable for receiving said shaft and said plug member having at least two packing openings intersecting said axial opening and wherein said plug member may be rotated within said body portion to substantially align said ram openings in said body portion with said packing openings of said plug member whereby said packing rams may enter said packing openings of said plug member to engage said shaft;
and means extending externally of said body portion to rotate said plug member.

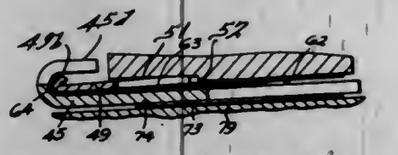
3,273,901
AXIAL SHAFT SEAL
Johann Schmengler, Gutenbergstrasse 13, Hemmingen-Westerfeld, Germany
Filed June 11, 1963, Ser. No. 287,085
3 Claims. (Cl. 277—92)



1. An axial shaft seal, particularly for sealing track roller bearings of crawler tractors, comprising
two flexible annular sealing bodies of elastic material of a truncated cone configuration,
a sealing ring secured to each of said sealing bodies,
said sealing rings engaging each other,
support members having a recess,
each of said support members receiving the corresponding of said sealing bodies in said recess,
said support members having an annular groove at their inner face,
said sealing bodies having a collar received in and supported by the corresponding groove of said support members,
said recess in said support members being of conical shape,
said collar of said sealing rings being likewise of conical shape,
said collar being inwardly bent in its cross-section, and
said sealing bodies extending inwardly and joining said collar such that upon axial pressure on said sealing rings the cross-section of said collar is stretched, simultaneously engaging the inner side walls of the recess in said support members.

3,273,902
SEALING OF SPINDLES
Frederick William Billson, Cwmbran, England, assignor to Saunders Valve Company Limited, Monmouthshire, England, a British company
Filed June 25, 1963, Ser. No. 290,432
Claims priority, application Great Britain, July 11, 1962, 26,697/62
7 Claims. (Cl. 277—95)

1. A seal for sealing against fluid pressure a spindle to a casing in relation to which it makes a rotational movement about its axis, comprising a centrally apertured elastic and flexible diaphragm incorporating a rib around the edge of its central aperture, the diaphragm in its free condition being substantially dished with a slight reverse curvature in the zone which runs into the rib, the diameter of the aperture being slightly less than that of the spindle whereby the rib engages the spindle with a grip sufficient to minimize leakage at low pressure but not so great as to prevent the spindle from rotating in relation to the rib, means sealing the outer margin of the diaphragm to

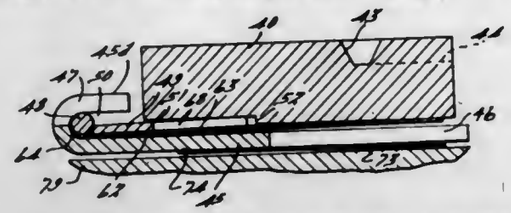


the casing, the diaphragm being mounted with the convexity due to its dished form towards the low pressure side of the seal, and supporting means in the casing having a supporting surface and supporting the diaphragm on the low pressure side, the supporting surface having substantial clearance around the spindle and being shaped to leave a small space around the spindle between the supporting surface and the diaphragm into which pressure acting on the high pressure side of the seal tends to force the rib against the spindle, and said rib projecting toward the high pressure side of the seal.

3,273,903
REGENERATOR SEAL FOR A GAS TURBINE ENGINE

William I. Chapman, Birmingham, James H. Whitfield, Madison Heights, Clinton P. Atwood, Warren, and William A. Ziemke, Jr., Livonia, Mich., assignors to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Filed Oct. 7, 1963, Ser. No. 314,318
23 Claims. (Cl. 277—96)

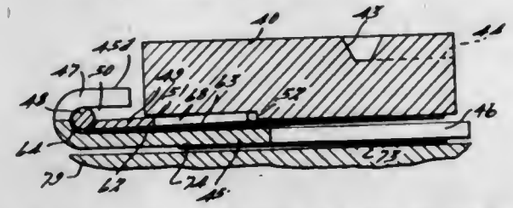


1. In a seal for the regenerator of a gas turbine engine, rubbing means having an inner sealing surface adapted to engage a mating surface of said regenerator to define a seal between high and low pressure gases, base means confronting an outer side of said rubbing means opposite said sealing surface and being movable toward and from the same, bridge means engaging said outer side of said rubbing means, resilient sealing means engaging said bridge means and base means to effect a fluid seal therebetween, said resilient sealing means lapping the engagement between said bridge means and rubbing means and engaging the latter's outer side in fluid sealing relationship, said base means and resilient sealing means comprising a bellows type seal open to said high pressure gases to enhance said fluid sealing relationship.

3,273,904
REGENERATOR SEAL WITH DIAPHRAGM SUPPORT

William I. Chapman, Birmingham, James H. Whitfield, Madison Heights, Clinton P. Atwood, Warren, and William A. Ziemke, Jr., Livonia, Mich., assignors to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Filed Oct. 7, 1963, Ser. No. 314,466
20 Claims. (Cl. 277—96)

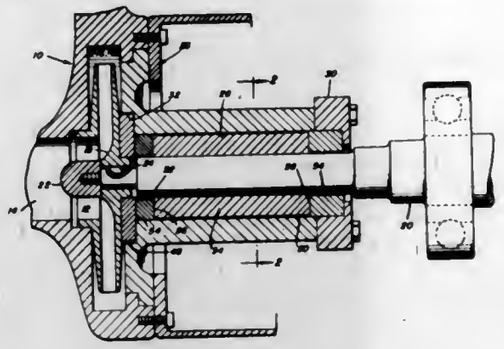


1. In a seal for the regenerator of a gas turbine engine, rubbing means having an inner sealing surface adapted to engage a mating surface of said regenerator to define a seal between high and low pressure gases, base means confronting an outer side of said rubbing means opposite said sealing surface and being movable toward and from the same, bridge means engaging said outer side of said rubbing means, resilient sealing means including a flexible diaphragm and a flexible diaphragm support, said diaphragm support having one edge confined between portions of said bridge means and base means to effect a fluid seal therebetween and extending from said one edge to overlap the engagement between said bridge means and rubbing means and engage the latter's outer side, said diaphragm being wedged between said support and base means adjacent said one edge and extending therefrom in juxtaposition with said support and beyond the latter in juxtaposition with said outer side of said rubbing means to engage the latter in fluid sealing relationship, said base means and resilient sealing means comprising a bellows type seal open to said high pressure gases to enhance said fluid sealing relationship.

3,273,905
REGENERATOR SEAL WITH BRIDGE AND WIRE

William I. Chapman, Birmingham, James H. Whitfield, Madison Heights, Clinton P. Atwood, Warren, and William A. Ziemke, Jr., Livonia, Mich., assignors to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware

Filed Oct. 7, 1963, Ser. No. 314,843
18 Claims. (Cl. 277—96)

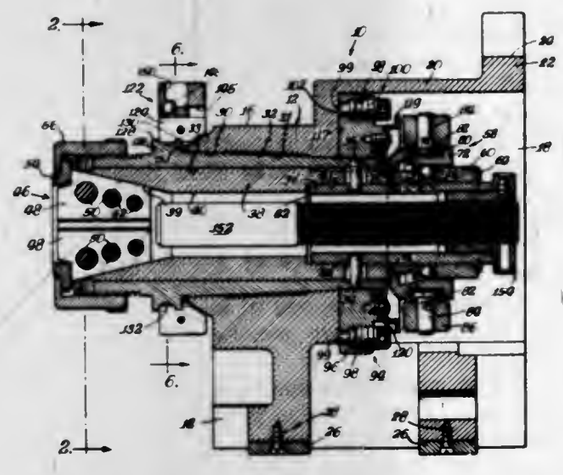


1. In a seal for the regenerator of a gas turbine engine, rubbing means having an inner sealing surface adapted to engage a mating surface of said regenerator to define a seal between high and low pressure gases, base means confronting an outer side of said rubbing means opposite said sealing surface, a wire extending longitudinally of said seal adjacent said base means, a portion of said base means formed around said wire to grip the latter, a bridge member of rigid material extending from said wire to said rubbing means and spacing the same, said bridge member being freely supported for pivotal movement at one end by said rubbing means and at it opposite end by said wire and base means, resilient sealing means engaged between said wire and base means to effect a fluid seal therebetween along said wire, said resilient sealing means overlapping the engagement between said bridge member and rubbing means and engaging the latter's outer side in fluid sealing relationship, said base means and resilient sealing means comprising a bellows type seal open to said high pressure gases to enhance said fluid sealing relationship.

3,273,906
ROTATING SHAFT SEAL

James A. Pennington, Brownsville, Tex.
(4410 E. Xyler St., Tulsa, Okla.)

Filed Aug. 15, 1963, Ser. No. 302,279
7 Claims. (Cl. 277—134)

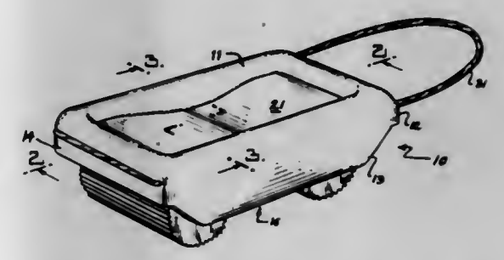


1. In combination with a housing from which a shaft is journaled and including a bore through which said shaft projects, a seal assembly for forming a seal between said shaft and the portions of said housing defining said bore, said assembly comprising first and second forms of seal members encircling said shaft and alternately spaced longitudinally thereof, each of said first form of seal members being carried by said shaft for rotation therewith and defining a diametric enlargement thereof and each of said second form of seal members comprising a generally cylindrical member stationarily secured in said bore and defining a diametrically reduced portion thereof, the outer and inner surfaces of said first and second members, respectively, being oppositely threaded, there being minimum operating clearance between the threads on said first and second members and said bore and said shaft, respectively, the adjacent ends of said first and second forms of seal members including opposing complementary generated and spaced end faces with at least portions thereof disposed in minimum spaced relation.

3,273,907
FIXTURE

Kurt E. Voderberg, 531 Lake Ave., Wilmette, Ill., and Theodore R. Lang, 6312 N. Monticello, Chicago, Ill.

Filed Mar. 2, 1964, Ser. No. 348,657
4 Claims. (Cl. 279—5)



1. A work holding fixture comprising a housing having a main body portion with a bore therethrough, a hollow rotatable outer spindle extending through and outwardly beyond both ends of said bore, a hollow inner spindle axially slidable in and substantially coextensive in length with said outer spindle, said inner spindle having an inner conical surface at one end thereof and radial slots adjacent the other end thereof, a work holding device engageable with the inner conical surface of said inner spindle, collar means on said outer spindle at one end thereof and engaging said work holding device for preventing axial movement of the latter in one direction, a sleeve member at one end thereof extending into said other end of said inner spindle, radial pin members extending through said slots in said inner spindle and secured at their ends in said outer spindle and said sleeve member, and means carried by said sleeve member for moving said inner spindle axially relative to said work holding device for effecting actuation of the latter to clamp a workpiece therein.

3,273,908
SAND CART

John D. Geiser, Jr., 39 Scotch Pine Drive, Central Islip, N.Y.

Filed Apr. 4, 1966, Ser. No. 539,760
1 Claim. (Cl. 280—79.2)

A conveyance for use on sand to support articles, comprising:

a body of generally rectangular configuration formed integrally of molded plastic and having four sides depending downwardly forming a cavity therebetween with a bed member formed integrally with and extending between the four sides, each of the sides being substantially thicker along their uppermost edges for providing structural strength,

the bed member having a central portion recessed downwardly from the uppermost edges a small distance relative to the depth of the cavity underneath,

two of the sides opposite each other depending downwardly a greater distance than the other two sides and each having two spaced apart grooves opening downwardly,

two elongated rollers each having axles extending concentrically from opposite ends, the rollers being received up within the cavity, the extending axles being received within respective ones of the grooves, and

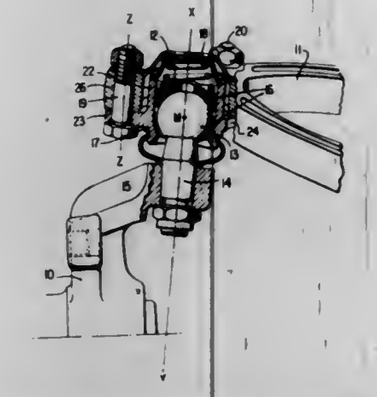
flexible means attached to the body for pulling the conveyance by hand.

3,273,909
INDEPENDENT WHEEL SUSPENSION

Josef Müller, Stuttgart-Riedenberg, and Alf John Müller, Stuttgart-Bad Cannstatt, Germany, assignors to Daimler-Benz Aktiengesellschaft, Stuttgart-Unterturkheim, Germany

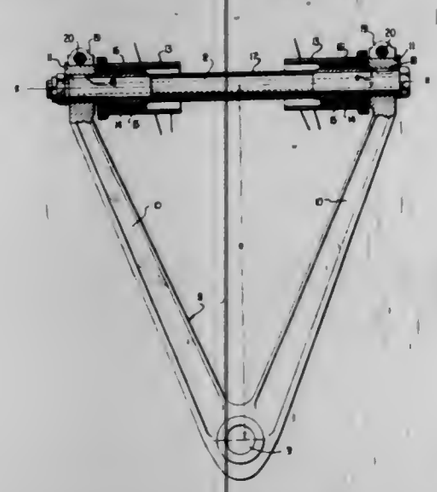
Filed Nov. 27, 1964, Ser. No. 414,287
Claims priority, application Germany, Nov. 30, 1963, D 43,057
7 Claims. (Cl. 280—96.2)

1. An arrangement for adjusting the caster of a wheel guided by means of a guide member, especially for motor vehicles, comprising:



wheel guide means,

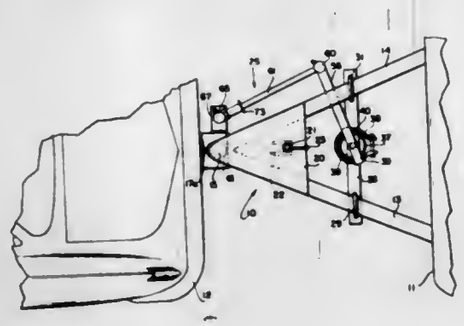
wheel carrier means,



and universal joint means including ball joint means operatively connecting said wheel carrier means with said wheel guide means to effectively provide a steering pin axis,

the joint portion on the side of the wheel guide means of said universal joint means including a joint piece engaging with said ball joint means, and further

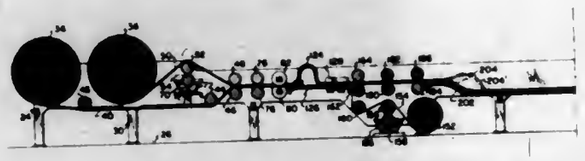
means for adjustably connecting said joint piece with said wheel guide means for selective movement about a pivot axis at least approximately parallel to the steering pin axis and offset therefrom in the transverse direction of the vehicle so as to pass beyond said ball joint means.



3,273,910
WHEEL SUSPENSION
Walter Willingshofer, Hofingen, Wurttemberg, and Alf John Müller, Stuttgart-Bad Cannstatt, Germany, assignors to Daimler-Benz, Aktiengesellschaft, Stuttgart-Unterturkheim, Germany
Filed Nov. 6, 1964, Ser. No. 409,390
Claims priority, application Germany, Nov. 9, 1963, D 42,898
12 Claims. (Cl. 280—96.2)

1. An arrangement for the adjustment of the camber of an independently suspended wheel, comprising:
wheel suspension means including cross guide means,
said cross guide means having a pivot axis and including two cross guide arm portions arranged in an approximately fork-shaped manner,
and means operatively connecting the two cross guide arm portions with each other in such a manner as to enable adjustment of the camber of the wheel including bearing bolt means between the two guide arm portions, eccentric means between a respective cross guide arm portion and said bearing bolt means, and means rigidly connecting the eccentric means with the two parts consisting of said bearing bolt means and the associated guide arm portion including further means for adjustably connecting the eccentric means with one of said two parts so as to be adjustable about said pivot axis,
said means operatively connecting said two cross arm portions with each other further comprising a juncture portion connecting adjacent ends of said cross-arms, said juncture portion comprising a joint member adapted to rotatably receive a steering pin joint member,
said means rigidly connecting the eccentric means with said bearing bolt means comprising key means, and said means connecting the eccentric means with the associated guide arm portion comprising clamping means carried by the divergent ends of said arm portions and engaging said eccentric means.

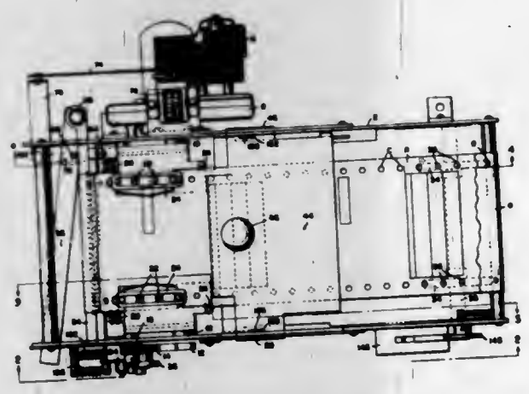
3,273,911
TRAILER STABILIZING DEVICE
John R. Waldie, 7866 Claybeck, Sun Valley, Calif.
Filed Oct. 7, 1964, Ser. No. 402,249
8 Claims. (Cl. 280—446)



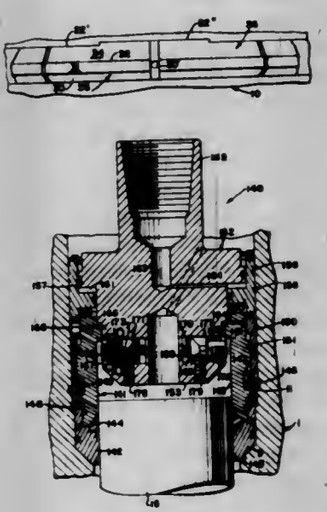
1. A trailer stabilizing device for preventing swaying motion of a trailer connected to its towing vehicle by a pivot connection comprising:
a tow arm connected to said vehicle and extending rearwardly thereof;
tow means extending from the front of said trailer and pivotally connected to said tow arm by said pivot connection;
a mounting bar rigidly connected to said tow means;
a shaft rotatably mounted in said bar and extending on opposite sides thereof;
brake means supported by said mounting bar and comprising a circular brake band rigidly connected to one end of said shaft;
a split sleeve member surrounding said brake band and carrying a brake lining in engagement with said band;
means connected to the end of said sleeve member for tightening said sleeve member against said brake band;
and linkage means for connecting the other end of said shaft with said vehicle to provide a brake force between said band and lining against swaying of said trailer.

3,273,912
OFF-ROAD MOTOR VEHICLE WITH OPPOSITE SWINGING AXLES
Clarence V. Crockett, Bloomfield Hills, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed Apr. 2, 1963, Ser. No. 270,053
4 Claims. (Cl. 280—104)

1. A vehicle comprising a body portion, a front and rear axle rotatably mounting wheels, first means rigid with the front axle and extending towards the rear axle, second means rigid with the rear axle and extending towards the front axle, third means connecting said first and second means and serving as a support for said body portion, a differential gearing arrangement operatively associated with said first, second and third means for positively positioning the latter about the longitudinal axis of said vehicle upon relative rotation of said axles about said axis, said differential gearing arrangement comprising side gears rigidly connected with said first and second means and pinion gears rotatably connected to said third means.



3,273,913
BOOK COVER BOARDS AND BOARD STRUCTURES AND APPARATUS AND METHOD FOR MAKING THE SAME
Edward K. Mullen and Leewood C. Carter, Union County, N.J., assignors to Book Covers, Inc., Newark, N.J., a corporation of New Jersey
Filed May 27, 1965, Ser. No. 459,397
10 Claims. (Cl. 281—29)



1. A cover board structure for books, said structure comprising a first leaf board portion, a second leaf board portion, a spine board portion disposed between said first and second leaf board portions, and a hinge material portion on one side of said cover board structure including a pair of hinge material strips, each of said strips being bonded to one of said first and second leaf board portions and a minor portion of said spine board portion.

3,273,914
MACHINE FOR PRODUCING AND ISSUING BUSINESS FORMS
Joseph C. Wagner, Timonium, Md., assignor to Universal Controls, Inc., Towson, Md., a corporation of Maryland
Filed Oct. 15, 1964, Ser. No. 403,979
5 Claims. (Cl. 282—16)

1. A machine for the production of transaction forms comprising means delimiting a write-in area, means providing a backing surface below said area, a member movable to close and open said area, means for guiding and feeding at least two superimposed paper strips across said area above said backing surface and below said movable member so that when matter is written on a portion of the uppermost of said sheets exposed in said write-in area it is reproduced on the lower of said sheets, means for latching the movable member in open position, control means effecting a cycle of operation involving release of said movable member from said latching means and closure thereof, and predetermined feed of said strips, and means driven by the lower of said strips during each feed thereof to an extent to measure its movement and effective to prevent operation by said control means whenever the lower strip is not fed to the predetermined extent in any cycle of operation.

3,273,915
REMOTELY INSTALLED WELL DEVICES AND WELLHEAD ASSEMBLIES INCLUDING THE SAME
Robert Bishop, Edward E. Castor, Michael A. Walker, and William W. Word, Jr., Houston, Tex., assignors to Armco Steel Corporation, Middletown, Ohio, a corporation of Ohio
Filed Aug. 19, 1963, Ser. No. 302,836
2 Claims. (Cl. 285—18)

1. In a well device for remote installation, the combination of
an outer tubular member having an internal upwardly facing transverse seat and an inwardly opening transverse annular groove located above said seat;
an inner member adapted to be inserted downwardly into said outer member and having
a downwardly facing transverse annular shoulder to engage said seat for support of said inner member on said outer member, and
a transverse annular outwardly opening groove located above said shoulder and disposed to face said inwardly opening groove when said shoulder is engaged with said seat;
a plurality of arcuate latch elements arranged in a circular series in said outwardly opening groove and each disposed for movement generally radially of said inner member;
each of said latch elements being biased outwardly and having a tip portion to engage in said inwardly opening groove to latch said inner member against upward movement relative to said outer member, said tip portion having an upwardly directed face extending transversely of said inner member for engagement beneath a

similar, downwardly directed face of said inwardly opening groove,

said inner member having a diameter above said outwardly opening groove which is smaller than the inner diameter of said outer member above said inwardly opening groove, whereby an annular upwardly opening space is provided between said inner and outer members,

said latch elements each having a downwardly and outwardly slanting, upwardly directed cam face disposed to cross said annular space when the latch element is engaged in said inwardly opening groove,

the upper one of the side walls of said outwardly opening groove being provided with a dependent peripheral lip disposed to retain said latch elements within said outwardly opening groove, said dependent lip being interrupted to provide a gate dimensioned to allow introduction of said elements individually into said outwardly opening groove;

means fixed to said inner member and projecting into said outwardly opening groove between adjacent ones of said latch elements to prevent said elements from shifting to positions in which one thereof registers with said gate;

a rigid annular member surrounding said inner member above said outwardly opening groove;

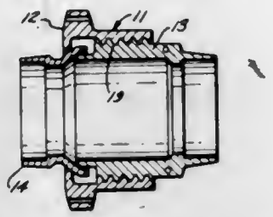
said rigid member having a thickness such as to substantially fill said annular space and thereby block said space against entry of debris; and

means releasably securing said rigid annular member to said inner member to normally retain said rigid annular member against downward movement;

the upper end portion of said rigid annular member being disposed for engagement by a downwardly actuated annular element of a retrieving tool whereby, when said inner member is disposed with said shoulder engaging said seat and said latch elements engaged in said inwardly opening groove, said annular member can be released and driven downwardly through said annular space to engage said cam faces and so cam said latch elements inwardly to disengage the same from said inwardly opening groove;

said inner member being hollow to accommodate a downwardly inserted retrieving tool and including internally disposed, inwardly directed latch means by which such tool can be connected thereto.

3,273,916
UNITARY FLEXIBLE METALLIC CONNECTOR
Lloyd E. Tillery, 1507 Melbourne, Dallas, Tex.
Filed Mar. 13, 1961, Ser. No. 95,204
6 Claims. (Cl. 285—226)



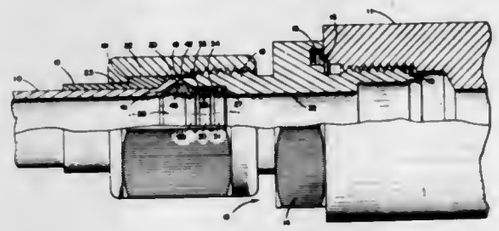
1. A flexible coupling comprising:

(a) a central spiral grooved corrugated metallic tube,

(b) cylindrical end portions each of diameter corresponding approximately with the root of the spiral groove, and

(c) an annular frusto-conical transition zone between each of said end portions and said central portion with said spiral groove ending in the transition zones, the maximum diameter of said zones corresponding approximately with the crests on the central spiral portion.

3,273,917
COUPLING HAVING CONCENTRIC SPHERICAL SURFACES SEALED BY LINE CONTACT
Richard O. Chakroff, 298 Park Blvd., Worthington, Ohio
Filed Aug. 25, 1961, Ser. No. 133,974
6 Claims. (Cl. 285—263)



1. A coupling assembly for connecting in fluid tight relationship a pair of generally oppositely extending fluid conduits notwithstanding possible longitudinal misalignment of said fluid conduits, comprising

a pair of tubular axially adjustable solid clamping devices one of which is a female clamping device and the other of which is a male clamping device and one of which is to be connected in fluid tight sealed relationship with one of said fluid conduits; and

an intermediate solid tubular coupling member, clamped between said clamping devices, having an outer face formed as an annular segment of an external spherical surface which engages the female clamping member at a single line of tangency, having an inner face formed as an annular segment of an internal spherical surface which engages the male clamping member at a single line of tangency, and arranged to be secured in fluid tight sealed relationship with the other of said fluid conduits;

the spherical surfaces of the outer face and of the inner face being segments of two spheres both of which have a common center and wherein any displacement of said lines of tangency relative to each other occurs along concentric arcs.

3,273,918
SEALED COUPLING
Philip H. Legarra, 1701 Sepulveda Blvd., Manhattan Beach, Calif., and Elton C. Hallett, 2021 Sabrina Terrace, Corona Del Mar, Calif.
Filed Apr. 20, 1964, Ser. No. 360,915
13 Claims. (Cl. 285—332.3)

1. A sealed coupling arrangement comprising

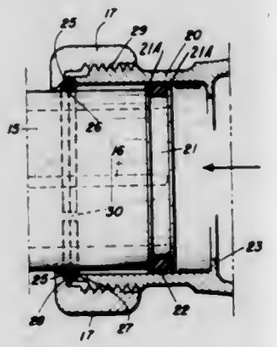
a first member to be connected,

a second member to be connected,

said members having bores therein

and having interengaging surfaces for interconnecting said bores,

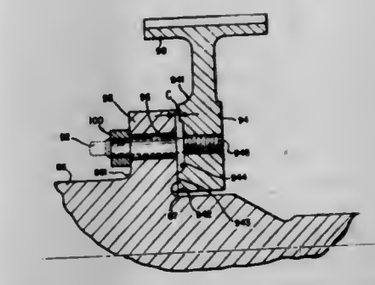
an axially compressible sealing member,



said sealing member having a first surface sealingly engaging said first member adjacent the bore thereof and a second surface sealingly engaging said second member adjacent the bore of said second member,

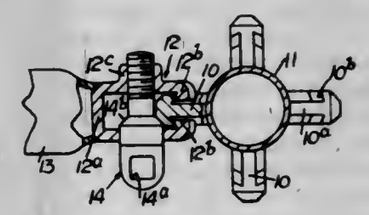
said first member including an abutment

said sealing member engaging said abutment inwardly of said second surface thereof,



and being relatively rigid between said second surface and said abutment for acting as a stop upon said interengagement of said first and second members, and means holding said first and second members together, with the movement of said first and second members toward each other limited by said engagement of said second surface of said sealing member and said abutment of said first member.

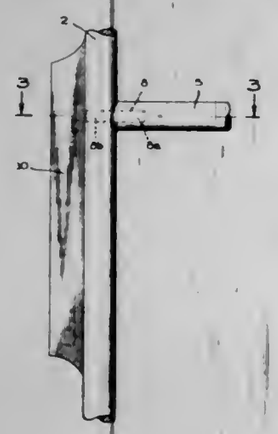
3,273,919
ADJUSTABLE PLUMBING FITTINGS
Henry R. Billeter, Deerfield, and Axel B. Nelson, Mount Prospect, Ill., assignors to Sloan Valve Company, Chicago, Ill., a corporation of Illinois
Filed Mar. 16, 1965, Ser. No. 440,147
4 Claims. (Cl. 285—340)



1. In a plumbing fitting, an adjustable connection for use between a flush valve and a control valve to compensate for variations in the relative position of the valves, said connection comprising a tubular fitting threaded at one end into the flush valve and having its other end slidably and adjustably inserted in the outlet end of said control valve to a position depending upon the relative distance between the valves, the adjacent walls of said tubular fitting and said control valve being slightly spaced apart, the end of said fitting having spaced apart flanges formed thereon extending outward from the side of said fitting into close proximity to the walls of said control valve, an O-ring recessed in said fitting between said flanges and in slidable leak-proof contact with the walls of said control valve, a locking ring around said fitting slidable thereon and closely embracing the same and bridging the space between said fitting and said control valve, said locking ring having a sharp edge in slidable contact with said fitting, a coupling nut threaded upon the outside of said control valve outlet and having a clamping edge portion closely slidable along the outside surface of said fitting, said clamping nut adapted to slide and force said locking ring along said fitting into engagement with the end of said control valve outlet to a position on said fitting depending upon the relative distance between the flush valve and control valve, the contacting surfaces between said locking ring and with said coupling nut and the end of said control valve outlet being tapered whereby tightening of said coupling nut forces the sharp edge of said locking ring into biting and locking engagement with the surface of said fitting, said locking ring bridging the space between said fitting and control valve outlet, one of said flanges adapted to engage and be stopped by said locking ring to prevent outward sliding movement and blow-out of said fitting from said control valve outlet, in case said coupling nut becomes loose under high pressures whereby said fitting remains locked in said control valve outlet and said O-ring maintains a leak-proof seal therein.

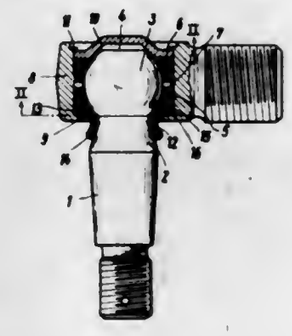
3,273,920
COMBINATION SHAFT AND HUB ASSEMBLY FOR CENTRIFUGAL COMPRESSOR
James H. Anderson, Spring Garden Township, and Marinus J. Spruitenburg, York, Pa., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Filed Apr. 8, 1963, Ser. No. 271,200
2 Claims. (Cl. 287—52)

1. A combination shaft and hub assembly comprising a shaft having a radially extending flange; an annular hub having a central, circular opening, said hub being positioned on said shaft so that a portion of said shaft extends through said opening; means defining a first abutment surface on said hub in abutting engagement with a portion of said flange, means defining a second abutment surface on said hub spaced radially inwardly from said first abutment surface; said second abutment surface abutting a second portion of said flange and being axially spaced from said first abutment surface so as to engage said second portion of said flange prior to the engagement of said first abutment surface and said flange; a plurality of circumferentially spaced, threaded fasteners securing said hub to said flange and cooperating therewith so as to hold the hub and the flange in tight engagement, said hub being deformed in the vicinity of said second abutment surface when said hub is secured by said fastening elements, the diameter of said hub opening being initially greater than the diameter of said portion of the shaft extending therethrough, but being reduced in final assembly and thereby binding upon said shaft when the engagement of said second abutment surface with said flange is effective to deform the radially inner portion of said hub.



3,273,921
JOINT FOR USE IN SCAFFOLDING
George Bernard Arthur Young, Lichfield, and Kenneth John Cadman, Sutton Coldfield, England, assignors to Rapid Metal Developments Limited, Birmingham, England
Filed June 2, 1964, Ser. No. 371,926
Claims priority, application Great Britain, June 4, 1963, 30,694/63; Aug. 2, 1963, 22,116/63
3 Claims. (Cl. 287—53.5)

1. A joint for use in scaffolding comprising a bracket of channel shaped form having a web portion secured to one scaffold member, a pair of spaced side portions extending from said web portion, and a pair of inturned

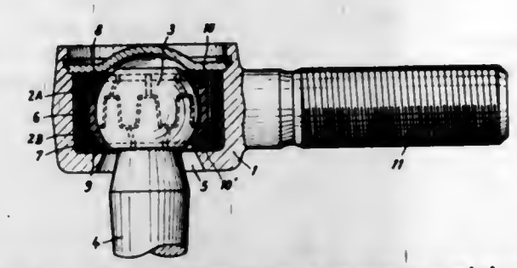


flanges on edges of the side portions spaced from the web portion, said flanges having internal engaging surfaces directed towards the web portion; a rotatable member extending between said side portions of the bracket at a position intermediate said inturned flanges and said web portion and comprising a screw-threaded portion engaged in a nut portion integrally formed on one of said side portions of the bracket, and an enlarged head projecting through a hole in the other of said side portions and a frustoconical cam portion between the screw-threaded portion and the head and disposed between the side portions of the bracket; and a lug of T-shaped section comprising a web secured along one edge to another scaffold member and a pair of flanges projecting in opposite directions from the web at an opposite edge thereof, said flanges being bevelled along their external edges at an angle corresponding to the angle of the frustoconical cam portion and having their inner faces inclined to the web of the lug at an acute angle greater than the angle of said frustoconical cam portion, the engaging surfaces of flanges on the bracket being inclined to the side portions thereof at an equal angle and being engaged against the faces of the flanges on the lug adjacent the web thereof, and the cam portion of the rotatable member being engaged against one of the bevelled edges of the flanges of the lug; and the joint being releasable by turning of the rotatable member to displace the latter axially so as to permit disengagement of the bracket from the lug.

3,273,922
FURNITURE CONSTRUCTION
John C. Rasor, Youngstown, Ohio, assignor to The General Fireproofing Company, Youngstown, Ohio, a corporation of Ohio
Filed Sept. 21, 1964, Ser. No. 397,727
1 Claim. (Cl. 287—54)

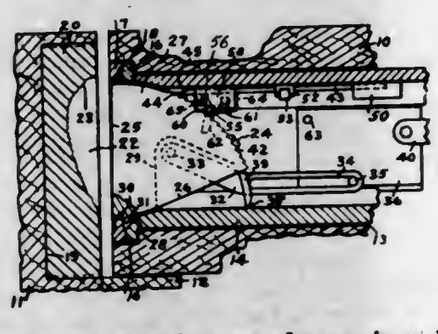
In an article of furniture having a plurality of legs and at least one load supporting rail member joined between said legs, said legs and rail member of solid metal rod construction of a diameter no greater than one-half inch, the improvement comprising, a joint formed between an end of said rail member and one of said legs, said rail member disposed normal to and in abutment with said leg, the end face of said rail concaved to mate with the abutting surface of said leg, said leg and the adjacent end of said rail member provided with aligned bores, said leg bore extending substantially throughout the diameter of said leg, a metal pin having one end disposed transversely through said leg bore and having its other end axially disposed within said rail bore and retained within said bores by a press fit, and a stiffener comprising a thin flat bladed member longitudinally attached to the surface of said leg and extending above and below said pin.

3,273,923
BALL JOINT
Jürgen Ulderup, Lemforde (Hann.), No. 207, Germany
Filed July 31, 1963, Ser. No. 298,903
Claims priority, application Germany, Aug. 3, 1962, L 42,618; Dec. 24, 1962, U 9,479
2 Claims. (Cl. 287—87)



1. A ball joint comprising:
(a) a female member having a generally cylindrical socket provided with a reduced opening at one end defined by an inwardly extending annular flange;
(b) a male member having a ball portion receivable in said socket and a neck extending substantially axially from said socket portion through said end thereof;
(c) antifriction bearing means in said socket in engagement with said ball portion, said bearing means including a pair of axially spaced annular bodies having generally spheroidal seats and bearing axially upon said ball portion on opposite sides of a diametral plane therethrough;
(d) an annular resiliently compressible elastomeric seal disposed in said opening and bridging said neck and said socket at said opening while pressing axially upon said ball portion to urge it against said bearing means, said seal having an annular outwardly extending flange overlying said inwardly extending flange of said socket and disposed between said inwardly extending flange and said bearing means while clamped thereby in said socket, a collar portion extending axially outwardly from said opening along said neck, and a layer of an elastomeric foam disposed intermediate said bearing means and said outwardly extending flange and also along the outer periphery of said outwardly extending flange, said outwardly extending flange being compressed between said bearing means and said inwardly extending flange; and
(e) closure means at the other end of said socket whereby said bodies and said seal are retained under compression between said inwardly extending flange and said closure means.

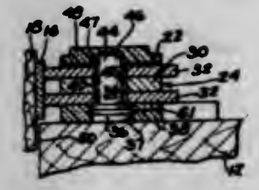
3,273,924
BALL AND SOCKET JOINT
Gottfried Maxeiner, Dusseldorf, Germany, assignor to A. Ehrenreich & Cie, Dusseldorf-Oberkassel, Germany
Filed Jan. 28, 1964, Ser. No. 340,727
Claims priority, application Germany, Jan. 29, 1963, E 24,249
2 Claims. (Cl. 287—90)



1. A ball and socket joint comprising in combination
a stud having a ball head at one end,
a hollow housing having a bore extending therethrough, said housing having an inturned flange portion at one end of said bore defining an opening for said stud,
closure means for closing said housing at the other end of said bore,
bearing cups of synthetic material disposed against said ball head,

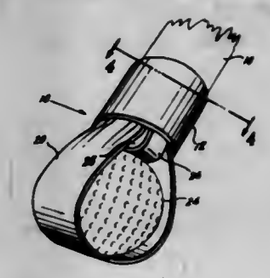
retaining ring means disposed around said bearing cups and positioned axially of said stud between said inturned flange portion and said closure means,

a resilient sleeve disposed between said retaining ring means and the inner wall of said housing, and said retaining ring means has an inturned flange at each edge extending over said bearing cups and an elastic rubber ring lodged between each inturned ring flange and the edge of the adjacent bearing cup.



3,273,925
LATCHES AND LOCKS
Percy R. Graham, 7342 24th Ave. NW., Seattle, Wash.
Filed Apr. 20, 1964, Ser. No. 360,974
7 Claims. (Cl. 292—201)

1. In latch and lock means for use in a door, a bolt housing capable of being embedded in a door; a bolt of permanently magnetized material having its inner end portion pivotally supported by said housing for swinging movement of its outer end portion between a retracted position and a position in which it protrudes from said housing; ratchet teeth on the outer end portion of said bolt; and a pawl in the housing said pawl being constructed of material capable of being magnetically attracted to said bolt and having a movable end portion positioned to rest on said ratchet teeth.

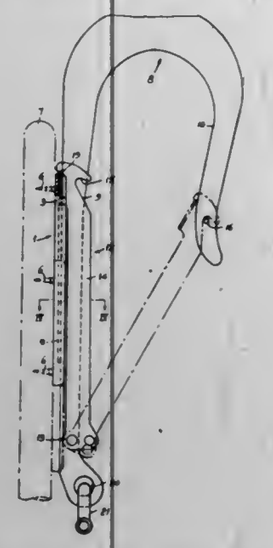


3,273,926
MAGNETIC CATCH ASSEMBLY
Raymond L. Pietsch, Flint, Mich., assignor to Engineered Products Company, Flint, Mich., a corporation of Michigan
Filed Nov. 20, 1963, Ser. No. 325,014
3 Claims. (Cl. 292—251.5)

2. A magnetic catch comprising a housing having vertically spaced top and bottom walls integrally connected together by side walls to form a magnet enclosure, said housing comprising a one-piece plastic molded member having an apertured mounting flange for mounting the housing on a supporting surface with said bottom wall disposed generally parallel to and closely adjacent said mounting surface, a magnet unit disposed in said housing, said magnet unit comprising a magnet having a pair of pole pieces at the opposite poles of the magnet, said pole pieces disposed one adjacent the top wall of the housing and one adjacent the bottom wall of the housing with the magnet sandwiched therebetween, said pole pieces extending outwardly of the housing along an open side thereof, said magnet unit having a vertically extending through passageway therein, said top and bottom walls of the housing each having an opening therein registering with the ends of the certical passageway in the magnet unit, the opening in the top wall comprising a blind hole and the opening in the bottom wall comprising a through hole, and a pin extending vertically through said passage-

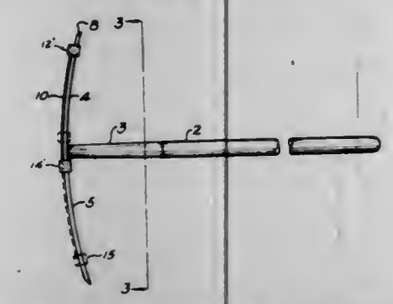
way with its upper end extending into and interengaged with said blind hole, the opening in the bottom wall having a circumferential groove therein and the lower end portion of the pin having a circumferentially extending rib thereon interengaging with said groove to hold the magnet unit assembled with the housing.

3,273,927
GOLF BALL RETRIEVER
Lesley J. Carlson, 2023 E. 29th, Des Moines, Iowa
Filed Mar. 16, 1965, Ser. No. 440,083
5 Claims. (Cl. 294—19)



1. In a golf ball retriever,
a collar for removable attachment to a handle,
a strap secured at respective ends to said collar so as to define a golf ball encircling and retaining loop, and
a second strap smaller than the other strap and secured at respective ends to said collar so as to define a loop disposed to extend partially into said first mentioned loop and serving to abut any golf ball encircled by said first mentioned loop.

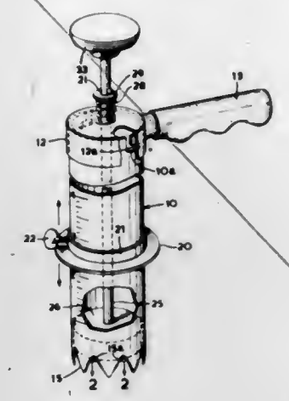
3,273,928
DEVICES FOR USE IN MOORING BOATS
Vladimir Marcel Wisniewski, Finchley, London, England, assignor to Development, Manufacture & Trade Company Limited, London, England, a British company
Filed Feb. 5, 1964, Ser. No. 342,671
6 Claims. (Cl. 294—19)



1. A mooring device or the like, comprising an elongated support having an end; an elongated socket member secured to said support adjacent said end and having a pair of longitudinally extending grooves; a hook having a hook element and an elongated shank portion of substantially square cross-section, said shank portion having a pair of spaced flanges projecting in a common plane and slidably receivable in said grooves; a gate member movably secured to said shank portion so as to be shiftable between a locking position in which it engages a free end portion of said hook element and an open position in which said gate member is spaced from said free end portion, said gate member having a U-shaped cross-

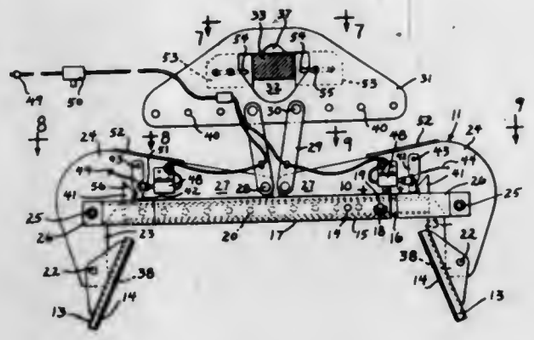
section and in said open position partly surrounding said shank portion; and cooperating retaining means on said

socket member and said gate member for maintaining the latter in said open position when said flanges are received in said grooves.



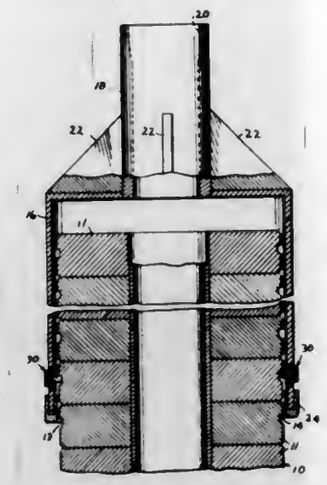
3,273,929
GARDEN TOOL FOR REMOVING WEEDS
Lawrence R. Shurtz, 858 W. 8th St., Mesa, Ariz.
Filed July 27, 1964, Ser. No. 385,376
1 Claim. (Cl. 294—50)

A garden tool for removing weeds comprising an elongated flat head plate of rectangular configuration and longitudinally curved with a centrally disposed handle extending at a right angle from one face of said head plate, one end of said head plate having a V notch with the sides thereof converging inwardly from the end edge thereof, and a slidable knocker plate of rectangular configuration and longitudinally curved, transverse crossbars secured to opposite ends of said knocker plate with the opposite ends of said bars folded over and around the opposite side edges of said head plate to permit slidable movement of said knocker plate on said head plate, said crossbars being disposed on opposite sides of the jointure of said central handle with said head plate to limit slidable movement of said knocker plate along the longitudinal axis of said head plate, said knocker plate being substantially shorter than said head plate to knock weeds out of said V notch when said tool is shaken.



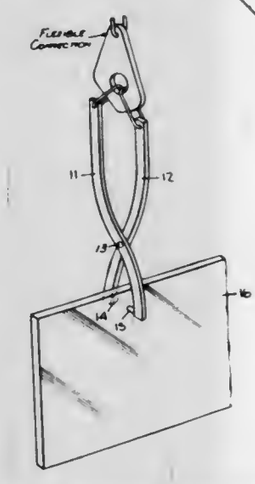
3,273,930
SOIL-EXTRACTING IMPLEMENTS
Adam P. Gottfried, 528 Bedford Park Ave., Toronto 12, Ontario, Canada
Filed July 13, 1964, Ser. No. 382,312
6 Claims. (Cl. 294—50.5)

1. A hand operated soil extracting implement for preparing a hole in the ground preparatory to planting, comprising: an elongated cylindrical barrel having a transversely extending handle secured adjacent to the upper end thereof; an annulus of downwardly extending inwardly curved tooth members forming the lower end of the implement, the perforate annular juncture zone of said tooth members with the barrel having a greater outside diameter than the adjacent lower end of the barrel, said curved teeth extending in a radially inward direction



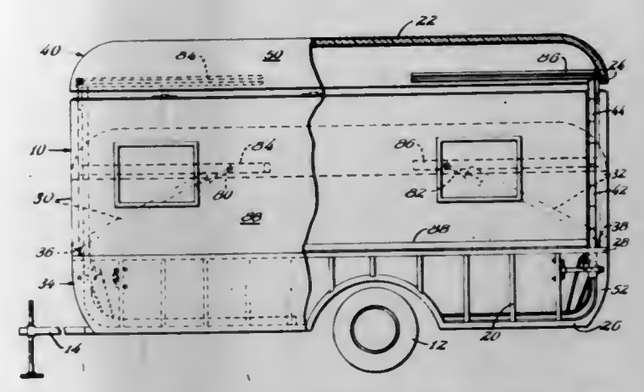
to provide an inner diameter less than the inner diameter of said barrel in the zone adjacent thereto, whereby owing to the perforate annular juncture the implement may be readily withdrawn from the soil, and owing to the incurved teeth the plug of soil thus removed is substantially loosely packed in the barrel and may be readily removed therefrom.

3,273,931
LIFTING GRAB
Leslie M. Caldwell and John W. Remington, Rockford, Ill., assignors to The Caldwell Company, Inc., Rockford, Ill., a corporation of Illinois
Filed Jan. 4, 1965, Ser. No. 433,245
20 Claims. (Cl. 294—81)



1. A lifting device comprising, in combination, a substantially horizontal elongated spreader bar, a pair of bell-crank levers pivotally connected to the opposite ends thereof, each having a substantially vertical clamp portion at one end and a substantially horizontal actuating portion at the other end, grab pads mounted on the clamp portions for engagement with diametrically opposite sides of an object to be lifted, the actuating portions of said levers extending substantially horizontally inwardly toward each other over opposite ends of said spreader bar, a lifting bale above and in spaced relation to said actuating portions and adapted to be lifted, and a pair of upright links pivotally connected at their lower ends to the inner ends of said actuating portions pivotally connected at their upper ends to the lifting bale.

3,273,932
FISHING TOOL
Donald L. Burner, Norman, Okla., assignor to Acme Tool, Inc., Oklahoma City, Okla., a corporation of Kansas
Filed July 6, 1964, Ser. No. 380,469
3 Claims. (Cl. 294—86.33)

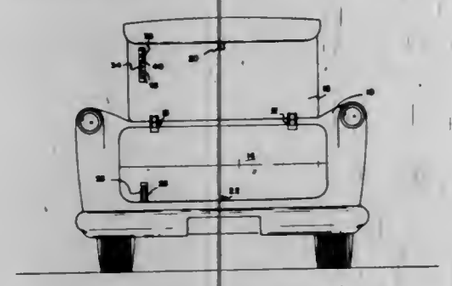


1. A fishing tool for drill collar weights, including: an elongated casing adapted to be lowered into a borehole, and encompass a column of drill collar weights, said casing having a series of teeth formed on its lower end; and a plurality of gripping members slidably positioned in circumferential spaced relation within the wall of said casing adjacent its lower toothed end, said gripping members comprising a body member secured within the wall of said casing, said body member having an aperture therein, a finger slidably received by the aperture in said body member and projecting inwardly of the inner wall surface of said casing, a shield secured to the outwardly disposed surface of said body member in overlapping relation with respect to the aperture therein, and a spring interposed between said shield and said finger and normally urging the latter inwardly of said casing into drill collar contacting and gripping position.

3,273,933
SELF-GRIPPING TONGS
Friedrich Jochim, Herzogenrath, Germany, assignor to Compagnie de Saint-Gobain, Neuilly-sur-Seine, France
Filed Dec. 10, 1963, Ser. No. 329,496
11 Claims. (Cl. 294—118)

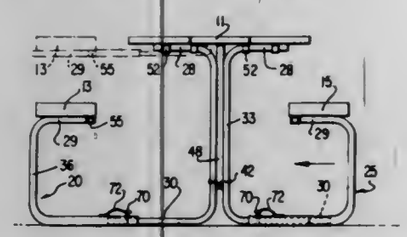
1. Tongs adapted to suspend glass plates and the like which have arms pivoted together and gripping tips carried by the arms, the arms and tips being arranged to urge the tips toward each other when the tongs is suspended, in which the tips are constituted of crystalline grains embedded in a binder and projecting therefrom.

3,273,934
FOLDING TRAVEL TRAILER
Leo J. Hagenson, Grantsburg, Wis., assignor to Rolite, Inc., Grantsburg, Wis., a corporation of Wisconsin
Filed Jan. 20, 1964, Ser. No. 338,901
13 Claims. (Cl. 296—26)



1. A collapsible and expandable house trailer having two sections in superimposed edge abutting relation,
(a) telescoping support means secured opposedly between said sections to hold said sections in spaced apart relations,
(b) means engageable with said first means to move said sections toward and away from each other,
(c) a pair of opposed end walls and side walls hingedly secured about coplanar oppositely parallel horizontal axes to the lower said section,
(d) means pivotally and rollably securing said end walls to said upper section whereby said walls are adapted to move toward and away from said lower section in correspondence with similar movement of said upper section,
(e) each said wall movable from a generally horizontal lying position to an upstanding generally vertical position,
(f) upper ends of said upstanding side walls and opposed portions of said upper section having cooperable aligning means including longitudinally extending tongue and groove members extending substantially from end to end of said side walls and opposed portions adapted to cooperate,
(g) said tongue members being adapted to reside within said groove of said groove members when the upper ends of said side walls abut in alignment with corresponding portions of said upper sections, said side walls and corresponding upper sections being aligned thereby and in which said telescoping means secured opposedly between said sections include racks formed of a series of rigid links pivotally connected and having ends which abut when the links are in alignment and having spaced teeth on said links, said tongue members extending longitudinally of the ends of said side walls.

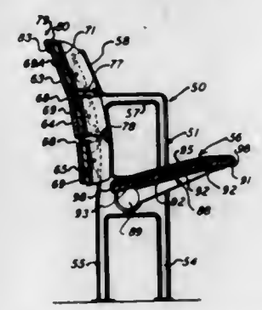
3,273,935
AUTOMOBILE COMPARTMENT LOCK MEANS
Gordon L. Carson, 1829 E. Thomas Road, Apt. 41, Phoenix, Ariz.
Filed Nov. 13, 1964, Ser. No. 411,023
5 Claims. (Cl. 296—76)



1. In an automobile trunk lock means the combination of: an automobile body; a trunk compartment in the rearward portion thereof; a compartment cover horizontally

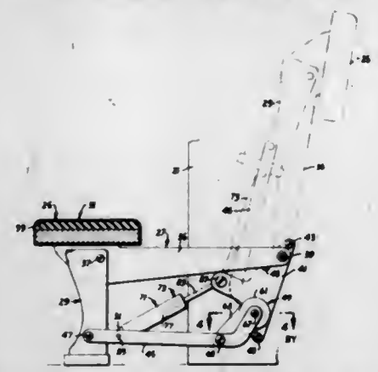
pivotally mounted on said body and disposed to pivot upwardly into open position relative to said compartment; lock means accessible externally of said compartment and disposed to lock said cover in downwardly closed fixed position; second lock means disposed and connected to said body and said cover to permit only partial upward opening movement of said cover relative to said body; a first strap of said second lock means secured to said body; a second strap secured to said cover; one of said straps having an elongated slot therein disposed generally in a vertical direction; auxiliary lock means interconnecting

said first and second straps; a member of said auxiliary lock means in said slot and relatively slidable longitudinally therein to permit a limited relative movable connected relation between said first and second straps, said first and second straps and said auxiliary lock means disposed inside said compartment whereby the release or failure of said first mentioned lock means may permit only partial opening of said cover relative to said compartment and to thereby provide access of a person externally of said compartment to said auxiliary lock means internally of said compartment.



3,273,936
COMBINED TABLE AND BENCH ASSEMBLY
Kenneth L. Deavers, Eckstine Road, Rte. 1, Box 29, Williamsport, Md.
Filed Oct. 14, 1964, Ser. No. 403,839
2 Claims. (Cl. 297—159)

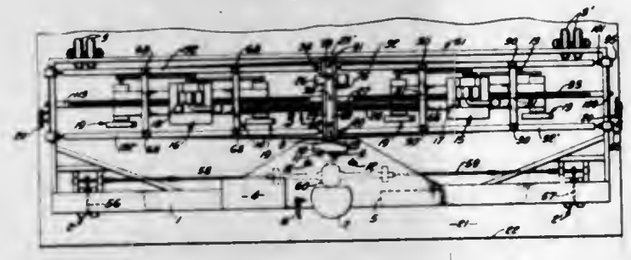
1. A collapsible article of furniture of the picnic-table type having a table and a bench supported at each end thereof by a G-shaped leg member which provides an upper horizontal portion supporting said table and rotatable thereunder, and an intermediate horizontal portion supporting said bench and slidable thereunder, said leg members having a telescoping lower horizontal portion to provide for movement of said bench from a position underlapping said table to a position remote from said table.



3,273,937
WEATHER PROTECTED CHAIRS
Paul G. Anderson, Ontario, Calif., assignor of twenty-five percent to Freeman A. Parsons, and of twenty-five percent to Floyd H. Wells, both of San Bernardino, Calif., and of twenty-five percent to Byron V. Curry, Arcadia, Calif.
Filed Mar. 24, 1965, Ser. No. 458,303
3 Claims. (Cl. 297—219)

1. A chair comprising a chair frame having vertical uprights, each of said uprights having a vertically extending channel opening toward the center of the chair, a plurality of horizontally extending vertically spaced, wooden back members affixed to the vertical uprights to define a chain back such that a front flange of each channel overlies the side ends of the back members, a plurality of resilient back pads each extending horizontally across a chair back member, a water-repellent back sheath overlying the resilient back pads, an upper sheath cap flange extending across the upper edges of the upper back member and the upper resilient back pad and extending downwardly adjacent the rear surface of the upper back member, a plurality of horizontally-extending rearward indentations in the chair back sheath, each indentation intervening between pairs of adjacent resili-

ent back pads and contacting the horizontal edge of each of adjacent wooden back members, a plurality of fasteners extending through the back sheath and the back members of the chair back, a seat frame mounted for pivotal motion with respect to the vertical uprights, a plurality of horizontally-extending wooden seat members fixed to the seat frame, a resilient seat pad overlying the seat members, a water-repellent seat sheath covering the surface of the seat pad remote from the seat members, downwardly depending seat sheath flanges extending across the vertical edges of the seat pad and the seat members, and fastening means extending through the seat sheath and into the seat members so as to secure the seat sheath to the seat.



3,273,938
SWINGABLE SUPPORT DEVICE
Arno M. Jacobi, Belmont, Calif., assignor to Walter Jacobi & Sons, Inc., Belmont, Calif., a corporation of California
Filed June 17, 1965, Ser. No. 464,814
11 Claims. (Cl. 297—426)

1. A supporting device adapted to be connected to furniture, comprising a resting member, at least one leg pivotally connected to said resting member, a first arm secured at one end to said resting member, a bracket adapted to be connected to said furniture, said arm being pivotally connected at its other end to said bracket, a second arm pivotally connected at one end to said leg, means pivotally supporting the other end of said second arm, said device being adapted for movement between an operative position wherein said resting member is generally horizontal and said leg is substantially normal to said resting member, and a retracted position wherein said rest-

ing member and said leg are swung out of operative position and said leg is swung out of its substantially normal position relative to said resting member, spring means connected to one of said arms biasing the device toward said retracted position, and control means connected between said bracket and one of said arms adapted to oppose said spring means for dampening the movement of said resting member as the latter is swung toward said retracted position and being adapted to oppose the gravitational forces exerted on the device as the latter is swung toward the operative position.

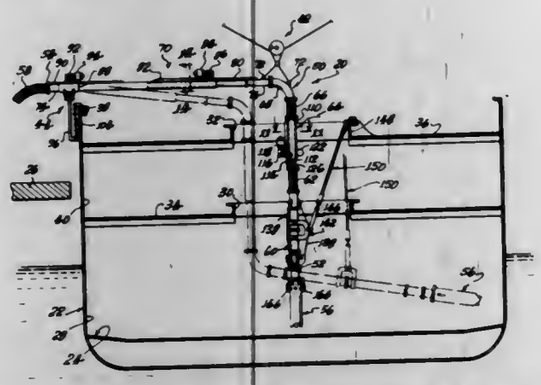
3,273,939
CONCRETE SAWING MACHINE
Cecil W. Hatcher, West Covina, Calif., assignor to Concut, Inc., El Monte, Calif., a corporation of California
Filed Feb. 4, 1964, Ser. No. 342,431
14 Claims. (Cl. 299—39)

1. A concrete sawing machine comprising a vehicle having a main frame, a central support arising from said frame, a track means laterally extending from opposite sides of said central support, an outer support on said frame for the outer end of each of said track means, means providing a tilt connection between each end of each track means and its respective supports, a carriage for each of said track means, each carriage having a power driven saw spindle means for traversing said carriages on their said track means, means for raising or lowering said track means, and means for adjusting the upright tilt of each of said track means with respect to the other track means.

3,273,940
MINING PICK
Pierre Belugou, Paris, France, assignor to Charbonnages de France, Paris, France, a public institution of France
Filed June 8, 1964, Ser. No. 373,391
Claims priority, application France, June 20, 1963, 938,804, Patent 1,368,318
3 Claims. (Cl. 299—81)

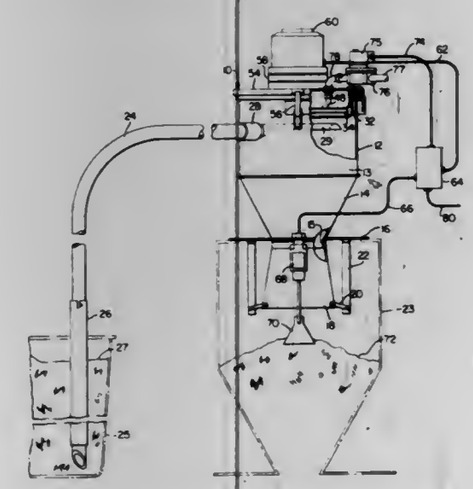
1. An improved mining pick associated with a water-injection device, said pick comprising: a water-intake conduit discharging perpendicularly into a spraying conduit pierced right through the body of said pick, and spraying conduit having a cylindrical middle portion which has a length less than its diameter and a divergent portion at each extremity of said spraying conduit; a nozzle on said intake conduit, and discharging into said spraying conduit, said nozzle having a section smaller than that of said spraying conduit.

3,273,941
RESILIENTLY MOUNTED WHEEL BALANCING WEIGHTS
Frank O. Skidmore, Cuyahoga Falls, Ohio, assignor to Donald Gottwald, Akron, Ohio
Filed Oct. 28, 1964, Ser. No. 406,984
7 Claims. (Cl. 301—5)



5. In combination,
a wheel having a rim with an axially extending flange,
a pneumatic tire mounted on the rim and retained by the flange, said tire having an extended arcuate heavy area of gradually distributed unbalance,
a metal strip moldable by finger pressure positioned on a radially inward surface of the rim to uniformly counterbalance statically and dynamically the extended arcuate heavy area of the tire, said metal strip being heavier than the amount of weight necessary to counterbalance the tire if it were concentrated at a point on the rim at the center of the metal strip,
a deformable resilient water repellent layer of substantially the same length and width as the metal strip positioned between the strip and the rim, said layer being at least $\frac{1}{32}$ inch in thickness, and
pressure sensitive adhesive means to secure said strip to said resilient layer, and said resilient layer to said surface of the rim, whereby the deformable resilient layer eliminates shock to the adhesive means during wheel operation by providing a floating mounting of the strip to the rim.

3,273,942
VACUUM BULK CARGO UNLOADING SYSTEM FOR SHIPS
Glen W. McFarland, 101 Ocean Ave., Seal Beach, Calif.
Filed Sept. 17, 1964, Ser. No. 397,112
4 Claims. (Cl. 302—17)

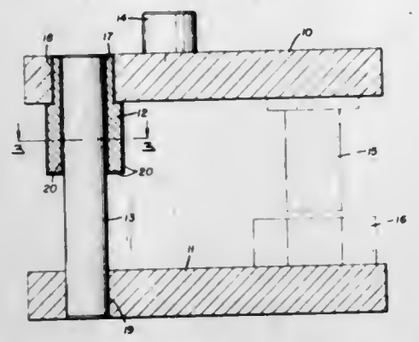


1. In a vacuum conveyor system for unloading bulk cargo from a hold of a ship through a hatchway formed in a deck above the hold, the ship being equipped with hoisting gear, the combination of:
(a) a duct having an inlet end positionable within the hold and having an outlet end positionable adjacent one side of the ship and connectible to a vacuum source;
(b) universal mounting means connected to said duct adjacent said outlet end thereof for supporting said duct for universal movement relative to the ship;
(c) means on said duct intermediate said inlet and outlet ends thereof for connecting said duct to the ship's hoisting gear;

(d) said duct including extensible and contractible and flexible sections to render said inlet end of said duct maneuverable within the hold; and

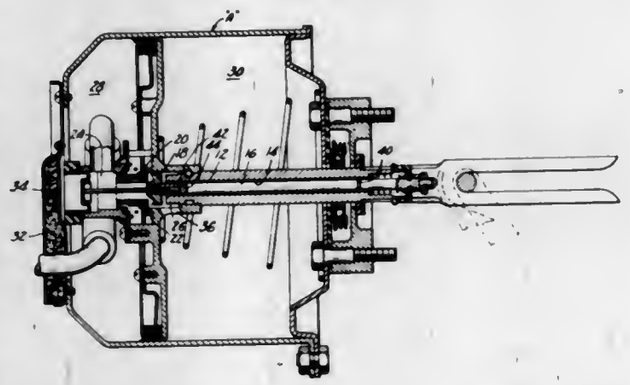
(e) inlet means connected to said inlet end of said duct for feeding the bulk cargo into said duct.

3,273,943
MATERIAL TRANSPORTING DEVICE
John D. Russell, Franklin, Pa., assignor to Conair, Incorporated, Franklin, Pa.
Filed Dec. 11, 1962, Ser. No. 243,825
5 Claims. (Cl. 302—59)



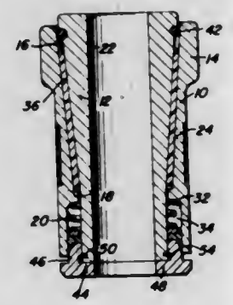
1. A transporting device for granular material comprising, a vertically extending material receiving housing having a selectably openable discharge opening in a lower portion thereof and an outlet opening in an upper portion thereof, a hollow material inlet communicating with said housing at a location spaced upwardly of said discharge opening, a filter member comprising a hollow porous disk having a deformable outer periphery and extending completely across said housing at a location spaced upwardly from said inlet and downwardly from said outlet to divide the interior of said housing into upper and lower interior portions; means located within said housing engageable with said deformable outer periphery of said filter member to provide a peripheral air seal between said upper and lower interior portions; means carried by an upper portion of said housing for creating a vacuum within said upper interior portion of said housing with the air in said lower interior portion of said housing evacuating upwardly through said filter member and said outlet opening, said filter member having a completely enclosed chamber therein extending transversely across said housing, passageway means extending from within said chamber to an externally accessible portion of said housing, and selectively operable control means connected to said passageway means to control flow of pressurized air through said passageway into said chamber.

ERRATUM



For Class 303—9 see:
Patent No. 3,273,950

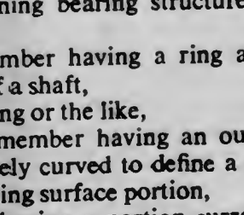
3,273,944
DIE SET HAVING ALUMINUM OXIDE BEARING SURFACE
Edwin J. Hammon, Bedford Heights, Ohio, assignor to Fountainhead Industries, Inc., Maple Heights, Ohio, a corporation of Ohio
Filed Oct. 2, 1963, Ser. No. 313,331
6 Claims. (Cl. 308—4)



1. A die set comprising a pair of punch and die-supporting plates arranged for relative movement toward and from one another; a plurality of relatively spaced apart, substantially aluminum-free metal, guide pins carried by and projecting outwardly from one of said plates; a plurality of relatively spaced apart, tubular guide bushings carried by the other of said plates and telescoping said guide pins; and a layer of amorphous aluminum oxide carried by each of said bushings and defining a bearing surface for each of said pins.

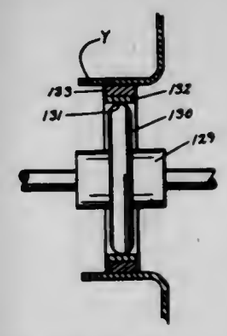
3,273,945
BEARING FOR PNEUMATIC SERVOMOTOR
Edward E. Hupp, South Bend, Ind., assignor to The Bendix Corporation, South Bend, Ind., a corporation of Delaware
Continuation of application Ser. No. 100,408, Apr. 3, 1961, which is a continuation of application Ser. No. 561,186, Jan. 25, 1956. This application Jan. 16, 1964, Ser. No. 338,064
1 Claim. (Cl. 308—4)

In guide structure and the like: a generally tubular member having a longitudinally extending chamber with longitudinally spaced apart surfaces of revolution, a rod in said chamber and also having longitudinally spaced apart surfaces of revolution, said surfaces of said rod having a diameter appreciably less than said surfaces of said tubular member and being positioned opposite to respective surfaces of said tubular member to form first and second sets of generally concentric surfaces with the respective surfaces of said tubular member, with a fluid passageway formed by the differing diameters of said chamber and rod surfaces, the surface of said rod being formed with longitudinally spaced grooves, first and second pieces of cold drawn wire positioned between said surfaces of respective sets, each of said wires having a diameter less than the clearance between the surfaces between which it is positioned by an amount providing a running reciprocatory fit, each of said wires being bent into a torus shaped spring whose normal condition provides an interference fit with respect to its receiving groove, said torus shaped spring being snapped into said grooves to concentrically space and at two points contact said member and rod, one within the other, and said rod and member being reciprocable longitudinally of each other, whereby each piece of wire is retained in its groove and a clearance is maintained between the tips of said springs and the opposing surface such that said fluid passageway is open from one end of said tubular member to the other.



3,273,946
IDLER ARM REPAIR BUSHING
Theodore C. Gerner, 1800 S. Broadway, Oklahoma City 9, Okla.
Filed Dec. 21, 1962, Ser. No. 246,631
6 Claims. (Cl. 308—70)

3. An adjustable slack take-up bearing bushing assembly comprising concentric outer and inner members having cooperating tapered conical bearing surfaces, a bearing sleeve rotatably interposed between said member surfaces, said sleeve having conical internal and external surfaces cooperatively and movably engaged with said surfaces of said inner and outer members respectively, sealing means interposed between said members at their opposite ends enclosing said sleeve, resilient means within said outer member for yieldingly and axially urging said inner member surface into wear take-up engagement with said sleeve and the latter into wear take-up engagement with said outer member surface.



3,273,947
BEARING STRUCTURE
George W. Hoddy, Gerald L. Hoddy, and Raymond A. Hoddy, Owosso, Mich., assignors to Universal Electric Company, Owosso, Mich., a corporation of Michigan
Application May 24, 1962, Ser. No. 197,398, now Patent No. 3,223,464, dated Dec. 14, 1965, which is a division of application Ser. No. 753,695, Aug. 7, 1958, now Patent No. 3,063,761, dated Nov. 13, 1962. Divided and this application Feb. 4, 1965, Ser. No. 430,297
3 Claims. (Cl. 308—72)

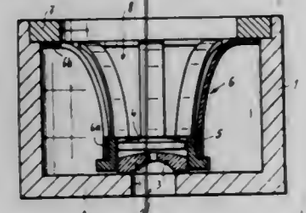
1. A self-aligning bearing structure for a shaft comprising
a bearing member having a ring and a bore for the reception of a shaft,
a motor housing or the like,
said housing having a portion thereof circumscribing a cylindrical supporting surface,
said bearing member having an exterior surface,
radially yieldable means on said exterior surface portion having an outer perimeter with at least some portions which are transversely curved to define a substantially spherical contacting surface portion,
said spherical contacting surface portion having its center aligned substantially on the axis of the cylindrical supporting surface and having a diameter substantially equal to the diameter of the cylindrical supporting surface,

said radially yieldable means having limited radial resiliency sufficient to accommodate dimensional variations but insufficient to permit any substantial movement of the center of the bearing member so that the center of the bearing member is maintained in position,
said cylindrical supporting surface having a longitudinal extent sufficient to permit relatively unrestrained axial movement of said bearing member relative to said supporting surface.

3,273,948
BEARING STRUCTURE
George W. Hoddy, Gerald L. Hoddy, and Raymond A. Hoddy, Owosso, Mich., assignors to Universal Electric Company, Owosso, Mich., a corporation of Michigan
Application May 24, 1962, Ser. No. 197,398, now Patent No. 3,223,464, dated Dec. 14, 1965, which is a division of application Ser. No. 753,695, Aug. 7, 1958, now Patent No. 3,063,761, dated Nov. 13, 1962. Divided and this application Feb. 4, 1965, Ser. No. 430,424
4 Claims. (Cl. 308—72)

1. A self-aligning bearing structure for a shaft comprising
a bearing member having a ring and a bore for the reception of a shaft,
a motor housing or the like,
said bearing member having an outer perimter which is transversely curved to define a substantially spherical contacting surface portion,
said housing having a portion surrounding said spherical contacting surface portion,
radially yieldable means interposed between said housing portion and said spherical contacting surface portion,
said radially yieldable means circumscribing a generally cylindrical supporting surface,
said spherical contacting surface portion having its center aligned substantially on the axis of the cylindrical supporting surface and having a diameter substantially equal to the diameter of said cylindrical supporting surface,

said radially yieldable means having limited radial resiliency sufficient to accommodate dimensional variations but insufficient to permit any substantial movement of the center of the bearing member so that the center of the bearing member is maintained in position,



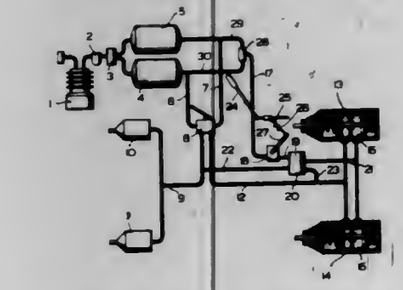
said cylindrical supporting surface having a longitudinal extent sufficient to permit relatively unrestrained axial movement of said bearing member relative to said supporting surface.

3,273,949

SHOCK-ABSORBING BEARING FOR SMALL MECHANISMS

Roger Matthey, Le Locle, Switzerland, assignor to Parechoc S.A., Canton of Vaud, Switzerland, a firm of Switzerland

Filed Apr. 7, 1964, Ser. No. 357,921
Claims priority, application Switzerland, May 9, 1963, 5,817/63
4 Claims. (Cl. 308—158)



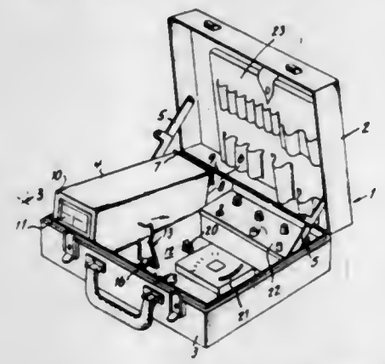
1. In a shock-absorbing bearing for small mechanisms, comprising a bearing support and a bearing body located within the said support, and a return spring acting on the said bearing body, said spring being in the shape of a circular body formed by the rotation around a geometrical axis of a curved generating line and having a substantially tubular extremity for carrying said bearing body and an opposite extremity located approximately in a plane perpendicular to the axis of said spring and bearing on said bearing support, said spring being provided with longitudinal elongated apertures to define elastically-deformable flexible blades therebetween for allowing the tubular part of said spring to be displaced in any direction, with said spring absorbing the axial as well as the radial shocks to which said bearing body is subject.

3,273,950

BRAKING INSTALLATION FOR VEHICLES

Oskar Vielmo, Stuttgart-Sonnenberg, Germany, assignor to Robert Bosch G.m.b.H., Stuttgart, Germany

Filed Sept. 17, 1964, Ser. No. 397,132
Claim priority, application Germany, Sept. 17, 1963, B 73,543
10 Claims. (Cl. 303—9)



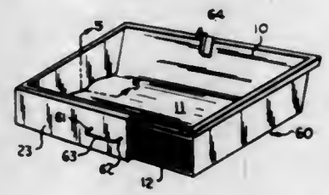
1. In a braking assembly for vehicles, in combination, a braking unit including fluid-pressure brake means and spring-pressure brake means; a source of fluid pressure; conduit means communicating with said source of fluid pressure and said fluid-pressure brake means for supplying fluid under pressure to said fluid-pressure brake means so as to actuate the latter when the fluid pressure of the fluid supplied to said fluid-pressure brake means is increased to a predetermined pressure; operator actuated valve means in said conduit means for opening the latter to increase the fluid pressure of fluid supplied to said fluid-pressure brake means to brake the vehicle with the fluid-pressure brake means of said unit; and means maintaining said spring-pressure brake means inoperative while the fluid pressure of said fluid in said conduit means supplied to said fluid-pressure brake means during actuation of said valve means is at least equal to said predetermined pressure but responding automatically to actuation of said operator actuated valve means upon a drop of pressure of the fluid in said conduit means below said predetermined pressure for rendering said spring-pressure brake means automatically operative.

3,273,951

PORTABLE INSTRUMENT UNIT

Robert E. Miller, Milford, Conn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware

Filed Apr. 15, 1965, Ser. No. 448,462
5 Claims. (Cl. 312—319)



1. A portable instrument unit comprising an attache type case and a front face viewable instrument, a hinge connected between the back of said instrument and the inner rear wall of the base of said case, and manually operable means connected to the base of said case and to said instrument for positioning the front end of said instrument in raised or nested position within the base of said case.

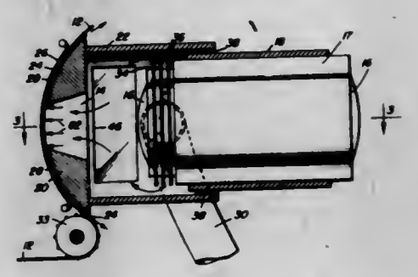
3,273,952

METHOD OF MAKING FURNITURE DRAWERS OR THE LIKE AND ARTICLE PRODUCED THEREBY

Louis E. Himelreich, Louisville, and Warren A. Dillen, Jeffersontown, Ky., assignors to H. J. Scheirich Company, Louisville, Ky., a corporation of Kentucky

Filed July 14, 1964, Ser. No. 382,444
5 Claims. (Cl. 312—330)

1. In a method for producing furniture drawers and the like, the steps comprising; providing as a stock intermediate an elongated member having a bottom portion and front and rear wall portions integral therewith and upstanding from said bottom portion in spaced relation to each other and defining therebetween an unobstructed space in which the contents of the drawer may later be stored, cutting said elongated member transversely thereof to form a detached member adapted for use as the central body portion of a drawer, thereafter rigidly affixing a pair of drawer side wall members to the respective ends of said detached member, and thereafter rigidly affixing to the exterior of said front wall portion a front member covering the space between the front ends of said side wall members, thus to form a drawer.



3,273,953

MOTION PICTURE PROJECTOR FILM FOCUS STABILIZATION AND LENS COOLING MEANS

Lawrence W. Davee, 153 Westervelt Ave., Tenafly, N.J.

Filed Feb. 26, 1965, Ser. No. 435,425
22 Claims. (Cl. 352—222)

1. Film focus stabilizing means in a motion picture projection apparatus having a curved film gate having a light aperture therethrough, means for intermittently feeding the film along curved film gate shoes extending longitudinally on opposite edges of said film gate and past the light aperture, and film gate spring trap shoes maintaining the longitudinal opposite side edges of the feeding film against said curved film gate shoes and past said light aperture; said stabilizing means comprising a pressure chamber including said curved film gate and the film in said light aperture as one wall thereof, means for continuously providing a generally uniform air pressure in said pressure chamber against substantially the entire surface of the film in said light aperture, said pressure chamber being open to the atmosphere only through said light aperture and along the throats provided by the surface of the feeding film between said curved film gate shoes, the inner sides of the curved film gate shoes, and the film gate surface.

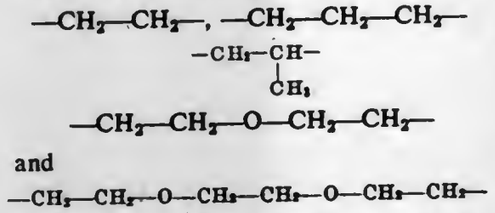
CHEMICAL

3,273,954

MIXTURES OF QUATERNARY AMMONIUM DYE ASSISTANTS AND DYEING RETANNED LEATHER THEREWITH

Hubert Wachsmann, Basel-Land, Jakob Bindler, Riehen, and Max Erny, Gelterkinden, Switzerland, assignors to J. R. Geigy A.G., Basel, Switzerland

No Drawing. Filed Aug. 26, 1963, Ser. No. 304,662
Claims priority, application Switzerland, Sept. 14, 1962, 10,946/62
8 Claims. (Cl. 8—12)



1. An aqueous dyeing liquor for the dyeing of re-tanned leather in deep color shades, comprising, as essential ingredients

(1) an anionic leather dyestuff,

(2) a shade-deepening mixture consisting essentially of

(I) the quaternized salt of a condensation product of

(a) an aliphatic amine containing, per molecule, from one to six amino nitrogen atoms, one lipophilic N-substituent being a member selected from the group consisting of alkyl with from 10 to 20 carbon atoms and alkenyl with from 10 to 20 carbon atoms, and, between every two adjacent amino nitrogens in amines with more than one nitrogen atom, a linking member selected from the group consisting of

and

(b) from 10 to 200 moles, per mole of (a), of ethylene oxide, and

(c) from 0 to 2 moles, per mole of (a), of a member selected from the group consisting of styrene oxide and propylene oxide,

quaternized with a member selected from the group consisting of the esters of a strong acid with one of the following: a lower saturated aliphatic alcohol, benzyl alcohol, phenyl-ethyl alcohol, chlorobenzyl alcohol, bromobenzyl alcohol and lower alkyl-benzyl alcohol; and

(a) a quaternary salt of an organic tertiary monoamine having per molecule from 1 to 2 alkyl radicals of at least 10 and not more than 30 carbon atoms, said alkyl radical being a substituent of the amino nitrogen atom, the remaining nitrogen bonds being substituted with lower alkyl, and

(II) a basic fixing agent selected from the group consisting of

(b) the condensation product of

(α) a polytertiary polyamine with from 2 to 5 amino nitrogen atoms, two to four of which are tertiary nitrogen atoms, and with a linking alkylene chain of 2 to 3 carbon atoms between every two adjacent amino nitrogen atoms, with

(β) a straight-chain aliphatic dihalide, the halogen atoms of which are of an atomic number ranging from 17 to 53 and the aliphatic chain of which is of 2 to 6 carbon atoms interrupted by from 0 to 2 oxygen atoms, the molar ratio of (α) to (β) ranging from about 2:3 to 3:2,

said quaternizing salt defined under (I) being present in said dyeing liquor in an amount of from about 0.1 to 3% by weight, and said basic fixing agent defined under (II) being present in said dyeing liquor in an amount of from about 005 to not more than 1.5% by weight, calculated on the weight of the wet leather being dyed which has been pressed out to a water content of about 50%.

3,273,955

PROCESS FOR REDUCTION OF VAT ANTHRAQUINONE DYESTUFFS

Dieter Goerrig, Lohmar, Postfach 2, Siegkreis, Germany, and Friedrich Schubert, Neuried, Eberhard Weise, Cologne-Mulheim, and Manfred Soll and Konrad Lang, Leverkusen, Germany; said Schubert, Weise, Soll, and Lang assignors to said Goerrig

No Drawing. Continuation of application Ser. No. 765,737, Oct. 7, 1958, now Patent No. 3,118,724, dated Jan. 21, 1964. This application Jan. 14, 1964, Ser. No. 337,521
Claims priority, application Germany, Oct. 11, 1957, F 24,153
3 Claims. (Cl. 8—34)

1. In a process for the reduction of a vat anthraquinone dyestuff with an alkali-metal borohydride, the improve-

ment which consists in carrying out the reduction in the precence of a catalytic proportion of a catalyst selected from the group consisting of

(a) metal complex compounds from which the metal on which they are based can be separated in the presence of a reducing agent at a redox potential between 0 and −1.5 volts at a pH value between 8 and 15,

(b) water-soluble anthraquinone compounds which form a component of an organic redox system the potential of which lies between 0 and −1.5 volts at a pH value between 8 and 15, and where the reduction of this organic redox system involves hydrogenation and its oxidation involves dehydrogenation, and mixtures of these compounds.

3,273,956

METHOD OF TREATING ACRYLONITRILE SYNTHETIC FIBERS

Yoshimasa Fujita, Saidaiji, and Nobuhiro Tsutsui, Okayama, Japan, assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Aug. 8, 1962, Ser. No. 215,524
Claims priority, application Japan, Aug. 19, 1961, 36/30,223
12 Claims. (Cl. 8—55)

1. A process for retarding the dyeability of an acrylonitrile polymer fiber containing acid groups and which is highly substantive to cationic dyes, said process comprising immersing such fiber in an aqueous solution of a water-soluble salt of a multivalent metallic ion selected from the group consisting of magnesium, calcium, barium, chromium, zinc, cobalt, nickel, aluminum, tin, and lead with an anion selected from the group consisting of nitrates, sulfates, chlorides, and organic acid residues prior to exposure of such fiber to cationic dyes.

3,273,957

METHOD OF RETARDING WATER SURFACE EVAPORATION

Nicky Beredjick, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Filed June 28, 1962, Ser. No. 205,878
7 Claims. (Cl. 21—60.5)

1. In the method for retarding the evaporation of water from an evaporating surface thereof which comprises forming and maintaining an evaporation retardant film of a water-insoluble C_{12-24} aliphatic alcohol on said evaporating surface, the improvement consisting of forming said film by applying to said evaporating surface a liquid solution consisting of about 0.01–2 percent by weight of the total composition of said C_{12-24} aliphatic alcohol dissolved in a C_{1-5} alkanol.

3,273,958

PROCESS FOR THE PREPARATION OF SODA ASH

Guy D. Peverley, Green River, Wyo., assignor to Intermountain Research & Development Corporation, Cheyenne, Wyo.

Filed Nov. 27, 1962, Ser. No. 240,279
4 Claims. (Cl. 23—63)

1. A process for the preparation of soda ash from crude trona which comprises dissolving crude trona and crude soda ash in water to form an aqueous solution of sodium carbonate and sodium bicarbonate having a molar ratio of sodium carbonate to sodium bicarbonate greater than 1:1, clarifying and filtering the said aqueous solution to remove insolubles, heating and evaporating water from the filtered solution to form a slurry of sodium carbonate monohydrate and sodium sesquicarbonate crystals in mother liquor, separating the said crystals from the mother liquor, recycling the mother liquor to the evaporation step, calcining the said crystals to soda ash and recovering the soda ash.

3,273,959

PROCESS OF RECOVERING SODIUM CARBONATE FROM THE MOTHER LIQUOR BLEED

Warren Standish Miller, Fullerton, Calif., assignor, by mesne assignments, to Intermountain Research & Development Corporation, Cheyenne, Wyo., a corporation of Wyoming

Filed June 16, 1965, Ser. No. 469,040
5 Claims. (Cl. 23—63)

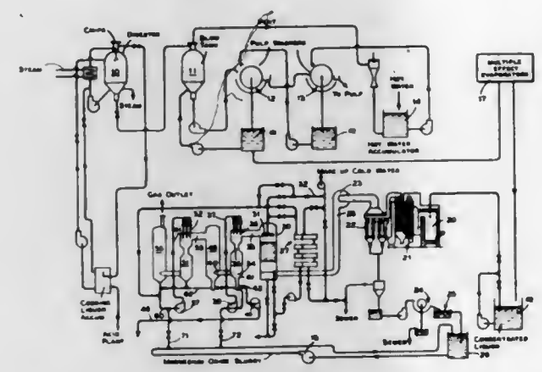
1. A process for the production of soda ash from crude trona which comprises dissolving the trona in a recycling mother liquor to form an aqueous solution of sodium sesquicarbonate containing sodium chloride, evaporating water from the sodium sesquicarbonate solution to form a major slurry of sodium sesquicarbonate crystals in a mother liquor, bleeding off a portion of the mother liquor from the slurry when the mother liquor contains approximately 6% sodium chloride, evaporating water from the bleed stream until the sodium chloride content is near its saturation point to form a minor slurry of sodium sesquicarbonate and sodium carbonate monohydrate crystals in a mother liquor, separating the mother liquor of high sodium chloride content from the minor slurry of crystals, discarding the minor mother liquor, recycling the sodium sesquicarbonate and sodium carbonate monohydrate crystals from the minor slurry to the major slurry of sodium sesquicarbonate in mother liquor from which the bleed stream has been removed, wherein the said monohydrate crystals dissolve in the major slurry of sodium sesquicarbonate crystals, separating the mother liquor and the sodium sesquicarbonate crystals in the major slurry which contains only sodium sesquicarbonate crystals, recycling the major mother liquor to dissolve more trona, calcining the sodium sesquicarbonate crystals separated from the major slurry to soda ash and recovering the said soda ash.

3,273,960

CAKING RESISTANT MONOCALCIUM PHOSPHATE, MONOHYDRATE AND PROCESS FOR ITS MANUFACTURE

Norman Earl Stahlheber, Columbia, Ill., assignor to Monsanto Company, a corporation of Delaware

No Drawing. Filed Oct. 17, 1961, Ser. No. 147,127
4 Claims. (Cl. 23—108)



1. A process for manufacturing a particulated monocalcium orthophosphate monohydrate composition which is resistant to caking, which process comprises intermixing with said monocalcium orthophosphate monohydrate from about 0.2 to about 10 weight percent of a finely divided alkaline earth metal hyperphosphate, whereby the normal tendency of said monocalcium orthophosphate monohydrate to cake is inhibited; at least about 80 weight percent of the particles of said finely divided alkaline earth metal hyperphosphate being small enough to pass through a U.S. Standard 100 mesh screen; said alkaline earth metal hyperphosphate being the product resulting from reacting together a material selected from the group consisting of alkaline earth metal bases and alkaline earth metal carbonates with a superphosphoric acid containing initially from about 71 to about 85 weight percent of phosphorus, calculated as P_2O_5; said product being characterized as containing at least about 30 weight percent polyphosphates having more than one phosphorus atom in their molecules, and being at least about 65 weight percent in the amorphous condition.

3,273,961

REGENERATION OF MAGNESIUM BISULPHITE PULPING LIQUOR AND ABSORPTION OF SULPHUR DIOXIDE DURING REGENERATION

Charles E. Rogers and Robert E. Matty, Alliance, Ohio, and Edward L. Ralston, Flossmoor, Ill., assignors to The Babcock & Wilcox Company, New York, N.Y., a corporation of New Jersey

Filed Feb. 12, 1963, Ser. No. 261,931
4 Claims. (Cl. 23—131)

1. The method of treating a magnesium base residual sulphite pulp liquor which comprises concentrating the residual liquor by evaporation, burning the combustible organic constituents of the concentrated liquor in suspension to obtain a dry ash consisting mainly of magnesium oxide and combustion gases containing SO_2, mixing said magnesium oxide with water to form a slurry of magnesium hydroxide, passing said combustion gases through a venturi-like SO_2 absorption zone in intimate direct co-current contact with a constantly moving atomized magnesium bisulphite-monosulphite liquid in an acid state containing magnesium monosulphite in an amount in excess of the normal solubility of the monosulphite in the liquid and at a temperature in the range between 100° F. and the dew point temperature of the said hot combustion gases to form magnesium bisulphite in the liquid, said excess monosulphite being in the form of a suspension of reactive microscopic crystals, separating the liquid containing magnesium bisulphite from said combustion gases, discharging a portion of the magnesium bisulphite containing liquid from said absorption zone to a storage zone, withdrawing the remainder of said magnesium bisulphite containing liquid from said absorption zone, and mixing said withdrawn liquid with a controlled amount of said magnesium hydroxide slurry to form magnesium monosulphite in excess of the normal solubility of the monosulphite in the bisulphite containing liquid in the acid state while recirculating said mixed liquid to a successive absorption zone to absorb gaseous SO_2 in said liquid, said excess monosulphite being in the form of a suspension of reactive microscopic crystals.

3,273,962

PROCESS FOR PRODUCING OXIDES IN THE FORM OF HOLLOW SHELLS

Robert J. Walsh, Ballwin, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Mar. 17, 1965, Ser. No. 440,591
2 Claims. (Cl. 23—140)

1. A process for the production of a hollow shell form of at least one of the oxides of aluminum, zirconium, zinc, magnesium, nickel, iron, cobalt, copper, manganese, chromium and vanadium, which comprises atomizing a solution of a salt selected from the class consisting of sulfates, nitrates, acetates and oxalates of the said metal in an organic solvent selected from the class consisting of alcohols and ketones having less than 5 carbon atoms in the molecule into a combustible gas flame, with the weight ratio of combustible gas relative to the weight of the salt solution being not more than 0.6, and therein decomposing the said salt with the evolution of a gas to form hollow spheres of the said oxide the said oxidation being conducted by means of an oxidizing flame at a flame temperature of from 900° C. to 1150° C. for a period of time of from 0.1 second to 0.01 second and thereafter cooling and collecting the product at a temperature in the range of from 50° C. to 350° C.

2. A process for the production of hollow shell particles of at least one oxide of the group consisting of aluminum, zirconium, zinc, magnesium, nickel, iron, cobalt, copper, manganese, chromium and vanadium oxides, the said hollow shell particles having an average particle diameter of from 1 to 10 microns, which comprises atomizing a solution of a salt selected from the class consisting of the sulfates, nitrates, acetates and oxalates of the said metals in water into a combustible gas flame, and therein decomposing the said salt with the evolution of a gas to form hollow spheres of the said oxide, and the said oxidation being conducted by means of an oxidizing flame at a flame temperature of 900° C. to 1150° C. for a period of time of from 0.5 second to 0.001 second and with the weight ratio of combustible gas relative to the weight of the salt solution being within the range of from 0.1 to 0.6, and thereafter cooling and collecting the product at a temperature in the range of from 50° C. to 350° C.

ERRATUM

For Class 23—153 see:
Patent No. 3,273,713

3,273,963

PROCESS FOR GENERATING SILICON TETRAFLUORIDE

Elton F. Gunn, Jr., Monroe, La., assignor to Columbian Carbon Company, New York, N.Y., a corporation of Delaware

Filed Jan. 17, 1963, Ser. No. 252,153
12 Claims. (Cl. 23—182)

1. The method of generating mixtures of SiF_4 and water vapor substantially free from HF which comprises vaporizing an aqueous solution of predominantly fluosilicic acid, thereby forming a vapor mixture of SiF_4, HF and water, contacting said vapor mixture with crystalline silica maintained in an essentially dry state at a temperature above the condensation point of the vapors but less than about 450° F., thus converting the HF of the vapor mixture to additional SiF_4 and water vapor and thereby producing a reformed vapor mixture of SiF_4 and water that is substantially free of HF while having a water content substantially in excess of the amount produced by the aforesaid conversion of HF to SiF_4 and water vapor.

3,273,964

PROCESS FOR PRODUCING BROMINE FROM A MIXTURE OF HYDROGEN BROMIDE AND OLEFINIC HYDROCARBON

Armand J. De Rosset, Clarendon Hills, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Feb. 28, 1963, Ser. No. 262,817
9 Claims. (Cl. 23—216)

1. A method for producing bromine from a mixture of hydrogen bromide and olefinic hydrocarbon which comprises contacting said mixture with a composite of an oxide of a metal selected from the group consisting of magnesium, calcium and zinc and an oxide of a metal of Group IV–B of the Periodic Table at conditions to

sorb the hydrogen bromide in said composite, and thereafter contacting the composite containing sorbed hydrogen bromide with an oxygen-containing gas at conditions effective for the oxidation of the sorbed hydrogen bromide.

3,273,965
PROCESS OF PREPARING A BURDEN FOR USE IN ELECTRO-THERMAL FURNACES

Friedbert Ritter, Buschhof, near Konigswinter, Germany, Franz Rodis, deceased, late of Bad Hersfeld, Germany, by Hildegard Rodis, nee Arend, heiress, Konrad Reuter, Augsburg, Germany, and Hugo Querengasser, Hermulheim, near Cologne, Germany, assignors to Knapsack Aktiengesellschaft, a corporation of Germany

No Drawing. Continuation of application Ser. No. 186,566, Feb. 23, 1962, which is a division of application Ser. No. 624,750, Nov. 28, 1956. This application Apr. 20, 1965, Ser. No. 450,263

Claims priority, application Germany, Dec. 2, 1955, K 27,495

1 Claim. (Cl. 23—223)

In the process of producing phosphorus in an electrothermal furnace, the improvement comprising (1) providing at least one electrically conducting substance in the form of both lumpy and fine-grained particles, the fine-grained particles constituting from 50–85% by weight of the electrically conducting substance, the fine-grained particles having a grain size of 6 to substantially less than 10 mm., the lumpy particles having a grain size of 10 to 50, and the electrically conducting substance being selected from the group consisting of anthracite, crude lignite, high bituminous lignite coal, and coke; (2) providing electrically non-conducting substances in the form of both lumpy and fine-grained particles, said fine-grained particles constituting from 15–80% by weight proportion of the electrically non-conducting substances, said electrically non-conducting substances being phosphate rock and quartz gravel, the fine-grained phosphate rock particles having a grain size of substantially less than 10 mm., the lumpy phosphate rock particles having a grain size of 10 to 40 mm., the fine grain quartz gravel particles having a grain size of substantially less than 6 mm., and the lumpy quartz particles having a grain size of 6 to 50 mm.; (3) compressing the fine-grained electrically conducting and electrically non-conducting particles into briquets having an electric conductivity smaller than the electrically conducting substance alone; and (4) introducing the briquets and the lumpy electrically conducting and electrically non-conducting particles into the electrothermal furnace.

3,273,966
PURIFICATION OF SULFUR

Jack L. Bowling, St. Albans, and Ernst J. Solberg, Charleston, W. Va., assignors to FMC Corporation, New York, N.Y., a corporation of Delaware

Filed Nov. 15, 1963, Ser. No. 323,926

8 Claims. (Cl. 23—229)

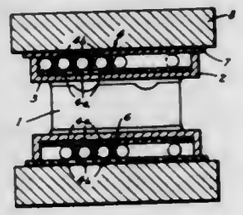
1. The process of purifying sulfur containing iron and sulfur chloride impurities which comprises, contacting the crude sulfur in the liquid phase with water and maintaining the molten sulfur and water in intimate contact with each other at a temperature of at least about 120° C. and under a superatmospheric pressure of at least about 15 p.s.i.g. for a contact time sufficient for the water to react with chlorides to produce hydrochloric acid and for the hydrochloric acid to dissolve iron impurities, separating the water containing dissolved impurities from the molten sulfur and releasing the pressure on the molten sulfur and releasing the pressure on the molten sulfur to flash-off residual water and volatile impurities.

3,273,967
METHOD FOR DETERMINING PROCESSABILITY OF TAR SAND

Omer L. Wilson, Tulsa, Okla., assignor to Cities Service Research and Development Company, a corporation of Delaware

No Drawing. Filed May 7, 1963, Ser. No. 278,751

8 Claims. (Cl. 23—230)



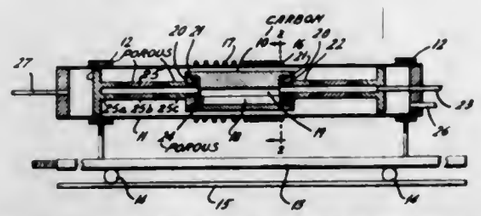
1. A method for determining the processability of tar sand which comprises collecting samples of tar sand from an exploration zone, analyzing a plurality of samples for their content of a member selected from the group consisting of iron and zinc, and correlating the analyses with the sample locations in said exploration zone to determine the location having the higher content of said member and hence the more easily processable tar sand.

3,273,968
HEAT-BURST MICROCALORIMETER

Theodor H. Benzinger, Holly Oaks, Tilden Lane, Rockville, Md.

Filed Mar. 23, 1960, Ser. No. 17,232

15 Claims. (Cl. 23—253)



1. For use in a heat-burst microcalorimeter, the subcombination of a reaction vessel, a helical conductor made of a first metal, each turn thereof having a corresponding half-length portion plated with a second metal whereby a first and second series of oppositely polarized thermal junctions are formed, said helical conductor being coiled about the surface of said reaction vessel such that said first series of thermal junctions senses the temperature of said vessel at a multiplicity of points, means for maintaining said second series of thermal junctions at a substantially constant temperature, said means for maintaining said second series of thermal junctions at a substantially constant temperature including a hollow metallic cylindrical heat sink, said second series of thermal junctions being in thermal contact with the inner wall of said heat sink.

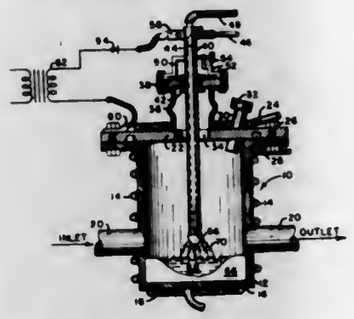
3,273,969
APPARATUS FOR GROWING FLUORIDE CRYSTALS

Valdeko H. Sirgo, Elkins Park, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Delaware

Filed Dec. 5, 1963, Ser. No. 328,264

8 Claims. (Cl. 23—273)

1. In an apparatus for growing fluoride crystals, a horizontally-movable assembly comprising a horizontally-disposed porous-walled crystal-growing inner chamber and a similarly-disposed outer chamber, stationary heating means outside said outer chamber to effect crystal growth in said inner chamber as said assembly is moved, means for introducing reactive gas into said inner chamber as an ambient for the crystal growth, the porosity of said inner



chamber permitting the excess of said gas to diffuse through the wall of the inner chamber into the outer chamber, and means for separately introducing and continuously flowing an inert gas into and through said outer chamber to protect said inner chamber and to carry away the reactive gas that has entered the outer chamber.

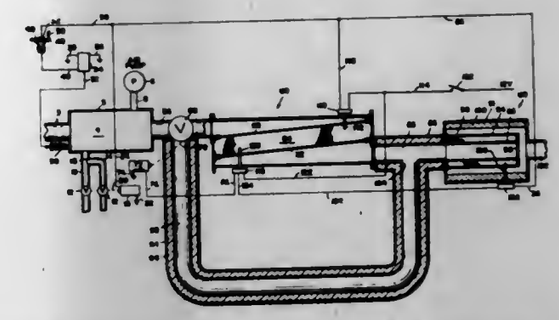
3,273,970
GETTERING DEVICE

John C. Priscu and Linden E. Snyder, Las Vegas, Nev., assignors to Titanium Metals Corporation of America, New York, N.Y., a corporation of Delaware

Filed Dec. 17, 1962, Ser. No. 245,249

5 Claims. (Cl. 23—277)

1. A gettering device comprising;
(a) a cooled container,
(b) a body of reactive metal in said container,
(c) an electrode suspended above the said reactive metal body in said container,
(d) means for maintaining the bottom of said electrode spaced arcing distance above the top of the said body of reactive metal in said container,
(e) means for supplying electric current between said electrode and said body of reactive metal in said container in amount to maintain an electric arc therebetween of intensity sufficient to maintain a pool of said reactive metal molten within a skull of solid reactive metal in said container, and,
(f) means for contacting the surface of the molten portion of said reactive metal with gas to be gettered.



3,273,971
APPARATUS FOR IMPROVING THE PURIFICATION OF EXHAUST GASES FROM AN INTERNAL COMBUSTION ENGINE

Paul E. Baddorf, Chester Springs, and Jacques H. Houdry, Villanova, Pa., assignors to Oxy-Catalyst, Inc., Berwyn, Pa., a corporation of Pennsylvania

Filed Sept. 26, 1963, Ser. No. 312,256

2 Claims. (Cl. 23—288)

1. In combination with an engine having an exhaust system provided with an exhaust pipe for conveying exhaust gases from the engine, air supply means and an exhaust purifier having an inlet in communication with the exhaust pipe and an outlet and containing an oxidation catalyst for the oxidation of the oxidizable constituents of the exhaust gases, the improvement comprising:
means forming a combustion chamber upstream of the exhaust purifier,
means to introduce an air-fuel mixture into the combustion chamber,
igniting means in said combustion chamber to ignite the air-fuel mixture,
a by-pass conduit having its inlet end connected to the exhaust pipe upstream of the exhaust purifier and downstream of the air supply means and of the combustion chamber,
valve means controlling the exhaust pipe and by-pass line and normally closing off the by-pass line and directing the flow of exhaust gases to the exhaust purifier,
means forming a reaction chamber in communication with said by-pass line and with the outlet of the exhaust purifier,
ceramic material in said reaction chamber for contact by gases passing through the reaction chamber,
means responsive to a predetermined minimum temperature of the oxidation catalyst to stop the introduction of the air-fuel mixture into the combustion chamber and deactivate the igniting means,

means responsive to a predetermined maximum temperature of the oxidation catalyst to shift the valve means to a by-pass condition to stop the flow of gases to the exhaust purifier and cause the gases to flow through the by-pass conduit and the reaction chamber, and
means responsive to a predetermined minimum temperature of the refractory material during the flow of gases through the by-pass conduit to cause the reintroduction of the air-fuel mixture into the combustion chamber and the reactivation of the igniting means.

3,273,972
SULPHURIC ACID LEACHING OF URANIUM-BEARING MATERIAL

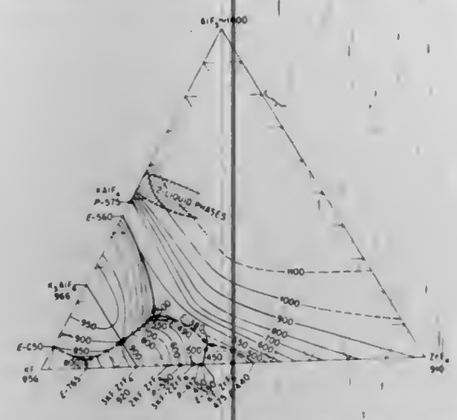
Robert A. Campbell, James D. Elliott, James R. Fisher, and Val Opratko, Elliot Lake, Ontario, Canada, assignors to Rio Algom Mines Limited, Toronto, Ontario, Canada, a corporation of Canada

No Drawing. Filed Dec. 14, 1962, Ser. No. 244,571

7 Claims. (Cl. 23—322)

1. A method of extracting uranium values from uranium-bearing materials which comprises (1) preparing an aqueous concentrate of sulphide minerals from a finely-divided aqueous slurry of said sulphide minerals; said aqueous-sulphide concentrate having a solids content of less than 31% by weight with the sulphide minerals containing a sufficient amount of sulphur to form acidic reagents of sulphuric acid and sulphates for leaching uranium from its ore; (2) treating said aqueous concentrate of sulphide minerals in the presence of an effective amount of oxygen and oxygen-containing gases at a temperature ranging from about 130–180° C. and at a pressure ranging from about 35 p.s.i.g. to 280 p.s.i.g. to obtain said acidic-leaching reagents; and (3) subsequently treating uranium-bearing materials with the acidic-leaching reagents at atmospheric pressures to obtain the uranium values.

3,273,973
METHOD FOR PROCESSING ALUMINUM-CONTAINING NUCLEAR FUELS



Roy E. Thoma, Jr., Melvin R. Bennett, and Jacob W. Ullmann, Oak Ridge, Tenn., assignors to the United States of America as represented by the United States Atomic Energy Commission

Filed Mar. 31, 1964, Ser. No. 356,338

10 Claims. (Cl. 23—324)

7. A method for the separation and recovery of fuel values from aluminum-containing nuclear fuels containing said fuel values and fission products therein compris-

ing the steps of dissolving said fuels in a molten fluoride salt solvent of $KF\text{-}ZrF_4$ at a temperature no greater than 658° C. to form a melt while passing anhydrous hydrogen fluoride through said melt, then passing fluorine gas

through said melt while maintaining the temperature of said melt between 500–600° C. to thereby convert said dissolved fuel values to the volatile hexafluoride and thereafter separately recovering said volatilized hexafluoride product.

3,273,974

FLUIDIZATION OF SINTERABLE FINES

John D. Gabor, Western Springs, Ill., and Manfred G. Baerns, Hannover, Germany, assignors to the United States of America as represented by the United States Atomic Energy Commission

No Drawing. Filed Oct. 11, 1965, Ser. No. 494,984

6 Claims. (Cl. 23—352)

5. A method of fluidizing and reacting uranosic oxide fines of about 4 to 20 microns in diameter with fluorine gas to yield uranium hexafluoride, comprising: mixing said uranosic oxides fines with alumina particles of about 200 to 300 microns in diameter to form a bed of about 30 weight percent alumina, said bed being about 15 inches in depth; introducing nitrogen gas into said bed at a velocity of about 0.4 to 0.5 foot per second with respect to the cross-section of the bed, thereby fluidizing a lower portion of said bed and creating a zone of agitation in an upper portion of said bed about 9 inches from the bottom of said bed; and introducing fluorine gas into said fluidized bed at a level corresponding to the level of said zone of agitation.

6. A method of fluidizing and reacting uranyl fluoride fines of about 10 microns in diameter with fluorine gas to yield uranium hexafluoride, comprising: mixing said uranyl fluoride fines with alumina particles of about 200 to 300 microns in diameter to form a bed of about 40 weight percent alumina, said bed being about 4 feet in depth; introducing nitrogen gas into said bed at a velocity of about 1.2 to 1.4 feet per second with respect to the cross-section of the bed, thereby fluidizing a lower portion of said bed and creating a zone of agitation in an upper portion of said bed about 2 feet from the bottom of said bed, and introducing fluorine gas into said fluidized bed at a level corresponding to the level of said zone of agitation.

3,273,975

PRODUCTION OF CHLORODIFLUORAMINE

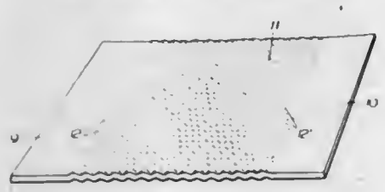
Mervin D. Marshall, Fombell, Pa., assignor to Callery Chemical Company, Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Filed July 7, 1960, Ser. No. 41,444

1 Claim. (Cl. 23—356)

A method of producing chlorodifluoramine, $ClNF_2$, which comprises reacting dinitrogen tetrafluoride, N_2F_4, with sulfur dichloride, SCl_2, and recovering the chlorodifluoramine thus formed.

3,273,976



SHEET STEEL AND SECTIONS, TUBES AND COMPOSITE CONSTRUCTIONS MANUFACTURED THEREFROM

Alfred Wogerbauer, Linz, Austria, assignor to Vereinigte Österreichische Eisen- und Stahlwerke Aktiengesellschaft, Linz, Austria, a company of Austria

Filed Mar. 16, 1964, Ser. No. 351,932

Claims priority, application Austria, Mar. 19, 1963, A 2,166/63

6 Claims. (Cl. 29—180)

1. Strain hardened sheet steel having a yield point of more than 50 kg./mm., a tensile strength of more than 55 kg./sq. mm., and an elongation of at least 8%, the sheet steel being made of steel having a carbon content of less than 0.30% and being provided with a ridge-and-groove profile in which the inner radius of curvature of the grooves is smaller than three times the sheet thickness and the ratio of depth to pitch of the ridge-and-groove profile amounts to 1:15 to 1:3.

3,273,977

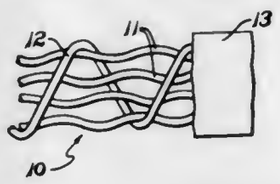
BEARING OF SINTERED METAL CONTAINING INTERSTITIAL SOLID LUBRICANT

William J. Davis, Wyomissing, Pa., assignor, by mesne assignments, to The Polymer Corporation, a corporation of Pennsylvania

No Drawing. Continuation of application Ser. No. 187,183, Apr. 13, 1962. This application June 1, 1964, Ser. No. 371,734

3 Claims. (Cl. 29—182.5)

1. An article of manufacture comprised of sintered metal and a solid lubricant held within the interstices of such sintered metal, said metal being selected from the class consisting of copper and silver and said solid lubricant being thermally degraded polytetrafluoroethylene.



3,273,978

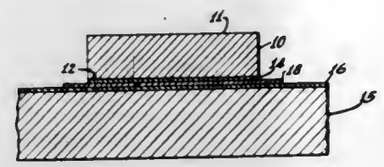
REINFORCING ELEMENT

Francis Victor Frederic Paul, Paris, France, assignor to Pneumatiques et Caoutchouc Manufacture Kleber-Colombes, Paris, France, a corporation of France

Filed May 9, 1962, Ser. No. 193,539

5 Claims. (Cl. 29—191)

1. A reinforcing element for elastomeric articles comprising an assembly of a plurality of metallic filaments extending in generally parallel juxtaposed relationship with each filament having undulations transversely of its length and with at least some of the undulations of adjacent filaments noncoincident thereby providing interstices between adjacent filaments penetrable by elastomer, and at least one filament helically wrapped in spaced convolutions about said plurality of generally parallel filaments, the spacing of said convolutions being sufficient to permit penetration by elastomer.



3,273,979

SEMICONDUCTIVE DEVICES

Alfred S. Budnick, New Providence, N.J., assignor to Radio Corporation of America, a corporation of Delaware

Filed July 6, 1964, Ser. No. 380,427

10 Claims. (Cl. 29—195)

1. The method of making a semiconductor device assemblage, comprising the steps of:

preparing a silicon die having at least one major face, and having a layer of germanium on said one major face;

positioning a gold-germanium alloy preform on a metallic body;

disposing said die and said preform with said germanium layer in contact with said preform; and,

heating the assemblage of said die, said preform, and said metallic body to a temperature sufficient to bond said die to said body.

3,273,980

OPERATION OF FUEL OIL BURNERS

William M. Le Suer and Casper J. Dorer, Jr., Cleveland, Ohio, assignors to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Oct. 22, 1962, Ser. No. 232,292

10 Claims. (Cl. 44—63)

1. In the operation of a hydrocarbon fuel burner assembly equipped with a filter screen through which the fuel passes and in which the fuel is characterized by the presence therein of a small amount of a soap-like contaminant having a tendency to form deposits on said filter screen, the improvement comprising preventing the formation of said deposits which comprises incorporating in the fuel at least about 0.0001% by weight of a salt of (A) a basic amino reactant selected from the class consisting of (1) ammonia, (2) amines having up to about 30 carbon atoms and selected from the class consisting of alkylamines, arylamines, and heterocyclic amines, and (3) partially acylated polyamines obtained by the reaction at a temperature above about 100° C. of one mole of an alkylene polyamine having n amino groups with up to $(n-1)$ equivalents of an aliphatic hydrocarbon carboxylic acid having at least about 12 carbon atoms with (B) at least about one equivalent, per equivalent of (A), of an acidic, phosphorus-containing reactant prepared by the process comprising the reaction of phosphorus pentoxide with from about 2 to about 4 moles of a hydroxy compound selected from the class consisting of olefin polymer-substituted phenols wherein the olefin polymer substituent has a molecular weight of at least about 250 and the condensation products of said phenols with an epoxide selected from the class consisting of hydrocarbon epoxides and polar-substituted hydrocarbon epoxides.

3,273,981

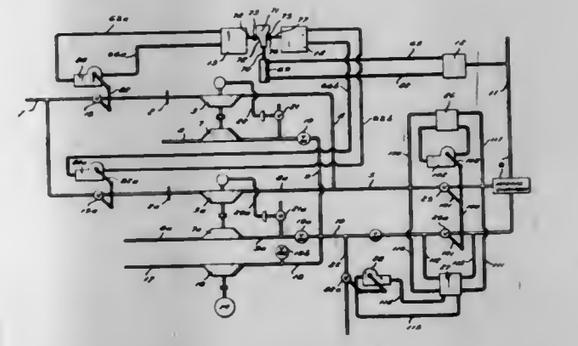
ANTI-WEAR OIL ADDITIVES

Michael J. Furey, Berkeley Heights, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed July 16, 1963, Ser. No. 295,546

7 Claims. (Cl. 44—66)

1. A hydrocarbon middle distillate boiling in the range from 50° to about 750° F. containing dissolved therein between about 0.001 and about 1.0 wt. percent of an additive mixture comprising a polycarboxylic acid of between about 9 and about 42 carbon atoms per molecule between the carboxylic acid groups and a partial ester of a polyhydric alcohol of between about 3 and about 8 carbon atoms per molecule and containing between about 3 and about 6 hydroxyl groups per molecule and a C_{12} to C_{22} fatty acid.



3,273,982

GAS MIXING METHOD AND APPARATUS

Edwin C. McDonald and Franklin E. Stephens, Cleveland, Ohio, assignors to Republic Steel Corporation, Cleveland, Ohio, a corporation of New Jersey

Continuation of application Ser. No. 98,186, Mar. 24, 1961. This application Feb. 24, 1965, Ser. No. 440,056

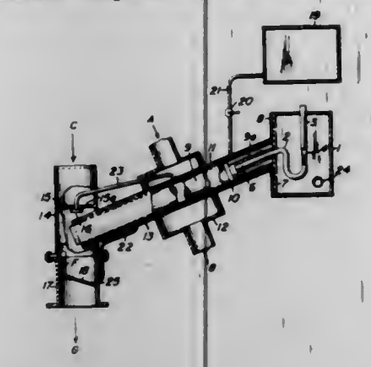
7 Claims. (Cl. 48—180)

1. The method of mixing gases which comprises the steps of passing a high pressure gas through a single, continuously variable volume valve means, expanding said gas in a chamber and discharging the gas at a lower, predetermined, constant pressure into a mixing chamber having an outlet conduit, utilizing the energy released by the expansion of the high pressure gas to draw a lower pressure gas into a chamber, compress it therein to a higher, predetermined, constant pressure and discharge it into said mixing chamber, maintaining substantially constant the predetermined ratio of the gases flowing into said mixing chamber by venting excess compressed gas, maintaining substantially constant the pressure drop in the gases flowing to said mixing chamber, withdrawing mixed gases from said mixed chamber in widely varying volumes and controlling the volume of said high pressure gas passing through said valve means in accordance with variations in the pressure of gases in said mixing chamber and thereby varying the volume of gases discharged into said mixing chamber in direct proportion to the volume of gases withdrawn therefrom.

3,273,983

FUEL VAPORIZER CARBURETOR

Clemente Miñoza, Diliman, Quezon City, Philippines, assignor of one-fifth to Felipe LL. Santillan, Quezon City, Philippines



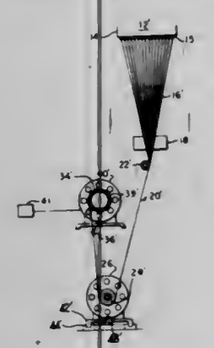
Filed Nov. 20, 1961, Ser. No. 154,107

Claims priority, application Republic of the Philippines, Jan. 27, 1961, 3,449

12 Claims. (Cl. 48—180)

6. In a fuel carburetor system for internal combustion engines and said system including fuel vaporizing means; a mixer tube assembly for mixing and feeding to the cylinders of said engines a selectively proportioned fuel-air mixture, said mixer tube assembly comprising a vertically arranged tubular member having an air inlet at its upper end and outlet means for connecting said tube to the inlet manifold of the engine at the other end, baffle means disposed within said tube and spaced from the upper end thereof to define upper and lower chambers, said baffle means including a venturi throat and at least

one air passageway, first and second conduit means communicating between said venturi throat and fuel vaporizing means and between said lower chamber and said fuel vaporizing means respectively for introduction of said

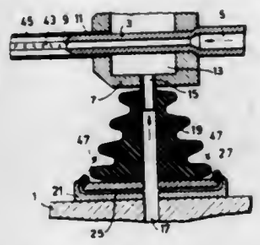


vaporized fuel into the respective chambers, and throttle means in said lower chamber for varying the internal pressure within said chamber to vary the passage of vaporized fuel through one or the other of said first and second conduit means.

3,273,984
GRINDING WHEEL
Roy S. Nelson, Sterling, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
No Drawing. Filed July 18, 1963, Ser. No. 296,100
2 Claims. (Cl. 51—296)

1. A grinding wheel of organic resin bonded abrasive grains consisting of between 30 and 50% by volume of abrasive, more than 20% but not more than 68% pores and at least 2% bond, said bond consisting of a principal bond which is essentially a shellac bond containing a minor amount of phenol formaldehyde resin, and a stabilizer bond in the amount of 10 to 20% by weight of said principal bond selected from the group consisting of diglycidyl ether epoxy resins, epoxylated novolac resins, and unsaturated polyester resins.

3,273,985
PRODUCTION OF FIBER GLASS STRAND
Russell L. Small, Pittsburgh, and Warren W. Drummond, Allison Park, Pa., assignors to Pittsburgh Plate Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Filed Mar. 1, 1962, Ser. No. 176,734
2 Claims. (Cl. 65—2)

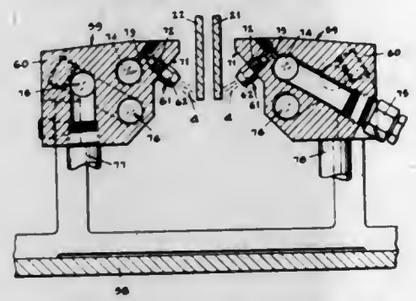


1. A method of producing continuous glass fiber strand which comprises,
(a) withdrawing glass fibers from a pool of molten glass,
(b) moving said glass fibers over and in contact with the curved surface of a rotating cylindrical member connected to the drive shaft of a constant-speed motor, said rotating member being at a first location spaced from the location of said fiber withdrawal,
(c) operating said constant-speed motor to apply a substantially constant withdrawal force on said fibers to withdraw the fibers at a substantially constant linear rate of speed,
(d) thereafter at a second location spaced from the first location and the location of fiber withdrawal, laying said fibers in a plurality of layers on a rotating tubular surface connected to the drive shaft of a constant torque electric motor, thereby progressively increasing the distance between the axis of said rotating tubular surface and the outermost layer of fibers laid thereon,
(e) operating said constant-torque motor to apply a second force on said fibers of less magnitude than said withdrawal force to exert a tension in the fibers throughout the length thereof between the first and second locations, said tension being positive and less than that exerted by said withdrawal force between the pool of molten glass and the said first location,
(f) driving said constant-torque motor at a constant input voltage to decrease said second force progressively in direct proportion to the increase in distance between the axis of said rotating tubular surface and the outermost layer of fibers, whereby the product of said second force and said distance is maintained substantially constant as said second force and said distance vary.

ERRATUM

For Class 65—6 see:
Patent No. 3,273,358

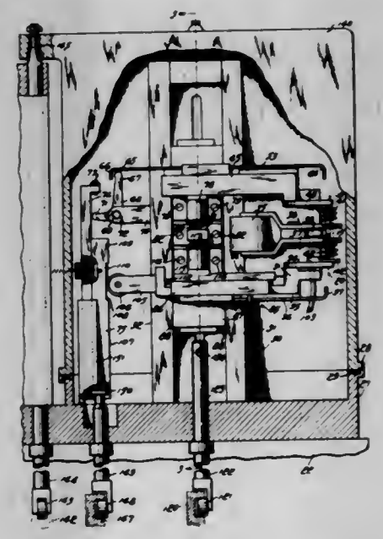
3,273,986
METHOD AND DEVICE FOR SEALING TOGETHER GLASS PARTS
Kurt Zukowski, Haaren, near Aachen, Germany, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Aug. 20, 1962, Ser. No. 218,042
Claims priority, application Germany, Aug. 29, 1961, P 27,781
4 Claims. (Cl. 65—40)



1. A method of sealing glass parts together comprising the steps, heating the glass parts to soften the same, conducting an electric current through a jet of ionized gas to the heated glass parts and seal them together; and enveloping the jet of ionized gas conducting the electric current with a current of nonionized gas coaxial with the jet to limit the surface area on which the ionized gas strikes the sealing area and to aid in cooling the area of the glass parts surrounding that struck by the jet of ionized gas.

3,273,987
COATING FIBROUS GLASS YARNS
Alfred Marzocchi, Cumberland, R.I., and William H. Otto, Coronado, Calif., assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio, a corporation of Delaware
Filed June 19, 1961, Ser. No. 117,893
10 Claims. (Cl. 65—60)

1. The method of applying a coating material, of a type made more fluid by heat, to a yarn which comprises directing the yarn along a linear path, continuously applying heat to the yarn in a first section of such path to uniformly heat the yarn, in a second section of the path following immediately thereafter continuously depositing coating material upon the yarn, said material being fluidized by the heat of the yarn, and then in a final section of the path setting the coating material on the yarn.

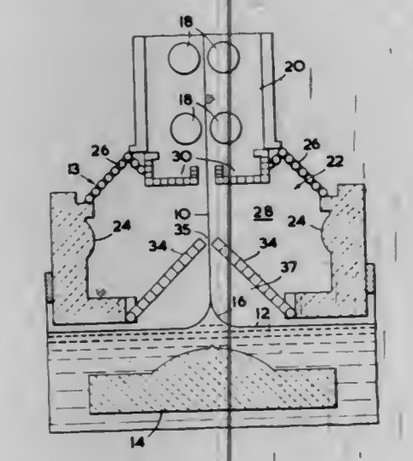


3,273,988
APPARATUS FOR PRODUCING ALL-GLASS MULTIPLE SHEET GLAZING UNITS
Harry N. Dean, Perrysburg, John C. Morgan, Jr., Toledo, and Lester H. Flaherty, Maumee, Ohio, assignors to Libbey-Owens-Ford Glass Company, Toledo, Ohio, a corporation of Ohio
Filed July 6, 1964, Ser. No. 380,249
5 Claims. (Cl. 65—152)

1. In apparatus for producing all-glass multiple sheet glazing units, supporting and conveying means to support two sheets of glass in spaced face-to-face relation and to carry them along a definite path through a heating chamber, a heating assembly disposed in said chamber adjacent said path, said heating assembly having directing means disposed on opposite sides of said path to direct heating flames toward said path, said directing means being disposed adjacent areas of said sheets located inwardly of the marginal edge portions thereof to direct said flames in an angular direction away from the inner portions of the sheets and onto said marginal edge portions thereby to bring said portions to the fusion temperature of glass as the sheets are carried thereby, and means disposed adjacent said path beyond said burner assembly to engage the heated marginal edge portions of the sheets and to urge them into fusion contact with one another.

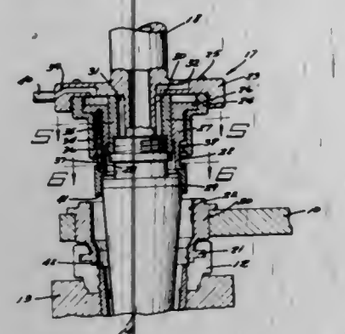
3,273,989
APPARATUS FOR ASSEMBLING SWITCHES
Nicholas F. Gubitose, Emmaus, and Jack J. Monahan, Allentown, Pa., assignors to Western Electric Company Incorporated, New York, N.Y., a corporation of New York
Filed Dec. 20, 1963, Ser. No. 332,101
11 Claims. (Cl. 65—154)

1. In an apparatus for assembling a switch having a pair of contacts extending within a glass sleeve, an assembly unit which comprises:
a housing with an open top,
a carriage frame mounted in the housing and extending upwardly through the open top,
a stationary chuck mounted at a given position on the frame for receiving a glass sleeve,
upper and lower gripping jaws for receiving upper and lower contacts for the switch,
upper and lower carriages for the upper and lower gripping jaws disposed respectively above and below the stationary chuck and supported for simultaneous opposing movement relative to each other by the carriage frame,
means cooperatively associated with the lower carriage to support the lower gripping jaws for lateral movement,
heating coils supported by the carriage frame and disposed respectively above and below the chuck and in substantial axial alignment therewith to receive the ends of the glass sleeve and cause sealing of the ends of the sleeve at given intervals,
means disposed at the feeding station to feed upper and lower contacts to the upper and lower jaws and a glass sleeve into the heating coils and the chuck,
means for simultaneously advancing the carriages to locate the upper and lower jaws in a position to receive their respective upper and lower contacts and to retract the carriages to locate the jaws in a position such that they are in substantial alignment with the stationary chuck,
means for moving the carriages simultaneously for causing the upper and lower jaws to move in opposing relationship towards the chuck for locating the inner ends of their respective contacts in the glass sleeve,
means for moving the lower carriage laterally to cause the lower jaws to move the lower contact out of alignment with the upper contact and thereby position the inner ends of the contacts in overlapping relationship,



a hood,
means to open the hood prior to the unit entering a feeding station for receiving the contacts and glass sleeve,
means to close the hood after the unit leaves the feeding station, the hood closing the open top of the housing and cooperating with the housing, when closed, to completely enclose the frame and structure therein,
means to move the carriages relative to each other for positioning the jaws to receive their contacts and to return the carriages to positions toward the chuck to locate the inner ends of the contacts in overlapping positions in the glass sleeve, and
means operable to move the lower carriage laterally to cause the lower jaws to move the lower contact out of alignment with the upper contact as they are moved into an overlapping position.

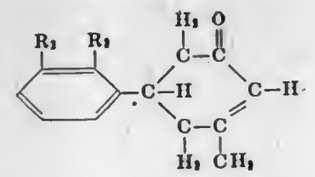
3,273,990
GLASS DRAWING APPARATUS WITH PIVOTAL COOLER
Jean M. Peeters, St. Laurent, Quebec, Canada, assignor to Pittsburgh Plate Glass Company, Pittsburgh, Pa.
Filed May 23, 1960, Ser. No. 30,900
Claims priority, application Canada, Mar. 25, 1960, 795,380
1 Claim. (Cl. 65—202)



Apparatus for drawing sheet glass from a meniscus at a free surface of a bath of molten glass comprising a draw-

ing kiln adapted to contain the bath of molten glass, a pair of horizontally spaced L blocks, a drawing machine above said drawing kiln, a pair of coolers pivotally secured to adjacent edges of said L blocks and inclined upwardly and inwardly with respect to the level of said bath, directly to overlie the free surface of said bath, said coolers serving to define a drawing chamber closely surrounding the critical zone of formation of said sheet glass, the upper extremities of said coolers being at least as efficiently cooled as any other portions of said coolers and being

located immediately adjacent opposite surfaces of said sheet glass to define a constricted channel located in the vicinity of the terminus of said zone of formation, said coolers extending downwardly and outwardly to a horizontal plane passing through said meniscus, said channel serving for passage of said sheet glass to said drawing machine and for control of flow of air to and from said chamber, said chamber being substantially sealed against access of air thereto and emergence of air therefrom other than by way of said constricted channel.



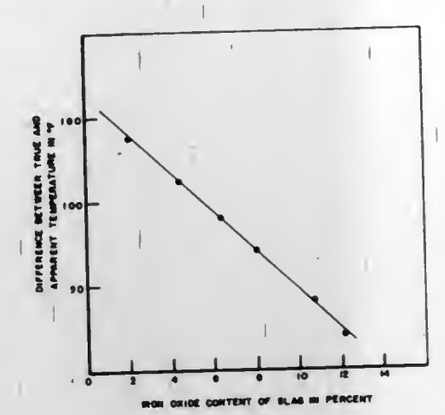
3,273,991
PRESSING PLUNGER FOR GLASS PARISONS
Robert R. Denman, Toledo, Ohio, assignor to Owens-Illinois, Inc., a corporation of Ohio
Original application Apr. 10, 1961, Ser. No. 101,749, now Patent No. 3,203,778, dated Aug. 31, 1965. Divided and this application Mar. 1, 1965, Ser. No. 435,995
5 Claims. (Cl. 65—307)

1. A plunger assembly adapted to be inserted axially through a stationary neck ring and an annular alignment bushing comprising an elongated plunger, a vertically reciprocable support for said plunger, means for connecting the upper end of said plunger to the support, a member connected to said support having spaced concentric walls surrounding said connecting means and forming an annular chamber, said support having an annular piloting surface adapted to cooperate with said alignment bushing, an annular thimble adapted to seat against the top surface of said neck ring in surrounding relationship with the upper end of said plunger, an annular piston slidably received within said chamber, said piston having a downwardly extending sleeve portion and being axially movable with respect to said plunger, means for engaging said sleeve with said thimble, and means for introducing fluid under controlled pressure to the top of said chamber in said support whereby said thimble is held against said neck ring with a constant force regardless of movement of the plunger relative thereto.

3,273,992
HERBICIDAL USE OF SUBSTITUTED METHYLCYCLOHEXENONES
Gino R. Treves, Princeton, N.J., and Kenneth L. Hill, Lyndonville, and Kenneth P. Dorschner, Middleport, N.Y., assignors to FMC Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Feb. 6, 1962, Ser. No. 171,346
4 Claims. (Cl. 71—2.3)

1. The method of destroying weeds in the presence of desired crop species which comprises applying an herbicidal amount and concentration, to the locus to be protected, of a compound having the formula

in which (A) one of R_2 and R_3 is selected from the group consisting of chlorine, bromine, fluorine, methoxy, ethoxy and allyloxy and the other is hydrogen, and (B) R_2 and R_3 are selected from the group consisting of chlorine, bromine or fluorine.



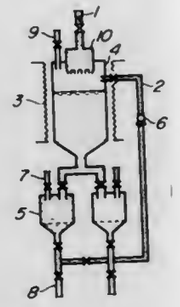
3,273,993
PROCESS OF REDUCTION ROASTING OF IRON ORE WITH METALLIC IRON
Norwood B. Melcher, Minneapolis, Minn., assignor to the United States of America as represented by the Secretary of the Interior
No Drawing. Filed Jan. 30, 1964, Ser. No. 341,462
15 Claims. (Cl. 75—1)

1. A method for reduction of non-magnetic iron ore comprising mixing said ore with metallic iron-containing material and heating said mixture to elevated temperature in an atmosphere selected from the group consisting of CO_2 gas, water vapor, and a mixture of CO_2 gas and water vapor to effect a reaction in which said ore is reduced at least in part to magnetic iron oxide.

3,273,994
FOUNDRY MELTING METHOD
William H. Moore, Purchase, N.Y., assignor to Meehanite Metal Corporation, a corporation of Missouri
Filed Jan. 13, 1964, Ser. No. 337,197
3 Claims. (Cl. 75—43)

1. The process of rapidly determining the iron oxide content of a foundry slag utilized in the melting of iron and steel, comprising the steps of, constructing a calibration curve by selecting a plurality of different calibration slag samples and for each sample chemically measuring the iron oxide content and also measuring the true and apparent temperatures and plotting iron oxide values on a first axis and the difference between true and apparent temperatures on a second axis to form the calibration curve, measuring the true and apparent temperature of the foundry slag, projecting the difference between true

and apparent temperature from the second axis and at right angles thereto to its intersection with the previously constructed calibration curve and then projecting this



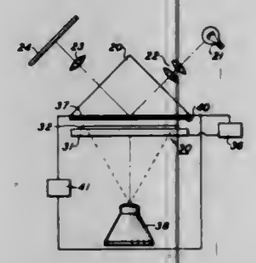
point on the curve to the first axis and in a direction at right angles thereto to determine the iron oxide content of the foundry slag without the necessity of chemical analysis.

3,273,995
RECOVERY OF ZINC FROM ZINC DIE-CAST SCRAP
John A. Ruppert, Washington, D.C., and Paul M. Sullivan, Adelphi, Md., assignors to the United States of America as represented by the Secretary of the Interior
No Drawing. Filed May 22, 1964, Ser. No. 369,644
13 Claims. (Cl. 75—63)

1. A method for removal of aluminum from a zinc-aluminum alloy comprising forming a melt of the alloy; treating the molten alloy with a flux comprising an iron halide and maintaining the iron halide in contact with the molten alloy for a time sufficient to achieve the formation of (1) an aluminum halide and (2) an iron-aluminum intermetallic compound; removing any excess flux from the surface of the melt and separating the iron-aluminum intermetallic compound from the residual molten zinc.

3,273,996
METHOD FOR MANUFACTURING ALUMINUM
Hachiro Ikeda, Nagoya, and Juntaro Yurimoto and Hirosuke Ryu, Niihama-shi, Japan, assignors to Sumitomo Chemical Company, Ltd., Osaka, Japan, a corporation of Japan
Filed Sept. 2, 1964, Ser. No. 393,933
Claims priority, application Japan, Oct. 29, 1960, 35/43,546
17 Claims. (Cl. 75—68)

10. A method for continuously manufacturing aluminum which comprises heating a complex compound of an alkylaluminum compound and an alkali metal compound in a heating zone to a temperature between 180° C. and 300° C., the alkylaluminum compound having the formula of $(R^1R^2CH—CH_2)_2AlY$ wherein each of R^1 and R^2 is selected from the group consisting of hydrogen atom and alkyl radicals, and Y is selected from the group consisting of hydrogen atom and $R^1R^2CH—CH_2$- radicals, and the alkali metal compound having the formula of MZ wherein M stands for an alkali metal and Z is selected from the group consisting of alkyl radicals, hydrogen atom, halogen atom and ⅓ AlF_6 radical, continuously supplying an amount of a fresh alkylaluminum compound corresponding to the amount of the consumed alkylaluminum compound moiety to the heating zone while taking out the aluminum produced by the decomposition from the heating zone together with reaction mass, separating the said aluminum from the said reaction mass, and recycling the remaining reaction mass into the heating zone to make the complex compound in the heating zone from the alkali metal compound included in the said reaction mass and the said supplied alkylaluminum compound.



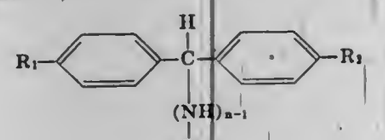
3,273,997
WET PROCESS FOR THE SEPARATION, ISOLATION, AND RECOVERY OF CERTAIN METALLIC AND NON-METALLIC CONSTITUENTS OF WASTE SLAG FROM REVERBERATORY REFINING OF COPPER PYRITIC TYPE ORES
Harold W. Wilson, El Paso, Tex., assignor of fifty percent to Wilson Laboratories, Inc., ten percent to Jack W. Flowers, ten percent to James H. Maxey, ten percent to David C. Casey, ten percent to Wesley D. Rogers, Jr., and ten percent to Vernon E. Thompson
Continuation of application Ser. No. 333,333, Dec. 26, 1963. This application Feb. 28, 1964, Ser. No. 348,063
8 Claims. (Cl. 75—108)

1. A wet process for the separation, isolation and recovery of the acid soluble metallic and non-metallic values in waste slag resulting from the reverbratory refining of copper pyritic type ores which comprises:
crushing the slag;
adding a warm solution of at least one mineral acid to said crushed slag, said solution having a normality of 4 at the time it is added to the slag;
mixing the slag and acid for not less than 8 minutes under conditions such that the two are not permitted to reach a temperature of 175° F., whereby the formation of silica gel is avoided;
separating the resulting solution from the solid insoluble residue; and
recovering the soluble iron, lead, copper, calcium, silicon, zinc and aluminum values originally present in said slag from said solution.

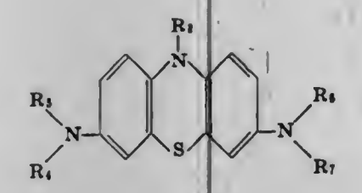
3,273,998
CHILL-CAST DUCTILE IRON ROLLING MILL ROLLS
Roy J. Knoth, Westfield, N.J., Robert D. Schelleng, Suffern, N.Y., and Charles R. Isleib, Berkeley Heights, N.J., assignors to The International Nickel Company, New York, N.Y., a corporation of Delaware
No Drawing. Filed May 13, 1964, Ser. No. 367,214
11 Claims. (Cl. 75—128)

11. An alloy ductile iron having a high combination of wear resistance, hardness, strength and toughness containing about 3% to about 3.3% carbon, about 1.6% to about 2.2% silicon, about 0.3% to about 1% manganese, about 3.5% to about 5.1% nickel, about 0.15% to about 0.9% chromium, about 0.4% to about 1% molybdenum, a small amount up to about 0.1% magnesium to control the occurrence of graphite therein to the spheroidal form, and the balance essentially iron.

3,273,999
IMAGE DEFORMATION UTILIZING A PRISM
Harold E. Clark, Penfield, N.Y., assignor to Xerox Corporation, Rochester, N.Y., a corporation of New York
Filed July 2, 1962, Ser. No. 206,991
5 Claims. (Cl. 96—1.1)



1. The method of projecting a facsimile of an original image comprising the steps of:
(a) deforming in a facsimile configuration corresponding to an electrostatic latent image of an original image the interface formed by a substantially flat surface of a transparent medium including a prismatic element and a second medium of a lower index of refraction than said transparent medium;
(b) directing a beam of light into said transparent medium toward said interface at an angle whereby the pattern of light totally internally reflected by said interface in the absence of said deformation of said interface is altered to produce a reflected light pattern corresponding to said deformation; and
(c) focusing said altered reflected pattern on a viewing screen.



3,274,000
ELECTROPHOTOGRAPHIC MATERIAL AND METHOD
Robert Joseph Noe, Marcel Jan Libeer, and Jean Marie Nys, Mortsel-Antwerp, Belgium, assignors to Gevaert Photo-Producten N.V., Mortsel, Belgium, a Belgian company
No Drawing. Filed Jan. 19, 1965, Ser. No. 426,681
Claims priority, application Belgium, Feb. 19, 1960, 39,580
19 Claims. (Cl. 96—1.5)

1. A method of forming developed electrostatic images comprising the steps of (1) exposing to a pattern of light a uniformly, electrostatically charged photoconductive insulating layer on a support which comprises (a) a polymeric binder, and dispersed therein (b) a leucobase of a dye selected from the group consisting of diaryl methane dyes and triaryl methane dyes; and (2) developing the electrostatic charge image.

2. Electrophotographic material comprising a photoconductive layer and an electroconductive backing member in intimate surface contact therewith, said photoconductive layer consisting essentially of at least one organic compound corresponding to one of the following general formulae:

and

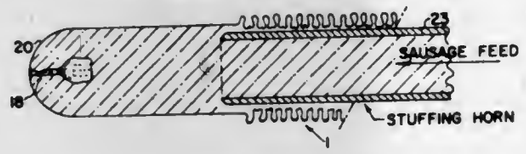
wherein:
each of R_1 and R_2 represents a member selected from the group consisting of hydroxyl, an alkoxy radical and an amino group,
R_3 is a member selected from the group consisting of hydrogen, hydroxyl, a monocyclic aryl radical and a heterocyclic radical containing a single hetero atom,
n is an integer from 1 to 2,
each of R_4, R_5, R_6 and R_7 represents a member selected from the group consisting of hydrogen and lower alkyl, and
R_8 is a member selected from the group consisting of hydrogen and a benzoyl group.

3,274,001
PROCESS FOR THE PRODUCTION OF INTEGRAL COLOR CORRECTION MASKS
Karl-Heinz Menzel, Vaihingen (Enz), Wurttemberg, Ottmar Wahl, Baden-Baden, and Gerhard Kuhn, Leverkusen, Germany, assignors to Agfa Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany
No Drawing. Filed Dec. 29, 1964, Ser. No. 421,988
Claims priority, application Germany, Jan. 30, 1964, A 45,117
3 Claims. (Cl. 96—9)

1. In the process of producing integral color masking images in a multilayer color photographic material by developing with a primary aromatic amino color-forming developer an imagewise exposed multilayer color photographic material comprising a silver halide emulsion layer sensitive to blue light and containing a color coupler that reacts with the oxidation products of said developer to form a yellow dye, a silver halide emulsion sensitive to green light and containing a color coupler that reacts with the oxidation products of said developer to form a magenta dye, and a silver halide emulsion layer sensitive to red light and containing a color coupler that reacts with the oxidation products of said developer to form a cyan dye, and treating the developed material with at least one aqueous bath containing a diazonium salt, the improvement according to which the diazonium salt is a diazonium salt of an aminosalicylic acid.

3,274,002
STABILIZER FOR SILVER HALIDE EMULSIONS
Vere Maffet, New Brunswick, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Filed Dec. 27, 1963, Ser. No. 334,033
6 Claims. (Cl. 96—109)

1. A photographic layer comprising a dispersion of light-sensitive silver halide grains in a water-permeable, macromolecular organic colloid binder containing 0.1 to 100 grams of a stabilizing agent selected from the group consisting of the calcium salt of pantothenic acid, pantothenoyl lactone and DL-pantothenal per mole of silver halide.



3,274,003
FORMULATIONS FOR INFANT FEEDING
Frederick William Zilliken, Kapittelweg, Netherlands, assignor to American Home Products Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Aug. 5, 1964, Ser. No. 387,772
6 Claims. (Cl. 99—54)

1. A composition comprising cow's milk solids and up to 5.0% by weight of a compound which will effectively promote the growth of *Lactobacillus bifidus*, said compound being selected from the group consisting of N-octanoyl-d-glucosamine, N-benzoyl-d-glucosamine and N-carboethoxy-d-glucosamine said percentage being based on the solids content of the composition.

3,274,004
LAMINATED FOOD PACKAGE
Howard Curler and Glenn E. Lineburg, both of New London, Wis., assignors, by mesne assignments, to Curwood, Inc., a corporation of Delaware
Original application May 14, 1963, Ser. No. 280,200. Divided and this application Apr. 21, 1964, Ser. No. 361,484
5 Claims. (Cl. 99—171)

2. An hermetically sealed food package of the type having nonconformed ends and characterized by its resistance to flex cracking and pinhole development for extended periods of time under severe handling conditions, said package consisting of a laminated wrapper of Saran-coated cellophane sandwiched between and bonded with an ethylene polymer to an outer layer of oriented polypropylene and bonded also to an inner layer of polyethylene, and a food product within the package.

3,274,005
SHIRRED SAUSAGE CASING WITH END CLOSURE
Clarence M. Alsys, Danville, Ill., assignor to Tee-Pak, Inc., Chicago, Ill., a corporation of Illinois
Filed Apr. 1, 1964, Ser. No. 356,510
8 Claims. (Cl. 99—176)

1. A method of closing an end of a shirred strand of synthetic tubular meat casing to render said end substantially closed to the passage of meat emulsion therethrough, which comprises turning a portion of the casing inwardly within the bore of said strand and forming a closure of the casing portion positioned therein.

3,274,006
BOROSILICATE GLASS MELTING METHOD
Charles L. McKinnis, Granville, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware
No Drawing. Filed June 29, 1960, Ser. No. 39,452
20 Claims. (Cl. 106—50)

1. In a continuous method for producing borosilicate glass fibers containing at least one alkaline earth metal oxide and at least 2 percent of boric oxide, the combined content of alkaline earth metal oxide and boric oxide comprising at least 4 percent of the glass composition, balance silica and other glass-forming ingredients, which method includes the steps of charging batch constituents into a suitable melting tank, and heating the batch constituents to effect vitrification thereof, while withdrawing streams of the vitreous material from the tank and forming fibers from such streams, the improvement comprising the steps of adding all of the boric oxide to the batch as an alkaline earth metal borate comprising an amount of boric oxide sufficiently low that such borate forms a single liqnid phase upon fusion, but sufficient boric oxide to supply the proportion thereof required without also supplying an excess of an alkaline earth metal oxide, and simultaneously increasing the rate of charging of the batch constituents and correspondingly increasing rate of withdrawal of the streams of the vitreous material from the tank to rates at which foam in the melting tank prevents withdrawal of the streams of the vitreous material therefrom when the boric oxide is charged in an uncombined form.

19. In a continuous method for producing borosilicate glass fibers consisting essentially of from about 50 percent to about 75 percent of silica, from about 2 percent to about 15 percent of boric oxide, from about 2 percent to about 25 percent of at least one alkaline earth metal oxide, from about 0 percent to about 15 percent of at least one alkali metal oxide, from about 0 percent to about 10 percent of titania, as much as about 1 percent of iron oxide, and from about 0 percent to about 3 percent of fluorine, which method includes the steps of charging batch constituents into a suitable melting tank to formulate a composition within the indicated proportions. and heating the batch constituents to effect vitrification thereof, while withdrawing streams of the vitreous material from the tank and forming fibers from such streams, the improvement comprising the steps of adding essentially all of the alkaline earth metal oxide to the batch as at least one alkaline earth metal compound selected from the group consisting of silicates and aluminates.

3,274,007
HIGH-TEMPERATURE RESISTANT SELF-HEALING COATING AND METHOD OF APPLICATION
Francis L. Jones, Atlanta, Ga., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
No Drawing. Filed Aug. 1, 1963, Ser. No. 299,175
7 Claims. (Cl. 106—55)

1. A self-healing heat-resistant coating composition for arc plasma spraying consisting essentially of:
a refractory oxide dry-mixed with silicon wherein the proportion of silicon is between in the order of 20 percent to 40 percent by weight of the composition.

3,274,008
REFRACTORY COMPOSITIONS AND METHODS OF PREPARATION
Victor A. Braunwarth, Alexander Gordon Nickle, and Norman W. F. Phillips, Arvida, Quebec, Canada, assignors to Aluminium Laboratories Limited, Montreal, Quebec, Canada, a corporation of the Dominion of Canada
Filed Dec. 23, 1963, Ser. No. 332,546
20 Claims. (Cl. 106—65)

1. A fired refractory cement consisting essentially of a mixture of —325 mesh size alumina particles whereof a minor fraction constituting at least about 2% of said mixture are particles smaller than 1 micron and the remainder are particles larger than about 1 micron; and as a binder for said mixture of aluminum particles, the residue produced upon firing of an aqueous solution of an aluminum salt selected from the class consisting of aluminum chloride, aluminum chlorohydrate, aluminum sulfate, aluminum nitrate, and aluminum phosphate, said binder being present in a proportion effective to hold the mixture together as a strong integral mass.

3,274,009
REFRACTORY COMPOSITION
Luther M. Foster, Chappaqua, N.Y., and George Long, Naperville, Ill., assignors to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Filed Feb. 9, 1965, Ser. No. 431,458
2 Claims. (Cl. 106—65)

1. A vitrified refractory composition having a crystal structure which is at least 90% cubic and consisting essentially of alumina and 9% to 12% by weight of aluminum nitride.

3,274,010
CERAMIC ADHESIVE COMPOSITION
Orval G. Caldwell, Los Angeles, Calif., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
No Drawing. Filed Feb. 18, 1963, Ser. No. 259,466
1 Claim. (Cl. 106—71)

An adhesive composition for forming laminates of thin porous highly refractory sheets comprising an aqueous

slurry consisting essentially of approximately 60 to 95% by weight of water and the following ingredients in the approximate percentages by dry weight indicated:

(a) 2–6 of bentonitic clay,

(b) 70–90 of a compound consisting of 60.8 SiO_2, 23.3 Al_2O_3, 0.07 Fe_2O_3, 0.6 CaO, 0.1 MgO, 10.0 Na_2O, 4.5 K_2O and 0.6 ignition loss said compound being known as a fine grained syenite and

(c) 10–30 of a compound consisting of 61.90 SiO_2, 0.59 Al_2O_3, 0.56 Fe_2O_3, 0.17 CaO, 30.41 MgO, 0.16 Na_2O and K_2O and 5.38 ignition loss said compound being known as a fine grained, carbonate free talc.

3,274,011

CLAY PRODUCTS AND AQUEOUS SYSTEMS CONTAINING SAME

James B. Duke, Metuchen, N.J., assignor to Minerals & Chemicals Philipp Corporation, Menlo Park, N.J., a corporation of Maryland

Filed Oct. 4, 1963, Ser. No. 313,742
6 Claims. (Cl. 106—72)

1. A method for reducing the high shear viscosity of kaolinite which consists essentially of:

forming a slurry consisting essentially of a kaolinite and an aqueous solution of hydrofluoric acid having a concentration less than 1 percent, said slurry containing about 5 to 40 pounds HF per ton of said kaolinite,

agitating said slurry,

separating the kaolinite from the aqueous phase and washing the kaolinite to eliminate free acid.

3,274,012

POLYMERIC COMPOSITION COMPRISING HEXOSE SUGAR AND ALKALI METAL SALTS

Ronald H. Cooper, Clare, and Robert D. Goodenough, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Dec. 4, 1964, Ser. No. 416,099
9 Claims. (Cl. 106—162)

1. A composition for the preparation of a non-hygroscopic thermosetting polymer which comprises; a mixture of from about 55 to about 65 parts by weight of a hexose saccharide sugar and from about 45 to about 35 parts by weight of an acidic salt selected from the group consisting of alkali metal hydrogen sulfates and mono-substituted alkali metal orthophosphates, and water from about 20 to about 40 weight percent as based on the total composition weight.

3,274,013

SHRINKABLE REGENERATED CELLULOSE BAND INCORPORATED WITH TRANSLUCENT MICACEOUS FLAKES

Irving Paul Batt, Buffalo, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Mar. 21, 1963, Ser. No. 266,833
15 Claims. (Cl. 106—168)

1. A shrinkable, cellulosic article having incorporated therein from 3 to 65%, based on the weight of cellulose, of a pigment composition consisting essentially of translucent micaceous flakes having on the surface thereof a translucent layer of metal oxide particles of at least one of the group consisting of titanium dioxide, zirconium dioxide, hydrous titanium dioxide, and hydrous zirconium dioxide particles.

3,274,014

STABILIZED YARN COMPOSITIONS

Robert C. Harrington, Jr., and James L. Smith, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Mar. 29, 1963, Ser. No. 269,156
9 Claims. (Cl. 106—177)

1. A man-made filament yarn composed essentially of a fiber-forming composition selected from the group consisting of cellulose esters, acrylonitrile copolymers, polyesters and poly-alpha-olefins stabilized against deterioration from ultraviolet light containing 0.1 to 5%, based on the weight of the yarn, of a salt selected from the group consisting of (1) metal salts of monoalkyl, monoaryl and dialkyl acid phosphates; (2) metal alkyl phosphonates and metal alkyl (alkyl phosphonates), and (3) metal dialkyl phosphites, said alkyl and aryl groups containing from 1 to 18 carbon atoms and said metal being selected from the group consisting of zinc, chromium and aluminum.

3,274,015

DRYING OIL BASED COATING COMPOSITIONS AND METHOD OF IMPROVING SAME

Nathaniel Willis, Chicago, Ill., assignor, by mesne assignments, to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Filed May 9, 1963, Ser. No. 279,292
6 Claims. (Cl. 106—252)

1. A method of reducing water sensitivity of a drying oil based paint which comprises adding, as a percentage of the drying oil content of said paint, up to about 10 percent by weight of the reaction product of ammonia and a mixture comprising from about 20 to about 80 molar percent of dimethyldichlorosilane and the balance of said mixture being vinyltrichlorosilane.

3,274,016

PROCESS FOR MANUFACTURE OF SOLID COMPOSITIONS COMPRISING ASPHALT AND CLAY CONTAINING SOILS

Dilworth T. Rogers, Summit, and John C. Munday, Cranford, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed June 24, 1963, Ser. No. 289,869
3 Claims. (Cl. 106—281)

1. A process for the manufacture of a hard bituminous solid composition which comprises the steps of:

(a) mixing a clay with an excess of water to form a slurry, said clay being one which expands in the presence of water or other polar material,

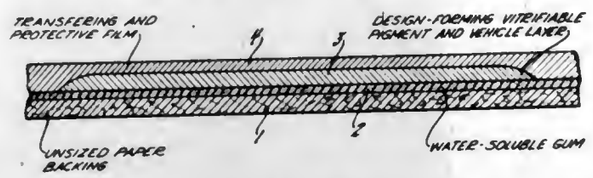
(b) adding a salt of a nitrogenous base until said clay separates from the water and floats,

(c) removing the clay from the water and drying it at a temperature of from 220° to 240° F.,

(d) mixing the treated clay with from 8 to 20 wt. percent of a bituminous binder,

(e) compressing the mixture to 80 to 98% of its theoretical density, and

(f) curing the compressed mixture at a temperature of from 300° to 500° F. for from 4 to 80 hours.



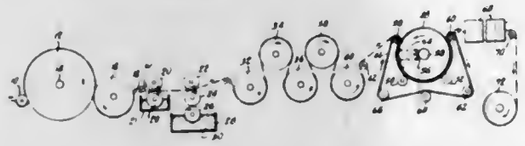
3,274,017

VITRIFIABLE DECALCOMANIA

Enrique Pereira Borrajo, Belgrano 919, Buenos Aires, Argentina

Filed Jan. 4, 1965, Ser. No. 423,039
6 Claims. (Cl. 117—3.2)

1. In a vitrifiable decalcomania, a design layer consisting of a vitrifiable pigment and a reversibly fusible solid vehicle, said vehicle consisting essentially of a mixture of beeswax 16%, cetyl alcohol 8%, solid paraffin wax 24%, liquid paraffin wax 41%, carnauba wax 1%, spermaceti 2%, WW resin 5% and Venetian turpentine 3%, said vehicle being capable of returning to liquid state upon application of heat prior to volatilizing upon further application of heat.

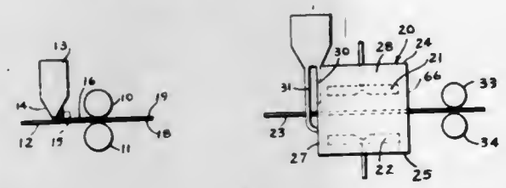


3,274,018

METHOD FOR PRODUCING A DECORATIVE NONWOVEN FABRIC

Gordon D. Russell, Chateauguay Heights, Quebec, and Edmund J. Sklejka, Montreal North, Quebec, Canada, assignors to Johnson & Johnson, a corporation of New Jersey

Filed Feb. 18, 1965, Ser. No. 438,174
4 Claims. (Cl. 117—11)



1. A method of making a decorative bonded nonwoven fabric from a fibrous web of uniformly distributed overlapping and intersecting fibers which comprises: applying a settable bonding material to said fibrous web in a predetermined pattern of areas, setting said bonding material to bond the fibrous web, and applying rearranging forces to the entire bonded fibrous web to rearrange the fiber portions only in the unbonded areas into a network of openings and fiber bundles.

3,274,019

IMPREGNATION AND COATING WITH SPLIT-OFFS OF VERMICULITE AND PRODUCTS THEREOF

Paul F. La Vine, St. Paul, Minn., assignor of one-half to Alton V. Oberholtzer, White Bear Lake, Minn.

Filed Nov. 6, 1964, Ser. No. 411,178
9 Claims. (Cl. 117—16)

1. In a method of providing metal with a coating of a composite of metal oxides and silica material, the steps consisting essentially of

heating the metal to a temperature sufficient to open the pores of said metal,

and treating the heated metal in an atmosphere of a powder of fine crystalline material of a particle size which passes through about a 400 to a 500 mesh sieve and consisting essentially of an oily feeling composite of a uniformly appearing crystalline form of metal oxides and silica material prepared by heat-expanding vermiculite to produce exfoliated vermiculite and by-product dust fines consisting essentially of metal oxides and silica material and screening and separating said dust fines from said exfoliated vermiculite,

thereby effecting an embedding of the said fine crystalline material into the pores of the surface of the metal while heated to said temperature,

and providing a thin tightly adherent coating of the said metal oxides and silica material on said metal material.

3,274,020

FILMS MADE FROM HIGHLY HYDROLYZED POLYVINYL ALCOHOL

Charles A. Heiberger, Princeton, and Daniel S. Dixler, Berkeley Heights, N.J., assignors, by mesne assignments, to Cumberland Chemical Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Feb. 15, 1962, Ser. No. 173,362
13 Claims. (Cl. 117—68)

1. A thin transparent film characterized by an oxygen permeability of at most about 0.03 cc./100 in.²/day at 72° F. and 50% relative humidity, comprising a base sheet formed from polyvinyl alcohol having a degree of hydrolysis of at least 99.8%, said base sheet having a thickness of about 0.0001 to about 0.01 inch, and an adherent water-proof polymeric coating on at least one side thereof.

3,274,021

STANNATE COATING BATH AND METHOD OF COATING ALUMINUM WITH TIN

Jan C. Jongkind, Roseville, and Peter G. Kenedi, Detroit, Mich., assignors, by mesne assignments, to M & T Chemicals Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Apr. 27, 1962, Ser. No. 190,805
17 Claims. (Cl. 117—130)

1. The method of treating aluminum by immersion plating to form a surface layer of tin thereon which comprises immersing said aluminum in an aqueous bath containing water, an anion of a polyhydroxy carboxylic acid in amount of 0.01–0.25 mole per liter calculated as salt, and a stannate salt selected from the group consisting of sodium stannate and potassium stannate; maintaining said aluminum in said bath for time sufficient to deposit a surface layer of tin thereon; and withdrawing said aluminum from said bath.

3,274,022

PALLADIUM DEPOSITION

Richard N. Rhoda, Westfield, N.J., assignor to The International Nickel Company, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 26, 1963, Ser. No. 267,947
6 Claims. (Cl. 117—130)

4. A process for the electroless deposition of palladium which comprises establishing an aqueous bath containing about 1 to about 20 grams per liter of divalent palladium, about 0.04 to about 0.50 gram per liter of unsymmetrical dimethylhydrazine, an amine selected from the group consisting of ammonia, aminoethyl ethanolamine and amylamine in an amount equivalent in molar concentration to about 100 to about 350 grams per liter of ammonia and a stabilizing agent selected from the group consisting of ammonium chloride, ammonium sulfate and ethylenediaminetetraacetic acid in an amount equivalent in molar concentration to up to about 80 grams per liter of ethylenediaminetetraacetic acid and placing a body having a catalytic surface in contact with said aqueous bath while maintaining the temperature of said bath at about 68° C. to about 100° C. to effect a deposition of metallic palladium from said bath on said surface and while replenishing said bath with unsymmetrical dimethylhydrazine to maintain the concentration thereof within said range of about 0.04 to about 0.50 gram per liter.

3,274,023
SCUFF RESISTANT LEATHER

Joseph A. Bassett, Topsfield, and Malcolm H. Battles, Andover, Mass., assignors to Swift & Company, Chicago, Ill., a corporation of Illinois

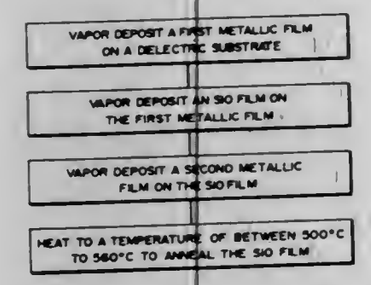
No Drawing. Filed July 25, 1960, Ser. No. 44,859
6 Claims. (Cl. 117—142)

1. A method of treating grain leather to impart to the grain surface thereof scuff resistant properties while maintaining desirable flexibility and water vapor transmission characteristics of said leather as well as good break in said leather, comprising: applying to the grain side of said leather a modified unplasticized polyamide resin, which impregnates the grain layer of said leather substantially with said resin, the amount of said polyamide resin being sufficient to penetrate said grain layer, said modified polyamide resin being the reaction product of a polyamide of polymeric fat acids and an alkylene polyamine and an aliphatic monoepoxide having 4–18 carbons.

3,274,024
ENERGY CONVERTER

Robert Matteson Hill, Palo Alto, and Burnell Vincent Dore, Sunnyvale, Calif., assignors to General Telephone and Electronics Laboratories, Inc., a corporation of Delaware

Filed Nov. 16, 1962, Ser. No. 238,299
4 Claims. (Cl. 117—200)



1. A device comprising first and second electrically conductive layers, a thin film or barrier having a thickness within the range of 20 to 1000 angstroms interposed therebetween, and a cathodoluminescent phosphor layer associated with said first and second layers and said barrier.

3,274,025
METHOD OF FORMING AN ELECTRICAL CAPACITOR

Sotirios Ostis, St. Paul, Minn., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York

Filed Dec. 13, 1963, Ser. No. 330,412
3 Claims. (Cl. 117—217)

1. In the method of forming an electrical capacitor comprising the steps of vapor depositing in vacuo on a dielectric substrate successive films of metal, silicon monoxide, and metal in the order named, the improvement comprising heating the capacitor so formed to a temperature ranging from about 500° C. to about 560° C. to anneal said film of silicon monoxide thereby decreasing the dissipation factor of said capacitor.

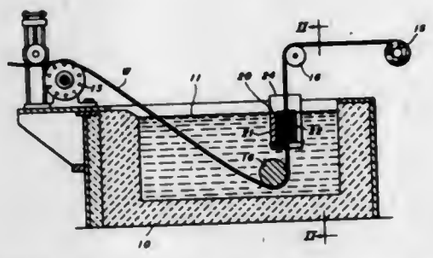
3,274,026
COATED PLASTIC ARTICLES

Arthur S. Nyquist, Darien, Conn., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed June 19, 1962, Ser. No. 203,450
18 Claims. (Cl. 117—138.8)

1. A heat- and pressure-consolidated article, prepared from a thermosetting aminoplast resinous composition, coated with a substantially insoluble and infusible cured, adherent, stain-resistant composition comprising the resinous reaction product of:

(A) from about 10% to about 70% by weight of a highly alkoxymethylated melamine having from about 3 to 6 methylol groups, of which from about 3 to 6 are alkylated with a lower alkyl group, and having not more than about one unalkylated methylol group, and correspondingly



(B) from about 90% to about 30% by weight of an epoxy resinous material obtained by reacting a polyhydric phenol with an epihalohydrin,

the percentages of said (A) and (B) each being based on the total weight of said (A) and (B).

3,274,027
METHOD AND APPARATUS FOR APPLYING HOT-DIPPED METAL COATING TO WIRE

Richard A. Nickola, Cleveland Heights, and Gordon T. Spare, Chardon, Ohio, assignors to United States Steel Corporation, a corporation of New Jersey

Filed Dec. 14, 1961, Ser. No. 159,278
2 Claims. (Cl. 117—114)

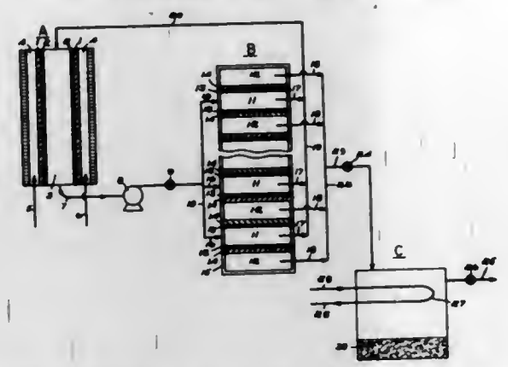
2. A method for applying hot-dipped metal coating to wire comprising inducing oscillation in the wire, immersing the oscillating wire in a bath of molten metal, passing the wire around a sinker roll, located in the wire path beyond the oscillation induction means, and withdrawing the wire upwardly from the bath through a mass of hard balls surrounding the wire and disposed at and below the surface of the bath metal whereby to dampen oscillations not damped by the sinker roll and to provide a mechanical wiping action to prevent the adherence of oxide particles.

3,274,028
MANUFACTURE OF NICKEL ELECTRODES

Yutaka Okinaka, Madison, and Dennis R. Turner, New Providence, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Jan. 7, 1965, Ser. No. 424,072
8 Claims. (Cl. 136—29)

1. A method for activating a foraminous nickel electrode which comprises impregnating the electrode with nickel hydroxide, immersing the electrode in a carbonate solution having a carbonate normality in the range 1 N to 8 N and cycling the electrode through complete discharge, complete charge and overcharge prescribed by the following:



$$TC = 2.5 \text{ to } 7$$

where T is the time of the cycle in hours and C is the ratio of charge-discharge current to electrode capacity and C varies from ½ to 2.

3,274,029
RECOVERING WATER FORMED IN A FUEL CELL AND APPARATUS THEREFOR

Robert M. Lurie, Waltham, Mass., and David J. Goldstein, Haifa, Israel, assignors to Ionics, Incorporated, Cambridge, Mass., a corporation of Massachusetts

Filed Sept. 12, 1962, Ser. No. 223,010
12 Claims. (Cl. 136—86)

1. The method of recovering potable water from the electrolyte solution of a fuel cell for use under space flight conditions, said water being formed therein by the reaction of a fuel and oxidant material comprising: passing said electrolyte under pressure into alternate distillation chambers of a membrane distillation unit, said distillation chambers being separated and defined from the adjacent alternate vapor chambers by semi-permeable membranes, said membranes consisting of a hydrophilic organic plastic material selectively permeable to water and substantially impermeable to dissolved salts, maintain at least a partial vacuum in said vapor chambers causing water of the electrolyte solution to pass through said membranes into said vapor chambers as a water vapor therein, withdrawing said vapor from said vapor chambers, and condensing said vapor to recover the water.

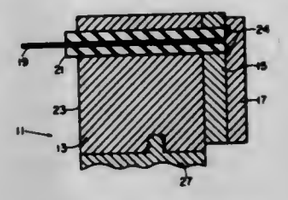
8. The apparatus for recovering potable water formed in the electrolyte of a fuel cell for use under space flight conditions, said cell comprising spaced porous catalytic electrodes having an electrolyte solution between the same and comprising: the combination of said fuel cell with a membrane distillation unit provided with means for withdrawing the electrolyte from said fuel cell into a manifold with means for passing said electrolyte into alternate distillation chambers of said distillation unit, said distillation chambers being separated and defined from the adjacent alternate vapor chambers by semi-permeable membranes, said membranes consisting of hydrophilic organic plastic material selectively permeable to water and substantially impermeable to dissolved salts, means for maintaining at least a partial vacuum in said vapor chambers, means for withdrawing the electrolyte from said distillation chambers and recirculating the same back to the electrolyte chamber of said fuel cell, means for withdrawing the water vapor passing into said vapor chamber from said distillation chambers, and means for recovering the same for further use.

3,274,030
PHOTOCELL WITH COOLING MEANS AND METHOD OF USING SAME

Robert E. Salomon, North Hills, Glenside, Pa., assignor to the United States of America as represented by the United States Atomic Energy Commission

Filed July 2, 1963, Ser. No. 292,798
10 Claims. (Cl. 136—89)

1. A photoelectric device which provides a high photovoltaic output in the presence of ultra-violet light, comprising



(a) a metal base electrode selected from the group consisting of zirconium and niobium,

(b) an oxide coating of said base electrode on at least one surface thereof,

(c) a thin metallic coating on said oxide coating,

(d) means for cooling said base electrode to a temperature no greater than about −130° C., and

(e) said device constructed for exposure to ultra-violet light.

4. The method of increasing the photovoltaic output of a photocell having a metal base electrode selected from the group consisting of zirconium and niobium, an oxide coating of said base electrode on at least one surface thereof, a thin metallic coating on said oxide coating, comprising exposing said photocell to ultra-violet light and cooling said photocell to a temperature no greater than about −130° C.

3,274,031
FUEL CELL ELECTRODE AND METHODS OF PREPARATION

Henri J. R. Maget, Marblehead, and Gerald Frank Wheeler, Salem, Mass., assignors to General Electric Company, a corporation of New York

No Drawing. Filed Aug. 7, 1963, Ser. No. 300,692
20 Claims. (Cl. 136—120)

1. A fuel cell electrode formed of a plurality of catalyst particles consisting essentially of titanium and at least one noble metal selected from the group consisting of platinum, palladium, iridium, and rhodium, each of said particles having a plurality of asperities formed in the surface thereof by the removal of a portion of said titanium, said asperities containing a predominant amount of said noble metal in an active condition, said particles, prior to the formation of said asperities, consisting essentially of from 4–25% of at least one of said noble metals and the remainder titanium.

10. A method for forming a catalytic fuel cell electrode including:

(1) preparing an alloy consisting essentially of from 4–25% of at least one noble metal selected from the group consisting of platinum, palladium, iridium, and rhodium and the remainder titanium,

(2) forming said alloy into particles,

(3) etching the surface of said particles with hydrofluoric acid to remove at least a portion of said titanium from said surface so as to produce a plurality of asperities containing a predominant amount of said noble metal in an active condition, and

(4) binding the particles with polytetrafluoroethylene film to form an electrode structure.

3,274,032
PROTECTIVE COATING

Richard L. Every, Ralph Le Roy Grimsley, and Olen L. Riggs, Jr., Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma

No Drawing. Filed Dec. 20, 1963, Ser. No. 332,285
11 Claims. (Cl. 148—6.14)

11. The method of forming a corrosion resistant coating on a ferrous metal surface which comprises the steps of:

immersing said metal surface into a solution comprising from about 2500 to about 3000 parts by weight of a compound chosen from the group consisting of meta-nitrobenzaldehyde and para-nitrobenzaldehyde per million parts by weight of said solution, a solvent chosen from the group consisting of ethanol and ace-

tone, and an acid chosen from the group consisting of sulfuric and hydrochloric acid, said acid being present in the solution in a concentration from about 0.25 to about 1.0 normal; and

maintaining said metal surface immersed within said solution for at least 4 hours.

3,274,033
ULTRASONICS
Stanley E. Jacke, Ridgefield, Conn., assignor, by mesne assignments, to Branson Instruments, Incorporated, a corporation of Delaware
No Drawing. Filed Aug. 12, 1963, Ser. No. 301,592
1 Claim. (Cl. 148—12.9)

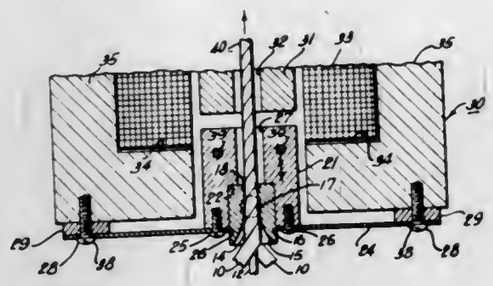
The method of reducing residual stress in weldments of titanium alloys substantially containing, by weight, 2.5 to 3.5 percent aluminum, 10 to 11 percent chromium, 12.5 to 14 percent vanadium, .05 percent maximum carbon, .08 percent maximum nitrogen, .025 percent maximum hydrogen, and the balance essentially titanium by manually pressing a high intensity ultrasonic transducer producing ultrasonic energy at a frequency of approximately twenty kilocycles per second directly against the bead of the weld at room temperature.

3,274,034
SEMICONDUCTOR MATERIAL OF PERYLENE AND FERRIC CHLORIDE HAVING A P-N JUNCTION
Martin S. Frant and Roger Eiss, Harrisburg, Pa., assignors to AMP Incorporated, Harrisburg, Pa., a corporation of New Jersey
No Drawing. Original application Oct. 9, 1962, Ser. No. 229,496, now Patent No. 3,231,500, dated Jan. 25, 1966. Divided and this application Apr. 9, 1965, Ser. No. 470,273
1 Claim. (Cl. 148—33)

A semiconducting body comprising a first portion of a semiconducting complex of perylene and ferric chloride in which said ferric chloride is in excess of an equimolar amount, said first portion having n-type conductivity, and a second portion comprising a semiconducting complex of perylene and ferric chloride in which said perylene is in excess of an equimolar amount, said second portion having p-type conductivity, the interface between said first portion and said second portion defining a p-n junction within said body.

3,274,035
METALLIC COMPOSITION FOR PRODUCTION OF HYGROSCOPIC SMOKE
Lohr A. Burkardt and William G. Finnegan, China Lake, Calif., assignors to the United States of America as represented by the Secretary of the Navy
No Drawing. Filed June 15, 1964, Ser. No. 375,402
4 Claims. (Cl. 149—40)

1. The composition which produces hygroscopic smoke comprising an admixture of the following ingredients:



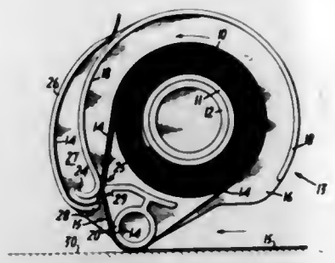
Ingredients:	Percent by weight
Lithium carbonate	19.34
Hexachloroethane	20.66
Aluminum	20.50
Potassium perchlorate	39.50

3,274,036
ARC ETCHING
Merritt B. Andrews, Southwick, Mass., and Harry A. Hokanson, Manchester, Conn., assignors to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
No Drawing. Filed Aug. 2, 1962, Ser. No. 214,211
2 Claims. (Cl. 156—2)

1. The method of pretreating a thermoelectric element prior to bonding said element to a metallic substance, said element having opposed bare end faces which faces constitute contact surfaces, and being formed from lead telluride semimetallic alloy comprising the steps of cleansing the contact surfaces by subjecting the surfaces to concentrated nitric acid bath, depleting the surface of tellurium by bombarding the surface with a concentrated emittance of electrons, and again subjecting the surface to a concentrated nitric acid bath.

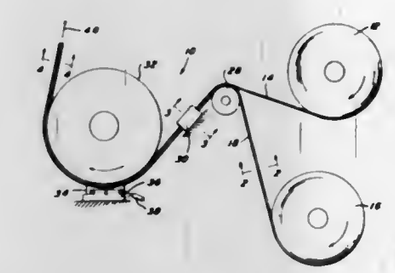
2. The method of pretreating a thermoelectric element prior to bonding said element to a metallic substance, said element having opposed bare end faces which faces constitute contact surfaces, and being formed from lead telluride semimetallic alloy comprising the steps of cleansing the contact surface by subjecting the surface to a concentrated nitric acid bath, depleting the surface of tellurium by subjecting the surface to an electromachining treatment, and again subjecting the surface to a concentrated nitric acid bath.

3,274,037
METHODS AND APPARATUS FOR INSULATING CONDUCTORS
Charles E. Nixon, Sayville, N.Y., assignor to Inso Electronic Products, Inc., Nutley, N.J., a corporation of Delaware
Filed Aug. 13, 1963, Ser. No. 301,774
17 Claims. (Cl. 156—52)



1. The method of treating a covering of plastic insulation tape surrounding an electrical conductor for purposes of increasing the dielectric strength and uniformity of the insulation tape covering comprising the steps of moving a conductor surrounded by a covering of insulation tape through a converging surface, exerting a squeezing action on the insulation tape by said converging surface, and relatively oscillating said converging surface back and forth with respect to the insulation tape and conductor moving through the converging surface.

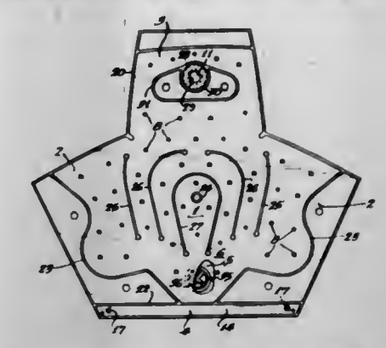
4. Apparatus for treating plastic insulation covering on conductors comprising a die member having a die opening therethrough defining a die surface converging toward the axis of said opening, a movable mounting for said die member adapted to reciprocate back and forth in a direction parallel with the axis of said die opening, and reciprocating drive mechanism for reciprocating said die member back and forth parallel with said axis.



3,274,038
DISPENSING DEVICE
Andrew B. Karn, 420 E. 86th St., New York, N.Y.
Filed Jan. 14, 1963, Ser. No. 251,385
18 Claims. (Cl. 156—247)

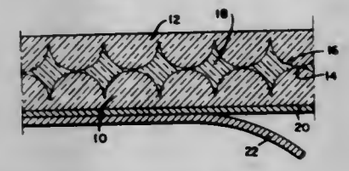
1. A method of dispensing a release-type pressure-sensitive adhesive from a roll of tape including a waste liner and a release-type pressure-sensitive adhesive releasably mounted on and radially outward of the liner with respect to contiguous portions thereof in the roll, comprising withdrawing a lead portion of said tape; pressing said tape against a surface zone and advancing said roll relative to a surface to apply the adhesive thereto and separate it from said waste liner; passing said waste liner at least partially around and in overlying relation to and in engagement and driving relation with a circumferential portion of the roll, passing said waste liner

and the underlying tape through a path having a fixed portion spaced radially outward from the periphery of said roll and separating said waste liner from said underlying tape at said portion and directing it away from said zone and roll.



3,274,039
METHOD OF MAKING PRINTING RIBBON
Walter Ploeger, Jr., North Bellmore, N.Y., assignor to Filmon Process Corporation, New York, N.Y., a corporation of New York
Original application Apr. 16, 1962, Ser. No. 187,736. Divided and this application Jan. 25, 1965, Ser. No. 427,744
9 Claims. (Cl. 156—251)

1. A method of making a laminated printing ribbon comprising the steps of overlapping first and second laminated ribbons each of which has a layer of impervious flexible plastic material which is heat sealable and inert with respect to ink, said overlapping step being accomplished in a manner so that the layers of impervious flexible plastic material of each ribbon are overlying one another in direct abutting contact and extending in the same direction, then heat sealing an ink impervious weld through each layer of each ribbon substantially parallel to and spaced from side edges of each ribbon, cutting the ribbons along the weld to provide third and fourth ribbons with each of the third and fourth ribbons containing a part of the first and second laminated ribbons and then flattening said third and fourth ribbons so that the third and fourth ribbons are substantially planar.



3,274,040
HAIR DRIER
Worthy L. Chambers, Wilmette, and Gilbert R. Wolter, Elmhurst, Ill., assignors to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Original application Apr. 6, 1961, Ser. No. 101,241, now Patent No. 3,168,382, dated Feb. 2, 1965. Divided and this application Mar. 20, 1964, Ser. No. 353,479
1 Claim. (Cl. 156—258)

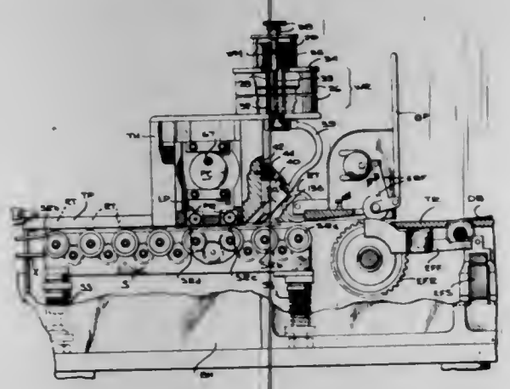
A method of forming a hair dryer cap, comprising cutting three spaced, aligned and peripherally positioned flaps in two superposed sheets of flexible plastic sheet material and connecting said sheets together continuously along their outermost edges by heat sealing said outermost edges together, folding each adjacent pair of connected flaps in the same direction and connecting them together continuously along their contiguous edges by

heat sealing said continguous edges together, and forming a plurality of spaced and continuous connections between said sheets in their central portions in a direction extending between two opposite pairs of flaps and toward the third thereof.

3,274,041
METHOD OF MAKING SHEET MATERIAL
Edwin R. Gill, Jr., Millerton, N.Y., assignor to Karl W. Flocks, Washington, D.C.
Original application Mar. 24, 1960, Ser. No. 17,342, now Patent No. 3,155,764, dated Nov. 3, 1964. Divided and this application Sept. 29, 1964, Ser. No. 406,954
3 Claims. (Cl. 156—292)

1. A method of producing a flexible weatherproof reflex light reflector sheet comprising embossing inner faces of an outer and a lower web of flexible water resistant light transmitting material to form each web into a lamina having a smooth outer surface and an inner surface embossed with a plurality of outwardly projecting rounded projections in an all-over pattern covering the surface so embossed, applying an adhesive light transmitting material having an index of refraction substantially lower than the index of refraction of said outer and lower webs to the embossed surfaces, bringing said coated embossed surfaces together with the adjacent projections on the two webs in alignment with the faces of said aligned projections in the two webs being separated not more than 0.4 time the radius of the rounded projections and with the adhesive completely filling the spaces between the said webs, and curing said adhesive while said webs are maintained in their respective positions.

3,274,042
METHOD OF FORMING HOT PRESS PLYWOOD AND PRODUCT
Daniel P. Gilboe, Minneapolis, and Lynn C. Adolphson, St. Paul, Minn., assignors to Archer-Daniels-Midland Company, Minneapolis, Minn., a corporation of Delaware
No Drawing. Filed Apr. 27, 1962, Ser. No. 190,782
10 Claims. (Cl. 156—328)



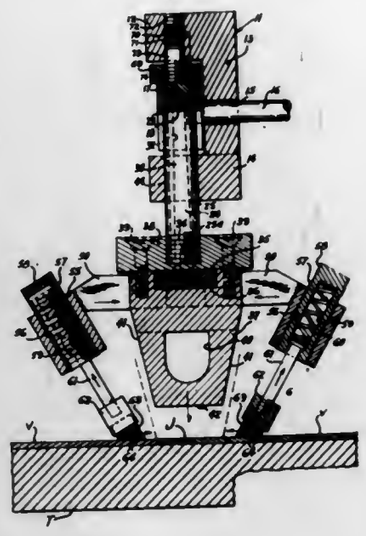
10. A method of laminating sheets of material comprising

(A) coating a wooden sheet with a mixture, having a pH of at least 12, which is stable at room temperature and which will react to form an adhesive material when subjected to an elevated temperature and pressure comprising

(1) soya protein,
(2) water, and
(3) the reaction product of an aldehyde and a primary amine selected from the group consisting of
(a) acetaldehyde-ammonia,
(b) formaldehyde-ethylenediamine,
(c) acetaldehyde-ethylamine, and
(d) acetaldehyde-aniline;

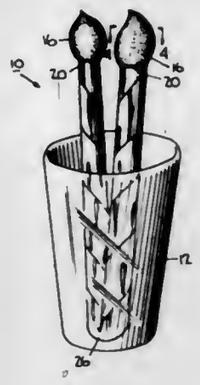
(B) placing the coated sheet in a surface-to-surface relation with another sheet;
(C) pressurizing the sheets at a pressure of 100 to 200 p.s.i.; and
(D) heating the pressurized sheets at a temperature of about 240° to 300° F. for a period of about 2 to 6 minutes.

3,274,043
LABELING MACHINE
Kurt Rudolf Schneider, Bainbridge, N.Y., assignor to Eureka-Carlisle Company, a corporation of Delaware
Filed Jan. 29, 1962, Ser. No. 169,439
14 Claims. (Cl. 156—357)



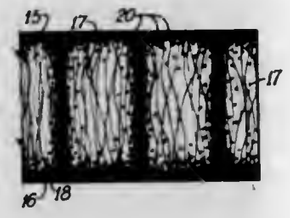
1. Moistening apparatus comprising a support, means for moving articles in succession along the support with a selected part of a surface of each article moving along a predetermined path, a reservoir for liquid mounted on the support above the level of the said path, a duct for conveying liquid downward from the reservoir, a nozzle fixed on the support and connected for supply through said duct and having an orifice positioned at a distance from said path for forming a liquid bead at the end of the nozzle during the flow of water from the reservoir, said bead extending from the nozzle for contact with the part of the article surface in said path for wetting the same, a valve effective when closed for preventing liquid flow through the duct and thereby establishing a hydraulic seal to prevent formation of a bead at the nozzle orifice and means on the support for preventing contact of the article with the nozzle end and means for varying the opening time of said valve for adjusting the area of application of the bead upon the article surface.

2. An apparatus as in claim 1, wherein said varying means includes means responsive to the moving articles and effective to procure opening and closing of the valve in timed relation to movement of the article whereby the liquid is deposited from said nozzle within the area of said selected part and for a limited length thereon.



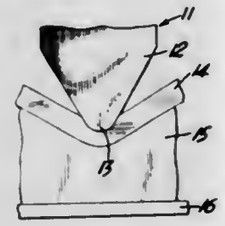
3. An apparatus as in claim 2, including means for feeding and placing gummed labels on the wetted area, means for preventing the movement of the articles, and means responsive to the presence of a label ready for such placing and effective for overriding the preventing means and procuring the advancement of an article for actuating said article responsive means.

3,274,044
COMBINATION FACE VENEER ASSEMBLER
Starling Trimen Efird, 1604 Lakewood Drive, High Point, N.C.
Filed Jan. 2, 1963, Ser. No. 249,048
6 Claims. (Cl. 156—556)



1. A combination face veneer assembler comprising a support, an elongated heating element mounted for vertical movement thereunder, transverse connecting rods slidably mounted on said heating element, rubber tipped spring biased clamping fingers carried by said arms, first cam means for lowering said heating element towards veneer pieces to be assembled, second cam means for simultaneously moving said transverse rods and hence said clamping fingers inwardly toward the center of said heating element to bias the veneer pieces together, and means for actuating said first and second cam means.

3,274,045
DECORATIVE DINING NAPKINS
Irving Smith, 1201 Evergreen Ave., Flushing, N.Y.
Filed May 22, 1963, Ser. No. 282,437
5 Claims. (Cl. 161—7)



1. A decorative dining napkin of a flexible and semi-limp material adapted to be folded to imitate a three-dimensional object in a fanciful manner, said napkin comprising a substantially rectangular flat blank decorated in accordance with the motif of said three-dimensional object, said blank having a corner cut out to an outline of an upper prominent component of said object, said outline having undercut portions on opposite sides thereof to define a constricted neck connecting the outline to the body of the blank and including an intermediate portion of greater transverse dimension that that of the neck so that said intermediate portion overhangs the neck in edge relief whereby when the body of the napkin is transversely arched to any specific radius of curvature, the neck will be similarly arched and the outline will be arched to a greater radius of curvature.

3,274,046
COMBINED FIBER AND CELLULAR ARTICLE
Richard F. Shannon, Lancaster, and Philip W. Sullivan, Newark, Ohio, assignors to Owens-Corning Fiberglas Corporation, a corporation of Delaware
Continuation of application Ser. No. 765,563, Oct. 6, 1958. This application June 1, 1964, Ser. No. 371,317
5 Claims. (Cl. 161—36)

1. An article of manufacture comprising, as a core material, a plurality of bodily separate masses of intermeshed vitreous fibers, which masses are disposed in closely adjacent, side-by-side relationship, the fibers in said masses being bonded to one another at points of contact by a first binder material, first and second bodies of a hardened binder intimately associated with, bonded to, and supporting fibers in each of said masses of core material, adjacent each of two opposed surfaces of each mass, one of said binder bodies substantially filling voids between fibers adjacent each of said opposed surfaces and extending a distance sufficient to provide a high strength region of combined binder and core material, and a rigid foam extending into juxtapositions of adjacent masses of fibers to interconnect the same, said rigid foam laterally bridging the individual fibers of said regions at points intermediate the points of connection of said fibers by said first binder.

3,274,047
LOCALLY DEFORMED AND LOCALLY DELAMINATED SCORES AND THE METHOD AND APPARATUS FOR MAKING SAME
Francis J. Sloan, Cranford, N.J., assignor to Union Carbide Corporation, a corporation of New York
Filed Apr. 1, 1963, Ser. No. 269,652
16 Claims. (Cl. 161—46)

10. As an article of manufacture a pre-scored plastic container blank in a single ply oriented styrene polymer sheet having at least two integral panel members with a score between said integral panel members, said score being characterized by localized deformation and localized delamination of the plastic blank along the line of the score such that the score consists of plurality of deformed and delaminated layers of plastic, each deformed and delaminated layer of plastic having a thickness less than that of the plastic sheet.

3,274,048
RAPID SETTING ADHESIVE COMPOSITIONS
Walter B. Armour, Plainfield, and Walter C. Kania, Colonia, N.J., assignors to National Starch and Chemical Corporation, New York, N.Y., a corporation of Delaware
No Drawing. Filed Aug. 22, 1962, Ser. No. 218,515
8 Claims. (Cl. 161—184)

1. An aqueous adhesive composition comprising (a) an emulsion copolymer of vinyl acetate with a comonomer selected from the group consisting of glycidyl acrylate and glycidyl methacrylate and (b) trimethylol phenol.

6. A laminate comprising at least two laminae which are adhesively bound with a film consisting of a dried residue of an aqueous adhesive composition comprising (a) an emulsion copolymer of vinyl acetate with a comonomer selected from the group consisting of glycidyl acrylate and glycidyl methacrylate and (b) trimethylol phenol.

3,274,049
PROCESS FOR PULPING BAGASSE WITH AMMONIUM HYDROXIDE AND OXYGEN
Marcel Mathew Gaschke, Toms River, and Marshall L. Spector, Livingston, N.J., assignors to Pullman Incorporated, Chicago, Ill., a corporation of Delaware
No Drawing. Filed Feb. 25, 1965, Ser. No. 435,367
1 Claim. (Cl. 162—65)

A process for pulping of bagasse to produce fibrous pulp which comprises treating bagasse in an aqueous alkaline solution containing ammonium hydroxide as essentially the sole alkaline producing reagent and having a pH from about 9 to about 12.2, dispersing a free oxygen-containing gas through said aqueous alkaline solution, the partial pressure of the oxygen being between about 25 and about 250 pounds per square inch, maintaining the aqueous reaction medium at a temperature between about 130° C. and about 150° C. for a digestion time between about 0.5 and about 1.5 hours, to produce fibrous pulp in a yield not less than 40 weight percent expressed on the basis of dried and depithed bagasse.

3,274,050
PITCH CONTROL IN PULP AND PAPERMAKING
Stanley J. Buckman, John D. Pera, and William P. Purcell, Memphis, Tenn., assignors to Buckman Laboratories, Inc., Memphis, Tenn., a corporation of Tennessee
No Drawing. Filed Apr. 29, 1963, Ser. No. 276,199
12 Claims. (Cl. 162—190)

1. A pitch control process which comprises adding to the aqueous fluids of a pulp or papermaking system a composition consisting essentially of an N,N-dimethylamide of a straight-chain carboxylic acid, characterized in that said acid contains 18 carbon atoms and at least one carbon to carbon double bond, at a rate which provides a concentration of said amide of at least 0.2 p.p.m. in said aqueous fluids.

3,274,051
METHODS FOR KILLING PLANT FUNGI
Masaru Kado, Takeo Tsubol, and Taizo Maeda, Shimizu, and Eiichi Yoshinaga, Ogasa-gun, Japan, assignors to Ihara Chemicals Company Limited, Shimizu, Japan, a corporation of Japan
No Drawing. Filed July 27, 1964, Ser. No. 385,489
Claims priority, application Japan, Aug. 30, 1963, 38/45,411; Feb. 5, 1964, 39/5,692
1 Claim. (Cl. 167—30)

Method of killing plant fungi comprising applying thereto S-benzyl-O.O-diethylthiolophosphate.

3,274,052

PREPARATION OF PESTICIDE GRANULES

Jerome Yaffe, El Cerrito, and Robert E. Sellers, Fresno, Calif., assignors to FMC Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed June 19, 1963, Ser. No. 288,895
21 Claims. (Cl. 167—42)

1. The process for preparing concentrated granular pesticides which comprises the step of coating the surface of granular carrier particles with toxicant, said toxicant comprising 25–85% by weight of the final product, by spraying molten droplets of a normally solid toxicant composition upon the surface of said granular carrier particles during said coating step, said particles being maintained in motion and at a temperature below the temperature at which the toxicant composition solidifies, whereby the molten toxicant solidifies on contact with the surface of the granular carrier particles and forms an adherent coating on the outer surface of said particles.

3,274,053

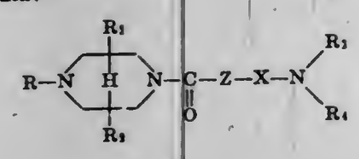
SENNOSIDE DERIVATIVES AND PHARMACEUTICAL COMPOSITIONS CONTAINING SAME

Alfred Halpern, Great Neck, and Mortimer D. Sackler, New York, N.Y., assignors to Synergistics, Inc., a corporation of New York

No Drawing. Filed June 4, 1962, Ser. No. 199,605
48 Claims. (Cl. 167—65)

1. A molecule selected from the group consisting of:
(a) Sennoside A tannate
(b) Sennoside B tannate
(c) molecules having the structure RX, wherein R is a moiety selected from the group consisting of Sennoside A tannate and Sennoside B tannate and X is a moiety selected from the group consisting of metallo ions, ammonium ions, and pharmaceutically acceptable amines, and
(d) the molecules having the structure SY wherein S is a moiety selected from the group consisting of Sennoside A and Sennoside B and Y is a moiety selected from the group consisting of primary aliphatic amines, secondary aliphatic amines, cyclic amines, heterocyclic amines, choline and betaine.

40. A pharmaceutical composition comprising a pharmaceutical carrier and from 2 to 75 mg. of sennoside equivalent of a compound selected from the group consisting of Sennoside A tannate, Sennoside B tannate, amine sennoside, amine sennoside tannate, metallo sennoside tannate, ammonium sennoside tannate and a composition of botanical origin containing Sennoside A tannate, Sennoside B tannate, amine sennoside, amine sennoside tannate, metallo sennoside tannate, ammonium sennoside tannate and mixtures of the same.



3,274,054

ANTIVIRAL COMPOSITIONS AND METHOD OF ADMINISTRATION

Andrew Stephen Tomcufcik, Tappan, Robert Bruce Angier, Pearl River, Martin Forbes, New City, and Howard Frederick Lindh, Monsey, N.Y., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed June 28, 1963, Ser. No. 291,282
11 Claims. (Cl. 167—65)

1. A method of treating virus infections in warm blooded animals which comprises administering to said animals an antiviral composition comprising an edible carrier and from 5 to about 500 mg. per kg. based on body weight of said animal, of a substituted piperazine of the formula:

wherein R is selected from the group consisting of hydrogen and lower alkyl, R_1 and R_2 are selected from the group consisting of hydrogen and lower alkyl, R_3 and R_4 are lower alkyl, X is lower alkylene, Z is selected from the group consisting of oxygen and sulfur and acid addition and quaternary salts thereof.

3,274,055

ACID ADDITION SALTS OF MORPHOLINE ETHANOL

Alfred Halpern, Great Neck, Lake Success, N.Y., assignor to Synergistics Inc., New York, N.Y., a corporation of New York

No Drawing. Filed Jan. 21, 1965, Ser. No. 427,164
9 Claims. (Cl. 167—65)

1. An acid salt of N-morpholine ethanol selected from the group consisting of N-morpholine ethanol tartrate, N-morpholine ethanol malate, N-morpholine ethanol maleate, N-morpholine ethanol glutamate, N-morpholine ethanol salicylate, N-morpholine ethanol nicotinate and N-morpholine ethanol citrate.

3,274,056

METHODS FOR LOWERING BLOOD CHOLESTEROL AND COMPOSITIONS OF ALKALI METAL 2-METHOXYESTRA - 1,3,5(10)-TRIEN-3-OL-17-ONE SULFATE

Edward Warren Cantrall, New City, N.Y., Ruddy Littell, Rivervale, N.J., and Seymour Bernstein, New City, N.Y., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Feb. 12, 1965, Ser. No. 432,376
6 Claims. (Cl. 167—65)

1. A method of lowering blood cholesterol in warm-blooded animals which comprises administering to said animal from 1 mg. to 10 mgs. per kg. of body weight of an alkali metal 2-methoxyestra-1,3,5(10)-trien-3-ol-17-one sulfate.

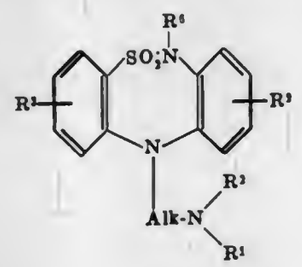
3,274,057

STABLE HEXYLRESORCINOL COMPOSITIONS

Max A. Cherkas, Philadelphia, and Wayne M. Grim, Chalfont, Pa., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

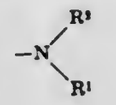
No Drawing. Filed Oct. 30, 1963, Ser. No. 319,968
2 Claims. (Cl. 167—65)

1. A stabilized germicidal composition suitable for administration as an aerosol consisting essentially of about 0.01 to 0.5% by weight hexylresorcinol, about 5 to 50% by weight anhydrous ethanol, about 15 to 60% by weight trichloromonofluoromethane, and a maximum of about 0.03% by weight ascorbyl palmitate.



3,274,058

5,5-DIOXODIBENZO[1,2,5]THIADIAZEPINES DERIVATIVES AND METHOD OF USE



Abraham Weber, Paris, France, assignor to Mead Johnson & Company, Evansville, Ind., a corporation of Indiana

No Drawing. Filed Dec. 6, 1963, Ser. No. 328,460
13 Claims. (Cl. 167—65)

1. A compound selected from the group having the formula and the acid addition salts thereof

wherein
R^3 is from one to two substitutents selected from the group consisting of hydrogen, halogen, methyl, trifluoromethyl, alkoxy, alkylthio, and alkylsulfonyl and contains up to four carbon atoms;
R^6 is selected from the group consisting of lower alkyl having one to four carbon atoms, and benzyl;
R^9 is selected from the group consisting of hydrogen, halogen, methyl, trifluoromethyl, dimethylamino, dimethylsulfamyl, carbalkoxy, alkylthio, alkylsulfonyl, alkoxy, and alkanoyl, and contains up to four carbon atoms;
Alk is selected from the group consisting of ethylene and tirmethylene haviing up to one alkyl substituent containing up to two carbon atoms;

is selected from the group consisting of pyrrolidino, piperidino, morpholino, thiamorpholino, 4-R^4-piperazino, and amino wherein
R^1 and R^4 are selected from the group consisting of alkyl, hydroxyalkyl having up to four carbon atoms and alkanoxyalkyl having up to seven carbon atoms, and
R^2 contains up to four carbon atoms and is alkyl.

8. The therapeutic process which comprises administering to a mammalian host a dose of from 0.1 mg. to 100 mg. of a compound claimed in claim 1 per kilogram of body weight of said host.

3,274,059

STABLE-ENHANCED PLASMIN SOLUTIONS

Maurel N. Richard, Gwynedd Valley, Pa., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Nov. 13, 1961, Ser. No. 152,030
4 Claims. (Cl. 167—73)

1. A stabilized solution of plasmin having enhanced proteolytic activity consisting essentially of
(1) a solution of Cohn alcohol Fraction III–3 having an initial plasminogen concentration within the range of from about 5 micrograms per ml. of solution to about 500 micrograms per ml. of solution,
(2) an amount of streptokinase within the range of from about one to about ten units thereof per microgram of said solution, and
(3) an amount of lysine within the range of from about 125 micrograms per ml. to about 2000 micrograms per ml. of said solution.

3,274,060

TREATMENT OF MULTIPLE SCLEROSIS WITH OXYTOCIN

Charles D. Bossinger, Kankakee, Ill., assignor to Armour Pharmaceutical Company, Chicago, Ill., a corporation of Delaware

No Drawing. Filed May 23, 1962, Ser. No. 196,882
8 Claims. (Cl. 167—74)

1. In treatment for multiple sclerosis, the parenteral administration to a human being afflicted with multiple sclerosis of a hormone substance consisting predominantly of oxytocin said hormone substance containing sufficient oxytocin to provide said human being with at least from about 5 to about 100 USP units of oxytocin per 12 hours.

3,274,061

PROCESS FOR STABILIZING SHELLAC COATING

Gene W. Johnston, Morris Plains, Ranjit I. Malani, East Orange, and Morton W. Scott, Livingston, N.J., assignors to Warner-Lambert Pharmaceutical Company, Morris Plains, N.J., a corporation of Delaware

No Drawing. Filed Apr. 29, 1963, Ser. No. 276,209
8 Claims. (Cl. 167—82)

1. The process for stabilizing the disintegration time of a shellac coating on an orally ingestible product, which comprises heating said shellac coated orally ingestible product at a temperature of 65°–70° C. for at least 16 hours.

3,274,062

DIAGNOSTIC REAGENT

Kingdon Lou, North Hollywood, Calif, assignor to Hyland Laboratories

No Drawing. Filed Aug. 20, 1963, Ser. No. 303,421
4 Claims. (Cl. 167—84.5)

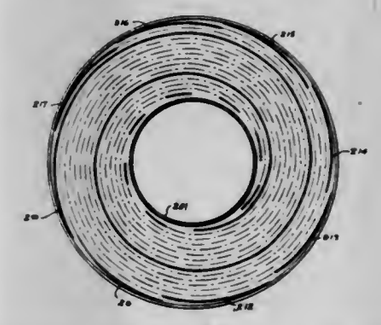
1. A method for the manufacture of a high cholesterol control standard for diagnostic use comprising the steps of:
(a) Adding calcium ions to a serum of non-elevated cholesterol content.
(b) Adding further to said serum a water soluble salt of a sulfated poly-galacturonic acid methyl ester methyl glycoside.
(c) Collecting the resultant precipitate of beta-lipoprotein and purifying said precipitate by dialysis.
(d) Dissolving said precipitate in a serum of non-elevated cholesterol content to thereby form a physiologic serum of high cholesterol content.

3,274,063

COSMETIC CREAM

Hans Alfred Nieper, Aschaffenburg, and Georg Escherich, Melsungen, Hesse, Germany, assignors to Firma Marbert-Kosmetik, Roeber and Sendler, Dusseldorf, Germany

No Drawing. Filed June 21, 1961, Ser. No. 118,495
Claims priority, application Germany, July 24, 1958, N 15,392; Sept. 22, 1958, N 15,614
4 Claims. (Cl. 167—91)

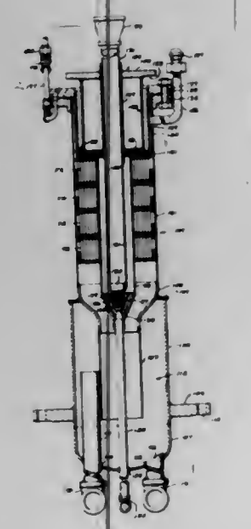


1. A cosmetic preparation containing a cosmetic fatty cream base and incorporated therein about 0.05 to 10 percent by weight of magnesium aspartate, said magnesium aspartate enhancing the skin-softening effect of said cosmetic fatty base.

3,274,064

ACTIVATION ANALYSIS NUCLEAR REACTOR AND SPOOL-LIKE FUEL ELEMENT THEREFOR

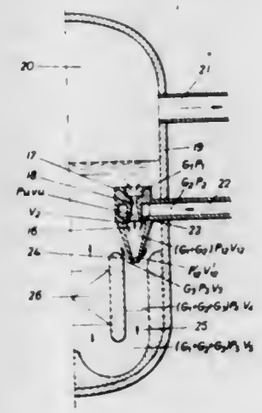
Byron H. Leonard, Jr., Ladue, Mo., assignor to Internuclear Company, Clayton, Mo., a corporation of Missouri



Filed Oct. 24, 1960, Ser. No. 64,438
26 Claims. (Cl. 176—20)

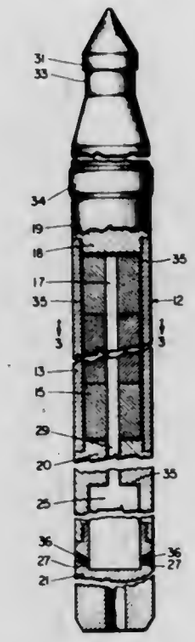
10. A nuclear reactor adapted for activation analysis purposes comprising a pressure vessel containing a moderator, a core tank mounted in said pressure vessel submerged in the moderator and containing a plurality of nuclear fuel bearing assemblies, a plurality of nozzles

supported adjacent the upper portion of said core tank and directed upwardly at an angle to the vertical, a cooling loop for the moderator including a plurality of connected lines with an interconnected pump for producing a circulation of moderator to and from said pressure vessel, a pair of branch inlets from said coolant loop one of which discharges to said pressure vessel and the other of which is a source of fluid pressure connected to supply said nozzles so as to produce an upward directed swirling fluid motion above said upward and angularly directed nozzles, a regulator means having a negative buoyancy mounting a strong absorber of neutrons projecting in the direction of said plurality of nuclear fuel bearing assemblies, a surface on said regulator means disposed above said nozzles and acted on by the upward swirling fluid motion to suspend said regulator means in a given position in the moderator with respect to said nozzles and with respect to said nuclear fuel bearing assemblies and produce rotation thereof and thereby a gyroscopic stabilizing effect, and a control valve in the branch discharging to said pressure vessel for indirectly controlling the position of said regulator means.



14. A spool-like fuel assembly for a nuclear reactor comprising a cylindrical hub, circular flanges secured in spaced axial relationship on said cylindrical hub and a

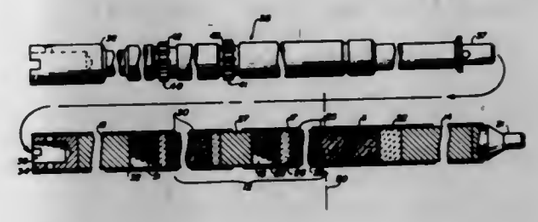
plurality of fuel elements in the form of plates of spiral configuration held at their edges between opposed faces of said spacer flanges to form spiral fluid passages, fluid inlet passages in said cylindrical hub communicating with the space between said flanges to admit a flow of moderator to the spiral paths formed between said fuel element plates and a cylindrical weir extending from the periphery of the lower flange upwardly adjacent the outlet of the spiral fluid passages between said fuel elements for maintaining a substantial portion of said fuel elements submerged in fluid during flow of fluid from said inlet passages over said cylindrical weir.



23. A nuclear reactor adapted for activation analysis purposes comprising a pressure vessel containing a moderator, a closed core tank mounted in said pressure vessel submerged in the moderator and containing a plurality of nuclear fuel bearing assemblies disposed in a first part to form vertical passage means and a sump part below said first part, an outlet connection with one of said vertical passage means extending from said first part into said sump part, means to provide an air chamber in said sump part arranged with respect to said outlet connection to prevent flow from said air chamber through said outlet connection back to said first part, a primary coolant loop connected to discharge moderator into said pressure vessel, a secondary coolant loop pressurized by the head of moderator in said pressure vessel for supplying moderator to other of said vertical passage means in said first part of said closed core tank for maintaining said nuclear fuel assemblies at least partially submerged and a connection between said parts of said core tank for returning the moderator to said pressure vessel from said sump part, means including a normally closed scram line connected to said first part of said core tank for maintaining the air chamber in said sump part and means to vent said scram line to atmosphere to discharge the moderator in said first part of said core tank to said sump part.

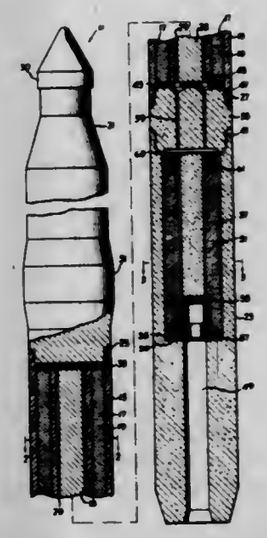
3,274,065
NUCLEAR REACTOR WITH JET PUMP ARRANGEMENT FOR OBTAINING FORCED LIQUID CIRCULATION
Birger Christian Kierulf and Thörbjörn Westrum, Kjeller, near Lillestrom, Norway, assignors to Institutt For Atomenergi, near Lillestrom, Norway
Filed May 14, 1963, Ser. No. 280,402
Claims priority, application Norway, May 18, 1962, 144,430; Mar. 27, 1963, 148,049
2 Claims. (Cl. 176—61)

1. A nuclear reactor including a closed tank containing a reactor core, a volume of liquid less than the volume of the internal space of the said tank and means providing forced circulation of such liquid in a liquid flow circuit passing the said reactor core, such circulation providing means including a conduit comprising a cooling system and a pump and extending externally of the said tank from an upstream end to a downstream end of said conduit, the said upstream end extending in fluid tight manner through the wall of said tank into the upper portion of the said tank and the said downstream and extending in fluid tight manner through the wall of said tank into the lower portion of the said tank, the said means further including an elongated hollow member situated inside the said tank in the said volume of liquid and in communication with the said downstream end of the said externally extending conduit, the said hollow member defining a chamber therein and being provided, at one end, with an inlet mouth of restricted area in communication with the said volume of liquid at a point of the said liquid flow circuit downstream of the said reactor core, said inlet mouth being followed by and communicating with a portion having a diverging cross sectional area, said portion extending into and communicating with said chamber, said chamber receiving the said downstream end of the said externally extending conduit through an opening of restricted cross sectional area, communicating with the downstream end of said externally extending conduit, the said chamber being defined by converging walls and being provided with an outlet mouth at the converging end of said walls, said converging end of said walls communicating with said liquid flow circuit at a location upstream of the said reactor core, the said means further including a passage of restricted cross sectional area included in the said liquid flow circuit and encircling the said converging end of said walls.



3,274,066
UNPURGED FUEL ELEMENT
Lloyd R. Zumwalt, La Jolla, Calif., assignor, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission
Filed Oct. 5, 1965, Ser. No. 493,280
5 Claims. (Cl. 176—68)

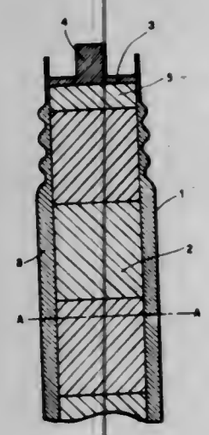
1. A non-purged fuel element for a nuclear reactor, which fuel element comprises a fuel element body section made of graphite and having a cavity formed therein, the entire internal wall surface of said cavity having been treated to provide therein a layer of material selected from the group consisting of silicon carbide and zirconium carbide, said layer forming a closed shell within said fuel element body section having excellent resistance to the passage of fission products, opening means in said fuel element body section leading to said cavity which provides the only entry to the interior of said shell, nuclear fuel material disposed within said cavity, fission product trapping means in connection with said fuel element body section, said fission product trapping means being in fluid communication with the interior of said shell through said opening means, and vent means connecting said fission product trapping means in fluid communication with the exterior of said fuel element whereby internal pressure caused by fission product formation within said shell is relieved by venting fission products through said trapping means into the fluid coolant stream flowing exterior of the fuel element.



3,274,067
FUEL ROD DESIGN
Paul Greebler, Kenneth M. Horst, Eugene E. Olich, and Bertram Wolfe, all of San Jose, Calif., assignors to the United States of America as represented by the United States Atomic Energy Commission
Filed June 7, 1965, Ser. No. 462,145
3 Claims. (Cl. 176—68)

1. In a fuel element for obtaining a thermal expansion coefficient of reactivity approaching zero and facilitating control of the rapidly rising reactivity of a nuclear reactor through the use of the Doppler broadening effect, the combination comprising an elongated tubular cladding having upper and lower closed ends defining a fissile fuel zone within said cladding, a plurality of from two to five serially arranged fuel segments in said zone, each segment having one end immovably fixed relative to said cladding within said fuel zone and with the free end of at least one of said segments together with a proximate fixed end of a second segment and the free end of the uppermost segment together with one end of said fuel zone defining void spaces of a length greater than the maximum thermal

expansion length of said fuel segment at any temperature below the melting point of said fuel, resilient restoring means disposed within said void spaces, each restoring means affixed proximate one end thereof relative to said cladding, with the other end bearing against the free end surface of fuel segment to maintain the fixed end in position with respect to said cladding to permit each of said segments to thermally expand and contract in unison in the same direction.

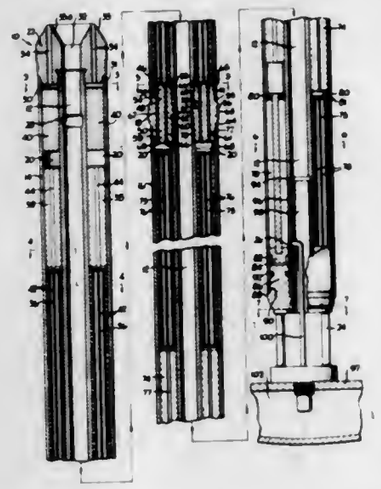


3,274,068
FUEL ELEMENT
Stanley L. Koutz and Richard F. Turner, San Diego, Calif., assignors, by mesne assignments, to the United States of America as represented by the United States Atomic Energy Commission
Filed July 22, 1964, Ser. No. 384,564
11 Claims. (Cl. 176—69)

2. In a fuel element for a nuclear reactor, which fuel element has a body section formed of a refractory material of a high thermal conductivity and which also has means for providing a purge flow of gas through the body section, a body of nuclear fuel material disposed within the fuel element body section, which body of nuclear fuel comprises a matrix of moderator material

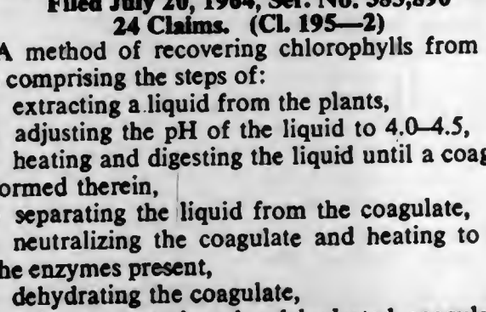
and a plurality of packets dispersed within said matrix, said packets including a mixture of nuclear fuel granules of a particle size less than about 10 microns and a refractory substance, whereby fission products from said nuclear fuel granules are released into said refractory substance in said packets and said matrix of moderator material remains free from recoil damage and dimensionally stable.

3,274,069
FUEL RODS FOR NUCLEAR REACTORS
Lucien Alfille, Brussels, Belgium, assignor to European Atomic Energy Community-Euratom, Brussels, Belgium
Filed June 17, 1963, Ser. No. 288,081
Claims priority, application Belgium, June 20, 1962, 494,456
9 Claims. (Cl. 176—72)



1. A fuel element for nuclear reactors cooled by a heat-carrying pressurized fluid, comprising:
a mechanically expansible and contractible elastic steel sheath having a thickness smaller than 0.1 mm.;
said sheath formed with means to allow axial and radial expansion and contraction thereof;
nuclear fuel material within said sheath and surrounded by the said sheath with a clearance greater than one tenth of one millimeter;
plugs closing the ends of said sheath;
a heat conductive filling material having a minimum neutron cross section and viscous at least at the operating temperatures of said reactor, said filling material completely filling any space between said sheath, plugs and fuel material and balancing by hydrostatic deformation thereof the pressure of the said heat carrying pressurized fluid acting externally upon said sheath for any mechanical and thermal stresses induced by the said fuel material.

3,274,070
FUEL ELEMENT WITH IMPROVED PURGE GAS ARRANGEMENT
Francis E. Vanslager, San Diego, Calif., assignor to General Dynamics Corporation, New York, N.Y., a corporation of Delaware
Filed May 31, 1963, Ser. No. 284,497
8 Claims. (Cl. 176—76)



1. A fuel element for use in a nuclear reactor comprising, a plurality of body pieces each of which includes a bore extending longitudinally therethrough and a plurality of fuel chambers in the walls thereof, fissionable fuel disposed in said fuel chambers, means retaining said body pieces in coaxial alignment with one another, said means having a bore therethrough allowing communication between said bores in said body pieces, said means having a passageway therethrough communicating between said chambers in said body pieces, interengaging means on said retaining means and on said body pieces preventing longitudinal movement of said body pieces relative to said retaining means, means for passing a coolant gas through said bores of said body pieces, and means for passing a coolant gas into said chamber of one of said body pieces, whereby said coolant gas will flow into said chamber of one of said body pieces and through said retaining means into said chamber of another of said body pieces.

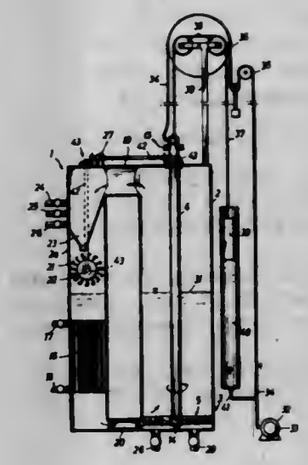
7. A connector for joining two elongated body pieces in coaxial alignment as a part of a fuel element, at least one of which body pieces contains a fuel chamber wherein fissionable fuel is disposed, and which body pieces also have recesses which terminate in beveled wall portions and which have one threaded wall, which connector comprises a generally cylindrical member having terminal portions at each end which are adapted to respectively engage an end of each of the elongated body pieces and thereby maintain the two body pieces coaxially aligned, threads on said terminal portions for mating with the threads on the recess-defining walls to prevent any longitudinal movement of the body pieces relative to said member, and beveled surfaces on said terminal portions so located to be adapted to frictionally engage the beveled wall portions of the recess-defining walls and create a gas-tight seal therebetween when said mating threads are interengaged, said member having a passageway extending therethrough for connecting the fuel chamber in gas-tight fluid communication with a chamber in the other body piece whereby a purge flow of gas can be established through the fuel chamber and through said member without leaking at said connector.

3,274,071
LATCH DEVICE FOR NUCLEAR FUEL
Stanislaw A. Janusz and John Pawliw, Peterborough, Ontario, Canada, assignors to Atomic Energy of Canada Limited, Ontario, Canada
Filed Sept. 30, 1964, Ser. No. 400,512
3 Claims. (Cl. 176—77)

2. The combination of a pair of fuel sections of a fuel rod assembly of a nuclear reactor and an elongated latch device for releasably interconnecting said fuel sections end-to-end, each said fuel section having an end support member and one of said fuel sections having in one of its ends a cavity sufficiently large to receive said latch device, a radially inwardly projecting annular lip surrounding the mouth of said cavity, said latch device comprising an elongated spindle having a base portion, a plurality of resilient collet fingers projecting from said base portion in parallel relation surrounding said spindle, and means for mounting said base portion on an end of the other of said fuel sections to project axially therefrom, said fingers having outwardly facing latching flanges on their free ends for engagement with said lip, said fingers being mounted for spring compression radially inwardly to release said flanges from said lip with said spindle limiting such radially inward compression of said collet fingers.

3,274,072
METHOD FOR TREATING PAPAYA PLANTS TO RECOVER DESIRED CONSTITUENTS THEREFROM
Everette M. Burdick, 4821 Ronda St., Coral Gables, Fla.
Filed July 20, 1964, Ser. No. 383,697
7 Claims. (Cl. 195—2)

1. A method of treating papaya plants to recover desired constituents therefrom comprising the steps of:
(a) extracting a liquid from the plants;
(b) adjusting the pH of the liquid to the range of approximately 4.0 to 4.5;
(c) digesting the liquid at not more than approximately 55° C. until a coagulate is formed therein;
(d) separating the liquid from the coagulate;
(e) treating the liquid to separate the proteolytic enzymes therefrom;
(f) treating the remaining liquid to separate carpaines therefrom;
(g) treating the coagulate to recover carotenoids therefrom; and
(h) treating the remaining coagulate to recover the chlorophylls therefrom.



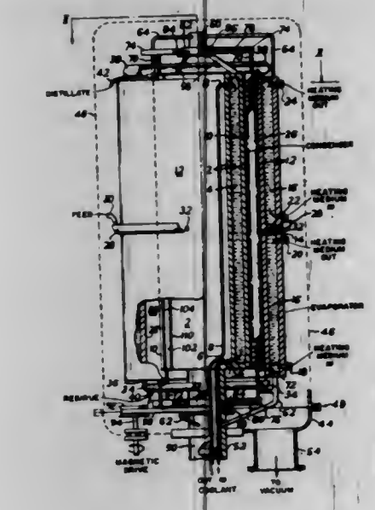
3,274,073
METHOD FOR RECOVERING CHLOROPHYLLS FROM PAPAYA PLANTS
Everette M. Burdick, 4821 Ronda St., Coral Gables, Fla.
Filed July 20, 1964, Ser. No. 383,890
24 Claims. (Cl. 195—2)

1. A method of recovering chlorophylls from papaya plants comprising the steps of:
(a) extracting a liquid from the plants,
(b) adjusting the pH of the liquid to 4.0–4.5,
(c) heating and digesting the liquid until a coagulate is formed therein,
(d) separating the liquid from the coagulate,
(e) neutralizing the coagulate and heating to destroy the enzymes present,
(f) dehydrating the coagulate,
(g) solvent extracting the dehydrated coagulate with hydrocarbon solvents having a boiling range of approximately 65° C. to approximately 85° C. for separation of carotenoids from the chlorophyll containing coagulate,
(h) solvent extracting the coagulate with a solvent to recover the chlorophylls from the residue,
(i) separating the solvent from the chlorophylls, and
(j) refining the separated chlorophylls.

3,274,074
PREPARATION OF SALICYCLIC ACID BY MICROBIOLOGICAL OXIDATION OF NAPHTHALENE IN THE PRESENCE OF A BORON COMPOUND
James E. Zajic and William J. Dunlap, Oklahoma City, Okla., assignors to Kerr-McGee Oil Industries, Inc., a corporation of Delaware
No Drawing. Filed Oct. 24, 1963, Ser. No. 318,508
15 Claims. (Cl. 195—51)

1. A process for preparing salicylic acid comprising cultivating a microorganism capable of oxidizing naphthalene to salicylic acid to the genus Pseudomonas in an aqueous nutrient medium containing naphthalene and an added boron compound to thereby microbiologically oxidize the naphthalene to salicylic acid.

3,274,075
DEVICE FOR AERATING FERMENTING LIQUIDS IN PARTICULAR FOR THE PRODUCTION OF BAKERS' YEAST
Hans Kersting, Am Heidkamp 19, Ratingen, Germany
Filed Oct. 14, 1964, Ser. No. 403,773
Claims priority, application Germany, Oct. 15, 1963, K 51,088
11 Claims. (Cl. 195—142)

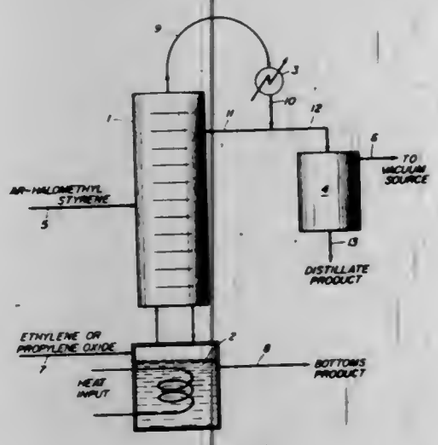


1. In a device for aerating fermenting liquids in particular for the production of bakers' yeast, the improvement comprising: an upright fermentation vessel, an air feed pipe extending in the direction of the longitudinal axis of said fermentation vessel, a series of aerating elements connected to and having openings leading from said pipe, said elements extending radially from said pipe, said elements comprising hollow bodies having porous walls, said elements being arranged in a helically-spiral imbricated pattern, the overlapping edges of said elements being spaced to provide passages for flow of fermentation liquid therebetween, said elements being each set at a predetermined angle to the longitudinal axis of said fermentation vessel.

3,274,076
FRACTIONATING STILLS
Peter Ridgway Watt, Reigate, Surrey, England, assignor to Vitamins Limited, London, England, a British company
Filed Feb. 19, 1963, Ser. No. 259,544
Claims priority, application Great Britain, Mar. 1, 1962, 8,059/62
13 Claims. (Cl. 202—187)

1. A molecular fractionating still, comprising a stationary convex first heat transfer surface surrounded by a stationary concave second heat transfer surface, one of said surfaces being a surface of a coolable condenser and

the other of said surfaces being a surface of a heatable evaporator, said surfaces being surfaces of revolution about the same vertical axis, at least one liquid transfer element mounted for rotation about said axis between



said surfaces and in scraping contact with the condenser surface and having a plurality of inclined channels for transferring liquid from the condenser surface to higher points on the evaporator surface.

3,274,077

DISTILLATION OF CRUDE Ar-HALOMETHYLSTYRENES IN PRESENCE OF AN ALKYLENE OXIDE

David Solomon Hoffenberg, Norwalk, and Harry Francis Cosway, Stamford, Conn., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

Filed Sept. 18, 1962, Ser. No. 224,517
8 Claims. (Cl. 203—8)

1. A process of purifying crude ar-halomethylstyrene to obtain the desired ar-halomethylstyrene product in greater than 95% purity, which comprises subjecting said crude material to vacuum distillation in a column fabricated from and packed with a non-ferrous material, said distillation being carried out in the presence of 0.005 to 2%, based on the weight of the crude material, of a member selected from the group consisting of ethylene oxide and propylene oxide and about 0–5%, based on the weight of the crude material, of a carbocyclic nitroaromatic compound.

3,274,078

PROCESS FOR TREATING THE SURFACE OF ALUMINIUM OR ALUMINIUM ALLOY WITH AN ORGANOHYDROGENPOLYSILOXANE

Yuji Tsuji, Shinagawa-ku, Tokyo-to, Japan, assignor to Tokyo Shibaura Denki Kabushiki Kaisha, Kawasaki-shi, Japan, a joint-stock company

No Drawing. Filed Sept. 11, 1962, Ser. No. 222,963
Claims priority, application Japan, Oct. 6, 1961, 36/35,865
3 Claims. (Cl. 204—35)

1. Process for treating the surface of a metal consisting essentially of comprising the steps of forming a porous film of aluminum oxide by electrolytically anodizing said metal, applying an organohydrogenpolysiloxane onto said porous film of aluminum oxide immediately after said anodizing step and then heating said thus-treated metal surface.

3,274,079

BATH AND PROCESS FOR THE ELECTRODEPOSITION OF NICKEL AND NICKEL-COBALT ALLOYS

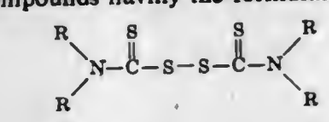
Frank Passal, Detroit, Mich., assignor, by mesne assignments, to M & T Chemicals Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed July 19, 1962, Ser. No. 211,128
14 Claims. (Cl. 204—43)

1. The process for electrodepositing a nickel plate by passing a current from an anode to a cathode to be plated which comprises electrodepositing said nickel plate from an aqueous bath consisting essentially of operative amounts of 10.5 to 73 g./l. nickel ion Ni^{++}, 2.43 to 36.5 g./l. ammonium ion NH_4^+, 17.0 to 120 g./l. sulfate ion $SO_4^=$, and 2.57 to 38.5 g./l. fluoride ion F^-.

5. The process for electrodepositing a nickel-cobalt alloy plate by passing a current from an anode to a cathode to be plated which comprises electrodepositing said nickel-cobalt alloy plate from an aqueous bath consisting essentially of operative amounts of 10.5 to 73 g./l. nickel ion Ni^{++}, 0.21 to 19.0 g./l. cobalt ion Co^{++}, 2.43 to 17.0 g./l. ammonium ion NH_4^+, 17.3 to 150 g./l. sulfate ion $SO_4^=$, and 2.57 to 18.0 g./l. fluoride ion F^-.

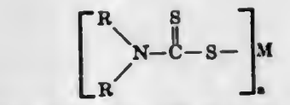
3,274,080



BRIGHTENERS AND PROCESS FOR CYANIDE ZINC ELECTRODEPOSITION

Robert E. Harrover, Jr., North Huntingdon Township, Westmoreland County, Pa., assignor, by mesne assignments, to Cowles Chemical Company, Shaker Heights, Ohio, a corporation of Ohio

No Drawing. Filed May 25, 1962, Ser. No. 197,598
17 Claims. (Cl. 204—55)



1. An aqueous alkaline zinc cyanide plating solution for electrodepositing zinc containing zinc ions and at least one brightener compound selected from the group consisting of compounds haviny the formulas

(1)

and

(2)

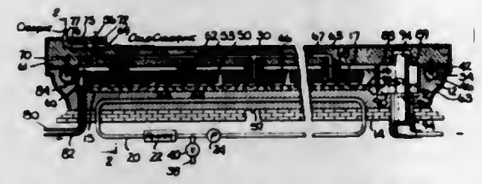
where R is selected from the group consisting of monovalent and divalent saturated substituted and unsubstituted hydrocarbon radicals having from 1 to 4 carbon atoms and the substituents are selected from the group consisting of $—NH_2$, —OH and $—COOR_1$, and R_1 is selected from the group consisting of H, NH_4 and alkali metal salts, M is selected from the group of monovalent and divalent materials consisting of NH_4, CH_3NH_3, $(CH_3)_2NH_2$, Na, K, Ca, Zn, Mg, Cd, Ni, Fe, Co, Mo and Mn and *n* is equal to the valence of M.

3,274,081

ELECTROCHEMICAL PROCESS FOR MAKING FLUORINE-CONTAINING CARBON COMPOUNDS

Wilbur H. Pearlson, White Bear Lake, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn., a corporation of Delaware

No Drawing. Filed Sept. 20, 1962, Ser. No. 225,150
7 Claims. (Cl. 204—59)



1. In a process for the electrochemical fluorination of an organic acid halide starting compound utilizing anhydrous liquid hydrogen fluoride, the improvement which comprises introducing into the electrochemical cell as the starting compound a partially chain halogen-substituted organic acid halide in which the halogen substitution is only fluorine and having attached to the acid halide radical an open chain comprising at least two skeletal atoms, which skeletal atoms are only carbon and not more than one hetero atom and that one hetero atom separated from the acid halide radical by at least one carbon atom, and having at least one of said skeletal carbon atoms of the chain selected from the group consisting of a hydrogen bearing carbon atom and an unsaturated carbon atom.

3,274,082

GAS REMOVAL FROM ELECTROLYTIC CELLS

Joshua Szechtman, deceased, late of Byram, Conn., by Rebecca Szechtman, executrix, Byram, Conn., assignor to Chlormetals Incorporated, a corporation of Delaware

Filed June 1, 1965, Ser. No. 460,597
7 Claims. (Cl. 204—60)

1. A process for producing chlorine which comprises electrolyzing a molten metal chloride salt in a substantially airtight electrolysis zone maintained at a pressure close to but not exceeding the existing atmospheric pressure and at a temperature sufficient to maintain said salt in a molten state, whereby gaseous chlorine is evolved, withdrawing from said zone evolved gaseous chlorine at substantially the temperature existing in said zone, co-mingling said evolved gaseous chlorine with a second stream consisting essentially of substantially pure chlorine, said second stream having a greater linear velocity and at least twice the mass of said evolved chlorine stream, and withdrawing from said process the co-mingled chlorine streams in the gaseous phase at a temperature of less than about 500° F., said second chlorine stream having sufficient mass and having a sufficiently low temperature relative to said evolved chlorine to produce a temperature in said co-mingled chlorine stream of less than about 500° F. in the absence of any indirect heat exchange.

3,274,083

ELECTROLYTIC PRODUCTION OF TITANIUM

Linden E. Snyder, Las Vegas, Nev., assignor to Titanium Metals Corporation of America, New York, N.Y., a corporation of Delaware

No Drawing. Filed May 13, 1963, Ser. No. 280,090
7 Claims. (Cl. 204—64)

1. In a process in which titanium metal is produced by electrolysis of a titanium halide in a cell having an anode and a cathode characterized by a perforated surface facing said anode, the said perforated cathode surface separating a fused halide salt electrolyte in said cell into a catholyte and an anolyte, the improvements comprising;

(a) passing electric current through said cell between said anode and said cathode, meanwhile,

(b) during an initial period introducing $TiCl_4$ into said catholyte at a rate to provide a current to $TiCl_4$ ratio at all times greater than 9 faradays per mol of $TiCl_4$, and for a time sufficient to deposit a porous titanium structure on said cathode, and,

(c) subsequently gradually increasing the rate of introduction of $TiCl_4$ into said catholyte while maintaining a rate just below a rate which would cause the presence of an appreciable amount of $TiCl_4$ in the chlorine by-product from said cell, until a steady state condition of operation is attained during which $TiCl_4$ is introduced at a rate to provide a current to $TiCl_4$ ratio of from 4.5 to 7 faradays per mol of $TiCl_4$.

3,274,084

ELECTROLYTIC REDUCTIVE COUPLING PROCESS

Manuel M. Baizer, St. Louis, Mo., assignor to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed July 1, 1965, Ser. No. 468,997
8 Claims. (Cl. 204—72)

1. The method of producing a reduced, coupled product which comprises subjecting an aqueous solution of α,β-olefinic ketone in contact with a cathode to electrolysis, the said aqueous solution containing a quaternary ammonium salt, and recovering a reduced, coupled product of said ketone from the aqueous solution.

3,274,085

GALVANIC ANODE

Herbert C. Rutemiller and Allen M. Montgomery, Cleveland, Ohio, assignors to Aluminum Company of America, Pittsburgh, Pa., a corporation of Pennsylvania

No Drawing. Filed Apr. 25, 1963, Ser. No. 275,497

1. A thermally treated galvanic anode composed of an aluminum base alloy consisting essentially of aluminum, from 3.5% to 9.0% of zinc, from 0.05% to 0.20% tin, and from 0.02% to 0.08% boron, the alloy containing a total of not over 0.50% of all impurities, said anode having a homogeneous internal structure resulting from a solution heat treatment and rapid cooling to room temperature and characterized by a more electronegative solution potential than the same anode without boron.

3,274,086

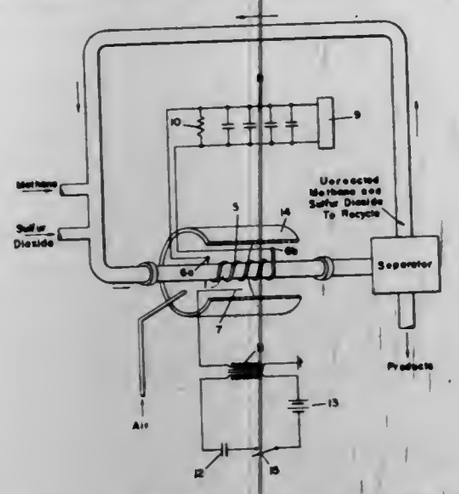
IRRADIATED RUBBERY ELASTOMERIC ETHYLENE-ALKYL ACRYLATE INTERPOLYMERS

James E. Potts, Millington, N.J., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed June 29, 1962, Ser. No. 206,148
9 Claims. (Cl. 204—159.14)

1. A method for producing ethylene-alkyl acrylate copolymers of low melt index which comprises the step of irradiating a normally solid ethylene-alkyl acrylate interpolymer having an initial melt index between 1 and 70 and containing from 5 to 40 weight percent of combined alkyl acrylate and a major amount of combined ethylene with ionizing radiation in an amount from about 0.5 to 50 megareps commensurate with the initial melt index of the copolymer such that the resulting irradiated copolymer has a melt index less than 1.0.

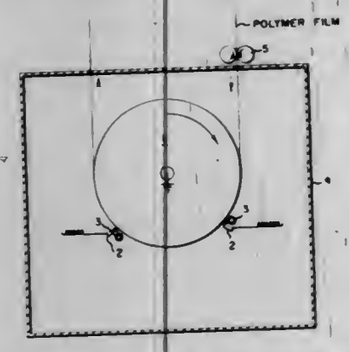
3,274,087



PROCESS FOR THE PREPARATION OF ETHANE BY FLASH PHOTOLYSIS

James L. Lauer, Penn Wynne, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of Pennsylvania

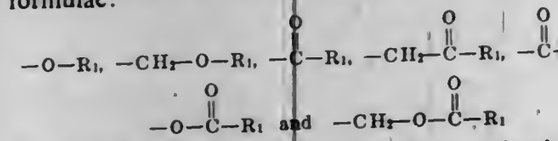
Filed Dec. 3, 1962, Ser. No. 241,620
2 Claims. (Cl. 204—162)



1. Method for preparing ethane which comprises sub-

jecting a mixture of methane and sulfur dioxide at a total partial pressure of from 10 mm. to 1000 mm. of mer-

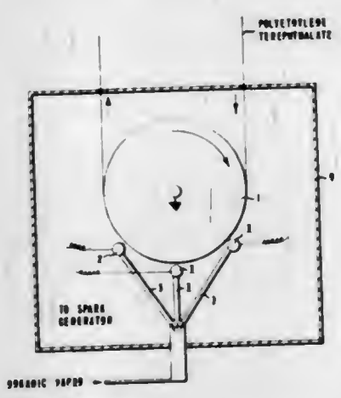
cury to multiple flashes of ultraviolet radiation sufficient to provide from 100 to 50,000 joules of energy.



3,274,088
SURFACE TREATMENT OF POLYMERIC SHAPED STRUCTURES
Leon E. Wolinski, Buffalo, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed July 27, 1961, Ser. No. 127,242
16 Claims. (Cl. 204—165)

1. A process for modifying and improving the surface characteristics of shaped structures of fluorocarbon polymers which comprises subjecting the surface of a shaped structure of a fluorocarbon polymer containing at least 5 mole percent of recurring structural units having the formula:

wherein $-X_1$ is a monovalent radical selected from the group consisting of —H, —F, —Cl and $-CF_3$; and $-X_2$ is a monovalent radical selected from the group consisting of —H, —F, $-R_1$ and R_2, wherein $-R_1$ is a radical selected from the group consisting of aryl and alkyl radicals having 1 to 8 carbon atoms and $-R_2$ is a radical selected from the group consisting of radicals of the formulae:

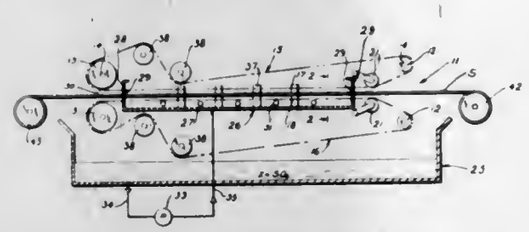


to the action of an electrical discharge maintained at a voltage in excess of 2000 volts and having an energy level below 15 electron volts in a gaseous atmosphere having a moisture content not in excess of 3.5 grams per cubic meter, measured at 25° C.

3,274,089
SURFACE TREATMENT OF POLYMERIC SHAPED STRUCTURES
Leon E. Wolinski, Buffalo, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Oct. 21, 1963, Ser. No. 318,149
7 Claims. (Cl. 204—165)

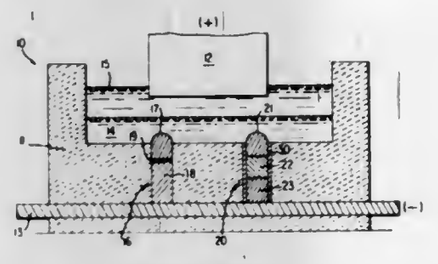
1. A process for modifying and improving the surface characteristics of polymeric shaped structures which comprises subjecting the surface of a polymeric shaped structure to the action of an electrical discharge maintained at a voltage in excess of 2000 volts and having an energy level below 15 electron volts, in a gaseous atmosphere at substantially atmospheric pressure consisting essentially of the vapor of an organic agent having a vapor pressure of at least one millimeter of mercury at 60° C., in a gaseous carrier medium which will sustain the electrical discharge, said organic agent constituting less than about 5% by volume of said atmosphere and selected from the group consisting of polymerizable organic compounds, non-polymerizable organic compounds having replaceable hydrogen atoms, and perhalohydrocarbons having a bond disassociation energy for the carbon halogen bond below 100 kilocalories.

3,274,090
METHOD OF PRODUCING NON-FOGGING FILMS
Leonard Edward Amborski, Buffalo, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Sept. 18, 1962, Ser. No. 224,400
6 Claims. (Cl. 204—165)



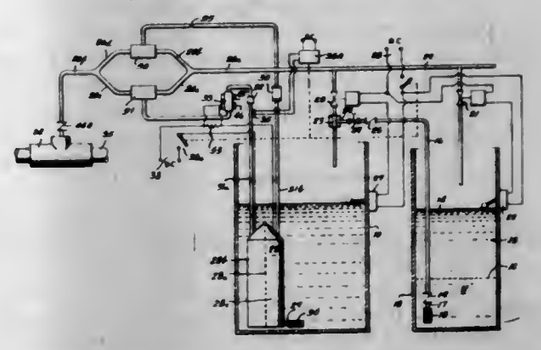
1. A process for improving the water-wettability of the surface of polyethylene terephthalate film which comprises subjecting the surface of said film to the action of an electrical discharge having an energy level below 15 electronvolts, in a gaseous atmosphere saturated with, as the sole active ingredient, the vapor of an organic agent selected from the group consisting of dimethyl formamide, triethyl phosphite, vinyl ethyl ether, acetone, and N-aminopropylmorpholine whereby to render said surface water wettable to a degree such that the contact angle for said surface is no more than about 10°.

3,274,091
METHOD OF PRODUCING NON-FOGGING FILMS
Leonard Edward Amborski, Buffalo, N.Y., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Sept. 18, 1962, Ser. No. 224,399
6 Claims. (Cl. 204—165)



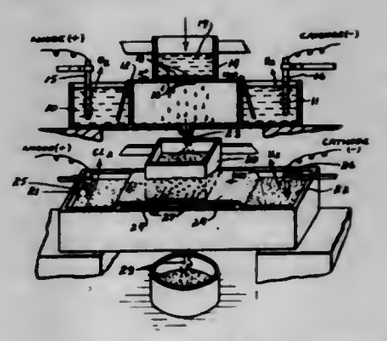
1. A process for improving the water-wettability of the surface of a normally hydrophobic, organic polymeric film which comprises subjecting the surface of said film to the action of an electrical discharge having an energy level below 15 electron volts, in a gaseous atmosphere saturated with, as the sole active ingredient, the vapor of an organic agent selected from the group consisting of acrylic acid and diethyl maleate, whereby to render said surface water wettable to a degree such that the contact angle for said surface is less than 15°.

3,274,092
APPARATUS FOR ELECTROPLATING NARROW STRIPS
Israel H. Marantz, New York, N.Y., assignor to Columbia Cable & Electric Corporation, Brooklyn, N.Y., a corporation of New York
Filed Aug. 28, 1962, Ser. No. 219,869
5 Claims. (Cl. 204—224)



1. Equipment for electroplating the edges of a narrow elongated strip of metal which comprises a pair of elongated masking belts having spaced vertically aligned parallel runs extending in substantially a horizontal plane between which the metal strip extends, each of said masking belts being of magnetic material and having a non-metallic surface, whereby the parallel runs will adhere to the top and bottom surfaces of said metal strip to mask such surfaces, a tank positioned beneath the parallel runs of said masking belts, said metal strip and the associated portions of the parallel runs of the masking belt adhering thereto, being positioned in said tank, means to effect an electroplating action to the exposed edges of the metal strip in said tank and means to advance the metal strip and the masking belts while said electroplating action is taking place.

3,274,093
CATHODE CONSTRUCTION FOR ALUMINUM PRODUCTION
Curtis J. McMinn, Florence, Ala., assignor to Reynolds Metal Company, Richmond, Va., a corporation of Delaware
Filed Aug. 29, 1961, Ser. No. 134,609
9 Claims. (Cl. 204—243)

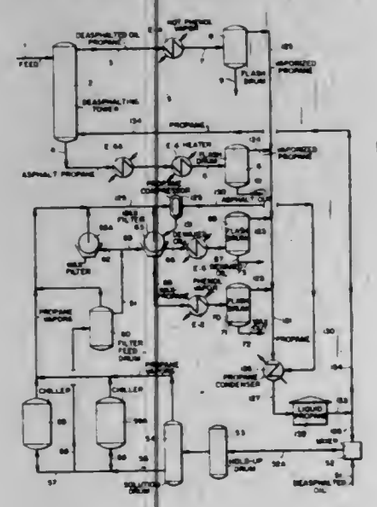


1. An electrolytic cell for the production of aluminum, including a cathode construction comprising a collector bar having a surface adapted for contact with the molten contents of the cell and a stem portion adapted for connection to a cathode voltage supply, said stem portion of the collector bar comprising a section of cermet material having a metal component and containing a refractory hard metal ceramic constituent, said metal component being distributed substantially throughout the cermet, the proportion of said refractory hard metal constituent relative to the metal component of the cermet being graded lengthwise of that section.

3,274,094
APPARATUS FOR THE CHLORINATION OF WATER
Alfred Klein, Brooklyn, N.Y., assignor, by mesne assignments, to Chemagnetics Controls, Inc., New York, N.Y., a corporation of New York
Filed Feb. 24, 1965, Ser. No. 434,823
The portion of the term of the patent subsequent to October 5, 1982, has been disclaimed
15 Claims. (Cl. 204—275)

1. Apparatus for the introduction of hypochlorite into a water supply line so that the flow rate of hypochlorite added is relatively independent of the flow rate in said water supply line and including a chamber for holding a dilute salt bath, said apparatus comprising electrolyzing means immersed in said dilute salt bath and adapted to electrolyze said salt solution into separate constituents by passing electric current therethrough, one of said constituents constituting an electrolyzed liquid and the other of said constituents constituting electrolyzed chlorines; combining means for combining said electrolyzed liquid and said electrolyzed chlorine outside said electrolyzing chamber to form hypochlorite; and regulating means responsive to the flow rate in said water supply line to control said introduction of hypochlorite to said water supply line so as to maintain the flow rate thereof substantially independent of the flow rate in said water supply line, said regulating means comprising a valve having an orifice variable within a range of open values and means sensitive to flow rate in said supply line adapted to increase and decrease the cross-section of said orifice in inverse response to variation in said rate, said regulating means being interposed in the fluid circuit between said electrolyzing chamber and said water supply line.

3,274,095
MEANS FOR TRANSFER OF IONS
Laurence Meyers, Rego Park, N.Y.
(3736 High Vista Drive, Dallas, Tex. 75234)
Filed Jan. 17, 1962, Ser. No. 166,750
2 Claims. (Cl. 204—301)



1. In an apparatus for the modification of water containing dissolved salts, the combination comprising: means for collecting and feeding water transversely through a perforated area of a cation exchange mat, two separate chambers for respectively giving and receiving cations,

said cation exchange mat extending longitudinally between said chambers, the opposite non-perforated end portions of said cation exchange mat being partially immersed in each of said respective chambers, and, second means for receiving and feeding the fluid from said perforated area of said cation exchange mat transversely through a perforated area of an anion exchange mat, two separate chambers for respectively giving and receiving anions, said anion exchange mat extending longitudinally between said chambers, the opposite non-perforated end portions of said anion exchange mat being partially immersed in each of said respective chambers, and, second whereby each of said mats provides paths for the continuous flow of ions longitudinally therethrough and means for the flow of fluid transversely therethrough.

3,274,096
SOLVENT RECOVERY IN COMBINED SOLVENT REFINING PROCESS

James D. Bushnell, Berkeley Heights, John L. Ehrler, Landing, and Harold N. Weinberg, East Brunswick, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Filed Sept. 27, 1962, Ser. No. 227,123
2 Claims. (Cl. 208—34)

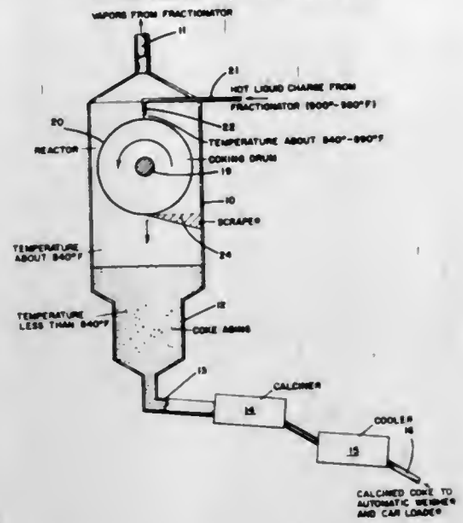
1. An improved process for refining lubricating oil fractions and for vaporizing, condensing and recovering vaporizable solvents used in conjunction with said refining process which comprises in combination—

(a) a propane deasphalting step, a phenol extraction step, and a propane dewaxing step, wherein

(b) the phenol extract and nonaromatic phenol raffinate phases from the phenol extraction step are separately heated to a temperature at which hot phenol vapors are selectively removed and combined, cooled and condensed; and wherein

(c) a deasphalted oil/propane phase and the asphalt/propane phase are separated by the propane deasphalting step, and a dewaxed oil/propane phase, and the slack wax/propane phase are separated by the propane dewaxing step, and

(d) propane is removed from the respective separated phases by heating the separated phase and flashing the propane from the respective phases,



(e) the improvement which comprises cooling and condensing the hot phenol vapors by indirect heat transfer between the hot phenol vapors and the relatively cool deasphalted oil/propane phase, the dewaxed oil/propane phase and the slack wax/propane phase, simultaneously heating said phases and vaporizing the propane therefrom—

(f) separating, condensing and collecting the vaporized propane and collecting said condensed phenol.

3,274,097
METHOD AND APPARATUS FOR CONTROLLING CARBON CRYSTALLIZATION

James A. Biehl, Robinson, Ill., assignor to Marathon Oil Company, a corporation of Ohio

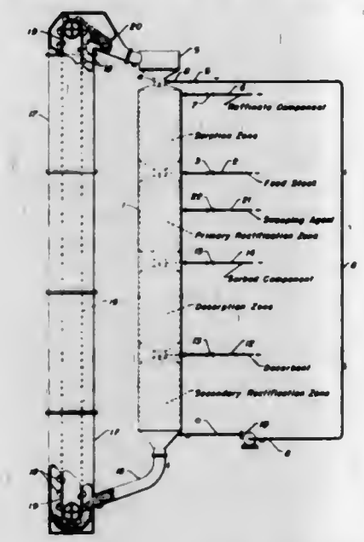
Filed Oct. 4, 1965, Ser. No. 496,738
9 Claims. (Cl. 208—46)

1. A continuous process for producing coke having a high index of graphitic crystallinity, which comprises treating a residuum obtained from fractionation of crude oil without aromatic addition by preheating in a furnace to a maximum temperature of about 920° F., continuously introducing the preheated liquid at a reduced temperature of about 890° F. in a thin stream onto the top of a moving coking surface in a coking vessel maintained at near atmospheric pressure, moving carbon coke in a thin layer out of contact with said stream immediately after it is formed on said surface so as to prevent deposit of additional liquid thereon, and discharging the formed carbon coke from the coking surface into a storage area in the coking vessel maintained out of contact with said entering stream.

3,274,098
HYDROREFINING OF PETROLEUM CRUDE OIL AND CATALYST THEREFOR

John G. Gatsis, Des Plaines, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Nov. 13, 1963, Ser. No. 323,273
10 Claims. (Cl. 208—264)



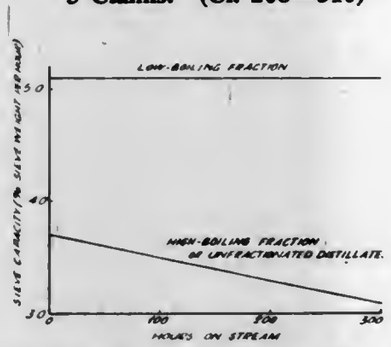
5. A process of hydrorefining a hydrocarbon charge stock which comprises forming the reaction product of an oxide of molybdenum and hydrogen peroxide, commingling said reaction product with said hydrocarbon charge stock, distilling the resulting mixture to remove water, thereby forming a colloidal suspension of said reaction product within said charge stock and thereafter reacting said colloidal suspension with hydrogen at a temperature above about 225° C. and at a pressure greater than about 500 pounds per square inch gauge.

3,274,099
CONTINUOUS SOLID-FLUID CONTACTING PROCESS

Donald B. Broughton, Chicago, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

Filed Feb. 19, 1963, Ser. No. 260,345
7 Claims. (Cl. 208—310)

1. An improvement in the process for continuously separating the components of a fluid mixture of compounds, at least one component of which is selectively sorbed from the mixture by contact with a solid sorbent and at least one other component of which is relatively less sorbed on the solid, in which process said mixture in fluid phase is charged into a bed of solid sorbent particles maintained in continuous, cyclic and effectively countercurrent flow relative to the fluid phase, raffinate is withdrawn from the bed of particles at a point downstream from the point of charging feed stock, desorbent which displaces sorbate component from the solid sorbent is charged into said bed of sorbent particles at a point downstream from the point of withdrawing raffinate, sorbate in admixture with desorbent is withdrawn from the fluid stream at a point downstream from the point at which desorbent is charged into the process flow, a portion of

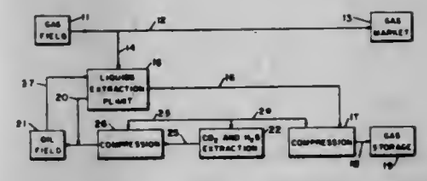


said raffinate stream and a portion of said sorbate stream continuously refluxed into the next adjacent downstream portion of sorbent relative to the points of withdrawing said sorbate and said raffinate streams from the sorbent, the improvement in said process which comprises charging a raffinate-type compound having a boiling point which differs sufficiently from the boiling point of said raffinate component to be separable from said raffinate component by distillation into the fluid phase at a point between the feed stock inlet and the sorbate outlet, while maintaining the fluid phase in contact with the solid sorbent continuously in equilibrium with the solid sorbent throughout the process cycle.

3,274,100
SEPARATION PROCESSES USING MOLECULAR SIEVES

Alan Arthur Yeo and Roger Templeton Lewis Mowll, Sunbury-on-Thames, Middlesex, England, assignors to The British Petroleum Company Limited, London, England, a joint-stock corporation of Great Britain

Filed Apr. 23, 1963, Ser. No. 275,128
Claims priority, application Great Britain, May 2, 1962, 16,827/62
3 Claims. (Cl. 208—310)



1. A process for separating straight-chain hydrocarbons from petroleum fractions boiling above C_{10} and containing molecular sieve deactivating hydrocarbons comprising fractionating the feedstock at a temperature within the range of 220–300° C. to obtain a lower-boiling fraction substantially free of deactivating hydrocarbons and a higher-boiling fraction containing substantially all the deactivating hydrocarbons and treating each fraction with a 5 A. molecular sieve in separate systems to extract straight-chain hydrocarbons.

3,274,101
SOLVENT RECOVERY PROCESS

Robert C. West and Frank H. Hunter, Tulsa, Okla., assignors, by mesne assignments, to Esso Production Research Company, a corporation of Delaware

Filed Jan. 6, 1964, Ser. No. 335,736
9 Claims. (Cl. 208—340)

1. A method for processing natural gas which comprises

(a) transmitting natural gas through a gas transmission line from a gas producing area to a gas marketing area;

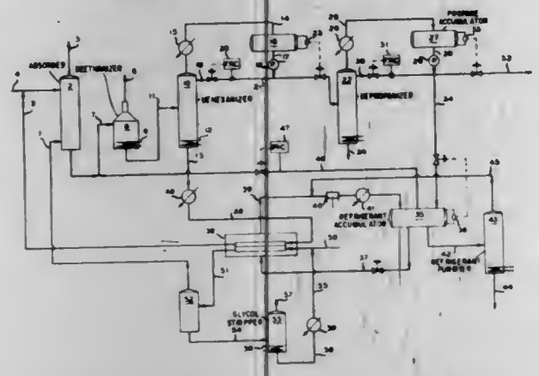
(b) withdrawing a portion of the gas passing through said transmission line at an intermediate point between said gas producing area and said gas marketing area and extracting ethane and higher hydrocarbons from the gas withdrawn from said transmission line;

(c) passing the ethane and higher hydrocarbons extracted from the gas withdrawn from said transmission line to an oil field for use in an oil recovery operation;

(d) compressing the dry gas remaining after ethane and higher hydrocarbons have been extracted from the gas withdrawn from said transmission line and injecting said dry gas into a gas storage reservoir during periods of low demand for gas;

(e) recovering compressor combustion gases produced in the compression of said dry gas, extracting carbon dioxide and hydrogen sulfide from said combustion gases, and passing the extracted carbon dioxide and hydrogen sulfide to said oil field for use in said oil recovery operation during periods of low market demand for gas;

(f) returning the dry gas remaining after ethane and higher hydrocarbons have been extracted from the gas withdrawn from said transmission line to said transmission during periods of high market demand for gas;



(g) withdrawing gas from said gas storage reservoir, compressing the gas withdrawn from said reservoir, treating the gas withdrawn from said reservoir for the extraction of carbon dioxide and hydrogen sulfide, and passing the treated gas to said gas marketing area during periods of high market demand for gas; and,

(h) recovering compressor combustion gases produced in the compression of said gas withdrawn from said storage reservoir, extracting carbon dioxide and hydrogen sulfide from the recovered combustion gases, and passing the extracted carbon dioxide and hydrogen, together with carbon dioxide and hydrogen sulfide extracted from said gas withdrawn from said gas storage reservoir, to said oil field for use in said oil recovery operation during periods of high market demand for gas.

3,274,102
NATURAL GAS SEPARATION WITH REFRIGERANT PURIFICATION

Douglass L. Brazell, Bill E. Greenfield, and Harold W. Barber, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

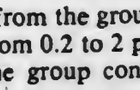
Filed Aug. 16, 1963, Ser. No. 302,556
5 Claims. (Cl. 208—341)

1. A gasoline absorption process comprising:
introducing a natural gas stream to an absorption zone;
introducing lean oil to said absorption zone;
countercurrently contacting said stream with said oil in said absorption zone to effect absorption of the hydrocarbon components in said stream by said oil;
passing the resulting rich oil from said absorption zone to a deethanizing zone for removing ethane and lighter materials;
passing the deethanized rich oil to a stripping zone for removal of the absorbed hydrocarbons from the oil;
withdrawing the resulting lean oil from said stripping zone;
withdrawing the resulting vaporized hydrocarbons from said stripping zone and condensing same;
passing the condensed hydrocarbons to a depropanizing zone for removing propane and lighter materials;
withdrawing the resulting depropanized hydrocarbons from said depropanizing zone as the gasoline fraction product;
withdrawing the resulting vaporized hydrocarbons from said depropanizing zone and condensing same as an impure propane product;
passing a portion of said condensed impure propane product to a refrigeration system;
passing said natural gas stream and said lean oil prior to said introducing steps in indirect heat exchange relationship with said impure propane to cool said stream and lean oil and to vaporize said impure propane;
compressing the thus vaporized said impure propane;
condensing the thus compressed impure propane and recycling same to said heat exchange relationship; and
withdrawing and passing noncondensible material from said condensed impure propane to said deethanizing zone for removal of the noncondensibles and recovery of propane.

3,274,103
FILTRATION

Loyd W. Adams, Dumas, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed Apr. 15, 1963, Ser. No. 272,879
4 Claims. (Cl. 210—23)



1. A filtration process which comprises coating a filter with a mixture of (1) a solid polymer of 1-olefins containing from 2 to 8 carbon atoms per molecule and (2) a filter aid material, and passing through the resulting coated filter a fluid mixture containing at least one liquid constituent which is immiscible with at least one of the other constituents, whereby said one liquid constituent is separated from said at least one other constituent.

3,274,104
SOLVENT EXTRACTION PROCESS

Charles E. Hamilton, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed May 1, 1963, Ser. No. 277,144
11 Claims. (Cl. 210—39)

7. A method which comprises passing an aqueous stream containing organic pollutants through a bed of activated charcoal to load the bed with adsorbed organic pollutants and thereafter eluting the wet charcoal bed with a solvent admixture of one part of

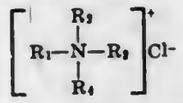
wherein R_1 is selected from the group consisting of hydrogen and methyl with from 0.2 to 2 parts of R_2OH wherein R_2 is selected from the group consisting of methyl and 2-propyl groups.

3,274,105
FIRE EXTINGUISHING COMPOSITION

Norbert Mevel, Antony, France, assignor to Societe d'Etudes Chimiques pour l'Industrie et l'Agriculture S.E.C.P.I.A., Paris, France

No Drawing. Filed July 15, 1963, Ser. No. 295,213
Claims priority, application France, Aug. 3, 1962, 905,979, Patent 1,338,454
10 Claims. (Cl. 252—2)

1. A method of extinguishing a fire, which method comprises the step of contacting the source of the fire with an aqueous solution containing about 300-600 grams/liter of potassium acetate and in addition a sufficient quantity of tetrapotassium pyrophosphate to increase the extinguishing effect of said potassium acetate, said solution having a pH higher than 7.



7. A process for the preparation of an aqueous potassium acetate fire extinguishing solution, which process comprises gradually adding acetic acid to an aqueous mixture of potassium carbonate and potassium hydroxide, the molar ratio K_2CO_3/KOH of the mixture being about 0.5:1 to about 1.25:1, the quantity of acetic acid being sufficient to neutralize said mixture, said solution having a pH above 7.

3,274,106
FREEZE-THAW STABILIZERS FOR QUATERNARY AMMONIUM COMPOUNDS

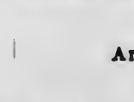
Leon D. Smiens, Minneapolis, Minn., assignor to Archer-Daniels-Midland Company, Minneapolis, Minn., a corporation of Delaware

No Drawing. Filed Jan. 20, 1964, Ser. No. 338,565
6 Claims. (Cl. 252—8.75)

1. A composition consisting essentially of a major amount of a fatty quaternary ammonium chloride compound and a minor amount sufficient to impart freeze-thaw stability to the composition of a dialkyl sulfate salt of a fatty amine, said fatty quaternary ammonium chloride compound having the formula:

wherein R_1 is selected from the group consisting of alkyl, arylalkyl and cycloalkyl, having saturated or unsaturated hydrocarbon chains of 12 to 26 carbon atoms, R_2 and R_3 are selected from the group consisting of R_1 and alkyl of 1 to 8 carbon atoms, and R_4 is an alkyl of 1 to 8 carbon atoms, and said dialkyl sulfate salt of a fatty amine having the formula:

$$[R_5R_6NHR']^+[R''SO_4]^-$$



wherein R_5 is selected from the group consisting of saturated and ethylenically unsaturated alkyls of 8 to 26 carbon atoms, R_6 is selected from the group consisting of hydrogen and saturated or unsaturated alkyls of 1 to 26 carbon atoms and R' and R'' are alkyls of 1 to 8 carbon atoms.

3,274,107
LUBRICANT COMPOSITION CONTAINING A SULFIDE

Glenn R. Wilson, Cambridge, Mass., Kenneth L. McHugh, Kirkwood, Mo., and John O. Smith, Swampscott, Mass., assignors to Monsanto Research Corporation, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Apr. 30, 1963, Ser. No. 277,021
11 Claims. (Cl. 252—46.4)

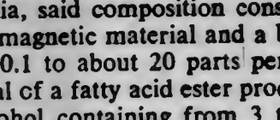
1. A lubricant composition consisting essentially of a base fluid comprising a polyphenyl ether and an adjuvant amount of a lubricity improving compound, said polyphenyl ether containing from 3 to 7 benzene rings joined by oxygen as ether linkages and said compound being an aryl Group V element sulfide of the formula

where Ar is an aryl radical, V' is an element selected from the group consisting of phosphorus and antimony, X is a radical selected from the class consisting of aryl and aliphatic hydrocarbon radicals, and Y is a radical selected from the class consisting of aryl hydrocarbon radicals and chlorine radicals.

3,274,108
LUBRICANT COMPOSITIONS CONTAINING POLYESTER ADDITIVES

George Wolfram, Des Plaines, and Theodore H. Szawlowski, Wonder Lake, Ill., and Louis A. Joo, Johnson City, Tenn., assignors, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed Apr. 15, 1963, Ser. No. 272,863
11 Claims. (Cl. 252—48.6)



1. An adhesive lubricating composition comprising a mineral lubricating oil and a fluid polyester formed by the reaction of (1) complex carboxylic acids obtained by metalation, carbonation and acidification of aromatic compounds that are characterized by containing about 0.5 to 4.5 weight percent of combined sulfur, about 1.7 to 5.0 aromatic rings per mean aromatic molecule and molecular weights of about 300 to 750 and that are from the group consisting of (a) solvent extracts obtained in the solvent extraction of mineral lubricating oil using a solvent selective for aromatic compounds, (b) hydrogenated solvent extracts, (c) FCC recycle stock, and (d) mixtures thereof; (2) a dibasic acid having about 2 to 20 carbon atoms in the hydrocarbon portion thereof; and (3) a polyol having about 2 to 20 carbon atoms in the hydrocarbon portion thereof, said fluid polyester containing unreacted carboxyl groups and being unsaturated and unpolymerized and being present in an amount sufficient to impart adhesiveness and cohesiveness to the composition.

3,274,109
COMPOSITION OF MATTER HAVING IMPROVED OXIDATIVE STABILITY

George P. Touey and Herman E. Davis, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed July 21, 1965, Ser. No. 473,857
15 Claims. (Cl. 252—56)

1. A composition of matter having improved oxidative stability comprising (A) an organic substance selected from the group consisting of edible fats, edible oils, gasoline and lubricating oils, (B) an amount sufficient to promote oxidative deterioration of said organic substance of a metal ion selected from the group consisting of copper, cobalt, iron, nickel and manganese, and (C) from about 0.0001 to about 0.5% by weight of said organic substance of a metal deactivator having the following chemical formula:

wherein R is a member selected from the group consisting of propylene and butylene radicals and x is an integer of from 2 to 10.

3,274,110
FERRITE PROCESS

Allan Getto, Poughkeepsie, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Dec. 21, 1962, Ser. No. 246,340
2 Claims. (Cl. 252—62.5)

1. The process of sintering a rectangular hysteresis loop ferrite structure of the ferrospinel system to enhance rectangularity of the hysteresis characteristic by the steps of:
preparing an intimate mixture of manganese, copper and ferric oxides wherein on a mol basis the major proportion of said mixture is manganese oxide, the minor proportion of said mixture is copper oxide and the proportion of iron oxide is therebetween;
calcining said mixture at a temperature in the range between 600° C. to 1000° C.;
firing said mixture at a temperature in the range between 1100° C. to 1500° C. to produce solid state reactions within said mixture to provide same with a spinel crystal structure; and,
annealing said ferrite mixture by cooling said fired mixture from said firing temperature to a temperature above 600° C. which is sufficiently high to enhance oxygen absorption, said cooling being carried out in a controlled oxidizing ambient consisting essentially of air that includes from ½% to 5% by volume of water vapor.

3,274,111
MAGNETIC RECORDING MEDIUM WITH SELF-CONTAINED LUBRICANT

Tomohiko Sada, Nakano-ku, Tokyo, and Minoru Nishida, Ichikawashi, Chiba-ken, Japan, assignors to Sony Corporation, Shingawaku, Tokyo, Japan, a corporation of Japan

No Drawing. Filed Sept. 5, 1963, Ser. No. 306,687
Claims priority, application Japan, Sept. 17, 1962, 37/40,269
6 Claims. (Cl. 252—62.5)

1. A magnetic composition for use in magnetic recording media, said composition consisting essentially of a powdered magnetic material and a binder together with from about 0.1 to about 20 parts per 100 parts of magnetic material of a fatty acid ester produced from a monohydroxy alcohol containing from 3 to 12 carbon atoms and at least one saturated monobasic fatty acid containing from 12 to 16 carbon atoms.

3,274,112
ANTICORROSION AND ANTIFREEZE COMPOSITIONS CONTAINING AN ALKALI METAL SALT OF 2,3-DIHYDRO-1,4-DITHIIN-5,6-DICARBOXYLIC ACID

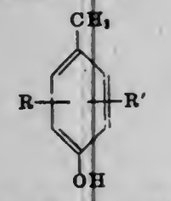
Dale C. Blomstrom, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Apr. 12, 1963, Ser. No. 272,546
4 Claims. (Cl. 252—78)

1. The process of protecting a ferrous metal surface against corrosion by water which comprises continuously

contacting the same with an aqueous liquid consisting essentially of an aqueous solution of at least 0.02 percent by weight, based on the weight of the liquid medium, of an alkali metal 2,3-dihydro-1,4-dithiin-5,6-dicarboxylate.

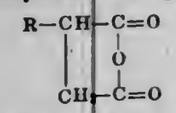
3,274,113



OXIDATION RESISTANT HYDRAULIC OIL

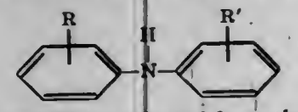
William H. Reiland, Jr., Havertown, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Filed Aug. 28, 1963, Ser. No. 305,213
10 Claims. (Cl. 252—78)



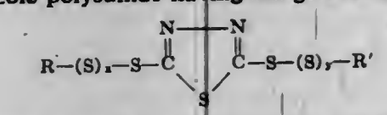
1. An oxidation resistant hydraulic oil comprising a major amount of a mineral oil and

(a) 0.1 to 2.0 weight percent of a hindered phenol having the general formula



wherein R and R′ are alkyl radicals containing from 1 to 8 carbon atoms,

(b) 0.001 to 0.5 weight percent of an oil soluble alkylated succinic anhydride having the general formula



wherein R is an alkyl radical containing from 6 to 20 carbon atoms, and

(c) 0.001 to 2.0 weight percent of an oil soluble material selected from the group consisting of an aromatic secondary amine having the general formula

wherein R and R′ are selected from the group consisting of hydrogen and alkyl radicals containing 1 to 20 carbon atoms, a sulfurized terpene and a 1,3,4-thiadiazole polysulfide having the general formula

wherein R and R′ are hydrocarbon radicals selected from the group consisting of ethyl, propyl, butyl, hexyl, octyl, nonyl, decyl, dodecyl, tridecyl, hexadecyl, octadecyl, cyclohexyl, phenyl, tolyl, benzyl, styryl, and naphthyl, and wherein x and y are integers in the range of from 0 to 8 and wherein the sum of x and y is at least 1 and ranges up to about 16.

3,274,114

PROCESS FOR DETARNISHING AND INHIBITING COPPER AND COPPER ALLOYS

Tibor Thomas Grof, 6517 Landover Road, # 203, Cheverly, Md.

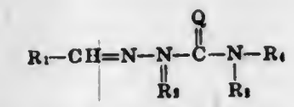
No Drawing. Filed Nov. 4, 1965, Ser. No. 506,407
3 Claims. (Cl. 252—100)

1. A method of detarnishing and inhibiting further tarnishing of a material selected from the group consisting of copper and copper alloys which comprises treating said material with a composition consisting essentially of (a) 5–40% by weight of sulfamic acid (b) 5–40% by weight of a compound selected from the group consisting of

(1) water soluble hexavalent chromium salts of the anions $—Cr_2O_7$ and $—CrO_4$ and the cations sodium, potassium and ammonium and

(2) chromic acid,

and (c) water to bring the total weight percentage up to 100 percent.



3,274,115

GERMICIDAL COMPOSITIONS

Walter J. Sydor, Somerville, N.J., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Original application Apr. 26, 1962, Ser. No. 190,257, now Patent No. 3,182,082, dated May 4, 1965. Divided and this application Dec. 26, 1962, Ser. No. 247,289
10 Claims. (Cl. 252—106)

1. A germicidal detergent composition comprising a detergent selected from the group consisting of anionic and nonionic detergents and from 0.1 to 5.0% by weight of the detergent of a germicidal compound of the formula:

wherein R_1 is a halogenated ortho-hydroxyaryl radical of less than three 6-membered rings, in which the halogen has an atomic number between 16 and 36, R_2 is a member selected from the group consisting of hydrogen and lower alkyl, R_3 is selected from the group consisting of hydrogen, lower alkyl, cycloalkyl, monocyclic ar(lower alkyl) and monocyclic aryl, R_4 is aryl of less than three 6-membered rings, and Q is selected from the group consisting of O and S; and each aryl moiety in the compound if it is substituted beyond the required substitution in R_1 has the substituents chosen from the group consisting of lower alkyl, lower alkoxy, chloro, bromo and nitro.

3,274,116

IODINE DETERGENT SOLUTION

Jack F. Mills, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Aug. 5, 1963, Ser. No. 300,063
5 Claims. (Cl. 252—106)

1. An aqueous germicidal solution of one part by weight of elemental iodine, about 5 to about 15 parts by weight of a water-soluble organic anionic detergent selected from the group consisting of the alkali metal and ammonium higher alkylbenzenesulfonates, higher alkyldiphenyl ether sulfonates and higher primary alkylsulfates and which is soluble in water at least to the extent of about 25 g. per 100 g. of solution, and about 5 to about 15 parts of a lower alkyl monoether of ethylene glycol.

3,274,117

POURABLE AND FREE-FLOWING DETERGENT, WETTING, AND EMULSIFYING COMPOSITIONS

Werner Stein, Dusseldorf-Holthausen, Herbert Weiss, Cologne-Dentz, and Otto Koch, Hilden, Rhineland, Germany, assignors to Henkel & Cie G.m.b.H., Dusseldorf-Holthausen, Germany, a corporation of Germany

No Drawing. Filed May 7, 1963, Ser. No. 278,780
Claims priority, application Germany, May 17, 1962, H 45,806; Aug. 31, 1962, H 46,801; Jan. 23, 1963, H 48,069
10 Claims. (Cl. 252—161)

1. A surface active composition characterized by outstanding pouring and free-flowing properties comprising (a) about 5–65 weight percent of a salt of an α sulfo fatty acid having 10–24 carbon atoms in its molecule; and (b) about 35–95 weight percent of a surface active α sulfo fatty acid ester salt, the fatty acid radical component of which has 10–24 carbon atoms, the alcohol radical component being derived from a member selected from the group consisting of monovalent alcohols having

1–18 carbon atoms and polyvalent alcohols having 2–4 carbon atoms in their molecules, the cations of said salt being selected from one member of the group consisting of Na, K, Mg, and NH_4 cations.

3,274,118

PREPARATION OF STABLE NON-PYROPHORIC ORGANOMETALLIC COMPOSITIONS

Conrad W. Kamienski and Dennis H. Lewis, Bessemer City, N.C., assignors to Lithium Corporation of America, Inc., New York, N.Y., a corporation of Minnesota

No Drawing. Filed Jan. 22, 1962, Ser. No. 167,966
The portion of the term of the patent subsequent to Apr. 30, 1980, has been disclaimed
2 Claims. (Cl. 252—182)

1. A new and useful composition of matter which is semi-solid to solid at room temperature consisting essentially of (a) at least one semi-solid to solid carrier selected from the group consisting of petroleum, paraffin waxes, diphenyl ether and hydroquinone-1,4-diphenyl ether, and (b) from about 15 to 50 weight percent of an organometallic compound which is normally unstable when exposed to moisture, said organometallic compound being generally uniformly distributed throughout said carrier, said organometallic compound being selected from the group consisting of alkylsodium and alkylpotassium, dialkylberyllium, dialkylmagnesium, dialkylcalcium and dialkylzinc, trialkylboron and trialkylaluminum, the alkyl radicals containing from 3 to 8 carbon atoms; trimethylenedisodium, trimethylenedipotassium, tetramethylenedisodium, tetramethylenedipotassium, pentamethylenedisodium, pentamethylenedipotassium, hexamethylenedisodium and hexamethylenedipotassium.

3,274,119

TRANSPARENT SOAP BAR

Seymore Goldwasser, Teaneck, and Frederick V. Ryer, Oradell, N.J., assignors to Lever Brothers Company, New York, N.Y., a corporation of Maine

No Drawing. Filed Mar. 1, 1963, Ser. No. 262,225
7 Claims. (Cl. 252—368)

1. A process for preparing a transparent soap bar which comprises working a liquid neat soap composition having about 5% to about 24% total trans-oleic acid radicals therein based upon total fat charge to convert mechanical energy into heat energy and to cause a rise in temperature to within a range of about 100° to 110° F. whose moisture content and salt content have been adjusted prior to the end of the working step to provide 14% to 17.5% moisture and about 0.2% to 0.8% water-soluble, soap-compatible alkali metal salt in the finished bar; and compacting the soap composition into bar form.

2. A transparent soap bar prepared by the process of claim 1.

3,274,120

CATALYST COMPOSITION HAVING INCREASED HYDROXYL GROUPS BOUND THERETO AND METHOD FOR PRODUCING SAME

Victor D. Aftandilian, Watertown, Mass., assignor to Cabot Corporation, Boston, Mass., a corporation of Delaware

No Drawing. Filed Feb. 20, 1964, Ser. No. 346,081
20 Claims. (Cl. 252—432)

8. A process for increasing the number of hydroxyl groups chemically bound to the surface of a finely-divided inorganic solid which comprises

(a) reaction hydroxyl groups originally chemically bound to the surface of a finely-divided solid with a compound conforming to the formula

$$TR_q$$

wherein T is a metal chosen from the group consisting of the elements of Groups III and IVa; each R is any radical chosen from the group consisting of alkyl, aryl, alkoxy, aryloxy, dihydrocarbon substituted amino and the halogen; and q is a number from 3 to 4; and

(b) hydrolyzing the resulting surface structures.

3,274,121

TRILITHIUM PHOSPHATE ISOMERIZATION CATALYST

Gerard Schneider, Caluire, Rhone, France, assignor to Progil, Paris, France, a society

No Drawing. Filed Sept. 9, 1963, Ser. No. 307,322
Claims priority, application France, Sept. 12, 1962, 909,208
5 Claims. (Cl. 252—437)

3. A process for preparing a trilithium orthophosphate catalyst, having a lithium to phosphorus atomic ratio of from 3.1 to 3.3, which comprises:

(a) mixing, within less than one minute, an aqueous solution of a water-soluble lithium compound with an aqueous solution of sodium orthophosphate, potassium orthophosphate, ammonium orthophosphate, or orthophosphoric acid;

(b) maintaining the pH of the resulting mixture between 7 and 14, and its temperature between 0° and 100° C., to precipitate said trilithium orthophosphate catalyst;

(c) separating the precipitate thus formed from said mixture;

(d) washing the precipitate with water; and

(e) drying the fine crystalline precipitate.

3,274,122

PREPARATION OF PARTIALLY SULPHIDED NICKEL CATALYSTS

Peter Desmond Holmes and Kenneth Hugh Bourne, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited, London, England, a British joint-stock corporation

No Drawing. Filed Feb. 20, 1963, Ser. No. 260,046
Claims priority, application Great Britain, Mar. 5, 1962, 8,390/62
7 Claims. (Cl. 252—439)

1. A process for the production of a catalyst which comprises contacting a nickel compound on a support, which compound is capable of conversion to elemental nickel, under conditions such that finely divided, or dispersed, elemental nickel is formed, contacting the elemental nickel at a temperature in the range 0–200° C., with an organic sulphur compound selected from the group consisting of thiophenes, thiacycloalkanes and dialkylmonosulphides, whereby the nickel is partially sulphided with from 1 to 40 mol percent of sulphur based on the elemental nickel content of the catalyst, and thereafter contacting the partially sulphided nickel catalyst with a free oxygen-containing gas at a temperature below 250° C. to effect surface oxidation of the nickel component of the catalyst.

3,274,123

ACETYLENE CONTAINER FILLER AND METHOD

John P. Coyne, Hillsborough, and George E. Haddeland, Mill Valley, Calif., assignors, by mesne assignments, to American Cryogenics, Inc., San Francisco, Calif., a corporation of Delaware

No Drawing. Filed July 23, 1963, Ser. No. 298,523
2 Claims. (Cl. 252—446)

1. An improved method for compounding a dimensionally stable acetylene container filler comprising: presoaking charcoal in water and subjecting the charcoal-water mixture to vacuum conditions for at least part of the pre-soaking period, adding finely divided silica to said pre-soaked charcoal with agitation and in an aqueous medium, applying a vacuum to said charcoal-silica com-

bination and adding a lime slurry thereto with agitation, removing the vacuum following said lime slurry addition, and adding asbestos with mixing until all of said ingredients form a homogeneous mass, the ingredients in said mass being approximately in accordance with the following formula:

	Ratio by weight
Water to solids	3.45
Silica to lime	1.75
Asbestos, percent of solids by weight	18.40
Charcoal	18.40

3,274,124

PROCESS OF PREPARING A SILICA-ALUMINA SUPPORTED GROUP VIII METAL HYDROCRACKING CATALYST

Mark J. O'Hara, Mount Prospect, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Jan. 2, 1964, Ser. No. 335,349
6 Claims. (Cl. 252—451)

1. A process for the preparation of a silica-alumina supported Group VIII metal hydrocracking catalyst which comprises commingling an alkali metal silicate solution with a sufficient quantity of a mineral acid solution to form an acidic-salt-containing silica sol, first gelling and aging the resultant salt-containing sol under acid conditions, and then adding an alkaline reagent and further aging the resultant gel under basic conditions, commingling the resultant aged gel with an aluminum salt solution, precipitating a silica-alumina composite therefrom by the addition of a basic precipitant sufficient to raise the pH to at least 8, water washing the freshly precipitated, undried silica-alumina composite sufficiently to remove from about 10% to about 90% but not all of the water soluble salts therefrom, drying said water washed silica-alumina composite at a temperature of from about 200° F. to about 500° F., further water washing the resultant dried silica-alumina composite sufficiently to remove the remaining water soluble salts therefrom, calcining the thus purified silica-alumina composite at a temperature of from about 800° F. to about 1400° F., and impregnating the calcined silica-alumina composite with a Group VIII metal catalytic component.

3,274,125

REGENERABLE ADSORBENT GELS AND THE METHOD OF THEIR PREPARATION

Richard G. Clarke, Hartford, Richard H. Groth, South Windham, and Edward J. Duzak, Hartford, Conn., assignors to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

No Drawing. Filed Mar. 24, 1961, Ser. No. 98,003
The portion of the term of the patent subsequent to July 21, 1981, has been disclaimed
10 Claims. (Cl. 252—466)

1. A regenerable adsorbent for carbon dioxide gas which comprises the oxide of a first metal selected from the group consisting of lithium, zinc, bivalent iron, nickel, copper, cobalt, manganese, magnesium, calcium, barium, cadmium, and mixtures of the foregoing, in combination with an oxide of a trivalent metal selected from the group consisting of iron, aluminum and chromium, the molar ratio of said first metal to said trivalent metal being in the range of 0.25 to 5 to 99.75 to 95, said adsorbent having a specific surface for adsorption of pure carbon dioxide at 1 atmosphere pressure and 0° C. of at least about 100 $m.^2/gm.$ and being capable of desorbing at least about 30 percent by volume of the carbon dioxide adsorbed at 0° C. and 1 atmosphere pressure when exposed to a vacuum of 10^{-4} atmosphere at 25° C.

4. A method for preparing a regenerable carbon dioxide adsorbent which comprises establishing an aqueous solution comprising between about 0.1 and 4.0 moles per liter of a solution comprising a carbonate of a member selected from the group consisting of alkali metal and ammonium, adding thereto at least one salt of a first metal selected from the group consisting of lithium, zinc, bivalent iron, nickel, copper, cobalt, manganese, magnesium, calcium, barium, cadmium, including mixtures of the foregoing, and one salt of a trivalent metal selected from the group consisting of aluminum, iron and chromium, including mixtures of the foregoing, continuing addition of said salts until there has been added an amount of salt which is 0 to 10 percent less than the amount stoichiometrically required to react with the carbonate ions in the solution, maintaining the temperature of the solution between about 0° and 35° C., but high enough to sustain evolution of carbon dioxide, separating the gel from the resulting solution and dehydrating the gel at temperatures less than 110° C.

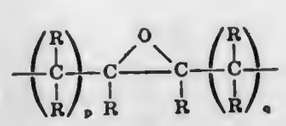
3,274,126

POLYEPOXY ETHERS AND CURED RESINS OBTAINED THEREFROM

Roy T. Holm, Orinda, Calif., assignor to Shell Oil Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 30, 1962, Ser. No. 183,746
14 Claims. (Cl. 260—2)

1. Polyepoxy compounds of the formula



G—O—A—O—G

wherein

(1) At least one G group is a monovalent monoepoxycycloalkyl radical of from 4 to 20 carbon atoms and having from 4 to 6 ring carbon atoms,

(2) Every non-cycloalkyl G group is hydrogen and

(3) A is a divalent linear radical of the formula

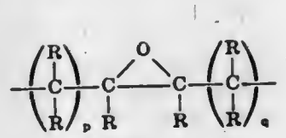
where p and q are integers from 1 to 4 and R is selected from the group consisting of hydrogen and a C_1–C_4 alkyl group.

7. A process for preparing polyexpoxide compounds of the formula:

G—O—A—O—G

12. A curable composition comprising

(a) 15% to 85% by weight of a polyepoxy compound of the formula:



G—O—A—O—G

wherein

(1) At least one G group is a monovalent monoepoxycycloalkyl radical of from 4 to 20 carbon atoms and having from 4 to 6 ring carbon atoms,

(2) Every non-cycloalkyl G group is hydrogen and

(3) A is a divalent linear radical of the formula

where p and q are integers from 1 to 4 and R is selected from the group consisting of hydrogen and a C_1–C_4 alkyl group, and

(b) 15% to 85% by weight of a polyglycidyl ether of 2,2-bis(4-hydroxyphenyl)dimethylmethane.

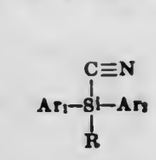
3,274,127

PYROLYSIS OF A 1,4-DIMETHYL BENZENE NUCLEARLY-SUBSTITUTED WITH AT LEAST ONE GASEOUS HALOGEN ATOM

Michael Mojzesz Szwarc, Syracuse, N.Y., assignor to Pullman, Incorporated, Chicago, Ill., a corporation of Delaware

No Drawing. Filed July 18, 1962, Ser. No. 210,859
7 Claims. (Cl. 260—2)

1. In the manufacture of solid polymers which have high heat stability, high resistance to acids and high resistance to organic solvents, the process which comprises pyrolyzing a halogenated 1,4-dimethyl benzene which is nuclear-substituted with at least one atom of a gaseous halogen selected from the group consisting of fluorine and chlorine; by heating the vapors of such a compound to a temperature above 700° C. but below those at which excessive decomposition occurs, at a partial pressure not substantially exceeding 150 mm. Hg absolute and a total pressure not substantially exceeding 400 mm. Hg absolute, for a time not substantially exceeding 1 second, followed by cooling the resulting vapors to a temperature at which a solid polymer is formed.



3,274,128

SILICON-CONTAINING POLY(NITRILOMETHYLIDYNES)

Iral B. Johns, Marblehead, Mass., assignor, by mesne assignments, to Monsanto Research Corporation, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Jan. 30, 1964, Ser. No. 341,414
4 Claims. (Cl. 260—2)

1. The method of polymerizing a diarylsilane cyanide which comprised compressing and heating a reaction mass consisting essentially of a diarylsilane cyanide of the formula

in which Ar_1 and Ar_2 are aromatic hydrocarbon radicals of from 6–18 carbon atoms joined to the silicon atom by an aromatic ring carbon atom, and R is a substituent selected from the class consisting of hydrocarbon radicals of up to 18 carbon atoms and cyano radicals, at a temperature of above about 200° C. and a pressure above about 1000 kg./sq. cm.

3,274,129

POLYMERIZATION OF EPOXIDES

Frederick E. Bailey, Jr., Charleston, W. Va., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed June 29, 1959, Ser. No. 823,364
10 Claims. (Cl. 260—2)

1. A polymerization process which comprises contacting a lower olefin oxide with from about 0.1 to about 10.0 weight percent, based on the said lower olefin oxide, of a catalyst selected from the group consisting of phosphates, aluminates, borates and molybdates of divalent metals having an atomic number greater than 11 and less than 57 of Group II of the Periodic Table; at a temperature in the range of from about 50° to about 150° C. for a period of time sufficient to produce a solid polymer of said lower olefin oxides having a reduced viscosity value of from 0.57 to 12.3 determined at a concentration of 0.2 gram of polymer per 100 milliliters of acetonitrile at 30° C.

3,274,130

PHOSPHORUS POLYURETHANE PLASTICS PREPARED FROM HYDROXYL PHOSPHORUS COMPOUNDS

Gunther Oertel, Cologne-Flittard, Otto Bayer, Leverkusen, and Gunther Braun, Cologne-Flittard, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation

No Drawing. Filed Mar. 22, 1962, Ser. No. 181,782
Claims priority, application Germany, Mar. 29, 1961, F 33,541
5 Claims. (Cl. 260—2.5)

1. A polyurethane plastic prepared by a process which comprises reacting an organic polyisocyanate with an hydroxyl phosphorus compound prepared by a process which comprises reacting a secondary N-hydroxy alkyl aryl amine having the formula Ar—NH—R—OH wherein Ar is an aromatic radical and R is an alkylene radical with a phosphohalide in the presence of an acid binding agent at a temperature within the range of about 20 to about 150° C. and in such proportions that there is one hydroxyl group of the N-hydroxy alkyl aryl amine for each phosphorus to halogen bond of the phosphohalide and reacting the resulting product with an alkylene oxide to prepare an hydroxyl phosphorus compound having a molecular weight of from about 400 to about 10,000.

3,274,131

POLYMERIC COMPOSITIONS HAVING PERCHLOROCOUMALIN CHEMICALLY COMBINED THEREIN

Edward Leon, Tonawanda, N.Y., assignor to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York

No Drawing. Filed Mar. 4, 1963, Ser. No. 262,371
18 Claims. (Cl. 260—2.5)

1. An organic polymeric composition of a polymer selected from the group consisting of an epoxy resin, a polyester resin of a polycarboxylic compound and a polyhydric alcohol, a polymer of an alkene, and a polymer of a cycloalkene having up to two fused rings, said composition having chemically combined therein a Diels-Alder adduct of perchlorocoumalin and an olefinic compound selected from the group consisting of alkenes, cycloalkenes having up to two fused rings, carboxylic compounds containing aliphatic carbon-to-carbon unsaturation and selected from the group consisting of a carboxylic acid, a carboxylic anhydride, a carboxylic acid ester and a carboxylic acid halide, and mixtures thereof.

2. A composition comprising an epoxy resin and a Diels-Alder adduct of perchlorocoumalin and a carboxylic compound containing aliphatic carbon-to-carbon unsaturation and selected from the group consisting of a carboxylic acid, a carboxylic anhydride, a carboxylic acid ester and a carboxylic acid halide.

15. The process which comprises reacting perchlorocoumalin with a polymer which contains aliphatic carbon-to-carbon unsaturation and which is selected from the group consisting of an unsaturated polyester resin of a polycarboxylic compound and a polyhydric alcohol, a polymer of an alkene, and a polymer of a cycloalkene having up to two fused rings, to form a cross-linked polymer.

3,274,132

PROCESS OF POLYMERIZING AND FOAMING CAPROLACTAM

John W. Gilberson, Woodstown, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Apr. 22, 1963, Ser. No. 274,803
6 Claims. (Cl. 260—2.5)

1. A process for the polymerization of ϵ-caprolactam to poly-ϵ-caprolactam which comprises heating said lactam in the presence of a lactam base salt prepared by

the reaction of a base with a lactam and a cocatalyst having the formula

wherein the R's are selected from at least one of the group consisting of hydrogen, aliphatic, cycloaliphatic and aryl radicals of up to 18 carbon atoms, X comprises a 5-membered heterocyclic ring having two conjugated double bonds and at least two ring nitrogen atoms, one of which is bonded to said

at a temperature between the melting point of said ε-caprolactam and the melting point of said poly-ε-caprolactam.

3,274,133

SELF-EXTINGUISHING EXPANDABLE POLYMERS CONTAINING VOLATILE HYDROCARBON, ORGANIC BROMIDE, AND N-NITROSO SECONDARY AMINE

Alvin R. Ingram, Murrysville, Pa., assignor to Koppers Company, Inc., a corporation of Delaware

Filed May 9, 1963, Ser. No. 279,155
7 Claims. (Cl. 260—2.5)

1. A self-extinguishing expandable polymer of styrene having been rendered capable of expansion by the incorporation therein of a volatile aliphatic hydrocarbon boiling in the range of −10 to 81° C. and having dispersed throughout (1) from 0.5 to 5 percent by weight of an organic bromide having a plurality of bromine atoms attached to carbon atoms of a radical selected from the group consisting of cyclohexyl and aliphatic radicals, said bromine atoms constituting at least 30 percent by weight of said bromide (2) and from 0.1 to 3 percent by weight of an N-nitroso secondary amine which evolves gas at a temperature of 150—180° C. when heated in a mixture consisting of 9 percent by weight of said N-nitroso secondary amine, 5 per cent by weight pentabromoethane and 86 percent by weight triethylbenzene.

3,274,134

VERY SOFT URETHANE VULCANIZATES WHICH COMPRISE A FULLY SATURATED URETHANE PREPOLYMER AND AN ORGANOTIN COMPOUND

Thomas Ramos, 536 Fort Washington Ave., New York, N.Y.

No Drawing. Filed Sept. 14, 1961, Ser. No. 138,202
3 Claims. (Cl. 260—18)

1. A soft polyurethane vulcanizate, which comprises a mixture, in the proportions in parts by weight, of

(a) 100 parts of a preformed fully saturated urethane polymer which is the reaction product of poly (1,4-oxybutylene) glycol and tolylene diisocyanate of approximately 2000 molecular weight and containing about 4.0 to 4.3 percent by weight of isocyanate groups,

(b) from about 5 to 55 parts of a chlorinated paraffin,

(c) about 20 to 55 parts of a polyol having a molecular weight at least about as high as that of castor oil, and

(d) about 10 to 30 parts of an organotin compound selected from the group consisting dibutyltin dilaurate, dibutyltin di-2 ethyl hexoate, stannous 2-ethyl hexoate and stannous octoate.

3,274,135

BARIUM-CADMIUM ORGANIC COMPLEXES AS STABILIZERS FOR HALOGEN-CONTAINING RESINS

George R. Norman, Lyndhurst, and William M. Le Suer, Cleveland, Ohio, assignors to The Lubrizol Corporation, Wickliffe, Ohio, a corporation of Ohio

No Drawing. Filed Mar. 25, 1963, Ser. No. 267,788
13 Claims. (Cl. 260—23)

1. A stabilized halogen-bearing polymeric composition comprising a halogen-bearing polymeric material containing an amount, sufficient to stabilize said polymeric material against deterioration, of a barium- and cadmium-containing organic complex made by the process which comprises preparing a mixture comprising:

(A) from about 0.1 to about 50 equivalents of an alcohol,

(B) one equivalent of an aliphatic monocarboxylic acid compound selected from the group consisting of aliphatic monocarboxylic acids containing an average of at least about 6 carbon atoms and the barium and cadmium salts thereof,

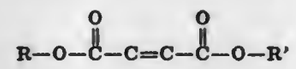
(C) at least about 0.1 equivalent of a barium base, and

(D) at least about 0.1 equivalent of a cadmium base, the amount of barium base and cadmium base in the mixture being sufficient to provide a total of at least about 1.1 equivalents of barium and cadmium per equivalent of component (B),

removing substantially all water from said mixture and then treating said mixture with at least about $(x-y)$ equivalents of carbon dioxide, where x represents a total equivalents of barium and cadmium in the mixture and y represents the equivalents of component (B).

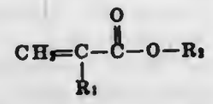
3,274,136

PREPARATION OF REINFORCED RESINS USING GLASS FIBERS COATED WITH PLASTICIZED VINYL CHLORIDE POLYMERS



William K. Glesner, Clifford F. Thompson, and Donald P. Kubisiak, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Dec. 7, 1962, Ser. No. 242,920
16 Claims. (Cl. 260—23.5)



1. The process for preparing reinforced resin laminates comprising the sequential steps of:

(I) uniformly coating unsized glass fiber reinforcing material with from between about 3 and 15 weight percent based on the weight of said reinforcing material of a homogeneous polymeric binder composed of (1) between about 50 and 80 weight percent of a vinyl chloride polymer containing at least about 85 weight percent of vinyl chloride in the polymer molecules, and (2) complementarily between about 50 and 20 weight percent of a plasticizer for said vinyl chloride polymer and subsequently fusing said polymeric binder to said reinforcing material;

(II) impregnating said coated reinforcing material with a polymerizable fluid composition comprising from 40 to 60 weight percent of vinyl chloride polymer containing at least about 95 weight percent of vinyl chloride in the polymer molecules intimately incorporated with from 60 to 40 weight percent of a monomeric composition composed essentially of (A) from 60 to 95 weight percent of a monovinyl aromatic hydrocarbon of the benzene series containing from 8 to 10 carbon atoms in the molecule, and (B) at least 5 weight percent of an unsaturated ester selected from the group consisting of (a) fumaric acid esters having the general formula:

wherein R and R' each represents an alkyl radical containing from 2 to 8 carbon atoms, and (b) acrylic and methacrylic acid esters having the general formula:

wherein R_1 represents hydrogen and the methyl radical and R_2 is a member of the group consisting of cyclohexyl and alkyl radicals containing from 4 to 12 carbon atoms; and

(III) curing the composition by polymerization of the monomers in the presence of from about 0.2 to 2 percent by weight of an organic peroxide polymerization catalyst.

16. The process of claim 1, wherein said polymerizable fluid composition contains not more than 10 weight percent of a polyethylenically unsaturated organic monomer which is copolymerizable with said monovinyl aromatic hydrocarbon.

3,274,137

ANTIFOULING PROTECTIVE COATING COMPOSITIONS

John R. Saroyan, P.O. Box 1388, Vallejo, Calif., and Hing D. Dear, 535 Grant Ave., San Francisco, Calif.

No Drawing. Filed May 4, 1962, Ser. No. 192,604
3 Claims. (Cl. 260—27)

3. An antifouling protective coating composition comprising, by weight, non-volatile ingredients comprising from about 82% to about 97.5% cuprous oxide, from about 1.7% to about 10.5% polyisobutylene, the approximate average molecular weight of which does not exceed essentially 50,000, from 0% to about 15% rosin, and volatile ingredients comprising solvent in an amount from about 20% to about 130% of the non-volatile ingredients.

3,274,138

PETROLEUM MULCH FILM

Robert H. Salvesen, Clark, N.J., assignor to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Filed Apr. 15, 1964, Ser. No. 360,096
1 Claim. (Cl. 260—28.5)

A petroleum mulch having improved moisture retention properties comprising about 50 wt. percent asphalt, about 50 wt. percent water and about 1 wt. percent oxidized polyethylene having a molecular weight of about 2500.

3,274,139

HIGHLY REACTIVE ALKALINE PHENOL-FORMALDEHYDE CONDENSATES

Alan L. Lambuth, Bellevue, Wash., assignor to Monsanto Company, a corporation of Delaware

No Drawing. Filed June 27, 1963, Ser. No. 290,907
8 Claims. (Cl. 260—29.3)

1. A process for preparing a condensation product in aqueous alkaline medium which comprises (a) initially contacting 1 hydroxyl equivalent proportion of a phenol selected from the group consisting of phenol, methylene bisphenols, and mixtures thereof, with from 2.1 to 3.25 molar proportions of formaldehyde and from 0.3 to 0.6 molar proportion of an alkali metal hydroxide at a temperature of from 160° F. to reflux for from 15 to 45 minutes, the relative proportion of alkali metal hydroxide being chosen so as to constitute from 12 to 20 mol percent based upon the formaldehyde, (b) adjusting the mixture to a temperature of from 140° F. to reflux and maintaining said temperature until a 70° F. viscosity of from 100 to 50,000 MacMichael #26d units is attained, (c) adding a further quantity of alkali metal hydroxide in a proportion such that the total alkali metal hydroxide in the mixture is no more than 0.8 molar proportion per hydroxyl equivalent porportion of the phenol while maintaining the mixture at a temperature of from 140° F. to reflux until a 70° F. viscosity of from 25 to 5000 MacMichael #26d units is attained, (d) adding in from 1 to 4 further increments sufficient alkali metal hydroxide to raise the total alkali metal hydroxide in the mixture to from 1.0 to 2.0 molar proportions per hydroxyl equivalent proportion of the phenol, heating the mixture at a temperature of from about 140° F. to reflux to attain 70° F. viscosities of from 25 to 150 MacMichael #26d units between each incremental addition and (e) rapidly cooling the mixture to room temperature.

3,274,140

PRODUCTION OF POLYMER SOLUTIONS

Graham John Brealey, Coventry, England, assignor to Courtaulds Limited, London, England, a British company

No Drawing. Filed Nov. 19, 1962, Ser. No. 238,770
Claims priority, application Great Britain, Nov. 28, 1961, 42,438/61
5 Claims. (Cl. 260—29.6)

1. In the production of solutions of acrylonitrile polymers containing at least 80 percent by weight of acrylonitrile units by dissolving a polymerisable material containing such a quantity of acrylonitrile as is necessary to give the desired polymer in an aqueous solution of an inorganic thiocyanate and polymerising said polymerisable material in the presense of a free-radical-forming initiator, the improvement which comprises carrying out said polymerisation in the presence also of a 0.05 to 2.0 percent, based on the weight of the polymer solution, of a secondary alcohol containing from 3 to 5 carbon atoms.

3,274,141

FILM-FORMING COPOLYMER EMULSION

Gustav Pieper, Cologne-Stammheim, and Heino Logemann, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation

No Drawing. Filed July 18, 1963, Ser. No. 296,109
Claims priority, application Germany, July 21, 1962, F 37,388
2 Claims. (Cl. 260—29.7)

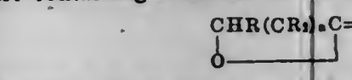
1. An aqueous emulsion of a film-forming acrylonitrile copolymer with self-crosslinking properties of (1) 50 to 60 percent by weight of acrylonitrile, (2) 15 to 20 percent by weight of styrene, (3) 15 to 20 percent by weight of butadiene, (4) 2 to 7 percent by weight of a member selected from the group consisting of acrylic acid and methacrylic acid, and (5) 2 to 7 percent by weight of a member selected from the group consisting of acrylamide and methacrylamide, said copolymer emulsion containing and emulsifier in an amount between 0.25 and 1% by weight based on the weight of monomers.

3,274,142

RUBBER-MERCAPTAN BLENDS AND METHOD FOR THEIR PREPARATION

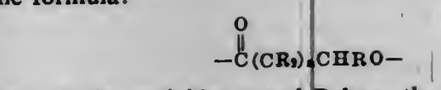
Paul F. Warner, Phillips, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed Mar. 1, 1962, Ser. No. 176,801
12 Claims. (Cl. 260—30.2)



1. As a new composition of matter, a blend consisting essentially of about 95–60 weight parts of a liquid dithiol which has the general formula HS—R—SH wherein R is an organic radical containing from 1–20 carbon atoms, and about 5–40 weight parts of a non-halogenated rubbery polymer selected from the group consisting of homopolymers of conjugated dienes, and copolymers of conjugated dienes with monomers having an ethylenic linkage copolymerizable therewith.

3,274,143
LACTONE POLYESTERS AS PLASTICIZERS FOR VINYL RESINS



Fritz Hostettler, Charleston, W. Va., and Donald M. Young, New York, N.Y., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Nov. 12, 1963, Ser. No. 323,154
23 Claims. (Cl. 260—32.2)

1. A plasticized composition comprising a major portion of a mixture of a plasticizable resin of the group consisting of polyvinyl chloride, polyvinyl butyral, copolymers of vinyl chloride with monoethylenically unsaturated monomers copolymerizable therewith, and copolymers of acrylonitrile with monethylenically unsaturated monomers copolymerizable therewith; and, as the plasticizer therefor, a lactone polyester which has an average molecular weight of from about 300 to 9000; said lactone polyester being formed by the reaction of an admixture containing a lactone of the formula:

wherein n is an integer of from four to six, wherein at least $n+2R$ variables are hydrogen, and wherein the remaining R variable are of the group consisting of hydrogen, alkyl, cycloalkyl, alkoxy, and single ring aromatic hydrocarbon radicals, none of the said R variables having more than 12 carbon atoms; and an organic functional initiator having at least one reactive hydrogen substituent and being of the group consisting of alcohols, amines, polyols, polyamines, amino alcohols, polycarboxylic acids, hydroxycarboxylic acids, and aminocarboxylic acids; said lactone being in molar excess with relation to said inititator; said initiator being capable of opening the lactone ring whereby said lactone is added to said initiator as a substantially linear group thereto; said lactone polyester possessing, on the average, at least two of said linear groups, each of said linear groups having the formula:

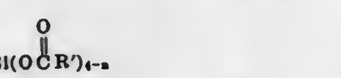
wherein the variables n and R have the aforesaid meanings.

3,274,144
LUBRICATED POLYCARBONATE COMPOSITIONS

Henno Keskkula and Cleowa A. Leatherman, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Jan. 2, 1962, Ser. No. 163,873
8 Claims. (Cl. 260—32.6)

1. A composition of matter comprising a synthetic organic polycarbonate and from about 0.1 percent to about 10 percent of a compound of the general formula



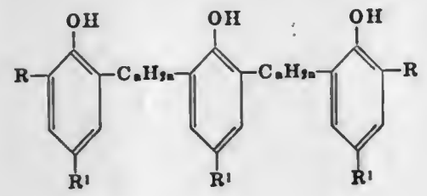
in which R_1 and R_3 are higher aliphatic hydrocarbon radicals having from 10 to 23 carbon atoms and R_2 is a lower alkylene group having from 2 to 8 carbon atoms.

3,274,145
NOVEL SILOXANE COMPOSITIONS

Wayne P. Dupree, St. Charles, Mich., assignor to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

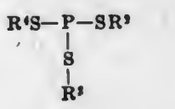
No Drawing. Filed Sept. 4, 1962, Ser. No. 221,314
8 Claims. (Cl. 260—37)

2. A stable, storable composition comprising (A) the reaction product of (1) an essentially diorganopolysiloxane having a viscosity of at least 100 cs. at 25° C., in which siloxane the terminal radicals are in part hydroxyl radicals and in part triorganosiloxane radicals such that more than half of the said terminal radicals are hydroxyl radicals, the organic radicals of the said siloxane and said triorganosiloxane radicals each being selected from the group consisting of monovalent hydrocarbon radicals and monovalent halohydrocarbon radicals, and said diorganopolysiloxane being a mixture consisting essentially of a hydroxyl endblocked diorganopolysiloxane and a diorganopolysiloxane being endblocked on one end with a triorganosiloxane group and on the other end by a hydroxyl group, and (2) at least one mol per mol of silicon-bonded hydroxyl radicals of polysiloxane (1) of a silane of the formula



wherein R is selected from the group consisting of monovalent hydrocarbon radicals and monovalent halohydrocarbon radicals, R′ is selected from the group consisting of hydrogen and alkyl radicals and n has a value from 0 to 1 inclusive, which reaction product is stable in the absence of moisture, and which, upon exposure to moisture, cures to a coherent, rubbery solid and (B) a filler.

3,274,146
POLYPROPYLENE STABILIZATION



Marilyn T. Lecher, Glen Mills, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Filed Dec. 5, 1961, Ser. No. 157,275
17 Claims. (Cl. 260—41)

1. A light and heat stable composition comprising solid, isotactic, substantially crystalline polypropylene and a stabilizing quantity of each of of (A) carbon black, (B) a compound having the formula:

wherein n is 1 to 3, and each of R and R^1 is a alkyl radical containing 1 to 16 carbon atoms, and (C) a compound having the formula:

wherein each of R^2, R^3 and R^4 is a hydrocarbon radical containing 6 to 20 carbon atoms selected from the group consisiting of alkyl, aryl and cycloalkyl radicals, said stabilizing quantity being sufficient to provide a synergistic stabilizing effect by the combination of components (A), (B) and (C).

3,274,147
COMPOSITIONS FROM LIQUID CONJUGATED DIENE POLYMERS

Robert P. Zelinski and Charles W. Strobel, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Filed May 15, 1961, Ser. No. 109,864
12 Claims. (Cl. 260—41.5)

1. A method of making a polymeric product which comprises mixing a first polymer of a conjugated diene having 4 to 8 carbon atoms per molecule, said first polymer having a molecular weight in the range of 1000 to 20,000 and at least 2 terminally reactive groups per molecule,

said terminal groups containing at least one reactive element bonding selected from the group consisting of O—H, S—H, N—H, S—X, OC—X, SC—X, RC—X, C═O, C═S and C≡N wherein X is halogen and R is selected from the group consisting of carbonyl, thiono, ethenylene and a carbon in an aromatic ring, with a plasticizing amount of a second homopolymer of 1,3-butadiene, said second polymer having a viscosity in the range of about 10 to 500 poises at 77° F. and up to 15 percent of its unsaturation in the vinyl form, up to 55 percent in the trans form, and from 35 to 85 percent of its unsaturation in the cis form, and curing the resulting mixture by reacting said terminally reactive groups of said first polymer with a polyfunctional organic compound selected from the group consisting of alcohols, acids, acid anhydrides, halides, amines, ketones, isocyanates, epoxides and aziridinyl compounds.

3,274,148
FRACTURE SUPPORT AGENTS MADE BY CYCLIZING AND CURING RUBBERY PELLETIZED BUTADIENE COPOLYMERS

William J. Sparks, Westfield, and Leon S. Minckler, Jr., Metuchen, N.J., assignors to Esso Research and Engineering Company, a corporation of Delaware

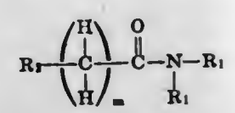
Filed May 13, 1964, Ser. No. 367,026
5 Claims. (Cl. 260—41.5)

1. A continuous method for preparing hard pelletized fracture supports which comprises:

continuously passing a polymer of conjugated diolefin through a plurality of treating zones comprising the following successive steps:

(a) pelletizing said polymer,

(b) effecting partial cure of said pelletized polymer under pressure in the presence of a curing agent at a temperature between 200 and 400° F. and a pressure between 20 and 1000 p.s.i.g. for a period of time between one minute and 17 hours,



(c) effecting cyclization of said partially cured pellets by passing said partially cured pellets through a heating zone under conditions of substantially plug flow at a temperature between 300 and 650° F. and a pressure between atmospheric and 1000 p.s.i.g. for a period of time between 5 minutes and 24 hours.

3,274,149
OXYMETHYLENE POLYMERS STABILIZED WITH AMINO SUBSTITUTED AMIDES

Frank M. Berardinelli, South Orange, N.J., assignor to Celanese Corporation of America, New York, N.Y., a corporation of Delaware

No Drawing. Filed Feb. 13, 1963, Ser. No. 258,126
8 Claims. (Cl. 260—45.8)

1. A polymer composition comprising an oxymethylene polymer having a melting point of at least 150° C. and a stabilizing amount of a compound having the structure

wherein m is an integer from two to seven; R_1 is hydrogen or a lower alkyl having up to about five carbon atoms; R_2 is amino, lower alkyl-substituted amino, lower alkylamido-substituted amino, 4-morpholinyl, lower alkyl-substituted-4-morpholinyl, N-piperazinyl, N′-alkylamido-substituted-N-piperazinyl, lower alkyl-substituted-N-piperazinyl, N-imidazolidinyl, N′-lower alkylamido-substituted-N-imidazolidinyl, lower alkyl-substituted-N-imidazolidinyl, 4- anilinyl, lower alkyl-substituted anilinyl, 4-piperidinyl, lower alkyl-substituted piperidinyl, lower alkylamido-substituted piperidinyl.

3,274,150
POLYAMIDES STABILIZED WITH ALKALI METAL IODIDES IN COMBINATION WITH PHENYLENE DIAMINES OR A BIS PHENOL

Melvin Myron Baevsky, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

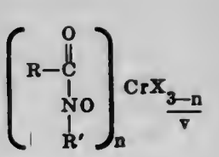
No Drawing. Filed Oct. 24, 1962, Ser. No. 232,875
3 Claims. (Cl. 260—45.9)

1. A composition of matter comprising a polyamide containing from 0.1–5% by weight of an inorganic antioxidant selected from the group consisting of sodium and potassium iodide and from 0.1–5% by weight of an organic antioxidant for rubber, said antioxidant having a boiling point above 270° C. and being selected from the group consisting of 4,4′-butylidene-bis-6-tertiary butyl-m-cresol, N-isopropyl-N′-phenyl-p-phenylenediamine, N,N′-naphthyl-p-phenylenediamine, N-cyclohexyl-N′-phenyl-p-phenylenediamine and 2,2′-methylene-bis(4-ethyl-6-tertiary butyl phenol).

3,274,151
POLYAMIDES CONTAINING A COMBINATION OF (1) A PHENOL, (2) A PHOSPHORUS ACID SALT OR ESTER, (3) A MANGANESE SALT, AND (4) A DICARBOXYLIC ACID AS STABILIZERS

Walter Settele, Lucerne, Switzerland, assignor to Societe de la Viscose Suisse, Emmenbrucke, Switzerland, a Swiss body corporate

No Drawing. Filed Nov. 21, 1962, Ser. No. 239,327
3 Claims. (Cl. 260—45.75)



1. Synthetic polyamide compositions which are substantially free from colour and of good stability against discolouration by heat and light, in which have been incorporated during polycondensation (1) between 0.02 and 0.2% of a compound selected from the class consisting of 2,5-di-tert-butyl-hydroquinone, 2,2′-methylene-bis-(4-methyl-6-tert-butyl-phenol), 2,2′-methylene-bis-(4-ethyl-6-tert-butyl-phenol), and 4,4′-butylidene-bis-(6-tert-butyl-m-cresol), (2) between 0.05 and 0.5% of triphenyl phosphate, (3) between 20 and 80 parts of manganese per million parts of said polyamide composition in the form of a compound selected from the class consisting of manganous lactate, manganous oxalate, and manganous hypophosphite, and (4) between 0.2 and 1.0% of a member of the class consisting of adipic acid, sebacic acid, and terephthalic acid, the proportions being based on the total weight of the composition.

3,274,152
POLYOLEFINS OF IMPROVED LIGHT STABILITY AND DYE RECEPTIVITY CONTAINING CHROMIUM SALTS OF HYDROXAMIC ACIDS

Albert S. Matlack, Wilmington, Del., assignor to Hercules Incorporated, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Feb. 27, 1963, Ser. No. 261,499
5 Claims. (Cl. 260—45.75)

1. A polyolefin selected from the group consisting of polyethylene and a stereoregular polymer of a mono-α-olefin having from 3 to 6 carbon atoms containing a small amount of a chromium salt of a hydroxamic acid, said salt having the formula

wherein R is a radical selected from the group consisting of hydrogen, hydrocarbon, oxyhydrocarbon and substituted amino radicals, R′ is a radical selected from the

group consisting of hydrogen, hydrocarbon, oxyhydrocarbon and substituted sulfonyl radicals, and not more than one of said radicals R and R' is hydrogen, X is an anion, n is an integer from 1 to 3, and v is the valence of said anion.

3,274,153
METHOD OF POLYMERIZING HYDROXYLATED ORGANOSILICON COMPOUNDS

James Franklin Hyde and Elmer M. Schultz, Midland, Mich., assignors to Dow Corning Corporation, Midland, Mich., a corporation of Michigan

No Drawing. Filed May 2, 1962, Ser. No. 191,738
12 Claims. (Cl. 260—46.5)

1. A method of polymerizing organosilicon compounds containing silicon-bonded hydroxyl radicals which method comprises contacting (1) an organosilicon compound having an average per silicon atom of 1.98 to 2.01 inclusive substituent groups selected from the group consisting of monovalent hydrocarbon radicals, perfluoroalkylethyl radicals, haloaryl radicals and cyanoalkyl radicals, and an average per molecule of two SiOH groups, any remaining valences of said organosilicon compound being satisfied with substituents selected from the group consisting of divalent oxygen atoms, divalent hydrocarbon radicals and divalent haloarylene radicals, with (2) a compound of the structure

wherein

R is selected from the group consisting of monovalent hydrocarbon radicals, monovalent halohydrocarbon radicals, halogen atoms, and monovalent hydrocarbonoxy radicals, each R group containing up to about 10 carbon atoms,
m is an integer from 0 to 3 inclusive, and
n is an integer from 1 to 3 inclusive,
$m+n$ is an integer from 1 to 4 inclusive

until the desired degree of polymerization is obtained.

7. A method of polymerizing organosilicon compounds containing silicon-bonded hydroxyl radicals which method comprises contacting (1) an organosilicon compound having an average per silicon atom of 1.98 to 2.01 inclusive substituent groups selected from the group consisting of monvalent hydrocarbon radicals, perfluoroalkylethyl radicals, haloaryl radicals and cyanoalkyl radicals, and an average per molecule of two SiOH groups, any remaining valences of said organosilicon compound being satisfied with substituents selected from the group consisting of divalent oxygen atoms, divalent hydrocarbon radicals and divalent haloarylene radicals, with (2) a compound of the structure

wherein

R is selected from the group consisting of monovalent hydrocarbon radicals, monovalent halohydrocarbon radicals, halogen atoms, and monovalent hydrocarbonoxy radicals, each R group containing up to about 10 carbon atoms,
M is a tetraorganonitrogen radical, the organic radicals of said nitrogen radical being selected from the group consisting of monovalent alkyl and aryl radicals attached directly to the said nitrogen atom,
m is an integer from 0 to 3 inclusive, and
n is an integer from 1 to 3 inclusive,
$m+n$ is an integer from 1 to 4 inclusive

until the desired degree of polymerization is obtained.

3,274,154
POLYMERIZATION OF CYCLIC SILOXANES

Thomas Charles Kendrick and David Randall Thomas, Dinas Powis, Glamorgan, Wales, assignors to Midland Silicones Limited, London, England

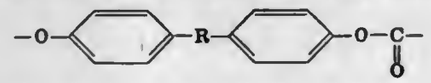
No Drawing. Filed July 17, 1963, Ser. No. 295,837
Claims priority, application Great Britain, Aug. 2, 1962, 29,722/62
8 Claims. (Cl. 260—46.5)

1. A method of polymerizing cyclic diorganosiloxanes of the general formula $(RR'SiO)_n$ where each R and each R' are individually selected from the group consisting of hydrogen atoms, monovalent hydrocarbon radicals, monovalent halogenated hydrocarbon radicals and aminoalkyl radicals and n is an integer having a value of at least 3, consisting essentially of contacting the cyclic diorganosiloxanes with (1) an anhydrous acid having a dissociation constant in aqueous solution of at least 10^{-5} and (2) a halide selected from the group consisting of halides of Al, Si, P, Sc, Ti, V, Ga, Ge, As, Y, Zr, Nb, In, Sn, Sb, Tl, Hf, Ta, Pb, Bi, Fe, Co, Ni, Ru, Rh, Pd, Os, Ir and Pt, and substituted covalent halide phenyldichlorophosphine, at a temperature up to 100° C.

3,274,155
ORGANOSILICON COMPOSITIONS

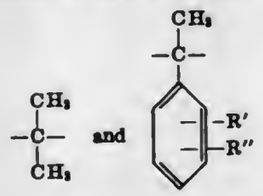
Frederick C. Saunders, Llandough, Cowbridge, Glamorgan, and Derek S. Caldwell, Penarth, Glamorgan, Wales, assignors to Midland Silicones Limited, London, England

No Drawing. Filed Aug. 5, 1964, Ser. No. 387,767
Claims priority, application Great Britain, Sept. 8, 1963, 31,526/63
11 Claims. (Cl. 260—46.5)



1. A composition of matter consisting essentially of the product formed by reacting
(A) pyromellitic dianhydride with
(B) an amino-organosiloxane having at least two units selected from the group consisting of R_2SiO, $RSiO_{1.5}$ and $R_3SiO_{0.5}$ wherein each R is a monovalent organic radical selected from the group consisting of hydrocarbon radicals, halogenated hydrocarbon radicals, cyanoalkyl radicals, alkoxy radicals and amino organic radicals of the formula $—Z—NH_2$ wherein Z is a divalent organic radical containing atoms selected from the group consisting of carbon atoms, hydrogen atoms, oxygen atoms, nitrogen atoms, halogen atoms and sulfur atoms and bonding the amino group to a silicon atom through a silicon-carbon bond, said siloxane having at least two monovalent organic radicals per molecule which are amino organic radicals.

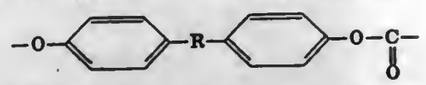
3,274,156
CHLORINATED POLYCARBONATES



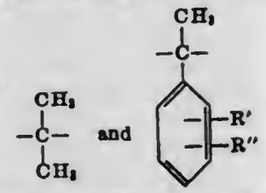
Kenneth P. Perry, Winston J. Jackson, Jr., and John R. Caldwell, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Jan. 10, 1964, Ser. No. 336,872
10 Claims. (Cl. 260—47)

1. A polycarbonate having the recurring structural unit



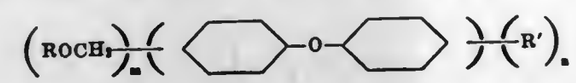
wherein R is at least one group selected from the group consisting of bivalent groups of the formulas



wherein R' and R'' are selected from the group consisting of hydrogen atoms and chlorine atoms, and wherein a portion of the hydrogens of the methyl groups of said bivalent groups are replaced with chlorine atoms to form a random distribution of $—CH_2Cl$ groups, $—CHCl_2$ groups and unchlorinated methyl groups.

4. The process for preparing the polymers of claim 1 comprising introducing chlorine into a solution of a polycarbonate having the recurring structural unit

wherein R is at least one group selected from the group consisting of bivalent groups of the formulas



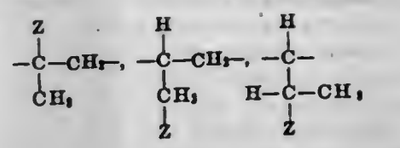
wherein R' and R'' are selected from the group consisting of hydrogen atoms and chlorine atoms in the presence of a chlorination promoter selected from the group consisting of ultraviolet radiation, visible light, and a free-radical catalyst.

3,274,157
CONDENSATION PRODUCTS OF ALKOXYMETHYLATED DIAROMATIC ETHERS

James D. Doedens, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

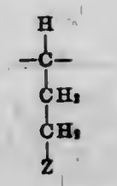
No Drawing. Filed Apr. 1, 1965, Ser. No. 444,792
7 Claims. (Cl. 260—47)

1. A solid polymerized composition of matter obtained by heating, in the presence of a condensation catalyst, an alkoxymethylated diaryl ether having the general formula:



wherein R is selected from the group consisting of methyl, ethyl, propyl and butyl radicals, R' is selected from the group consisting of alkyl, alkoxy and halogen radicals wherein the alkyl group contains from 1 to 4 carbon atoms, m is a number from 1 to 4 representing an average alkoxymethyl functionality and n is an integer from 0 to 2.

3,274,158
OLEFIN COPOLYMER MODIFIED WITH A HYDROXYBENZOIC ACID

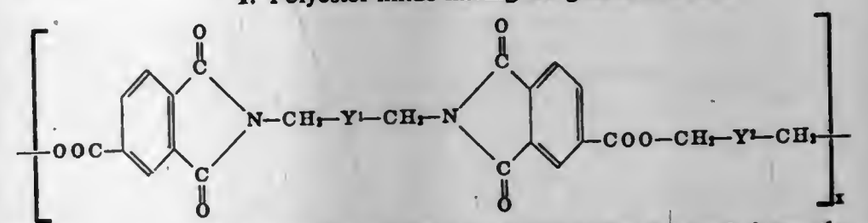


Stanley Tocker, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed May 24, 1965, Ser. No. 458,372
3 Claims. (Cl. 260—62)

1. A modified copolymer of 65–99 mole percent of ethylene and 1–35 mole percent of propadiene, said modification being by reaction with a hydroxyl-containing aromatic acid selected from the group consisting of salicyclic acid, metahydroxybenzoic acid and para-hydroxybenzoic acid to provide 1–35 mole percent of a random selection of recurring units selected from the group consisting of

and



where Z is hydroxybenzoyl.

3,274,159
POLYESTER IMIDES OF TRIMELLITIC ANHYDRIDE

Rudolph W. Kluiber, Bernardsville, N.J., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Jan. 7, 1963, Ser. No. 249,611
4 Claims. (Cl. 260—75)

1. Polyester imide having the general formula:

wherein Y^1 and Y^2 are individually selected from the group consisting of
(a) divalent radical of the formula $—(CH_2)_n—$, wherein n is an integer from 0 to 8, inclusive;
(b) divalent ether radical of the formula

$$—(CH_2)_n—O—(CH_2)_n—$$

where n is an integer from 1 to 3 inclusive;
(c) divalent ether radical of the formula

$$—(CH_2—O—C_3H_6—O—CH_2)—;$$

and x is an integer such that the polyester imide has a reduced viscosity, measured at 50° C. as a 0.2 gram sample in 100 milliliters of p-chlorophenol, of from 0.4 to about 20.

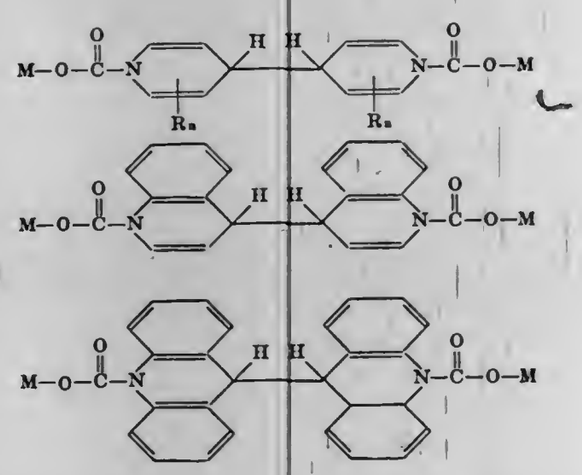
3,274,160
POLYURETHANES FROM A THREE COMPONENT PREPOLYMER

Konrad Ellegast, Leichlingen, and Artur Reischl and Erwin Müller, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation

No Drawing. Filed Aug. 29, 1961, Ser. No. 134,589
Claims priority, application Germany Sept. 2, 1960
9 Claims. (Cl. 260—77.5)

1. A process for the preparation of a polyurethane which comprises preparing a prepolymer by reacting an organic polyisocyanate with a mixture containing a polyhydric alcohol having at least two and not more than three hydroxyl groups and an organic compound having a plurality of alcoholic hydroxyl groups, said organic compound having a molecular weight above about 800 and selected from the group consisting of hydroxyl polyesters, polyhydric polyalkylene ethers, polyhydric polythioethers and polyacetals, said polyhydric alcohol having a molecular weight below about 500; the amount of said organic compound is such that an excess of from about

300 to about 900 percent of said polyisocyanate is present when calculated on the basis of the hydroxyl groups of said organic compound and is such that from about 150 to about 300 percent excess of said polyisocyanate is present after reaction with all the hydroxyl groups of said mixture containing said polyhydric alcohol and said organic compound and subsequently reacting said prepolymer with additional polyhydric alcohol to bring about crosslinking and produce a hard, elastic NCO terminated polyurethane casting by placing the final mixture into a mold and allowing it to cure.



3,274,161
POLYMERS OF N,N'-TETRAHYDRO-BIPYRIDYL-BIQUINOLYL AND -BIACRIDYL DICARBOXYLIC ACID DERIVATIVES

Walter E. Kramer, Niles, and Louis A. Joo and Robert M. Haines, Crystal Lake, Ill., assignors, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California

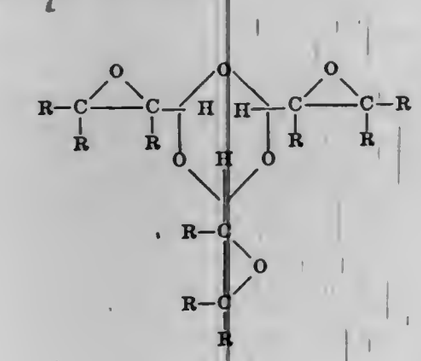
No Drawing. Original application May 13, 1960, Ser. No. 28,866, now Patent No. 3,147,262, dated Sept. 1, 1964. Divided and this application Jan. 9, 1964, Ser. No. 356,345

5 Claims. (Cl. 260—77.5)

1. A polymer produced by reaction of a strong mineral acid in aqueous solution with a compound selected from the group consisting of

and

wherein M is an alkali metal, R is an unsubstituted lower alkyl radical and *n* in an integer from 0 to 3, the substituents on both rings being identical.



3,274,162
EPOXY TRIOXANES

Elliot Bergman, Berkeley, Calif., assignor to Shell Oil Company, New York, N.Y., a corporation of Delaware

No Drawing. Filed Feb. 8, 1963, Ser. No. 257,096

16 Claims. (Cl. 260—78.4)

1. The 2,4,6-tris(1,2-epoxyalkyl)-trioxane having the formula

where R is selected from the group consisting of hydrogen, alkyl having from 1 to 10 carbon atoms, and aryl having 6 to 10 carbon atoms.

7. The infusible product obtained by heating the compound of claim 1 with a polycarboxylic acid anhydride selected from the group consisting of dodecenylsuccinic anhydride, methylnadic anhydride, phthalic anhydride and hexahydrophthalic anhydride.

3,274,163
PRODUCTION OF POLYCHLOROESTERS CONTAINING MONOFUNCTIONAL HALOGENATED ALCOHOLS

Gunther Elfers, Grosse Ile, and Pauls Davis, Gibraltar, Mich., assignors to Wyandotte Chemicals Corporation, Wyandotte, Mich., a corporation of Michigan

No Drawing. Filed Dec. 28, 1964, Ser. No. 421,667

56 Claims. (Cl. 260—78.4)

1. A polyester of

(1) at least one organic dicarboxylic acid anhydride,

(2) at least one vicinal alkylene oxide selected from the group consisting of

(a) an alkylene oxide containing from 2 to 18 carbon atoms inclusive, selected from the group consisting of saturated alkylene oxides and alkylene oxides which are free from other than aromatic unsaturation, and

(b) an alkylene oxide as defined in (a) but containing from 3 to 4 carbon atoms and at least 1 halogen atom, each halogen having an atomic weight of 19 to 80 inclusive and having from 1 to 2 alkyl groups attached to at least 1 carbon atom of the oxirane ring, said alkyl groups having up to 2 carbon atoms, and

(3) a halogenated monofunctional alcohol having the following general formula:

$$C_nH_{2n+1-z}Y_zOH$$

wherein *n* is an integer of from 1 to 11, *z* is an integer from 1 to 23, and Y is a halogen having an atomic weight of 19 to 80 inclusive.

41. The reaction product of

I. a polyester of

(1) at least one organic dicarboxylic acid anhydride,

(2) at least one vicinal alkylene oxide selected from the group consisting of

(a) an alkylene oxide containing from 2 to 18 carbon atoms inclusive, selected from the group consisting of saturated alkylene oxides and alkylene oxides which are free from other than aromatic unsaturation, and

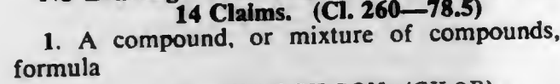
(b) an alkylene oxide as defined in (a) but containing from 3 to 4 carbon atoms and at least 1 halogen atom, each halogen having an atomic weight of 19 to 80 inclusive and having from 1 to 2 alkyl groups attached to at least 1 carbon atom of the oxirane ring, said alkyl groups having up to 2 carbon atoms, and

(3) a halogenated monofunctional alcohol having the following general formula:

$$C_nH_{2n+1-z}Y_zOH$$

wherein *n* is an integer of from 1 to 11, *z* is an integer from 1 to 23, and Y is a halogen having an atomic weight of 19 to 80 inclusive, and

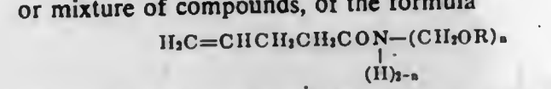
II. a compound selected from the group consisting of isocyanates, and inorganic and organic acid chlorides.



3,274,164
POLYMERIZABLE SUBSTITUTED-4-PENTENAMIDE MONOMERS, POLYMERS THEREOF, AND METHODS FOR MAKING AND USING THESE COMPOSITIONS

Melvin D. Hurwitz, Southampton, Pa., assignor to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Filed July 5, 1963, Ser. No. 293,582



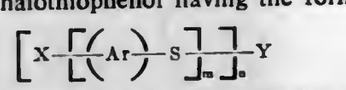
14 Claims. (Cl. 260—78.5)

1. A compound, or mixture of compounds, of the formula

wherein R is selected from the group consisting of H and alkyl having 1 to 18 carbon atoms, and *n* is a number having an average value of about 0.8 to 2.0.

5. A thermosettable addition polymer of a compound, or mixture of compounds, of the formula

wherein R is selected from the group consisting of H and alkyl having 1 to 18 carbon atoms, and *n* is a number having an average value of about 0.8 to 2.0.



3,274,165
METHOD FOR PREPARING LINEAR POLYARYLENE SULFIDE

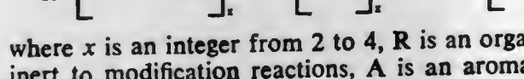
Robert W. Lenz, Dedham, Mass., and Carl E. Handlovits and William K. Carrington, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed May 10, 1965, Ser. No. 454,644

10 Claims. (Cl. 260—79)

1. A process which comprises reacting by heating a metal salt of a halothiophenol having the formula

wherein X represents a halogen atom having an atomic number from 35 to 53 in a position other than ortho to the sulfur molecule, Ar represents an aromatic hydrocarbon radical of the benzene series, Y represents a metal ion selected from the group consisting of alkali metal, alkaline earth metal, and the transition metals copper, gold and silver, *n* represents an integer equal to the valence of metal ion Y, *m* represents an integer from 1 to about 6 and recovering a polyarylene sulfide having a molecular weight above that of the monomer employed.



3,274,166
MODIFYING HYDROCARBON POLYMERS WITH POLY(DIAZO) COMPOUNDS

David S. Breslow and Harold M. Spurlin, Wilmington, Del., assignors to Hercules Incorporated, a corporation of Delaware

No Drawing. Filed June 19, 1963, Ser. No. 288,896

18 Claims. (Cl. 260—85.1)

1. The process of modifying a hydrocarbon polymer which comprises heating said polymer in admixture with from about 0.01% to about 20% based on the weight of the polymer of a poly(diazo) compound selected from the group consisting of

where *x* is an integer from 2 to 4, R is an organic radical inert to modification reactions, A is an aromatic radical inert to modification reactions, R' is selected from the group consisting of hydrogen, alkyl, aryl and —COOZ radicals where Z is selected from the group consisting of alkyl and aryl radicals and R'' is selected from the group consisting of hydrogen, alkyl and aryl radicals said heating being at the decomposition temperature of said poly(diazo) compound whereby chemical bonding is effected between the polymer molecules.

3,274,167
PREPARATION OF POLYETHYLENE IN THE PRESENCE OF A 2-BUTENE CHAIN TRANSFER AGENT

Kenneth W. Doak, Wyckoff, N.J., and Archie Hill, Pittsburgh, Pa., assignors to Koppers Company, Inc., a corporation of Delaware

No Drawing. Filed July 3, 1963, Ser. No. 292,737

5 Claims. (Cl. 260—88.2)

3. In the polymerization of ethylene at temperatures of 250–300° C. and pressures of 20,000–50,000 p.s.i.g. in the presence of a catalytic amount of an oxygen initiator, the improvement comprising controlling the molecular weight of the polyethylene product, as reflected by the melt index thereof, by polymerizing ethylene in the presence of 0.05–1.5 percent by volume butene-2, based on the ethylene, the melt index increasing within the range of 0.15–40 as the amount of butene-2 present is increased, and providing sufficient oxygen initiator during the polymerization to compensate for the presence of the butene-2 and to maintain a predetermined temperature within the range of 250–300° C. at a predetermined pressure of 20,000–50,000 p.s.i.g. in the presence of a predetermined amount of butene-2 within the above indicated range, thereby providing a product of the desired molecular weight characterized by improved optical properties and physical strength and a density of at least 0.919 g./cc.

3,274,168
METHOD FOR PREPARING POLY(t-BUTYL CROTONATE) AND POLYCROTONIC ACID USING ORGANO-LITHIUM CONTAINING CATALYST SYSTEMS

Mary Lucy Miller, New York, and John Skogman, Yonkers, N.Y., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed July 21, 1964, Ser. No. 384,247

9 Claims. (Cl. 260—89.3)

1. A process which comprises homopolymerizing t-butyl crotonate by contacting t-butyl crotonate with a catalyst system selected from the group consisting of (1) from about 0.01% to 2.0%, by weight, based on the weight of said t-butyl crotonate, of those having the formula

LiR

wherein R is selected from the group consisting of amyl and sec.-butyl radicals, (2) from about 0.01% to 2.0%, by weight, based on the weight of said t-butyl crotonate, of an alkyl lithium in admixture with about 0.01% to about 1.0%, by weight, based on the weight of said t-butyl crotonate, of lithium hydride, said alkyl group having from 4 to 5 carbon atoms, inclusive, and (3) an organic ether solvent solution of the product produced by reacting lithium with a fused ring aromatic hydrocarbon in the presence of said solvent, said product having an active lithium concentration of from about .01% to 2.0%, by weight, based on the weight of said t-butyl crotonate, at a temperature ranging from about −50° C. to +50° C., in an inert atmosphere and under substantially anhydrous conditions.

3,274,169
POLYMERIZATION CATALYST SYSTEM AND PROCESS

Robert O. Lindblom, Pleasant Hill, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Dec. 3, 1962, Ser. No. 242,871

36 Claims. (Cl. 260—93.7)

17. A polymerization process comprising the step of polymerizing an olefinic compound having no more than

30 carbon atoms therein selected from the class consisting of olefins having a $CH_2=CH-$ group and derivatives thereof in which each derivative group is selected from the class consisting of cycloalkyl, aryl and haloaryl groups, in which haloaryl groups each halogen atom is attached directly to the aromatic nucleus of the aryl group, at a temperature of room temperature to 250° C., at a pressure of atmospheric pressure to 20,000 pounds per square inch, in the presence of a catalyst composition comprising the reaction product obtained upon mixing the following four components:

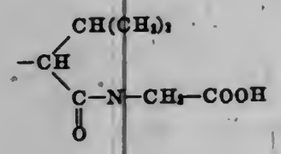
(A) A lithium derivative of an alkanolamine of no more than 60 carbon atoms having the formula $LiOZNR_2$ wherein Z is a divalent radical selected from the class consisting of OR', OLi, and NR_2'' radicals, said divalent radical having at least 2 and no more than 4 carbon atoms between said valencies; R' represents a radical selected from the class consisting of hydrogen, alkyl and acyl radicals having no more than 20 carbon atoms therein; R represents a radical of the class consisting of hydrogen, alkyl radicals and derivatives of alkyl radicals in which the derivative radicals are each selected from the class consisting of OR', OLi and NR_2'' radicals; R'' represents a radical selected from the class consisting of hydrogen, alkyl radicals and derivatives of alkyl radicals in which the derivative radicals are each selected from the class consisting of OR', OLi and RN_2''' radicals; and R''' represents a radical selected from the class consisting of hydrogen and alkyl radicals; said alkyl radicals represented by R, R'' and R'' each having no more than 20 carbon atoms therein, the total number of carbon atoms in said compound being no more than 60, the number of lithium atoms and nitrogen atoms each being no more than 3, and the number of oxygen atoms being no more than 6;

(B) An aryl mercaptan,

(C) A compound selected from the class consisting of halides, oxides, alcoholates and esters of metals of the periodic groups IV(b), V(b), VI(b), VIII and manganese, and

(D) A component selected from the class consisting of metals of periodic groups I, II, III, IV(b), V(b) and VI(b) and derivatives thereof in which each derivature group is selected from the class consisting of hydrogen and hydrocarbon radicals.

3,274,170
CARBOXYLIC ACID AMIDES

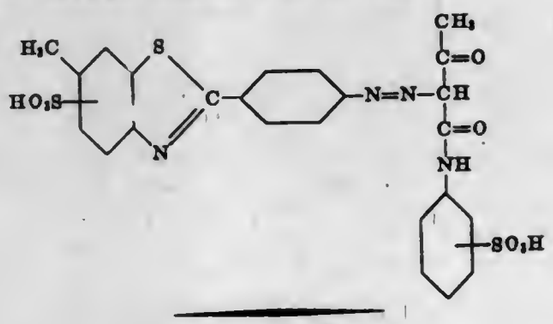


Ivar Ugi, Leverkusen, Klaus Offermann, Munich, and Friedrich-Karl Rosendahl, Leverkusen, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Feb. 27, 1963, Ser. No. 261,518
Claims priority, application Germany, Mar. 9, 1962, F 36,223
3 Claims. (Cl. 260—112.5)

3. A carboxylic acid amide of the formula

wherein R_1 stands for a member selected from the group consisting of 1-(N-formyl-benzylamino)-cyclohexyl and N-methylene-phthalimide and R_2 stands for

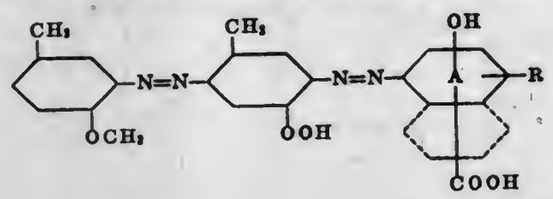


3,274,171
MONOAZO DYESTUFFS CONTAINING A BENZOTHIAZOLE NUCLEUS

Norman L. Anderson, Hamburg, and Alvin C. Litke, Buffalo, N.Y., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Apr. 29, 1963, Ser. No. 276,179
6 Claims. (Cl. 260—158)

1. A monoazo dyestuff of the formula



3,274,172
DISAZO DISPERSE DYESTUFFS

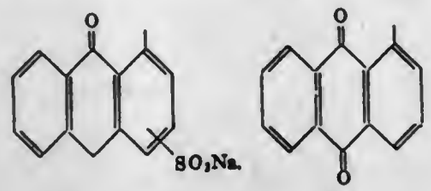
Eiji Koike and Fujio Kanazawa, Toyonaka-shi, Japan, assignors to Sumitomo Chemical Company, Ltd., and to Toyo Spinning Co., Ltd., both of Osaka, Japan, both corporations of Japan

No Drawing. Filed Aug. 16, 1963, Ser. No. 302,735
Claims priority, application Japan, Sept. 24, 1962 37/41,813
1 Claim. (Cl. 260—187)

A disazo disperse dyestuff having the general formula,

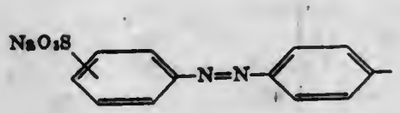
wherein A represents a nucleus selected from the group consisting of benzene and naphthalene nuclei, and R is selected from the group consisting of hydrogen atom and methyl radical.

3,274,173
FLUORO, NITROBENZYL SULFONYL AMIDE COLORANTS

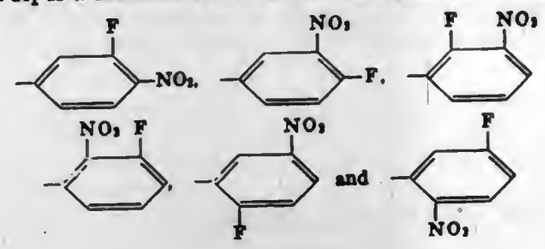


Joseph W. Dehn, Jr., Great Neck, N.Y., Edward Gancher, Clifton, N.J., and Harold J. Kubefuss and Paul Resnick, Brooklyn, N.Y., assignors to Interchemical Corporation, New York, N.Y., a corporation of Ohio

No Drawing. Filed Oct. 31, 1963, Ser. No. 320,532
6 Claims. (Cl. 260—205)



1. A reactive colorant having the structural formula



where R is a member selected from the group consisting of

and

and R_1 is a member selected from the group consisting of

3,274,174
N-1,1-DIHYDROFLUOROALKYL-N'-ALKYLENE UREA

Heinz Enders, Stadtbergen, near Augsburg, and Hans Karl Wiest, Gersthofen, near Augsburg, Germany, assignors to Chemische Fabrik Pfersee G.m.b.H., Augsburg, Germany, a firm of Germany

No Drawing. Filed Feb. 1, 1963, Ser. No. 255,690
Claims priority, application Germany, Feb. 14, 1962, C 26,226
6 Claims. (Cl. 260—239)

1. N-1,1-dihydrofluoroalkyl-N'-alkylene urea.

3,274,175
PENICILLIN DERIVATIVES

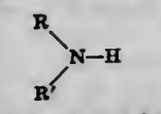
Hugh Colin Richards, David Frank Spooner, and John Rosindale Housley, Nottingham, England, assignors to Boots Pure Drug Company Limited, Nottingham, England, a British company

No Drawing. Filed Nov. 26, 1962, Ser. No. 240,149
Claims priority, application Great Britain, Dec. 7, 1961, 43,865/61; Mar. 7, 1962, 8,805/62
5 Claims. (Cl. 260—239.1)

1. A penicillin compound selected from the group of acids of the formula

and the non-toxic salts thereof in which Z is selected from the group consisting of hydroxy, lower alkoxy, benzyloxy, phenoxy, amino, lower alkyl amino, di-lower alkyl amino, benzyl amino, anilino and N-methyl anilino and R is a divalent heterocyclic radical of a formula selected from the group consisting of

in which R^1 and R^2 are selected from the group consisting of hydrogen and lower alkyl.



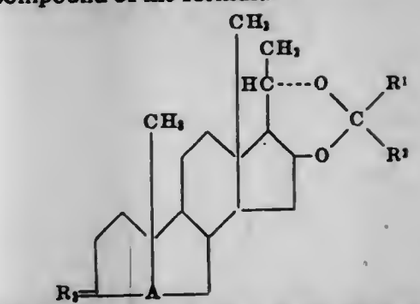
3,274,176
NOVEL PREPARATION OF ENAMINES AND NOVEL PRODUCTS

Jacques Dubé, Eaubonne, France, assignor to Roussel-UCLAF, Paris, France, a corporation of France

No Drawing. Filed Oct. 14, 1964, Ser. No. 403,936
Claims priority, application France, Oct. 18, 1963, 951,070
16 Claims. (Cl. 260—239.5)

1. A process for the preparation of 1,3-diamino-$\Delta^{3,5}$-steroids of the androstane and pregnane series of the formula

wherein X represents the remainder of the steroid molecule and R and R' are selected from the group consisting of lower alkyl, hydroxy lower alkyl, cyclohexyl, benzyl, phenyl, anilino and tolyl and when R and R' are taken together with the nitrogen atom they form a 5 to 6 member heterocyclic group which comprises reacting a 3-keto-$\Delta^{1,4}$-steroid with a secondary amine of the formula

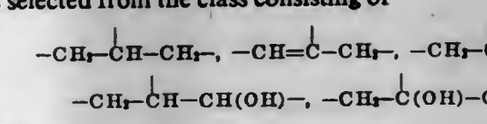


wherein R and R' have the above definition in the absence of a solvent and a catalyst at temperatures up to reflux temperatures to form the corresponding 1,3-diamino-$\Delta^{3,5}$-steroid.

3,274,177
METADIOXANE DERIVATIVES OF PREGNANE COMPOUNDS

Katsura Morita, Ikeda, Hayao Nawa, Nishitomatsu, Amagasaki, and Takuichi Miki, Mukosho, Amagasaki, Japan, assignors to Takeda Chemical Industries, Ltd., Higashi-ku, Osaka, Japan

No Drawing. Filed Aug. 1, 1962, Ser. No. 213,885
Claims priority, application Japan, Apr. 25, 1962, 37/17,007
24 Claims. (Cl. 260—239.55)



8. A compound of the formula

wherein R^1 and R^2 are selected from the class consisting of hydrogen, loweralkyl having not more than five carbon atoms, a carboxy-(lower)alkyl having not more than five carbon atoms, (lower)alkoxycarbonyl-(lower)alkyl of which the lower alkoxy has up to two carbon atoms and the lower alkyl has up to four carbon atoms, lower alkoxy having not more than two carbon atoms and a polymethylene having from four to five carbon atoms, said polymethylene including both R^1 and R^2; R^3 is selected from the class consisting of hydroxyl together with hydrogen, a lower aliphatic acyloxy together with hydrogen, and oxo; and

is selected from the class consisting of

and

3,274,178
METHOD FOR PREPARING 16α-HYDROXYPREGNENES AND INTERMEDIATES OBTAINED THEREIN

Percy L. Julian, Oak Park, and Arthur Magnani, Wilmette, Ill., assignors to Smith Kline & French Laboratories, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Filed May 28, 1964, Ser. No. 371,106
7 Claims. (Cl. 260—239.55)

1. The method of preparing 4-pregnene-16α,17α,21-triol-3,20-dione 21-acetate 16,17-acetonide comprising:

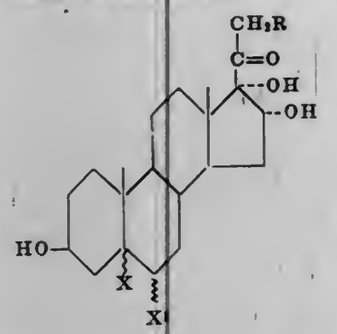
(1) reacting 5-pregnene-3β,16α,17α-triol-20-one with about 2 moles of bromine to form a mixture of 5,6, 21-tribromopregnane-3β,16α,17α-triol-20-ones,

(2) reacting said tribromopregnanetriolone with from

about 2–3 moles of an alkali metal iodide to form 21-iodo-5-pregnene-3β,16α,17α-triol-20-one,

(3) reacting said 21-iodopregnenetriolone with an alkali metal acetate to form 5-pregnene-3β,16α,17α, 21-tetrol-20-one 21-acetate,

(4) reacting said pregnenetetrolone acetate with an excess of acetone in the presence of a member selected from the group consisting of iodine and perchloric acid to form the 16,17-acetonide,



(5) reacting said acetonide with about one mole of bromine to form the 5,6-dibromide,

(6) oxidizing said dibromide with Jones reagent at below about room temperature to give 5,6-dibromopregnane-16α,17α,21-triol-3,20-dione 16,17-acetonide 21-acetate,

(7) reacting said dibromopregnanetrioldione with zinc-acid to give 5-pregnene-16α,17α,21-triol-3,20-dione 16,17-acetonide 21-acetate, and

(8) isomerization of said pregnenetrioldione under acid conditions to complete the formation of 4-pregnene-16α,17α,21-triol-3,20-dione 21-acetate 16,17-acetonide.

7. A compound of the structure:

in which

X and X' are members selected from the group consisting of bromine or when taken together with the carbon atoms to which they are attached, vinylene; and

R is a member selected from the group consisting of hydrogen and bromine, at least R being bromo or X and X^1 being both bromo.

3,274,179

3-HALOETHYNYL-3-HYDROXY DERIVATIVES OF THE ANDROSTANE-17-ONE AND PREGNANE-20-ONE SERIES

Burton G. Christensen, Scotch Plains, N.J., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

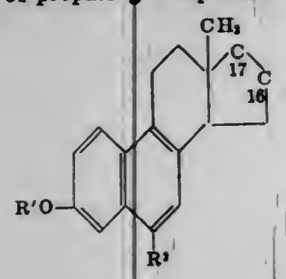
No Drawing. Filed Mar. 19, 1964, Ser. No. 353,276

8 Claims. (Cl. 260—239.55)

1. 3-haloethynyl-3-hydroxy-androstane-17-ones.

3. 17-alkylenedioxy-3-haloethynyl-3-hydroxy-androstane-17-ones.

3,274,180

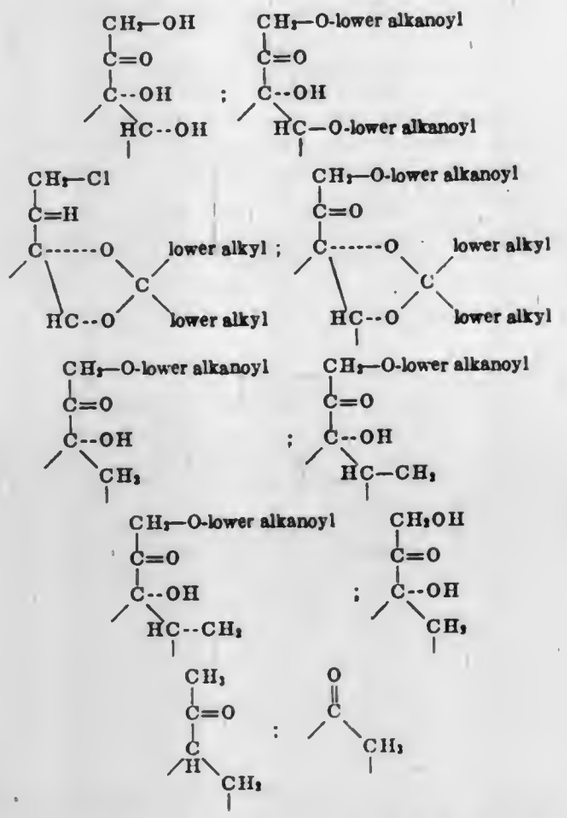


METHOD OF PREPARING PREGNAPENTAENES

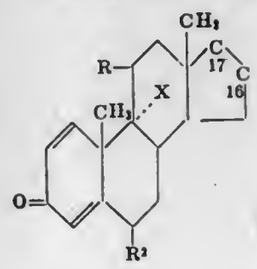
Milton David Heller, New City, N.Y., Robert Herman Lenhard, Ridgefield Park, N.J., and Seymour Bernstein, New City, N.Y., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed July 15, 1964, Ser. No. 382,936

20 Claims. (Cl. 260—239.55)



1. A method of preparing compounds of the formula:



wherein R' is selected from the group consisting of hydrogen and lower alkanoyl, R^2 is hydrogen, methyl, fluoromethyl, difluoromethyl, trifluoromethyl or fluorine and

is selected from the group consisting of

which comprises contacting a steroid of the formula:

wherein R_2 and

is as defined above and X is selected from the group consisting of chlorine and bromine and R is selected from the group consisting of hydroxyl and chlorine, with a weak base at a temperature within the range of about 15° C. to about 160° C. and recovering said product therefrom.

3,274,181

PROCESS FOR OXYGENATION OF ORGANIC COMPOUNDS

Christopher S. Foote and Sol Wexler, Los Angeles, Calif., assignors to The Regents of The University of California, a corporation of California

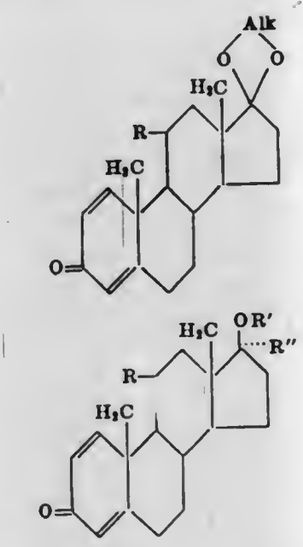
No Drawing. Filed Sept. 18, 1964, Ser. No. 397,602

12 Claims. (Cl. 260—239.55)

1. A process for oxygenating an organic compound selected from the group consisting of compounds containing at least 1 carbon-carbon double bond with a total of 3 to 4 organic electron-donating moieties attached to the carbon atoms of said double bond, compounds with at least 2 conjugated carbon-carbon double bonds in cisoid configuration, and polycyclic aromatic compounds with at least 3 linearly-fused aromatic rings, which comprises mixing said organic compound, hydrogen peroxide, and a positive halogen compound, and subsequently isolating an organic product containing additional chemically-bonded oxygen.

3,274,182

PROCESS FOR REDUCING 19-METHYL-1,4-DIEN-3-ONES TO CORRESPONDING 19-NOR-3-OXY-1,3,5(10)-TRIENES



Hugh L. Dryden, Jr., Deerfield, and Gayle M. Webber, Evanston, Ill., assignors to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Filed Dec. 24, 1964, Ser. No. 421,095

Claims priority, application Canada, Dec. 28, 1963, 892,254

20 Claims. (Cl. 260—239.55)

1. In a process for converting a steroidal 19-methyl-1, and dried in air to afford 3,11β-dihydroxyestra-1,3,5(10)-triene, the step which consists of contacting a member of the group consisting of compounds of the formulas

androsta-1,4-diene-3,-17-dione 17-17-dimethyl ketal, 11β-hydroxyandrosta-1,4-diene - 3,17 - dione 17,17 - dimethyl ketal, and 22α-spirosta-1,4-dien-3-one with a member of the group consisting of alkali metals and mixtures thereof in the presence of a solvent and a radical anion precursor, said solvent being a member of the group consisting of lower aliphatic ethers, fully alkylated polyhydric alcohols, acetals, cyclic ethers, tertiary amines, and benzene, said radical anion precursor being a member of the group consisting of biphenyl, naphthalene, methylnaphthalene, dimethylnaphthalene, phenanthrene, terphenyl, anthracene, acenaphthene, fluoranthene, dibenzofuran, and benzophenone, Alk in the first formula being an alkylene radial containing more than 1 and fewer than 6 carbon atoms and R therein being a member of the group consisting of hydrogen and hydroxyl and, in the second formula, R being defined as before, R' being a member of the group consisting of hydrogen and a tetrahydropyranyl radical, and R'' being a member of the group consisting of hydrogen and a lower alkyl radical containing fewer than 3 carbon atoms.

20. The process of converting 22α-spirosta-1,4-dien-3-one to the corresponding 19-nor-3-oxy-22α-spirosta-1,3,5(10)-triene which comprises heating a solution of said 22α-spirosta-1,4-dien-3-one in an inert solvent under nitrogen with a mixture of diphenylmethane and a continuous excess of the radical anion solution obtained by heating lithium with biphenyl in the presence of tetrahydrofuran under nitrogen.

3,274,183

3-(17β-HYDROXY-1,4-DIMETHYLESTRA-1,3,5(10)-TRIEN - 17α - YL)PROPIONIC ACID LACTONE AND INTERMEDIATES

Leland J. Chinn, Morton Grove, Ill., assignor to G. D. Searle & Co., Chicago, Ill., a corporation of Delaware

No Drawing. Filed Nov. 23, 1964, Ser. No. 413,297

5 Claims. (Cl. 260—239.57)

1. 3 - (17β-hydroxy-1,4-dimethylestra-1,3,5(10)-trien-17α-yl)propionic acid lactone.

3,274,184

METHOD FOR THE PREPARATION OF 2-STYRYLOXAZOLE COMPOUNDS

Harold Godfred Thompson, Whitehouse Station, N.J., and Martin Barry Bochner, Vienna, W. Va., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Nov. 30, 1964, Ser. No. 414,883

17 Claims. (Cl. 260—240)

1. A method for preparing a 2-styryloxazole compound which comprises the steps of:

(1) forming a reaction mixture comprising (a) a 2-methyloxazole compound selected from the group consisting of substituted and unsubstituted 2-methylbenzoxazoles and substituted and unsubstituted 2-methylnaphthoxazoles, the substituents of said substituted oxazoles being selected from the group consisting of lower alkyl, lower alkoxy, hydroxy, carboxy, cyano, nitro and halogen radicals, (b) an aryl aldehyde selected from the group consisting of substituted and unsubstituted benzene aldehydes and substituted and unsubstituted naphthalene aldehydes, the substituents of said substituted aldehydes being selected from the group consisting of lower alkyl, lower alkoxy, hydroxy, carboxy, cyano, nitro and halogen radicals, (c) a sulfonic acid, (d) a di(lower alkyl) derivative of an alkanoyl amide selected from formamide and acetamide and (e) an inert solvent; the proportions of 2-methyloxazole and aryl aldehyde employed being from substantially stoichiometric proportions to a small excess of the aldehyde and the proportions of the sulfonic acid and alkanoyl amide derivative being, respectively, from about 0.05 to about 2 moles and from about 0.5 to about 5 moles, per mole of the 2-methyloxazole;

(2) heating the reaction mixture at reflux temperature to effect the condensation of the 2-methyloxazole with the aryl aldehyde;

(3) removing water of condensation from the reaction mixture, and

(4) recovering the 2-styryloxazole product from the reaction mixture.

3,274,185

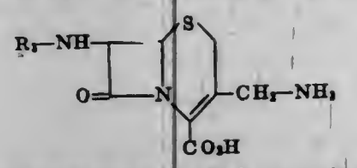
PHTHALAZINE DERIVATIVES

Max V. Sigal, Jr., Gayton, England, Paolo Marchini, Charlottesville, Va., and Buford L. Poet, Bristol, Tenn., assignors to The S. E. Massengill Company, Bristol, Tenn.

No Drawing. Original application Oct. 8, 1963, Ser. No. 314,640. Divided and this application May 3, 1965, Ser. No. 462,162

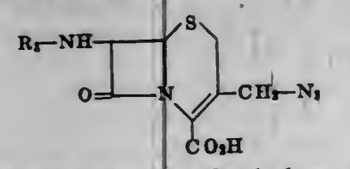
6 Claims. (Cl. 260—240)

3. 6,7-dimethoxy-1,4-dihydroxy phthalazine.



6. 1-(3',4',5' - trimethoxybenzylidene) - 2-(3'',4''-dimethoxybenzyl)phthalazinyl hydrazine.

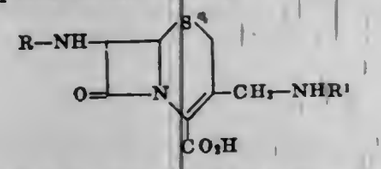
3,274,186
DERIVATIVES OF CEPHALOSPORIN C AND THEIR SYNTHESIS



Michael Derek Barker, Barnet, and Gordon Alan Somerfield, Beaconsfield, England, assignors to Glaxo Laboratories Limited, Greenford, England, a British company

No Drawing. Filed July 5, 1963, Ser. No. 293,171
Claims priority, application Great Britain, July 11, 1962, 26,675/62
19 Claims. (Cl. 260—243)

1. A process for producing a compound selected from the group consisting of compounds of the formula:



in which R^3 is carboxylic acyl which comprises the step of reducing a compound selected from the group consisting of compounds of the formula:

wherein R^3 has the meaning defined above, by catalytic hydrogenation using a precious metal catalyst selected from the group consisting of platinum and palladium.

5. A compound of the formula

and salts thereof in which R is selected from the group consisting of

(a) $R^2(CH_2)_nCO$— where R^2 is phenyl, nitrophenyl, chlorophenyl, bromophenyl, lower alkyl phenyl, lower alkoxy phenyl, cycloalkyl or thienyl, and *n* is an integer from 1 to 4,

(b) R^3CO— where R^3 contains from 2 to 7 carbon atoms and is alkyl, alkylthioalkyl or alkoxyalkyl,

(c) R^4CO— where R^4 contains from 2 to 7 carbon atoms and is alkenyl, alkylthioalkenyl, alkenylthioalkyl, alkoxyalkenyl or alkenyloxyalkyl,

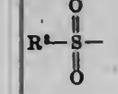
(d) $R^2X(CH_2)_nCO$— where R_2 and *n* are as defined above and X is oxygen or sulphur,

(e) $R^2(CH_2)_nS(CH_2)_m CH_2CO$— where R_2 and *n* are as defined above and *m* is 0 or an integer from 1 to 4, and

(f) R^2CO— where R^2 is as defined above,

and in which R^1 is hydrogen or an acyl group selected from the group consisting of

(g) $R^5(CH_2)_nCO$— where R_5 is the same as R^2 or lower alkyl pyridyl,



(h) R^6CO— where R^6 is the same as R^3 or hydrogen,

(i) R^4CO— where R^4 is as defined above,

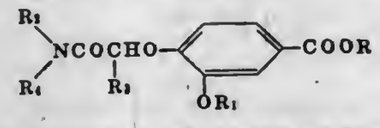
(j) $R^2X(CH_2)_nCO$— where R^2, *n* and X are as defined above,

(k) $R_2(CH_2)_nS(CH_2)_mCH_2CO$— where R_2, *n* and *m* are as defined above,

(l) R^7CO— where R^7 is the same as R^2, nicotinyl, isonicotinyl, quinaldinyl, quinoline-8-carbonyl, benzyloxy or lower alkoxy, and

(m) 

where R^8 is lower alkyl phenyl, lower alkyl, phenyl or pyridyl,



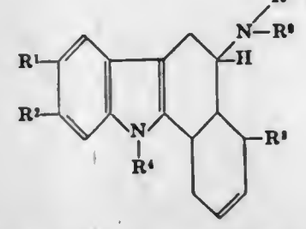
or is —CXNHR^9 where X is as defined above and R^9 is phenyl, cycloalkyl, lower alkoxy phenyl, lower alkenyl or lower alkyl.

3,274,187
3-ALKOXY-4-[α(N-SUBSTITUTED-CARBAMYL)-ALKOXY]-BENZOIC ACID ESTERS

Rudolf Hiltmann, Hartmund Wollweber, Friedrich Hoffmeister, and Wolfgang Wirth, Wuppertal-Elberfeld, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a corporation of Germany

No Drawing. Filed Dec. 19, 1962, Ser. No. 245,658
Claims priority, application Germany, Dec. 21, 1961, F 35,614
14 Claims. (Cl. 260—247.2)

1. A chemical compound of the formula:



wherein R is lower alkyl; R_1 is selected from the group consisting of methyl and ethyl; R_2 is selected from the group of hydrogen, methyl and ethyl; R_3 is selected from the group consisting of hydrogen and lower alkyl; R_4 is lower alkyl; and R_3 and R_4 when joined with the nitrogen atom form a heterocyclic member selected from the group consisting of pyrrolidino, piperidino, morpholino, 2-oxopyrrolidino, and 2-oxopiperidino.

3,274,188
5-AMINOBENZOCARBAZOLES

Stephen Sallay, Wynnewood, Montgomery, Pa., assignor to American Home Products Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed Mar. 23, 1964, Ser. No. 354,092
9 Claims. (Cl. 260—247.5)

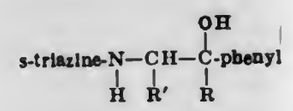
1. A compound selected from the group consisting of (1) a compound having the formula:

wherein R^1 and R^2 are selected from the group consisting of hydrogen, lower alkyl and lower alkoxy; R_3 is selected from the group consisting of hydrogen, lower alkyl and lower alkoxy; R^4 is selected from the group consisting of hydrogen, lower alkyl and benzyl; and R^5 and R^6 are selected from the group consisting of hydrogen, lower alkyl, dimethylaminoethyl and R^5 and R^6 together form a radical selected from the group consisting of morpholino, thiomorpholino, piperidino, piperazino, and pyrrolidino; and (2) the pharmaceutically acceptable, nontoxic acid addition salts thereof.

3,274,189
NOVEL COMPOSITIONS FOR TREATING TEXTILES AND PROCESS FOR MAKING SAME UTILIZING PHOSPHORIC ACID

Louis W. Smith, Danville, Va., assignor to Dan River Mills, Incorporated, Danville, Va., a corporation of Virginia

No Drawing. Filed Apr. 22, 1963, Ser. No. 274,851
3 Claims. (Cl. 260—248)



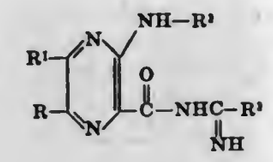
1. Process for making a readily curable, textile crease-proofing composition comprising adding phosphoric acid to 1,3-dimethylol-3,4,5,6-tetrahydro-5(2-hydroxyethyl)-s-triazin-2-one, said phosphoric acid being added in an amount in the range of about 0.04 to about 0.2 mol of phosphoric acid per mol of said 1,3-dimethylol-3,4,5,6-tetrahydra-5(2-hydroxyethyl)-s-triazin-2-one, thus forming said composition.

3,274,190
β-HYDROXYPHENETHYL-AMINO-s-TRIAZINE

Allan Poe Gray and Donald Elmer Heitmeier, Decatur, Ill., assignors to Neisler Laboratories, Inc., Decatur, Ill., a corporation of Delaware

No Drawing. Original application Oct. 30, 1961, Ser. No. 148,716, now Patent No. 3,192,216, dated June 29, 1965. Divided and this application May 12, 1965, Ser. No. 458,514
3 Claims. (Cl. 260—249.5)

1. A chemical compound having the formula



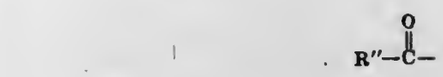
wherein s-triazine is the s-triazine ring attached to the β-hydroxyphenethylamino moiety by a ring carbon atom, the substituents on the s-triazine and phenyl rings being selected from the group consisting of hydrogen, and not more than one halo, lower-alkyl, lower alkoxy, methylenedioxy, amino, nitro, trihalomethyl, hydroxy, mercapto, lower-alkylthio and carboxy, R is selected from the group consisting of hydrogen, lower-alkyl, benzyl and phenyl and R′ is selected from the group consisting of hydrogen and methyl.

3,274,191
N-(3-AMINOPYRAZINOYL) BENZAMIDINES AND PROCESS FOR PREPARING

Edward J. Cragoe, Jr., and John B. Bicking, Lansdale, Pa., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Nov. 15, 1963, Ser. No. 323,886
14 Claims. (Cl. 260—250)

1. A compound selected from the group consisting of a N-(3-aminopyrazinoyl)benzamidine having the structural formula



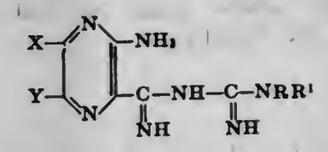
and pharmaceutically acceptable salts thereof wherein

R is selected from the group consisting of hydrogen, halo trifluoromethyl, lower alkyl, and phenyl;

R^1 is selected from the group consisting of hydrogen and lower alkyl;

R^2 is selected from the group consisting of hydrogen and

wherein R″ is selected from the group consisting of lower alkyl and phenyl;



R^3 is selected from the group consisting of phenyl and halophenyl.

3,274,192
DERIVATIVES OF PYRAZINE AND A METHOD FOR THEIR PREPARATION

Edward J. Cragoe, Jr., Lansdale, and James H. Jones, Blue Bell, Pa., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Oct. 4, 1965, Ser. No. 492,868
17 Claims. (Cl. 260—250)

7. (3 - amino-5-X-6-Y-pyrazinimidoyl) guanidine compounds having the structural formula

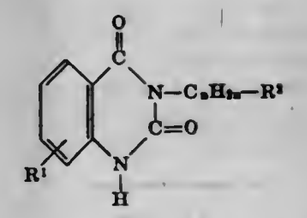
wherein X is selected from the group consisting of hydrogen, amino, mono-lower aliphaticamino and di-lower-aliphaticamino; Y is selected from hydrogen, chloro, bromo and iodo; and R and R^1 separately are selected from the group consisting of hydrogen, lower alkyl, hydroxy-lower alkyl, and phenyl-lower alkyl.

3,274,193
PURIN-6-YLTRIMETHYLAMMONIUM CHLORIDE AND PROCESSES OF MAKING IT

Jerome P. Horwitz, Oak Park, and Vainutis Vaitkevicius, Inkster, Mich., assignors to the United States of America as represented by the Secretary of Health, Education, and Welfare

Filed Nov. 26, 1962, Ser. No. 239,944
3 Claims. (Cl. 260—254)

1. Purin-6-yltrimethylammonium chloride.



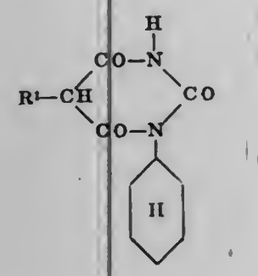
2. In a process for synthesizing purin-6-yltrimethylammonium chloride, the steps of preparing a solution of 6-chloropurine in N,N-dimethylformamide, bubbling trimethylamine through this solution, cooling the solution at room temperature, removing the solid precipitate from the cooled solution and then washing the removed precipitate with N,N-dimethylformamide and then with ether.

3,274,194
QUINAZOLINEDIONE DERIVATIVES

Shin Hayao, Elkhart, Ind., assignor to Miles Laboratories, Inc., Elkhart, Ind., a corporation of Indiana

No Drawing. Filed Mar. 29, 1963, Ser. No. 269,168
6 Claims. (Cl. 260—256.4)

1. A compound selected from the group consisting of a compound of the formula



wherein R_1 is a member selected from the group consisting of hydrogen, chloro, nitro and lower alkanoyl amino; *n* is a number from 0 to 6 inclusive; and R_2 is a member selected from the group consisting of piperazyl, 4-phenyl-1-piperazyl; 4-(chlorophenyl)-1 piperazyl; 4-phenyl lower alkyl -1-piperazyl; pyridyl; 1-piperidyl; 4-phenyl-1-piperidyl; piperazinium methosulfate; 4-phenyl piperazinium methosulfate; 4-phenyl-1 lower alkyl-1-piperazinium methosulfate; 4-chlorophenyl-1 lower alkyl-1-piperazinium; morpholino; 2,3,4,5-tetrahydro 1,4(1H)benzodiazepin-4-yl; and 2,3,4,5-tetrahydro-1 lower alkyl-1, 4(1H)benzodiazepin-4-yl; and pharmacologically acceptable acid additions salts thereof.

3,274,195
BARBITURIC ACID DERIVATIVES

Shigeo Senda, Gifu, Hajime Fujimura, Kyoto, and Hiroshi Izumi, Gifu, Japan, assignors to Takeda Chemical Industries, Ltd., Osaka, Japan

No Drawing. Filed June 18, 1964, Ser. No. 376,219
Claims priority, application Japan, Oct. 5, 1961, 36/36,324; Apr. 26, 1962, 37/17,087; July 26, 1962, 37/31,819
13 Claims. (Cl. 260—257)

1. A member selected from the class consisting of compounds of the formula

wherein R^1 stands for a hydrocarbon residue having up to six carbon atoms, their alkali metal salts and their alkaline earth metal salts.

3,274,196
PROCESS FOR THE PREPARATION OF 5-HALO-3,6-DISUBSTITUTED URACILS

Wallace W. Thompson, Wilmington, and Rollin H. Wallick, Claymont, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Apr. 22, 1963, Ser. No. 274,802
1 Claim. (Cl. 260—260)

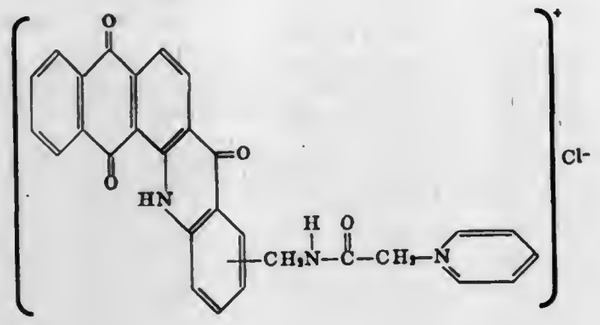
A process for the preparation of 5-halo-3,6-disubstituted uracils, said process comprising the steps of

(a) heating a 3,6-disubstituted uracil in an aqueous medium to a temperature of from 60° C. to 110° C. in a liquid medium;
(b) continuously adding a halogen selected from the group consisting of chlorine and bromine to said liquid medium, at said temperature;
(c) measuring the oxidation-reduction potential of the reaction mass during said addition of halogen;
(d) ceasing the addition of halogen when a rapid change occurs in the oxidation-reduction potential of the reduction mass;
(e) cooling the resulting reaction mass; and
(f) recovering the resulting solid 5-halo-3,6-disubstituted uracil from the reaction mass.

3,274,197
SULFO PHTHALOYLACRIDONES

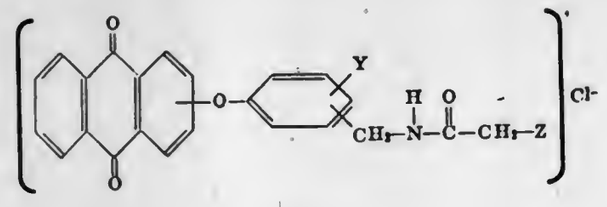
Kurt Weber and Max Staeuble, Basel, Paul Hugelshofer, Otelfingen, Zurich, and Istvan Hari, Basel, Switzerland, assignors to Ciba Limited, Basel, Switzerland, a Swiss company

No Drawing. Filed Nov. 28, 1961, Ser. No. 155,464
Claims priority, application Switzerland, Nov. 29, 1960, 13,356; Jan. 30, 1961, 1,065; Nov. 1, 1961, 12,649
4 Claims. (Cl. 260—276)



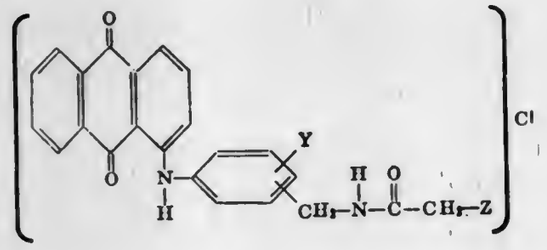
2. α-Sulfothenoylamino phthaloylacridone whose amine group bears the sulfothiophene carboxylic acid bound to the nitrogen atom of the amino group through its —CO— group.

3,274,198
QUATERNARY ANTHRAQUINONE DYESTUFFS



Melvin N. Turetzky, Wayne, N.J., assignor to General Aniline & Film Corporation, New York, N.Y., a corporation of Delaware

No Drawing. Filed June 14, 1963, Ser. No. 287,770
9 Claims. (Cl. 260—276)



4. The quaternary of the formula:

9. The quaternary compounds selected from the formulae:

and

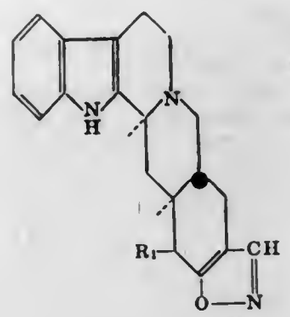
wherein Y represents a member selected from the group consisting of hydrogen and an electron donor selected from the group consisting of methyl, methoxy and methylthio and Z represents a quaternary nitrogen group.

3,274,199
QUATERNARY AMMONIUM SALTS OF HIGHER ALPHA-SULFO FATTY ACIDS

Reginald L. Wakeman, Philadelphia, Pa., and Joseph F. Coates, Washington, D.C., assignors, by mesne assignments, to Millmaster Onyx Corporation, New York, N.Y., a corporation of New York

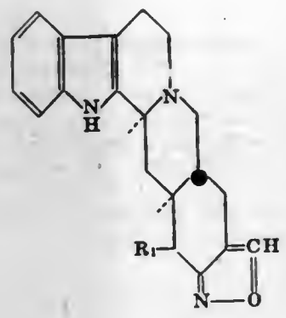
No Drawing. Filed Mar. 17, 1964, Ser. No. 352,664
4 Claims. (Cl. 260—286)

3. Di(lauryl isoquinolinium) alpha-sulfo-stearate.



4. The salt of an alkyl quaternary ammonium compound and an alpha-sulfo-fatty acid selected from the group consisting of alpha-sulfo-decanoic acid, alpha-sulfo-octanoic acid, alpha-sulfo-lauric acid, alpha-sulfo-myristic acid, alpha-sulfo-palmitic acid, alpha-sulfo-stearic acid, alpha-sulfo-arachidic acid, and alpha-sulfo-behenic acid said alkyl quaternary ammonium compound having a phenol coefficient of at least 100 with respect to both *Staphylococcus aureus* and *Salmonella typhosa* at 20° C. and having at least one alkyl having 8 to 22 carbon atoms.

3,274,200
YOHIMBANOISOXAZOLES



John Shavel, Jr., Mendham, and Maximilian Von Strandtmann, Rockaway Township, N.J., assignors to Warner-Lambert Pharmaceutical Company, Morris Plains, N.J., a corporation of Delaware

No Drawing. Filed Oct. 24, 1961, Ser. No. 147,172
5 Claims. (Cl. 260—288)

1. A member selected from the group consisting of compounds of the formulas:

and

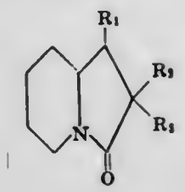
and mixtures thereof wherein R_1 is a member selected from the group consisting of hydrogen and methyl, and the pharmaceutically acceptable nontoxic acid addition salts selected from the group consisting of maleate, fumarate, benzoate, succinate, methyl-sulfonate, sulfonate, citrate, tartrate, salicylate, malate, cinnamate, hydrochloride, hydrobromide, phosphate, methyliodide, ethylbromide, n-hexylbromide, benzylchloride, methylsulfate, ethylsulfate and methyl p-toluene sulfonate.

3,274,201
2-LOWER ALKYL 1,2,3,4,4a,9a-HEXAHYDRO-9H-INDENO[2,1-c]PYRIDINES

Marshall D. Draper, Woodland Hills, Calif., assignor to Rexall Drug and Chemical Company, Los Angeles, Calif., a corporation of Delaware

No Drawing. Filed Aug. 12, 1965, Ser. No. 479,290
9 Claims. (Cl. 260—290)

1. 2 - lower alkyl - 4a-phenyl-1,2,3,4,4a,9a-hexahydro-9H-indeno[2,1-c]pyridine.



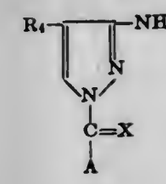
8. 3 - benzyl-1-methyl-4-phenyl-1,2,5,6-tetrahydropyridine.

3,274,202
CERTAIN OCTOHYDRO-3-OXO-INDOLIZINES

Richard Joseph Mohrbacher, Fort Washington, Pa., assignor to McNeil Laboratories, Incorporated, a corporation of Pennsylvania

No Drawing. Filed Apr. 2, 1963, Ser. No. 269,879
7 Claims. (Cl. 260—294)

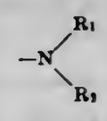
1. A compound having the formula



wherein R_1 is a member selected from the group consisting of hydrogen and phenyl, R_2 is a member selected from the group consisting of hydrogen and benzyl and R_3 is a member selected from the group consisting of hydrogen, carboxyl and lower alkoxycarbonyl, with the proviso that when one of R_1 and R_2 is hydrogen, the other substituent is a group other than hydrogen.

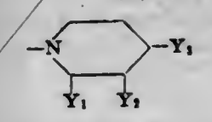
3,274,203
1-CARBAMYL AND THIOCARBAMYL-3-AMINO-4-NONSUBSTITUTED AND SUBSTITUTED PYRAZOLES

Clifford L. Dickinson, Jr., Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware



No Drawing. Filed May 31, 1963, Ser. No. 284,323
19 Claims. (Cl. 260—294)

1. A compound selected from compounds of the formula



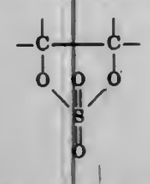
where

X is selected from the group consisting of oxygen and sulfur;
A is selected from the group consisting of

wherein R_1 is methyl; and R_2 is selected from the group consisting of alkyl of 1 through 6 carbons where the alkyl is joined to the carbamyl nitrogen by a carbon selected from the group consisting of a primary and a secondary carbon of said alkyl; alken-2-yl of 3 through 6 carbons where the alken-2-yl is joined to the carbamyl nitrogen by a carbon selected from the group consisting of a primary and a secondary carbon of said alken-2-yl; alkoxyalkyl of 2 through 6 total carbons; dimethylamino; and dialkylaminoalkyl where each of the alkyl groups in the dialkyl portion has 1 through 2 carbons and the remaining alkyl group has 1 through 4 carbons with a total of 3 through 7 in said dialkylaminoalkyl group;

morpholino;
pyrrolidino;
piperidino;
dehydropiperidino;
azabicyclononidino; and
a substituted piperidino group of the structure

wherein Y_1 is selected from the group consisting of hydrogen and methyl, Y_2 is selected from the group consisting of hydrogen, methyl, ethyl and —$COOR_5$ where R_5 is alkyl of 1 through 4 carbons; and Y_3 is selected from the group consisting of hydrogen, alkyl of 1 through 6 carbons, hydroxyalkyl of 2 through 6 carbons, trifluoromethyl, —$COOR_6$ where R_6 is alkyl of 1 through 4 carbons, dialkylaminoalkyl of 3 through 7 carbons where each of the alkyl groups in the dialkyl portion has 1 through 2 carbons and the remaining alkyl group has 1 through 4 carbons, pyrrolidinomethyl, and hydrocarbon aralkyl of 7 through 9 carbons;
R_3 is selected from the group consisting of hydrogen, formyl, acetyl, propionyl; and
R_4 is selected from the group consisting of hydrogen, chlorine, bromine, fluorine, alkyl of 1 through 3 carbons, and trifluoromethyl.



8. 1-N-(4 - methylpiperidino)carbonyl-3(5)-formamido-4-chloropyrazole.

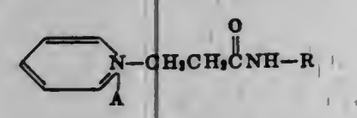
3,274,204
PREPARATION OF SULFATO-BETAINE-TYPE COMPOUNDS

Donald L. Klass, Barrington, and Vincent Brozowski, Mundelein, Ill., assignors, by mesne assignments, to The Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed Aug. 1, 1960, Ser. No. 46,362
12 Claims. (Cl. 260—294.8)

1. A method of preparing inner salts comprising reacting an oxirane containing 2–60 carbon atoms with sulfur trioxide to form a cyclic sulfate ester of the formula

in which the unsatisfied valences of the carbon atoms are connected to a material selected from the group consisting of hydrogen and hydrocarbon radicals, and reacting the resulting ester with a tertiary amine.



2. A method in accordance with claim 1 in which the ester is ethylene sulfate and in which the tertiary amine is pyridine.

3,274,205
QUATERNARY AMMONIUM DERIVATIVES OF N-ALKYLCARBAMOYLETHYL COMPOUNDS

Norbert M. Bikales, Livingston, N.J., assignor to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed Sept. 28, 1964, Ser. No. 399,913
2 Claims. (Cl. 260—295)

1. A quaternary ammonium compound of the formula:

wherein R is the residue of an olefin having from about 6 to 40 carbon atoms and A is an anion.

3,274,206
PROCESS FOR THE PRODUCTION OF PYRIDINE ALDEHYDES

Godfrey Wilbert, Carmel, Louis Scarano, Middletown, and Bernard F. Duesel, Yonkers, N.Y., assignors to Nepera Chemical Co., Inc.

No Drawing. Filed Mar. 6, 1964, Ser. No. 350,099
9 Claims. (Cl. 260—297)

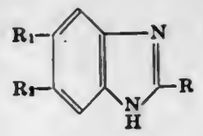
1. A method for the preparation of pyridine aldehydes which comprises, subjecting the corresponding nitrile maintained in an aqueous acid reaction medium containing a hydrogenation catalyst selected from the group consisting of palladium and platinum dioxide, to controlled hydrogenation by the action of an approximately equal molar amount of molecular hydrogen based on the quantity of said nitrile, wherein the reaction temperature is less than about 70° C.

3,274,207
PROCESSES FOR PREPARING THIAZOLE CARBOXYLIC ACIDS

Janos Kollonitsch, Westfield, N.J., assignor to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

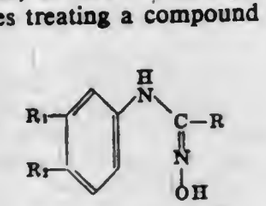
No Drawing. Filed Oct. 2, 1961, Ser. No. 142,000
7 Claims. (Cl. 260—302)

1. The method for producing a thiazole carboxylic acid from the corresponding halomethylthiazole which comprises treating a monohalomethylthiazole with an acid selected from the group consisting of sulfuric acid, phosphoric acid, hydrochloric acid and hydrobromic acid in an aqueous medium, wherein the amount of acid used when the halogen acids are employed is less than 4 moles per mole of said thiazole, to form a hydroxymethylthiazole, and contacting said hydroxymethylthiazole with a mixture of nitric acid and sulfuric acid.



7. The method for producing a thiazole-carboxylic acid which comprises contacting a compound selected from the group consisting of hydroxymethylthiazoles, and thiazole-aldehydes with a mixture of nitric acid and sulfuric acid.

3,274,208
PROCESSES FOR PREPARING 2-THIAZOLYL-BENZIMIDAZOLE COMPOUNDS

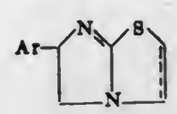


Robert E. Jones, North Muskegon, Mich., and George Gal, Summit, N.J., assignors to Merck & Co., Inc., Rahway, N.J., a corporation of New Jersey

No Drawing. Filed Aug. 30, 1965, Ser. No. 483,874
3 Claims. (Cl. 260—302)

1. The process for making a 2-substituted benzimidazole of the formula

where R is a thiazolyl, thiadiazolyl or isothiazolyl ring, the point of attachment of said ring to the benzimidazole nucleus being at a carbon atom of said heterocyclic ring, and R_1 and R_2 are hydrogen, loweralkyl, loweralkoxy, loweralkylthio, phenoxy, phenylthio, halo, phenyl, halophenyl or thienyl, provided that when both R_1 and R_2 are other than halo, at least one of R_1 and R_2 is hydrogen, that comprises treating a compound of the formula



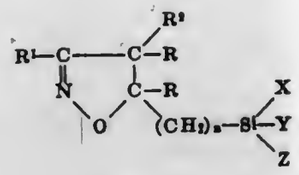
where R, R_1 and R_2 are as defined above, with an alkyl or aryl sulfonyl halide in the presence of a base.

3,274,209
CERTAIN 6-SUBSTITUTED-IMIDAZO [2,1-b] THIAZOLE COMPOUNDS

Alfons Herman Margaretha Raeymaekers, Beerse, near Turnhout, Denis Cyriel Irene Corneel Thienpont, Antwerp, and Paul Joseph Alfred Walter Demoen, Vosselaar, near Turnhout, Belgium, assignors to Janssen Pharmaceutica N.V., a corporation of Belgium

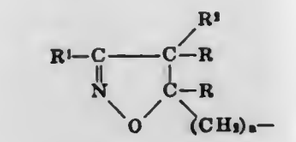
No Drawing. Filed Apr. 7, 1965, Ser. No. 446,408
10 Claims. (Cl. 260—306.7)

1. An imidazo [2,1-b] thiazole selected from the group consisting of



and the therapeutically acceptable acid addition salts thereof, wherein the dotted line between the 2- and 3-positions of the imidazo [2,1-b] thiazole nucleus represents an optional bond and Ar is a member selected from the group consisting of thenyl, furyl, phenyl, halophenyl, nitrophenyl aminophenyl, trifluoromethylphenyl, naphthyl and benzyl, provided that, when said Ar is benzyl, a saturated bond exists between the 2- and 3-positions of the imidazo [2,1-b] thiazole nuclus.

3,274,210
NEW SILICON-CONTAINING ISOXAZOLES AND ISOXAZOLINES



Christian Henri Yves Fritsch and Marcel Joseph Celestin Lefort, Lyon, France, assignors to Rhone-Poulenc S.A., Paris, France, a French body corporate

No Drawing. Filed July 20, 1964, Ser. No. 383,928
Claims priority, application France, July 24, 1963, 942,515; Nov. 8, 1963, 953,193
16 Claims. (Cl. 260—307)

1. A compound of the formula:

in which the R substituents when taken separately represent hydrogen atoms and when taken together represent a single bond, R^1 is a member selected from the class consisting of phenyl and lower alkyl, R^2 is a member selected from the class consisting of hydrogen and tri (lower alkyl)silyl, *n* is an integer at least 0 and at most 1, and X, Y, and Z are each members selected from the class consisting of lower alkyl, lower alkoxy, lower alkanoyloxy, and chloro, and when R^2 is hydrogen, in the case of X, a radical of formula:

3,274,211
N-ALKYLATION OF AMIDES AND IMIDES

Louis Schmerling, Riverside, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

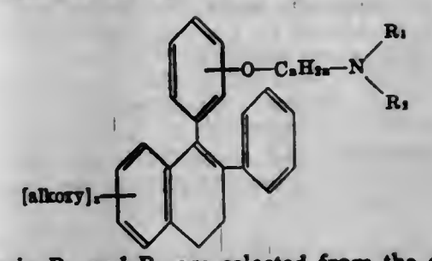
No Drawing. Filed Feb. 4, 1964, Ser. No. 342,549
9 Claims. (Cl. 260—326)

1. A process for the N-alkylation of a compound selected from the group consisting of amides and imides containing only the one functional group and having a hydrogen atom attached to the nitrogen atom which comprises reacting said compound with a carbonyl compound selected from the group consisting of aldehydes and ketones in which carbonyl is the only functional group at a hydrogen pressure of from about atmospheric to about 100 atmospheres and at a temperature of from about 60° C. to about 250° C. under acidic reaction conditions and in the presence of a platinum catalyst.

3,274,212
1,3-DIALKYLPROLINES

Barney J. Magerlein, Portage, and Robert D. Birkenmeyer, Comstock Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Filed June 15, 1964, Ser. No. 375,301
4 Claims. (Cl. 260—326.3)



1. N - acetyl-2,2-dicarboethoxy-3-propyl-5-hydroxypyrrolidine.

3,274,213
ALKOXY-SUBSTITUTED 2-PHENYL-1-(TERTIARY-AMINOALKOXY)PHENYL-3,4-DIHYDRONAPHTHALENES

Daniel Lednicer, Portage Township, Kalamazoo County, Mich., assignor to The Upjohn Company, Kalamazoo, Mich., a corporation of Delaware

No Drawing. Original application Sept. 5, 1961, Ser. No. 135,767. Divided and this application July 23, 1963, Ser. No. 296,939
8 Claims. (Cl. 260—326.5)

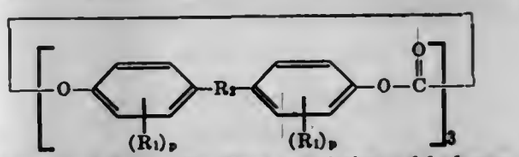
1. A compound selected from the class consisting of (a) compounds having the formula:

wherein R_1 and R_7 are selected from the class consisting of lower-alkyl from 1 to 8 carbon atoms, inclusive, and together with the nitrogen atom, a member selected from the class consisting of pyrrolidino, 2-methylpyrrolidino, 2,2-dimethylpyrrolidino, piperazino, 4-methylpiperazino, 2,4-dimethylpiperazino, morpholino, piperidino, 2-methylpiperidino, 3-methylpiperidino, hexamethyleneimino, homopiperazino and homomorpholino, C_nH_{2n} represents alkylene from 2 to 6 carbon atoms, inclusive, alkoxy has from 1 to 8 carbon atoms, inclusive, and *x* is an integer from 1 to 4, inclusive;

(b) the nontoxic pharmacologically acceptable acid addition salts of compounds of the above formula;

(c) the N-oxides of compounds of the above formula;

(d) the nontoxic pharmacologically acceptable acid addition salts of N-oxides of compounds of the above formula; and



(e) quaternary ammonium salts of compounds of the above formula, selected from the class consisting of lower-alkyl quaternary ammonium halides, lower-alkenyl quaternary ammonium halides, lower-alkyl quaternary ammonium sulfates, aralkyl quaternary ammonium halides, and lower-alkyl quaternary arylsulfonates.

3,274,214
AROMATIC CARBONATES

Robert J. Prochaska, Stockbridge, Mass., assignor to General Electric Company, a corporation of New York

No Drawing. Filed Dec. 26, 1962, Ser. No. 247,292
4 Claims. (Cl. 260—340.2)

1. A cyclic aromatic carbonate polymer having the structure

where

R_1 is selected from the class consisting of halogen and alkyl;

R_2 is an alkylidene group; and

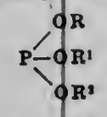
p is a whole number from 0 to 2.

3,274,215
MONOALKYL ADIPATE-4-LACTONES BY ALCOHOLYSIS OF 1,4-DICYANOBUTENE-1

Norman Eugene West, Vienna, W. Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

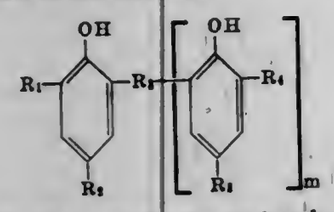
No Drawing. Filed Aug. 9, 1963, Ser. No. 301,175
8 Claims. (Cl. 260—343.6)

1. A process for the preparation of a monoalkyl



adipate-4-lactone, in which the alkyl group contains from one to four carbon atoms, by admixing 1,4-dicyanobutene-1 with a mixture of an excess, based on 1,4-dicyanobutene-1, of an alkanol containing from one to four carbon atoms, of water, and of sulfuric acid and heating the agitated mixture under reflux at a temperature above 100° C. until substantially all of the 1,4-dicyanobutene-1 has been consumed.

3,274,216
STABILIZATION OF LACTONES

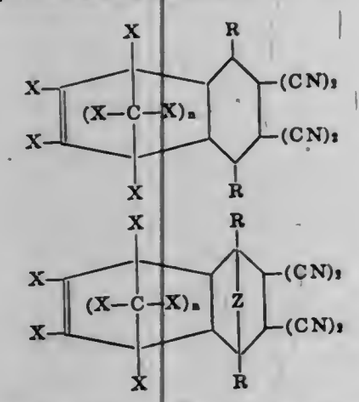


William F. Goldsmith, South Charleston, and David F. Marples, St. Albans, W. Va., assignors to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Oct. 2, 1963, Ser. No. 313,188
7 Claims. (Cl. 260—343)

1. A stabilized composition of matter comprising an epsilon-caprolactone and, incorporated therein, a stabilizing amount of a triorgano phosphite of the formula

wherein R, R^1 and R^2 are each selected from the group consisting of alkyl, cycloalkyl, aryl, aralkyl, and alkaryl, each containing up to about 18 carbon atoms and an alkylated phenol of the formula



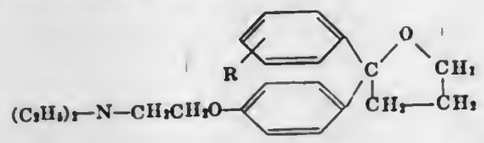
wherein R_1, R_2, R_4, and R_5 are each selected from the group consisting of hydrogen, alkyl, cycloalkyl, alkoxy, hydroxy, and hydroxyalkylene, each containing up to about 12 carbon atoms; *m* has a value of from 0 to 1, inclusive; and R_3, depending upon the value of *m*, is selected from the group consisting of hydrogen, alkyl, alkylene, cycloalkyl, cycloalkylene, alkoxy, alkyleneoxy, hydroxy, and oxy, each containing up to about 12 carbon atoms, with the proviso that at least one of the aforementioned R_1 through R_5 must be alkyl or alkoxy.

3,274,217
HALO-SUBSTITUTED TETRACYANOOCTAHYDROALKANONAPHTHALENES

Robert A. Dombro, Chicago, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed May 29, 1963, Ser. No. 284,000
6 Claims. (Cl. 260—346.2)

6. A compound having the formula:



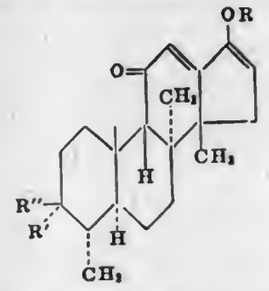
wherein X is hydrogen, chlorine or bromine, at least one X being chlorine or bromine, R is hydrogen, chlorine, bromine or alkyl containing from 1 to about 3 carbon atoms, Z is a member selected from the group consisting of methano, ethano, oxy and thioxy, and *n* is an integer of from 1 to 2.

3,274,218
SUBSTITUTED TETRAHYDROFURANS

James Harold Short, Lake Forest, Ill., assignor to Abbott Laboratories, North Chicago, Ill., a corporation of Illinois

No Drawing. Filed Aug. 20, 1964, Ser. No. 391,037
8 Claims. (Cl. 260—347.7)

1. A compound of the formula



in which R is a member of the group consisting of halogen, loweralkyl and loweralkoxy.

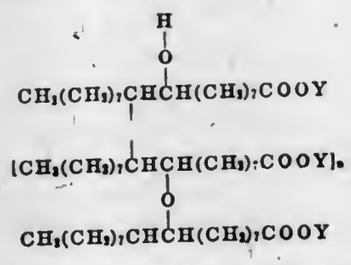
3,274,219
4α,8α,14β-TRIMETHYL-12,16-ANDROSTADIENES

Gerald W. Krakower, Elizabeth, N.J., assignor to Olin Mathieson Chemical Corporation, New York, N.Y., a corporation of Virginia

No Drawing. Filed Sept. 16, 1964, Ser. No. 397,034
3 Claims. (Cl. 260—397.45)

1. A compound of the formula

wherein R is acyl, wherein the acyl radical is of a hydrocarbon carboxylic acid of less than twelve carbon atoms; R'' is hydrogen; R' is acyloxy wherein the acyl radical is of a hydrocarbon carboxylic acid of less than twelve carbon atoms; and together R' and R'' is oxo (O=).



3,274,220
POLYETHER ALCOHOLS, POLYETHER ACIDS AND SALT DERIVATIVES AND METHOD OF PRODUCTION

Walter M. Budde, Minneapolis, Minn., assignor to Archer-Daniels-Midland Company, Minneapolis, Minn., a corporation of Delaware

No Drawing. Filed Nov. 28, 1956, Ser. No. 624,725
14 Claims. (Cl. 260—404.5)

1. Ammonium salts of polymerized epoxy higher fatty acids.

2. The polymer of the structure:

wherein Y is a metal ion and *n* is an integer of from 1 to 12.

9. Polymerized epoxy higher fatty alcohols having poly ether linkages and free alcohol groups.

3,274,221
REACTION PRODUCT AND PROCESS FOR THE PRODUCTION THEREOF

Sol B. Radlove, 5220 W. Van Buren St., Chicago, Ill.

No Drawing. Filed Dec. 15, 1961, Ser. No. 160,421
10 Claims. (Cl. 260—410.9)

1. The method of producing an additive having utility in shortenings which comprises admixing inert hydrocarbon solvent which forms azeotropic mixtures with water at temperatures below 150° C. with an aqueous solution of alkali metal salt of monomeric monohydroxy aliphatic monocarboxylic acid containing 2 to 5 carbon atoms in the aliphatic hydrocarbon group, heating the admixture to remove solvent-water azeotropes until the mixture is substantially dehydrated, mixing substantially dehydrated mixture under substantially anhydrous conditions with a halide of a saturated fatty acid containing 16 to 20 carbon atoms in substantially equimolar proportions, heating such mixture to a temperature in the range between about 100° C. and 200° C. whereby a product with acid number in the range between 161.5 and 168.2 is obtained, removing any solvent remaining in the reaction mixture after completion of reaction heating, and separating the substantially solvent free reaction mixture from alkali metal halide.

3,274,222
LEAD STABILIZERS FOR POLYVINYL CHLORIDE AND POLYVINYL CHLORIDE COPOLYMERS

Alfred Szczepanek, Duren-Rolsdorf, Germany, assignor to Firma Chemische Fabrik Hoesch K.-G.

No Drawing. Filed Dec. 28, 1961, Ser. No. 162,934
Claims priority, application Germany, Jan. 4, 1961, C 23,093
12 Claims. (Cl. 260—414)

1. A lead stabilizer for polyvinyl chloride and copolymers of polyvinyl chloride, obtained by reacting a basic lead salt which, in an aqueous suspension, has a pH value in excess of 6 with p-tert. octyl phenol, p-tert. nonyl phenol, p-tert. dodecyl phenol, o-tert. butyl phenol, 2,4-dibutyl phenol, and p,p'-secondary butylidene diphenol, in an aqueous medium at an elevated temperature.

6. A lead stabilizer according to claim 1, wherein the basic lead salt is a basic lead salt of an organic acid.

11. A lead stabilizer according to claim 1, wherein the basic lead salt is selected from the group consisting of: tetrabasic lead sulfate, tribasic lead sulfate, dibasic lead phosphite, monobasic lead phosphite, basic lead carbonate, dibasic lead stearate, dibasic lead phthalate, monobasic lead stearate, tetrabasic lead salicylate, tribasic lead maleate; and $13PbO \cdot PbSO_4 \cdot 4Pb(C_{17}H_{35}COO)_2$.

3,274,223
ORGANO-TITANIUM-ALUMINUM COMPOUNDS

Darrell C. Feay, Berkeley, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Filed Aug. 8, 1962, Ser. No. 215,529
10 Claims. (Cl. 260—429.5)

1. An organo-titanium-aluminum compound of the class having the general formula

$$(cp)_2Ti[CH_2Al(CH_3)X]_2$$

wherein cp is a cyclopentadienyl moiety selected from the group consisting of cyclopentadienyl and alkylcyclopentadienyl radicals and X is a substituent of the class consisting of halogen and lower alkoxy radicals.

3. A method of making an organo-titanium-aluminum compound by interacting a bis(cyclopentadienyl)titanium (IV) compound and at least one methylaluminum compound of kinds such that, on the basis of one mole of the titanium compound and two moles of the aluminum compound, there are supplied six methyl groups and two X groups in accordance with the relationship

$$(cp)_2TiG_2+Al(CH_3)_2G+Al(CH_3)_2G$$

wherein cp is a cyclopentadienyl moiety selected from the group consisting of cyclopentadienyl and alkylcyclopentadienyl radicals, two of the G's are methyl, the other two G's are X, and X is a substituent of the class consisting of halogen and lower alkoxy radicals, and carrying out the interacting at a reaction temperature not above about 135° C. until about two moles of methane have evolved per mole of starting $(cp)_2TiG_2$ compound.

3,274,224
STABILIZED TETRAETHYL LEAD ANTIKNOCK BLENDS

Herman E. Collier, Jr., Newark, Del., and John D. Sterling, Jr., Wenonah, N.J., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed July 25, 1963, Ser. No. 297,687
3 Claims. (Cl. 260—437)

1. An antiknock blend which consists essentially of
(A) tetraethyl lead,
(B) about 1 to about 2 theories, based on the lead, of a lead scavenger which consists of ethylene dichloride, and
(C) about 0.67% to about 1% by weight, based on the blend, of a turpentine which consists essentially of about 60% to about 80% by weight of alpha-pinene and about 35% to about 2% by weight of beta-pinene, the rest being monocyclic terpene hydrocarbons.

3,274,225
METHOD FOR PRODUCING ORGANIC POLYISOCYANATES SUBSTANTIALLY FREE OF SEDIMENT

James H. Saunders, Bridgeville, Pa., and Eugene L. Powers, New Martinsville, W. Va., assignors to Mobay Chemical Company, Pittsburgh, Pa., a corporation of Delaware

No Drawing. Filed Jan. 4, 1963, Ser. No. 249,331
4 Claims. (Cl. 260—453)

1. A method of producing an aromatic polyisocyanate which is substantially free of sediment which comprises
(a) phosgenating a polyamine obtained by a process which comprises reacting an aromatic amine with a member selected from the group consisting of aldehydes and ketones to prepare an aromatic polyisocyanate,
(b) heating the resulting aromatic polyisocyanate to a temperature of at least about 225° C. for a maximum of about one minute, and
(c) quenching the reaction mixture containing said aromatic polyisocyanate to a temperature below about 50° C. in less than about three minutes.

3,274,226
BIS(ALKOXYISOCYANATOPHENYL)METHANE COMPOUNDS

Frank Long, Trevor, Wrexham, and Ryland James Roberts, Glynceiriog, near Wrexham, Wales, assignors to Monstanto Chemicals Limited, London, England, a British company

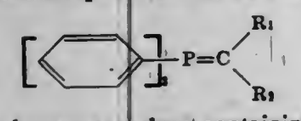
No Drawing. Filed July 30, 1963, Ser. No. 298,569
Claims priority, application Great Britain, Aug. 28, 1962, 32,962/62
4 Claims. (Cl. 260—453)

1. A compound selected from the group consisting of bis(2-alkoxy-5-isocyanatophenyl)methane, bis(2-alkoxy-3-isocyanatophenyl)methane, and bis(3-alkoxy-4-isocyanaotophenyl)methane wherein said alkoxy group has from 2 to 10 carbon atoms.

3,274,227
TRIHALOMETHYLATION OF POLARIZED DOUBLE BONDS

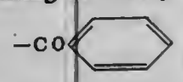
Heinz G. Viehe, Beersel-Linkebeek, Belgium, assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed June 12, 1962, Ser. No. 201,766
10 Claims. (Cl. 260—465)



1. A method for trihalomethylation of an organic compound having at least one polarized double bond, said organic compound being selected from the group consisting of hydrocarbyl aldehydes and ketones, methyl and ethyl esters of α,β-unsaturated hydrocarbyl carboxylic acids, and α,β-unsaturated hydrocarbyl nitriles which comprises contacting a trihalomethane selected from the group consisting of trichloromethane, tribromomethane and triiodomethane with said organic compound in liquid ammonia at a temperature below about −10° C. and in the presence of a strong base in an amount ranging from about 0.01 mole to about 2 moles of said strong base per mole of trihalomethane.

3,274,228
TRIPHENYLPHOSPHINEMETHYLENE COMPOUNDS

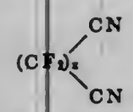


James J. Pappas, Flushing, N.Y., and Edward Gancher, Clifton, N.J., assignors to Interchemical Corporation, New York, N.Y., a corporation of Ohio

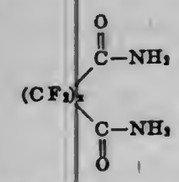
No Drawing. Filed July 29, 1963, Ser. No. 298,396
4 Claims. (Cl. 260—465)

1. The compound represented by the formula

wherein R_1 is a benzene nucleus containing from 1 to 3 nitro groups as substituents and R_2 is a member selected from the group consisting of —CN, $—CO_2CH_3$, and



3,274,229
DEHYDRATION OF PERFLUORINATED AMIDES TO PREPARE A PERFLUORINATED NITRILE

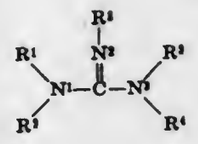


Carl J. Verbanic, Louisville, Ky., assignor to Hooker Chemical Corporation, Niagara Falls, N.Y., a corporation of New York

No Drawing. Filed June 17, 1963, Ser. No. 288,464
10 Claims. (Cl. 260—465.2)

1. A process for preparing a perfluorinated nitrile having the formula

wherein x is an integer from two to four, which comprises reacting with heat the corresponding perfluorinated amide having the formula



wherein x is an integer from two to four with a material selected from the group consisting of benzotrichloride and xylene hexachloride in the presence of a metallic halide Lewis acid catalyst therefor, the reaction with benzotrichloride being conducted at a molar ratio of greater than 3 moles of benzotrichloride per mole of the perfluorinated amide, and the reaction with xylene hexachloride being conducted at a molar ratio of greater than 1.5 moles of xylene hexachloride per mole of the perfluorinated amide.

3,274,230
PENTASUBSTITUTED GUANIDINES CONTAINING CYANO GROUPS

Robert A. Braun, Newark, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Sept. 18, 1962, Ser. No. 224,541
6 Claims. (Cl. 260—465.5)

1. A compound represented by the following structural formula

in which each of:

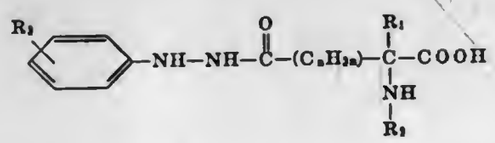
R^1, R^2, R^3 and R^4 are radicals selected from the class consisting of C_1–C_8 alkyl, C_3–C_8 alkenyl and C_1–C_4 alkoxy-C_1–C_4 alkyl; and

R^5 is a member selected from the class consisting of cyanoethyl and cyanovinyl.

3,274,231
COMPOSITIONS AND METHODS OF STABILIZING UNSATURATED ORGANIC NITRILES

Tadahiro Kobayashi, Fuji-shi, Japan, assignor to Asahi Kasei Kogyo Kabushiki Kaisha, Osaka, Japan, a corporation of Japan

No Drawing. Filed June 13, 1963, Ser. No. 287,516
Claims priority, application Japan, Sept. 13, 1962, 37/39,410; Nov. 10, 1962, 37/50,472, 37/50,473; Jan. 30, 1963, 38/3,286; Apr. 10, 1963, 38/17,627
8 Claims. (Cl. 260—465.9)



1. A composition consisting essentially of a nitrile compound selected from the group consisting of acrylonitrile, methacrylonitrile and dimethylacrylonitrile, and 0.5 to 2,000 p.p.m. of at least one stabilizer selected from the group consisting of acetonethiosemicarbazone, acetophenonethiosemicarbazone, acetaldehydethiosemicarbazone, acetylthiosemicarbazide, phenylthiosemicarbazide, formylthiosemicarbazide, carbaminylthiosemicarbazide, thiosemicarbazide, acetonesemicarbazone, acetaldehydesemicarbazone, acetylsemicarbazide, phenylsemicarbazide, iononesemicarbazone and semicarbazide.

3,274,232
ARYLHYDRAZIDES

Jack W. Hinman, Portage, and Ronald B. Kelly, Cooper Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Original application Aug. 4, 1961, Ser. No. 129,222. Divided and this application Dec. 23, 1964, Ser. No. 420,786
4 Claims. (Cl. 260—471)

1. Compounds represented by the formula:

wherein R_3 is selected from the group consisting of hydrogen, methylol, halogen, carboxy, alkyl of 1 to 4 carbon atoms, inclusive, and alkoxy of 1 to 4 carbon atoms, inclusive, R_1 is selected from the group consisting of hydrogen and alkyl of 1 to 4 carbon atoms, inclusive, R_2 is selected from the group consisting of carboallyloxy, carbobenzyloxy and tosyl, and n is an integer from zero to 7, inclusive.

3,274,233
PROCESS OF PREPARATION OF UNSATURATED TRICYCLIC ESTERS

Robert Joly, Montmorency, Julien Warnant, Neuilly-sur-Seine, and Bernard Goffinet, Paris, France, assignors to Roussel-UCLAF, Paris, France, a corporation of France

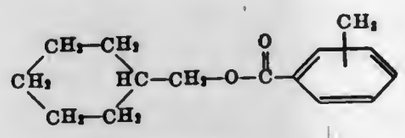
No Drawing. Filed Dec. 19, 1962, Ser. No. 245,656
Claims priority, application France, Dec. 27, 1961, 883,154
9 Claims. (Cl. 260—473)

1. A process for the preparation of a lower alkyl ester of 1-oxo-8-lower alkyl-4,5-(4'-methoxybenzo)-$\Delta^{3(9)}$-hydrindene-3-carboxylic acid which comprises the steps of dissolving 2-cyano-2-lower alkyl-6-methoxytetralone-1 and a di-lower alkyl succinate, in solution in a solvent amount of a disubstituted amide of an alkanoic acid, adding a solid, anhydrous alkali metal alkanolate, reacting the reactants at a temperature between about −15° C. and +15° C., hydrolyzing the reaction product, acidifying the reaction mixture with a strong organic carboxylic acid and recovering said lower alkyl ester of 1-oxo-8-lower alkyl-4,5-(4'-methoxybenzo)-$\Delta^{3(9)}$-hydrindene-3-carboxylic acid.

3,274,234
PROCESS FOR PREPARING C_{1-6} ALKYL PHENYLCYCLOHEXYLGLYCOLATES

Louis Spiegler, Woodbury, N.J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Mar. 26, 1963, Ser. No. 267,945
3 Claims. (Cl. 260—473)



1. A process for preparing a C_{1-6} alkyl phenylcyclohexylglycolate, which process comprises the steps of (a) treating a C_{1-6} alkyl benzilate at a temperature within the range of 75° C. to about 150° C. and pressure sufficient to liquefy said benzilate with hydrogen in water in the presence of a rhodium based catalyst and (b) recovering the resulting alkyl phenylcyclohexylglycolate.

3,274,235
CYCLOHEXYLMETHYL TOLUATES

Henry E. Hennis, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

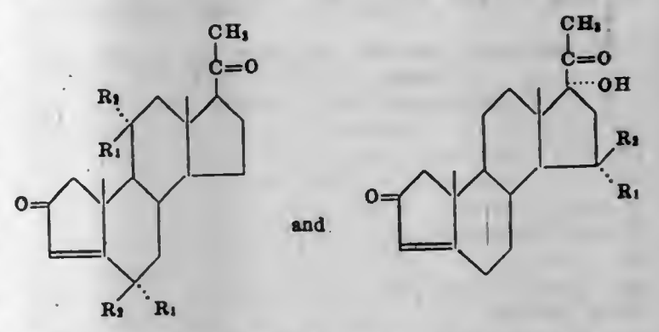
No Drawing. Filed Sept. 7, 1962, Ser. No. 222,213
4 Claims. (Cl. 260—476)

1. Compound of the formula

3,274,236
HALO-SUBSTITUTED CARBOXYLIC ACID ESTERS OF NITRO ALKANOLS

Louis Schmerling, Riverside, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Mar. 12, 1965, Ser. No. 439,451
6 Claims. (Cl. 260—487)



1. An ester of a halo-substituted saturated aliphatic carboxylic acid containing from 2 to about 18 carbon atoms and in which the halogen is selected from the group consisting of fluorine, chlorine and bromine and a nitro polyalkanol containing from 2 to about 12 carbon atoms.

3,274,237
A-NORPREGN-3-ENE DERIVATIVES

Edward Joseph Becker, Princeton, and Robert S. Robison, North Brunswick, N.J., assignors, by mesne assignments, to E. R. Squibb & Sons, Inc., New York, N.Y., a corporation of Delaware

No Drawing. Filed Oct. 23, 1963, Ser. No. 318,187
8 Claims. (Cl. 260—488)

1. A compound selected from the group consisting of steroids of the formulae:

wherein R_1 is hydrogen, R_2 is selected from the group consisting of hydroxy and the acyloxy radical of a hydrocarbon carboxylic acid of less than twelve carbon atoms and together R_1 and R_2 are oxo.

3,274,238
PRODUCTION OF UNSATURATED ESTERS BY OXIDATION OF OLEFINS

Hugo Kojer, Munich, Reinhard Jira, Munich-Pasing, Jürgen Smidt, Munich-Solln, and Heinz Stangl, Munich, Germany, assignors to Consortium für Elektrochemische Industrie G.m.b.H., Munich, Germany

No Drawing. Filed July 23, 1963, Ser. No. 296,902
Claims priority, application Germany, July 26, 1962, C 27,559
4 Claims. (Cl. 260—497)

1. In a process for the production of ethylenically unsaturated esters of the formula:

$$RCOOCX{=}CX_2$$

from a carboxylic acid of the formula RCOOH and an olefin of the formula $CHX{=}CX_2$ wherein R is lower alkyl and each X is selected from the group consisting of hydrogen and alkyl in the presence of a catalyst combination comprising a palladium salt, a salt of a multivalent heavy metal selected from the group consisting of iron, copper, manganese, cobalt, tin, lead, antimony and vanadium in their higher valent stage, as an oxidizing agent for metallic palladium, and a lower mono-alkanoic acid salt of a metal selected from the group consisting of alkali metals and alkaline earth metals, the steps of reacting the olefin with the carboxylic acid under superatmospheric pressure of 2.5 to 50 atmospheres at a temperature between 70 and 170° C. in a reaction space in contact with the catalyst combination maintained in said reaction space, the degree of oxidation of the catalyst combination being less than 0.2, periodically reducing said pressure in said reaction space substantially and distilling off the ester produced from the reaction space at such reduced pressure.

3,274,239
FLUOROCARBON ETHERS

Stanley Selman, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Aug. 31, 1962, Ser. No. 220,858
6 Claims. (Cl. 260—514)

1. A fluorocarbon ether compound having the general formula

where R''$_f$ is a perfluoroalkylene group of three to eight carbons, n is an integer from zero to twenty inclusive and Y is a group selected from the class consisting of the hydroxyl and the fluorine group.

3,274,240

SYNTHESIS OF 3-SUBSTITUTED ALKANOIC ACID COMPOUNDS

Henry E. Fritz, South Charleston, W. Va., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Sept. 10, 1962, Ser. No. 222,691
9 Claims. (Cl. 260—515)

1. A process for producing an alkanoic acid compound substituted in the 3-position by a polycyclic organic radical, which comprises heating at 150° C. to 350° C. a mixture of (a) a member selected from the group consisting of indene having at least one hydrogen atom on the 1-position, fluorene having at least one hydrogen atom on the 9-position, and 1,2,3,10b-tetrahydrofluoranthene having hydrogen atom on the 10b-position, (b) an alkali metal acrylate of the formula $CH_2{=}CRCO_2M$ wherein R is selected from the group consisting of hydrogen, alkyl of from 1 to 6 carbons and phenyl, and M is an alkali metal and (c) a catalytic amount of a strong base derived from an alkali metal.

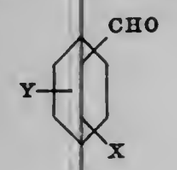
3,274,241

PREPARATION OF NAPHTHALENE-2,6-DICARBOXYLIC ACID

Raymond Wynkoop, Gladwyne, Pa., assignor to Sun Oil Company, Philadelphia, Pa., a corporation of New Jersey

No Drawing. Filed Oct. 15, 1962, Ser. No. 230,716
7 Claims. (Cl. 260—515)

1. Method of preparing naphthalene-2,6-dicarboxylic acid which comprises heating an alkali metal dihydronaphthalene dicarboxylate in which the alkali metal is selected from the group consisting of potassium, rubidium and cesium and the carboxylate groups are positioned other than in the 2,6-arrangement on the dihydronaphthalene nucleus to a temperature in the range of 350–530° C. in an atmosphere of carbon dioxide at a partial pressure of 50–1000 p.s.i., in the presence of an unsaturated hydrocarbon hydrogen acceptor having a hydrogenation Kp of at least 10^{14}, in the presence of a first catalyst selected from the group consisting of oxides and salts of cadmium, zinc and mercury and in the presence of a second catalyst selected from the group consisting of Raney nickel, Raney cobalt, palladium, platinum and halides of nickel, cobalt, palladium and platinum, whereby alkali metal naphthalene-2,6-dicarboxylate is formed, and converting the dicarboxylate to naphthalene-2,6-dicarboxylic acid by means of mineral acid.



3,274,242

PREPARATION OF AROMATIC ACID CHLORIDES BY VAPOR PHASE CHLORINATION OF AROMATIC ALDEHYDES

Robert W. Etherington, Jr., Pennington, and William F. Brill, Skillman, N.J., assignors to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware

No Drawing. Filed May 24, 1962, Ser. No. 197,237
10 Claims. (Cl. 260—544)

1. A process for preparing aromatic acid chlorides which comprises reacting in the vapor phase at a temperature above 225° C. chlorine with an aromatic aldehyde of the formula

wherein X is selected from the group consisting of hydrogen, halogen, —CH_3 and —CHO, and Y is selected from the group consisting of hydrogen, halogen and —CHO, and wherein chlorine is present in a molar ratio from about 10 to greater than one mol of chlorine per mol of aromatic aldehyde at a partial pressure of said aromatic aldehyde equivalent to less than one-third atmosphere.

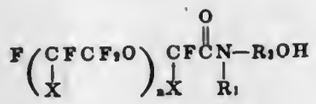
3,274,243

PREPARATION OF ALKANOIC THIOAMIDES

Everett E. Gilbert, Morris Township, Morris County, and Edmund J. Rumanowski, Jersey City, N.J., assignors to Allied Chemical Corporation, New York, N.Y., a corporation of New York

No Drawing. Filed Feb. 7, 1963, Ser. No. 256,824
3 Claims. (Cl. 260—551)

1. A process for preparing an alkanoic monothioamide which comprises adding H_2S to an alkanoic mononitrile while employing in the reaction mixture tetramethylguanidine, said tetramethylguanidine being employed in at least about 1:10 molecular proportions of amine:nitrile employed in the reaction mixture whereby the amine-H_2S salt is provided in the reaction mixture in at least 1:10 molecular proportions with the nitrile therein upon including H_2S in the reaction mixture; maintaining temperatures in the range of 35° C. to reflux and about atmospheric pressures; and terminating the reaction in not over 8 hours.



3,274,244

POLYFLUOROPOLYOXA-ALKANAMIDOALKYL COMPOUNDS

Alan K. Mackenzie, West Redding, Conn., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed June 14, 1963, Ser. No. 287,780
3 Claims. (Cl. 260—561)

1. A polyfluoropolyoxa-alkanamidoalkanol of the formula

wherein X is a member of the group consisting of F and CF_3, n is an integer from 2 to 6, R_1 is a member selected from the group consisting of hydrogen and C_1 to C_4 alkyl, and R_2 is a C_2 to C_4 alkylene.

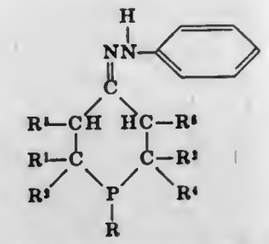
3,274,245

RECOVERY OF ACRYLAMIDE FROM ITS SALT BY VAPORIZATION WITH AN INERT GAS

William Patrick Bobsein, Plainfield, and Joseph Fidelis Mellor, Jr., Westfield, N.J., assignors to American Cyanamid Company, Stamford, Conn., a corporation of Maine

No Drawing. Filed July 9, 1963, Ser. No. 293,884
6 Claims. (Cl. 260—561)

1. A process for isolating acrylamide from a neutralization mixture resulting from the neutralization of acrylamide sulfate with a base comprising vaporizing the acrylamide by contacting said mixture with an inert gas having a temperature in excess of 20° C., and subsequently recovering acrylamide from said gas-containing acrylamide.



3,274,246

PHOSPHORINANONE-PHENYLHYDRAZONES

Richard Parke Welcher, Old Greenwich, Conn., assignor to American Cyanamid Company, New York, N.Y., a corporation of Maine

No Drawing. Original application Dec. 22, 1961, Ser. No. 161,438, now Patent No. 3,225,103, dated Dec. 21, 1965. Divided and this application Aug. 9, 1965, Ser. No. 485,971
4 Claims. (Cl. 260—566)

1. A 4-phosphorinanone, phenylhydrazone of the formula

wherein R is a member selected from the group consisting of substituted and unsubstituted, branched and straight chain alkyl having from 1 to 18 carbon atoms, cycloalkyl, substituted and unsubstitued aryl; said substituents for alkyl being selected from the group consisting of lower alkoxy, phenyl and cyano, and said substituents for aryl being selected from the group consisting of halogen and lower alkyl; R^1, R^2, R^3 and R^4 each represent a member selected from the group consisting of hydrogen, lower alkyl, phenyl, chloro-substituted phenyl, lower alkyl-substituted phenyl, cyclohexyl and lower alkoxyalkyl; and R^5 and R^6 each represent a member selected from the group consisting of hydrogen, lower alkyl and phenyl.

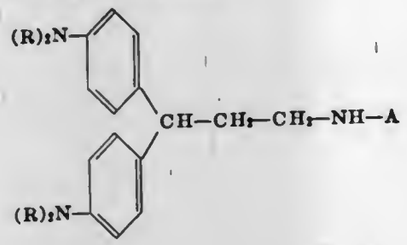
3,274,247

PROCESS FOR THE PREPARATION OF DIPHENYLMETHANE DIAMINES

Marcel Repper, Le Clou, Melle, France, assignor to Societe Toulousaine de Produits Chimiques "Tolochimie," Paris, France, a corporation of France

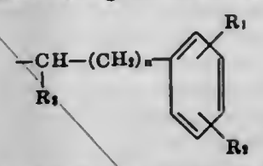
No Drawing. Filed June 14, 1963, Ser. No. 287,779
Claims priority, application France, July 5, 1962, 903,087
3 Claims. (Cl. 260—570)

1. A process for the production of 4,4'-diamino diphenylmethane which consists essentially of reacting formaldehyde with a molar excess of up to 6 moles of aniline per mole of formaldehyde in the presence of from about 0.15 to about 0.5 equivalent of hydrochloric acid per mole of formaldehyde.



3,274,248

N-1,1-BIS-[AMINOPHENYL]-PROPYL-AMINES AND SALTS THEREOF



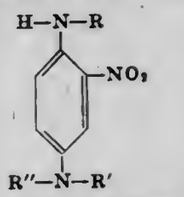
Kálmán Harsányi, Dezsö Korbonits, Kálmán Takács, László Tardos, György P. Leszkovszky, and Ilona Erdély, all of Budapest, Hungary, assignors to Chinoin Gyógyszer-és Vegyészeti Termékek Gyára RT., Budapest, Hungary, a firm

No Drawing. Filed Aug. 1, 1963, Ser. No. 299,181
Claims priority, application Hungary, Aug. 16, 1962, CI-409
9 Claims. (Cl. 260—570)

1. A material selected from the group consisting of compounds having the formula:

wherein R is selected from the group consisting of hydrogen, oxygen, and lower alkyl radicals containing from about 1 to about 4 carbon atoms, and A is selected from the group consisting of cyclo-hexyl, indanyl, 3-phenyl indanyl, and radicals having the formula:

wherein R_1 and R_2 are selected from the group consisting of hydrogen, hydroxy, and alkoxy radicals, R_3 is a short chain alkyl radical and n is an integer from about 0 to about 3 and salts thereof.



3,274,249

DERIVATIVES OF 1,4-DIAMINO-2-NITRO-BENZENES

Walter H. Brunner, Easton, Pa., and Alexander Halasz, Norwalk, Conn., assignors to Clairol Incorporated, New York, N.Y., a corporation of Delaware

No Drawing. Filed Sept. 14, 1964, Ser. No. 396,403
14 Claims. (Cl. 260—573)

1. Compounds of the formula:

wherein R is a member selected from the group consisting of alkyl of 1 to 8 carbon atoms, cycloalkyl of 4 to 6 carbon atoms, aryl, alkaryl and aralkyl of 6 to 8 carbon atoms and monohydroxy alkyl having from 1 to 4 carbon atoms; and R' is member selected from the group consisting of a saturated aliphatic hydrocarbon radical having from 1 to 4 carbon atoms and a hydroxyalkyl radical having from 1 to 4 carbon atoms and R'' is selected from the group consisting of hydrogen and hydroxyalkyl having from 1 to 4 carbon atoms, provided that R'' is hydroxyalkyl only when R' is also hydroxyalkyl and further provided that at least one of R and R' is a hydrocarbon radical.

3,274,250

N-PHENYL-N'-(1,2-DIMETHYLPROPYL)-p-PHENYLENEDIAMINES

Paul Schneider, Opladen, Germany, assignor to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation

No Drawing. Filed Nov. 8, 1963, Ser. No. 322,524
Claims priority, application Germany, Nov. 21, 1962, F 38,366
1 Claim. (Cl. 260—576)

N-phenyl - N' - (1,2 - dimethylpropyl) - p - phenylenediamine.

3,274,251

PRODUCTION OF UNSYMMETRICAL DIMETHYLHYDRAZINE

Paul Besson, La Chambre, Savoie, and Gilbert Luiset, Saint-Etienne-de-Cuines, Savoie, France, assignors to Societe d'Electro-Chimie d'Electro-Metallurgie et des Acieries Electriques d'Ugine, Paris, France, a French company

No Drawing. Filed May 31, 1963, Ser. No. 284,306
Claims priority, application France, Aug. 17, 1962, 907,177
7 Claims. (Cl. 260—583)

1. The process for producing unsymmetrical dimethylhydrazine which comprises preparing a solution of dimethylnitrosoamine in an organic solvent for the dimethylnitrosoamine and said dimethylhydrazine, the weight ratio

of the dimethylnitrosoamine to the sum of the dimethylnitrosoamine and said solvent being less than one, contacting said solution with sodium in the presence of water at a temperature in the range between about 0° and about 100° C. to produce hydrogen and sodium hydroxide, thereby concurrently hydrogenating the dimethylnitrosoamine in situ to the unsymmetrical dimethylhydrazine, the amount of water and sodium used being sufficient to produce at least the stoichiometric amount of hydrogen for the hydrogenation, separating the two resultant immiscible liquid phases consisting of an organic phase containing the unsymmetrical dimethylhydrazine and an aqueous phase containing sodium hydroxide solution, and recovering the unsymmetrical dimethylhydrazine from said organic phase.

3,274,252
PROCESS FOR TERTIARY AMINE OXIDES AND HYDROXYLAMINES
Harry Elmer Albert and Paul Gordon Haines, Lafayette Hill, Pa., assignors to Pennsalt Chemicals Corporation, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Filed July 9, 1963, Ser. No. 293,906
5 Claims. (Cl. 260—583)

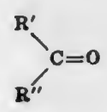
1. The process of oxidizing in an aqueous system a trilower alkylamine employing as oxidizer essentially stoichiometric amounts of hydrogen peroxide, said oxidation being carried out at a temperature between about 20° and 75° C. in the presence of 0.05 to 1.0 weight percent of the amine of an alkali metal tungstate as catalyst, and in the presence of 0.02 to 1% by weight of the amine of an alkali metal pyrophosphate and thereafter pyrolyzing the oxidation product by distilling the aqueous mass and collecting as distillate N,N-di-lower alkylhydroxylamine.

5. The process of preparing triethylamine oxide which comprises oxidizing triethylamine at a temperature between about 20° and 75° C. in an aqueous system with an essentially stoichiometric amount of hydrogen peroxide and having present in the reaction medium 0.05 to 1.0% by weight of the triethylamine of sodium tungstate as catalyst and 0.02 to 1% by weight of the amine of sodium pyrophosphate.

3,274,253
AMMONOLYSIS PROCESS
Kenneth H. Markiewitz, Wilmington, Del., assignor to Atlas Chemical Industries, Inc., Wilmington, Del., a corporation of Delaware
No Drawing. Filed July 18, 1963, Ser. No. 296,103
3 Claims. (Cl. 260—585)

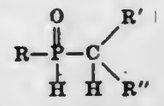
1. In the catalytic ammonolysis of aliphatic alcohols, which undergo ammonolysis reaction in the presence of hydrogenating catalyst, with ammonia in liquid phase to yield predominantly primary amines the improvement which comprises adding to the reaction system a minor proportion of a compound selected from the group consisting of alkali metal hydroxides, weak acid salts of alkali metal hydroxides and aluminum alkoxides.

3,274,254
OXIDATION OF CYCLOHEXANE
William Leslie Seddon, Sale, England, assignor to Petrocarbon Developments Limited, London, England, a British company
Filed Dec. 27, 1962, Ser. No. 247,629
Claims priority, application Great Britain, Dec. 28, 1961, 46,532/61
5 Claims. (Cl. 260—586)



1. A process for the manufacture of cyclohexanol and cyclohexanone by oxidising liquid cyclohexane with gaseous oxygen in a reaction zone into which liquid cyclohexane and an oxygen-containing gas are separately introduced and from which issues a mixture of hot residual gases and unreacted cyclohexane vapor, condensing the unreacted cyclohexane vapor in the residual gases leaving the reaction zone, and returning the said unreacted cyclohexane to the reaction zone, wherein liquid cyclohexane is introduced into said oxygen-containing gas before said oxygen-containing gas is supplied to said reaction zone and wherein said mixture of hot residual gases and unreacted cyclohexane vapor is subjected to indirect heat exchange with the mixture of oxygen-containing gas and cyclohexane being supplied to the reaction zone, and by the said heat exchange at least a part of the cyclohexane vapor to be condensed is condensed and liquid cyclohexane is vaporized in the oxygen-containing gas.

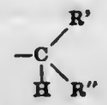
3,274,255
OXIDATION OF ISOBUTYLENE TO METHACROLEIN
William F. Brill, Skillman, and Alfio J. Besozzi, East Brunswick, N.J., assignors to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware
No Drawing. Filed June 27, 1963, Ser. No. 290,912
5 Claims. (Cl. 260—604)



2. A process for producing methacrolein which comprises contacting isobutylene at about 0.5 to 3.0 mols of oxygen per mol of isobutylene at reaction temperatures between about 400° and 700° C. for about 0.05 to about 0.5 second with a copper-phosphate catalyst containing atoms of copper and phosphorus in an atomic ratio of copper to phosphorus of about 1 to 1 to 3 to 1, the said catalyst having been activated at temperatures ranging from 200° C. to 700° C. by contacting the catalyst with an organic polybromide compound selected from the group consisting of ethylene dibromide, trimethylene bromide, tetramethylene bromide, pentamethylene bromide, ethylidene bromide and tetrabromoethane.

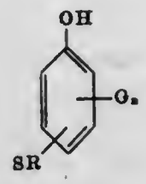
3,274,256
SYMMETRICAL AND UNSYMMETRICAL ORGANOPHOSPHORUS COMPOUNDS
Sheldon A. Buckler and Martin Epstein, Stamford, Conn., assignors to American Cyanamid Company, New York, N.Y., a corporation of Maine
No Drawing. Filed Mar. 1, 1962, Ser. No. 176,816
5 Claims. (Cl. 260—606.5)

1. A method which comprises bringing together into intimate contact a primary phosphine of the formula RPH_2 and a carbonyl compound of the formula

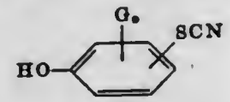


in the presence of a concentrated mineral acid and producing a secondary phosphine oxide of the formula

R in the above formulae representing a member of the group consisting of substituted and unsubstituted alkyl having from 1 to 18 carbon atoms, aryl, aralkyl, parahalosubstituted phenyl and cycloalkyl, said substituents for alkyl being selected from the group consisting of cyano and lower alkoxy; R′ representing a member selected from the group consisting of alkyl having from 1 to 8 carbon atoms, and phenyl; R″ represents a member selected from the group consisting of alkyl having from 2 to 8 carbon atoms and phenyl, and R′ and R″ taken together with



represent cyclohexyl; and the sum of the steric substituent constants, E_s, of the moieties R— and

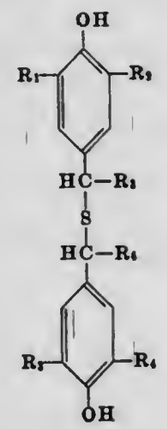


being below about —1.50 at 25° C.

3,274,257
SYNTHESIS OF (ALKYLTHIO) PHENOLS
Walter Reifschneider, Midland, and Jacqueline S. Kelyman, Auburn, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware
No Drawing. Filed June 17, 1963, Ser. No. 288,512
3 Claims. (Cl. 260—609)

1. Method of preparing phenolic thioethers of the general formula

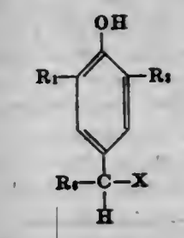
which comprises contacting a compound of the formula



with a compound of the formula

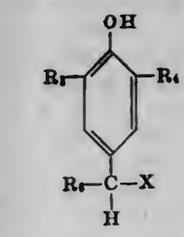
HOR

in the presence of a base wherein G is loweralkyl, loweralkenyl, loweralkynyl, cycloalkyl of from 5 to 6, both inclusive, carbon atoms, ar-loweralkyl, aryl of 6 carbon atoms, loweralkoxy, aryloxy of 6 carbon atoms, nitro, cyano, amido, amino, loweracyloxy, or halo; R is loweralkyl, loweralkenyl, loweralkynyl, cycloalkyl being of from 5 to 6, both inclusive, carbon atoms, halo loweralkyl, ar-loweralkyl, or loweralkanoyl; and in the compound HOR the HO radical is bonded to a carbon atom to which at least one hydrogen is also bonded; and *n* is an integer of from 0 to 4, both inclusive.



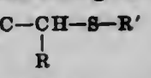
3,274,258
HYDROXYBENZYL THIOETHERS AND METHOD OF PREPARATION
Joseph D. Odenweller, Birmingham, Mich., assignor to Ethyl Corporation, New York, N.Y., a corporation of Virginia
No Drawing. Filed Sept. 1, 1960, Ser. No. 53,353
6 Claims. (Cl. 260—609)

1. A compound having the formula:



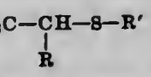
wherein R_1 and R_3 are independently selected alkyl radicals each having from one to 12 carbon atoms, R_2 and R_4 are independently selected alpha-branched alkyl radicals each having from 3 to 12 carbon atoms, and R_5 and R_6 are independently selected from the group consisting of hydrogen, alkyl radicals having from one to 12 carbon atoms and mononuclear aryl radicals having from 6 to 12 carbon atoms.

6. A process for preparing benzyl thio ethers which comprises reacting a compound of the formula:



wherein R_1 is an alkyl radical having from 1–12 carbon atoms, R_2 is an alpha-branched alkyl radical having from 3–12 carbon atoms, R_5 is selected from the group consisting of hydrogen, alkyl radicals having from 1–12 carbon atoms and mono-nuclear aryl radicals having from 6–12 carbon atoms and X is halogen, first with thiourea and then chlorine to produce a benzyl sulfonyl chloride, reducing said benzyl sulfonyl chloride with sulfuric acid and metallic zinc to form a benzyl thiol, and reacting said benzyl thiol with a compound having the formula:

wherein R_3 is an alkyl radical having from 1–12 carbon atoms, R_4 is an alpha-branched alkyl radical having from 3–12 carbon atoms, R_6 is selected from the group consisting of hydrogen, alkyl radicals having from 1–12 carbon atoms and mono-nuclear aryl radicals having from 6–12 carbon atoms and X is halogen.



3,274,259
2,2,2-TRINITRO ETHYL ALKYL SULFIDES
Paul F. Hartman, Clifton, N.J., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
No Drawing. Filed June 17, 1954, Ser. No. 437,578
6 Claims. (Cl. 260—609)

1. A chemical compound having the formula

wherein R is selected from the group consisting of alkyl, benzyl, furyl and phenyl radicals and R′ is selected from the group consisting of alkyl and lower alkenyl radicals.

6. The process of making a chemical compound having the formula

wherein R is selected from the group consisting of alkyl, benzyl, furyl and phenyl radicals and R′ is selected from the group consisting of alkyl and lower alkenyl radicals, which comprises bringing together at a temperature of from room temperature to 100° C. an aldehyde, R—CHO wherein R is as already defined, and a mercaptan, R′—SH wherein R′ is as already defined in the presence of nitroform.

3,274,260
METHOD FOR PRODUCING MONOALKYL ETHERS OF DIHYDRIC PHENOLS

Joseph Levy, Paramus, N.J., and Alvin Friedman, New York, N.Y., assignors to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Aug. 31, 1964, Ser. No. 393,419
3 Claims. (Cl. 260—613)

1. A process for the production of the monomethyl ether of hydroquinone which comprises reacting hydroquinone with dimethyl sulfate at a temperature of from about 65° C. to about 100° C. in admixture with from about 4 to 8 parts by weight per part of hydroquinone of an inert, water-immiscible solvent selected from the group consisting of benzene, lower alkyl substituted benzenes and halogenated hydrocarbons while gradually adding to the reaction mixture an aqueous alkali metal hydroxide solution, and separating the resultant hydroquinone monomethyl ether from the reaction mixture.

3,274,261
PROCESS OF PRODUCING ORTHO-FORMIC ACID METHYL ESTER

Arnold Lenz, Cologne-Stammheim, and Karl Hass and Hans Epler, Luelsdorf-Feldmuehle, Post Troisdorf, Germany, assignors to Feldmuehle Papier- und Zellstoffwerke A.G., Dusseldorf-Oberkassel, Germany, a corporation of Germany

No Drawing. Filed Feb. 7, 1962, Ser. No. 171,557
Claims priority, application Germany, Feb. 16, 1961, F 33,216
9 Claims. (Cl. 260—615)

1. In a process of producing ortho-formic acid methyl ester, the steps which comprise suspending a solid, finely comminuted methylate of a metal selected from the group consisting of sodium, of potassium and of mixtures thereof in an organic liquid which is substantially inert to the reaction mixture and in which said methanolate is insoluble, adding chloroform slowly and gradually to said suspension at an elevated temperature in the range of about 50° C. to about 125° C., and separating the ortho-formic acid methyl ester from the reaction mixture.

7. In a process of producing ortho-formic acid methyl ester, the steps which comprise suspending a solid finely pulverized metal methylate selected from the group consisting of sodium methylate, potassium methylate, and mixtures thereof in ortho-formic acid methyl ester, adding slowly and gradually about the equimolecular amount of chloroform to said suspension while maintaining the temperature between about 60° C. and about 80° C., distilling off the resulting ortho-formic acid methyl ester and the ester used as suspending agent from the metal chloride, and recycling part of the distilled ester as suspending agent in a succeeding reaction.

3,274,262
METHOD FOR IMPROVING THE CONVERSION OF AROMATIC CARBOXYLIC ACIDS TO PHENOLS

Denton M. Albright and Charles Perlaky, Penn Hills Township, Allegheny County, Pa., assignors to United States Steel Corporation, a corporation of Delaware

No Drawing. Filed Oct. 23, 1962, Ser. No. 232,595
9 Claims. (Cl. 260—621)

1. In a catalytic oxidation of a monocarboxlyic acid to a phenolic compound, said acid being one of the benzene series having at least one unsubstituted position on the benzene ring adjacent the carboxyl group, the steps of bringing said acid and a catalyst into contact with oxygen-containing gas, adding to the reaction mixture of said acid, catalyst and oxygen, at least about 0.8% by weight of said acid, of an inhibitor to formation of a tar-like by-product in said catalytic oxidation, said inhibitor being chosen from the group consisting of 4,4'-bis(2,6-di-tert-butylphenol), 4,4'-methylenebis(6-tert-butyl-o-cresol), 4,4'-thiobis(3-methyl-6-tert-butylphenol), tetramethylthiuram disulfide, N,N'-di-β-naphthyl-p-phenylene-diamine and copper dimethyldithiocarbamate and, recovering a phenolic compound therefrom.

3,274,263
PROCESS FOR OLEFIN HYDROFORMYLATION

Charles R. Greene and Robert E. Meeker, Berkeley, Calif., assignors to Shell Oil Company, New York, N.Y., a corporation of Delaware

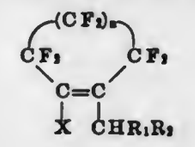
No Drawing. Filed Aug. 30, 1961, Ser. No. 134,852
5 Claims. (Cl. 260—632)

1. In the process for the production of hydroformylation products wherein an olefinic hydrocarbon is reacted with carbon monoxide and hydrogen in a reaction zone at a temperature of from about 100 to about 300° C., and a pressure of from about atmospheric to about 1000 p.s.i.g., in the presence of a complex catalyst consisting essentially of a complex of cobalt with carbon monoxide and a trialkyl phosphine biphyllic ligand, the improvement which consists essentially of introducing into said reaction zone a monocarboxylic alkanoic acid higher boiling than said hydroformylation products and having from 6 to 18 carbon atoms to the molecule, passing effluent from said reaction zone into a separating zone, distilling a vapor fraction comprising hydroformylation products and unconverted reactants from a liquid fraction comprising said complex catalyst and said monocarboxylic alkanoic acid in said separating zone, recycling at least a part of said liquid fraction from said separating zone to said reaction zone, and controlling the rate of introduction of said monocarboxylic alkanoic acid into said reaction zone to maintain a mol ratio of said monocarboxylic acid to said catalyst complex in said reaction zone in the range of from about 0.1 to 1 to about 10 to 1.

3,274,264
FLUORODINITROALKANE PREPARATION

Mark Graff, William E. McQuistion, and James W. Sterling, Washington, D.C., assignors to the United States of America as represented by the Secretary of the Navy

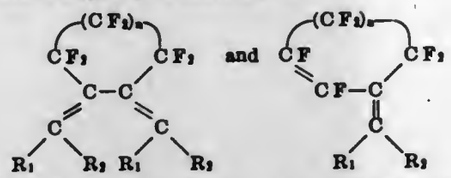
No Drawing. Filed Nov. 12, 1964, Ser. No. 410,835
7 Claims. (Cl. 260—644)



1. The method for preparing fluorodinitroalkanes which comprises continuously and concurrently feeding a stream comprising an aqueous solution of an alkali metal salt of a dinitroalkane and a stream comprising a gas mixture comprising an inert gas and gaseous fluorine into a reactor, allowing said dinitroalkane salt and said gas mixture to react under alkaline conditions and continuously withdrawing a fluorodinitroalkane product.

3,274,265
FLUORINATED ORGANIC COMPOUNDS

John Colin Tatlow and Robert Stephens, Birmingham, England, assignors to National Research Development Corporation, London, England, a corporation of Great Britain



No Drawing. Filed Nov. 23, 1962, Ser. No. 239,780
Claims priority, application Great Britain, Nov. 27, 1961, 42,293/61
10 Claims. (Cl. 260—648)

1. Process for the production of a polyfluoroalicyclic compound having conjugated unsaturation including at least one group of formula $=CR_1R_2$ connected to a nuclear carbon atom, wherein R_1 and R_2 are selected from the group consisting of hydrogen, fluorine and lower alkyl groups, the radical CR_1R_2 having a maximum of 5 carbon atoms which comprises dehydrohalogenating a corresponding alicyclic compound of the structure

wherein n is an integer of from 1 to 2 and R_1 and R_2 have the aforementioned significance and X is selected from the group consisting of fluorine and an α-haloalkyl group with an alkali metal fluoride selected from the group consisting of sodium, potassium and lithium fluorides at a temperature between 200–600° C. until dehydrohalogenation by 1:4 elimination is effected.

6. A polyfluoroalicyclic compound of a structure selected from the group consisting of

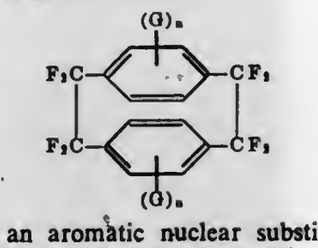
wherein n is an integer of from 1 to 2 and R_1 and R_2 are selected from the group consisting of hydrogen, fluorine and lower alkyl groups, the radical CR_1R_2 having a maximum of 5 carbon atoms.

7. 3-methylene-octafluorocyclohexene.

3,274,266
PROCESS FOR THE PRODUCTION OF TETRABROMOCYCLODODECENE

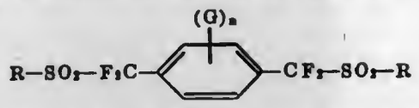
Karl Mönkemeyer and Hermann Sauer, Marl, Germany, assignors to Chemische Werke Huls Aktiengesellschaft, Marl, Germany, a corporation of Germany

No Drawing. Filed Sept. 26, 1963, Ser. No. 311,646
Claims priority, application Germany, Mar. 30, 1963, C 29,532
4 Claims. (Cl. 260—648)



1. Process for the production of tetrabromocyclododecene which comprises reacting bromine with cyclododecatriene in a mole ratio within the range from 2:1 to 2.2:1 in the presence of propionic acid, the weight ratio of cyclododecatriene to total propionic acid being within the range from 1:4 to 1:16, at temperatures within the range from −25 to 0° C.

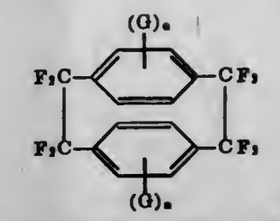
3,274,267
CYCLIC α-PERFLUORO-DI-p-XYLYLENES



Sui-Wu Chow, Somerville, N.J., assignor to Union Carbide Corporation, a corporation of New York

No Drawing. Filed Sept. 23, 1963, Ser. No. 310,860
13 Claims. (Cl. 260—649)

1. Process for the preparation of cyclic α-perfluoro-di-p-xylylenes having the structure:



wherein G is an aromatic nuclear substituent selected from the group consisting of hydrocarbon and halo and n is a number from 0 to 3, inclusive, which comprises pyrolyzing a bis-sulfone having the general formula

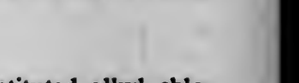
wherein G and n are as defined above and R is a hydrocarbyl group containing up to about six carbon atoms, inclusive, at temperatures between about 600° C. and 900° C. and at partial pressures of said bis-sulfone less than about 20 mm. Hg, cooling and bringing the resulting pyrolyzed vapors in intimate mixture with an inert organic solvent maintained at a temperature of from about 50° C. to about 250° C. and recovering said cyclic α-perfluoro-di-p-xylylene from said solvent.

12. Cyclic α-perfluoro-di-p-xylylene having the structure

wherein G is an aromatic nuclear substituent selected from the group consisting of hydrocarbon and halo and n is a number from 0 to 3, inclusive.

3,274,268
METHOD OF MAKING α-CHLOROBIBENZYLS, STILBENES AND RELATED COMPOUNDS

Donald F. Hoeg, Mount Prospect, and Donald I. Lusk, Chicago, Ill., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

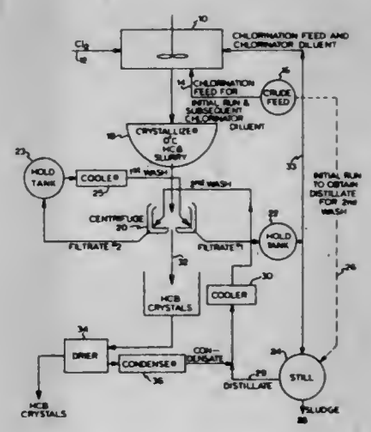


No Drawing. Filed Oct. 11, 1963, Ser. No. 315,684
7 Claims. (Cl. 260—649)

1. A method of making α,β-substituted chloroethanes of the formula

wherein R is selected from the group consisting of phenyl, substituted phenyl wherein the substituents are selected from the group consisting of methyl, halogen, and methoxy, vinyl and lower alkyl substituted vinyl groups and R' is selected from the group consisting of hydrogen and alkyl, said method comprising the step of

reacting an α-substituted alkyl chloride of the formula



wherein R and R' of said α-substituted alkyl chloride is as defined for the α,β-substituted chloroethanes, with a lower alkyllithium compound in a solution of tetrahydrofuran at a temperature of between about −100° C. and about 0° C.

3,274,269
PROCESS FOR PREPARING HEXACHLORO-BENZENE

Robert S. Cohen, Dover, Ohio, assignor to Dover Chemical Corporation, Dover, Ohio, a corporation of Ohio

Filed Apr. 30, 1963, Ser. No. 276,939
10 Claims. (Cl. 260—650)

6. A process of producing hexachlorobenzene from a raw material selected from benzene and chlorinated benzenes having less than six ring-substituted chlorine

atoms, comprising: reacting said raw material with chlorine to form a chlorinated material containing hexachlorobenzene; adding to said chlorinated material after said reaction and prior to crystallization of hexachlorobenzene therefrom a diluent selected from said raw material and said chlorinated material from which hexachlorobenzene and at least a portion of the tarry residues have been removed; and crystallizing hexachlorobenzene from the resulting mixture.

9. A process of separating hexachlorobenzene from a tarry mass containing hexachlorobenzene, used catalyst and at least one compound selected from benzene and chlorinated benzenes having less than six ring-substituted chlorine atoms, comprising: adding to said tarry mass a liquid diluent selected from benzene and chlorinated benzenes having less than six ring-substituted chlorine atoms; and crystallizing hexachlorobenzene from the resulting mixture; said process being characterized by the absence of a chlorination step between the addition of said liquid diluent and said crystallization step.

3,274,270

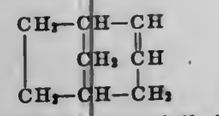
PYROLYSIS OF SODIUM TRIBROMOACETATE

John E. Harris, Boston, Mass., assignor to Monsanto Research Corporation, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Oct. 1, 1963, Ser. No. 312,887
4 Claims. (Cl. 260—654)

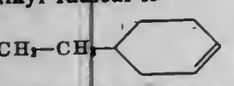
1. The method which comprises heating anhydrous sodium tribromoacetate in the absence of a solvent to a temperature of about 200° C., in an inert, oxygen-free atmosphere, at sub-atmospheric pressures, and condensing the volatilized reaction product at a temperature below about 0° C.

4. The method of producing carbon tetrabromide and tetrabromoethylene which comprises heating anhydrous sodium tribromoacetate to about 200° C., in an inert, oxygen-free atmosphere, under a vacuum of below about 1 mm. Hg, condensing the volatile reaction products at a temperature below about 0° C., and warming the condensate to a temperature of between 0° and 50° C., sufficient to liquefy the condensate.



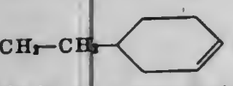
3,274,271

PROCESS FOR THE PREPARATION OF BICYCLO-(3,2,1)-OCTENE-(2)



Karl Heinz Müller and Peter Borner, Kamen, Westphalia, Germany, assignors to Schering Aktiengesellschaft, Berlin, Germany

No Drawing. Filed Feb. 11, 1963, Ser. No. 257,738
Claims priority, application Germany, Feb. 21, 1962, Sch 31,020
3 Claims. (Cl. 260—666)



2. A process for the preparation of bicyclo-(3,2,1)-octene-(2)

comprising heating aluminum trialkyl compounds, in which at least one alkyl radical is

and the rest of the alkyl radicals is selected from the group consisting of

and lower alkyl radicals, to a temperature in the range of 130° C. to 350° C. and separating the bicyclo-(3,2,1)-octene-(2) from the reaction mixture, the aluminum trialkyl compound being heated together with an alpha-olefin.

3,274,272

PROCESS FOR THE PRODUCTION OF CYCLOHEXENE AND METHYLCYCLOHEXENE

Masataka Amagasa, Komegafukuro, Uwacho, Sendai-shi, Japan, and Tadashi Yamaguchi, Nakajima-cho, Sendai-shi, Japan

No Drawing. Filed July 23, 1963, Ser. No. 296,927
Claims priority, application Japan, July 28, 1962, 37/31,927, 37/31,929
18 Claims. (Cl. 260—666)

1. A process for the production of cyclohexene which consists essentially of: admixing liquid ammonia, a substance selected from the group consisting of alkali metals and alkaline earth metals, and benzene; and subjecting the mixture to reduction.

3,274,273

DEHYDROHALOGENATION PROCESS

George R. Lester, Mount Prospect, and Cecelia J. Adams, Chicago, Ill., assignors to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Mar. 16, 1964, Ser. No. 352,321
10 Claims. (Cl. 260—666)

1. A method of dehydrohalogenating an alkyl halide and simultaneously separating hydrogen halide from the dehydrohalogenation reaction mixture at reaction conditions, which method comprises contacting the alkyl halide with a hydrogen halide sorptive catalytic composite at dehydrohalogenation conditions, said catalytic composite comprising an oxide of a metal selected from the group consisting of magnesium, calcium and zinc, and an oxide of a metal selected from the group consisting of copper and cerium, sorbing the hydrogen halide on the catalytic composite and recovering an olefinic hydrocarbon.

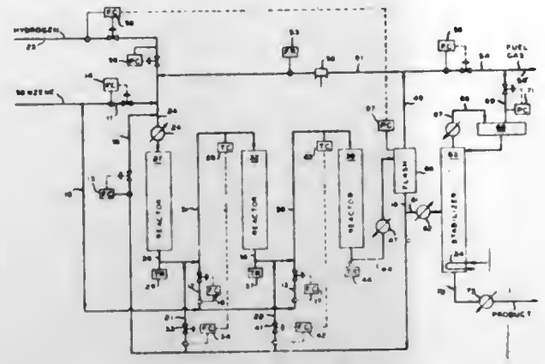
3,274,274

ADAMANTANE PROCESS

Harold E. Cupery, Wilmington, Del., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Dec. 16, 1964, Ser. No. 418,890
3 Claims. (Cl. 260—666)

1. In a process for preparing adamantane by the isomerization of trimethylenenorbornane with $AlCl_3$ and HCl the improvement of maintaining process conditions at atmospheric pressure and at 70° to 120° C. for one to four hours while agitating trimethylenenorbornane with 0.1 to 0.7 mole of hydrochloric acid and 0.4 to 0.95 mole of aluminum chloride per mole of trimethylenenorbornane to yield a reaction mixture containing adamantane.



3,274,275

METHOD FOR PRODUCTION OF CYCLOHEXANE

John F. Hutto, Ray D. Garlington, and John T. Cabbage, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

Filed Nov. 26, 1963, Ser. No. 326,120
7 Claims. (Cl. 260—667)

1. A process for the production of cyclohexane, which process comprises: contacting a mixture comprising benzene, an excess of hydrogen, and cyclohexane diluent with a hydrogenation catalyst under hydrogenating conditions in a plurality of contacting zones, said hydrogen being passed in series flow through each of said contacting zones, individual portions of said benzene being passed in parallel into individual contacting zones of said plurality of contacting zones, and individual portions of said cyclohexane diluent being passed in parallel into individual contacting zones of said plurality of contacting zones; regulating the amount of cyclohexane diluent thus supplied to each of said contacting zones to control the temperature therein so that the temperature in each of said contacting zones does not exceed about 600° F.; withdrawing resulting reaction mixture effluent containing the unreacted portion of said hydrogen from each of said contacting zones; passing said effluent from each of

said contacting zones except the last contacting zone to a succeeding contacting zone without separation of unreacted hydrogen therefrom; and recovering cyclohexane product from the effluent from said last contacting zone.

3,274,276

PREPARATION OF CYCLOALKYL AROMATIC COMPOUNDS

James J. Louvar, Riverside, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed May 29, 1963, Ser. No. 284,015
9 Claims. (Cl. 260—668)

1. A process for the preparation of a non-condensed cycloalkyl aromatic compound which comprises treating an aromatic compound with hydrogen in the presence of an alkylation-hydrogenation catalyst comprising aluminum chloride and platinum or palladium at a temperature of from about 25° C. to about 50° C., and recovering the resultant cycloakyl aromatic compound.

3,274,277

PREPARATION OF DIPHENYL

Herman S. Bloch, Skokie, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed Sept. 28, 1964, Ser. No. 399,825
17 Claims. (Cl. 260—670)

1. A process for preparing a diaryl derivative of an aromatic hydrocarbon which comprises heating the aromatic hydrocarbon together with ethylene and an alkaline-acting catalyst comprising a metal selected from the group consisting of alkali metals and alkaline earth metals on a high surface area support at a temperature of from about 125° C. to about 200° C., said aromatic hydrocarbon being devoid of alkyl substituents containing an alpha hydrogen.

3,274,278

PREPARATION OF DETERGENT ALKYLATES

Brij L. Kapur and Raymond D. Eccles, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma

No Drawing. Filed Nov. 4, 1963, Ser. No. 321,337
8 Claims. (Cl. 260—671)

1. An improved process for preparing detergent alkylates which comprises reacting a chlorination product of from 0.1–0.8 atom of chlorine per mole of an alkane selected from the group consisting of C_{10}–C_{16} normal paraffins and mixtures thereof with a substantial stoichiometric excess of benzene in the presence of $AlCl_3$ catalyst and an added amount of a diphenyl substituted higher alkane.

3,274,279

REMOVAL OF REACTION PRODUCTS OF WATER, BORON FLUORIDE, ETC. FROM HYDROCARBONS

Ernest L. Pollitzer, Hinsdale, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Filed May 31, 1962, Ser. No. 198,768
12 Claims. (Cl. 260—674)

1. A process for removing the reaction products of water, boron fluoride, and a boron fluoride-modified substantially anhydrous inorganic oxide from a substantially anhydrous hydrocarbon stream containing the same which comprises contacting said stream with a removal agent comprising a metal hydride selected from the group consisting of lithium hydride, sodium hydride, potassium hydride, rubidium hydride, cesium hydride, calcium hydride, strontium hydride and barium hydride, in a reaction zone at reaction conditions including a temperature of from about 0° to about 300° C. and a pressure of from about atmospheric to about 200 atmospheres, reacting at least a portion of said reaction products with said removal agent, and recovering purified hydrocarbon.

3,274,280

PREPARATION OF ALPHA-OLEFINS

David W. Marshall and Wayne R. Sorenson, Ponca City, Okla., assignors to Continental Oil Company, Ponca City, Okla., a corporation of Oklahoma

No Drawing. Filed Nov. 23, 1962, Ser. No. 239,771
17 Claims. (Cl. 260—677)

1. A process for preparing alpha-olefins which consists essentially of reacting an allylic halide with an organometal compound selected from the group consisting of AlR_3 and $(RO)_y$—Al—R_z, wherein R is a hydrocarbon radical selected from the group consisting of alkyl, aryl, aralkyl, cycloalkyl and alkaryl; $y+z$ equals three, and y is at least about 1.0; and recovering a reaction product comprising alpha-olefin.

3,274,281

PROCESS FOR REMOVING NITRIC OXIDE FROM GAS MIXTURES CONTAINING HYDROGEN AND HYDROCARBONS

Josef Hirschbeck and Josef Riedl, Burgkirchen, Bavaria, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany, a corporation of Germany

No Drawing. Filed Dec. 3, 1963, Ser. No. 327,820
Claims priority, application Germany, Dec. 7, 1962, F 38,489
4 Claims. (Cl. 260—677)

1. Process for removing nitric oxide from gaseous olefin-containing hydrocarbon mixtures by catalytic hydrogeneration with simultaneous conversion of the acetylene hydrocarbons present into olefins, which comprises passing the gaseous mixtures at a temperature in the range of 180° C. to 250° C. over a catalyst containing chromium oxide and nickel, the nickel content being 5–15%, calculated on the content of Cr_2O_3.

3,274,282

CATALYSTS AND THE HYDROGENATION OF UNSATURATED HYDROCARBONS USING SAID CATALYSTS

Kenneth Hugh Bourne and Peter Desmond Holmes, Sunbury-on-Thames, England, assignors to The British Petroleum Company Limited, London, England, a British joint-stock corporation

No Drawing. Original application Oct. 11, 1960, Ser. No. 61,832. Divided and this application Aug. 31, 1964, Ser. No. 438,803
3 Claims. (Cl. 260—677)

1. A process for the selective hydrogenation of acetylenes which comprises; passing a feedstock mixture of an

olefin containing a minor proportion of an acetylene with a molecular hydrogen-containing gas over a selective hydrogenation caltayst at a reaction temperature in the range of 0–200° C.; said catalyst formed by impregnating a porous catalyst base with a solution of nickel formate; heating the impregnated porous catalyst base under non-oxidising conditions at a temperature of between about 150–300° C. sufficient to decompose the nickel formate and liberate metallic nickel whereby metallic nickel is deposited on said base and a catalyst thereby formed; and substantially simultaneuosly with said heating sweeping out volatile decomposition products of the nickel formate by means of a stream of non-oxidising gas over the catalyst at a high flow rate of at least 500 vol./vol/hour.

3,274,283

PRODUCTION OF CONJUGATED DIOLEFINES

James Robert Bethell, Epsom Downs, England, assignor to The Distillers Company Limited, Edinburgh, Scotland, a British company

No Drawing. Filed Apr. 16, 1962, Ser. No. 187,980
Claims priority, application Great Britain, May 19, 1961, 18,257/61
16 Claims. (Cl. 260—680)

1. A process for the production of a conjugated diolefine which comprises reacting a mono-olefine selected from the group consisting of butene-1, butene-2, 2-methyl-butene-1 and 2-methylbutene-2, at an elevated temperature, in the vapor phase, with a molecular oxygen containing gas over a catalyst consisting of the mixture obtained by depositing phosphoric acid on tin oxide.

3,274,284

DEHYDROGENATION PROCESS

Olin C. Karkalits, Jr., and Clyde A. Leatherwood, Houston, Tex., assignors to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware

No Drawing. Filed Mar. 5, 1963, Ser. No. 262,842
7 Claims. (Cl. 260—680)

1. An improved process for the dehydrogenation of organic compounds which comprises: heating in a dehydrogenation zone at a temperature of at least 400° C. a mixture of an organic compound to be dehydrogenated, oxygen, and at least about 0.0001 mol of ammonium halide per mol of said organic compound to form a gaseous dehydrogenation zone effluent at a temperature of greater than 400° C., said effluent comprising dehydrogenated organic compound, steam and ammonium halide; quenching the said effluent with an aqueous quench; in a first separating step separating from the quenched effluent a non-gaseous phase comprising at least about 25 mol percent of the ammonium halide and a gaseous phase comprising steam, the unsaturated organic compound and the remainder of the ammonium halide; in a second step condensing from about 20 to 75 mol percent of the steam from the said gaseous phase to form a condensate containing condensed steam and ammonium halide and a vapor phase comprising the unsaturated organic compound and the uncondensed steam, the ratio of the mols of ammonium halide contained in the said condensate to the mols of ammonium halide remaining in the said vapor phase being at least 10 percent greater than the ratio of the mols of steam condensed in said second step to the mols of steam remaining in said vapor phase, at least 80 mol percent of the ammonium halide originally present in the said dehydrogenation zone effluent having been removed from the gaseous phase in the first and second separation steps; and separating the unsaturated organic compound product from the said vapor phase of the second step.

3,274,285

PROCESS FOR DEHYDROGENATING

Laimonis Bajars, Princeton, N.J., assignor to Petro-Tex Chemical Corporation, Houston, Tex., a corporation of Delaware

No Drawing. Filed June 11, 1965, Ser. No. 463,372
16 Claims. (Cl. 260—680)

1. The method for dehydrogenating aliphatic hydrocarbons of 4 to 6 carbon atoms which comprises heating in the vapor phase at a temperature of from about 450° C. to 850° C. an aliphatic hydrocarbon of 4 to 6 carbon atoms with oxygen in a molar ratio of at least one-fourth mol of oxygen per mol of said hydrocarbon and chlorine in a molar ratio of less than 0.5 mol of chlorine per mol of said hydrocarbon, the partial pressure of said hydrocarbon being equivalent to less than about one-fifth atmosphere at a total pressure of one atmosphere, with a material selected from the group consisting of metals, salts, oxides and hydroxides of cobalt and mixtures thereof in a catalytic amount, the ratio of the gram mols of the said oxygen to the gram atoms of said chlorine being at least 1.50.

3,274,286

PROCESS FOR THE REMOVAL OF ACETYLENIC HYDROCARBONS FROM HYDROCARBON MIXTURES CONTAINING DIOLEFINES

Manfred Reich, Marl, Germany, assignor to Chemische Werke Huls Aktiengesellschaft, Marl, Germany, a corporation of Germany

No Drawing. Filed Jan. 23, 1964, Ser. No. 339,576
Claims priority, application Germany, July 10, 1963, C 30,407
2 Claims. (Cl. 260—681.5)

1. A mixer catalyst composition consisting essentially of from 5 to 50% by weight of a metal selected from the group consisting of copper and copper chromite, from 0.01 to 20% by weight of at least one element selected from the group consisting of group VIII of the periodic system of Mendeleeff, silver and zinc, and from 0.1 to 50% by weight of a compound selected from the group consisting of the oxides and hydroxides of the elements of groups Ia and IIa of the periodic system of Mendeleeff and a carrier in amount constituting at least 40% by weight of the mixed catalyst.

2. A process for the reduction of the acetylenic hydrocarbon content of a hydrocarbon mixure containing it and a diolefine by selective hydrogenation in the gas phase which comprises passing the hydrocarbon mixture in the form of gas and a quantity of hydrogen which is at least molecularly equivalent to said acetylenic hydrocarbon content at a temperature within the range from 30° to 250° and at a pressure within the range from 0.2 to 30 atmospheres over and in contact with the catalyst composition defined in claim 1.

3,274,287

HYDROCARBON CONVERSION PROCESS AND CATALYST

Richard N. Moore and James F. Roth, St. Louis, Mo., assignors to Monsanto Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Filed Apr. 21, 1964, Ser. No. 361,552
16 Claims. (Cl. 260—683.3)

1. A process for the dehydrogenation of acyclic saturated hydrocarbons to form mono-ethylenically unsaturated hydrocarbons which comprises contacting said acyclic saturated hydrocarbons in the presence of 0.5 to 5 moles of hydrogen per mole of hydrocarbon at an elevated temperature, a pressure and contact time sufficient to produce said mono-ethylenically unsaturated hydrocarbons, with a catalyst comprised of 0.02 to 2.0 percent by weight of a noble metal dispersed on a low acidity alumina support having an acidity factor of no greater than 2.0, said low acidity alumina having a surface area of at least 10 square meters per gram and a macropore volume of at least 0.05 cc./gram, said noble metal being highly dispersed on said low acidity support and distributed on said support sufficiently to produce a local noble metal concentration profile such that at least 50 percent by weight of the total noble metal present in a catalyst particle is present in a local concentration of no greater than twice that of the total concentration of noble metal in said catalyst particle.

3,274,288

PREPARATION OF ORGANOPOLYSILOXANE RESINS

Glyn I. Harris and Hedley S. B. Marshall, Dinas Powis, Glamorgan, Wales, assignors to Midland Silicones Limited, London, England

No Drawing. Filed Dec. 24, 1963, Ser. No. 333,167
15 Claims. (Cl. 260—825)

1. A process for the preparation of organosilicon compositions having a ratio of organic groups to silicon atoms in the range from 1.01 to 1.85 comprising forming a mixture of the hydrolysis products of at least one diorganodichlorosilane of the formula R_2SiCl_2 and at least one silane of the general formula $RSiCl_nX_{3-n}$ wherein n has a value of from 1 to 2 inclusive, R represents a monovalent radical selected from the group consisting of hydrocarbon radicals and substituted hydrocarbon radicals and X is an alkoxy radical which is less easily hydrolyzable than the chlorine atoms under the conditions of the hydrolysis reaction, said hydrolysis being carried out under conditions wherein the pH value of the hydrolysis medium is maintained within the range from 5.5 to 9.0 at a temperature of from 0–25° C.

3,274,289

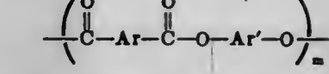
HOMOGENEOUS BLENDS OF POLYAMIDES WITH CARBOXYLATE COPOLYMERS CONTAINING A NEUTRAL MONOMER COMPRISING BUTADIENE-1,3, VINYL CHLORIDE, OR A MIXTURE OF BUTADIENE-1,3 AND METHYL METHACRYLATE

James David Murdock, St. Hilaire, Quebec, Norman Nelan, Scarborough, Ontario, and Gordon Hart Segall, St. Hilaire, Quebec, Canada, assignors to Canadian Industries Limited, Montreal, Quebec, Canada, a corporation of Canada

No Drawing. Original application May 2, 1960, Ser. No. 25,832, now Patent No. 3,236,914, dated Feb. 22, 1966. Divided and this application Sept. 14, 1964, Ser. No. 396,413
Claims priority, application Great Britain, May 12, 1959, 16,275/59
3 Claims. (Cl. 260—857)

1. A homogeneous blend of from 1 to 99 parts of a linear polymeric carbonamide which contains recurring carbonamide groups as an integral part of the polymer chain, said carbonamide groups being separated by at least two carbon atoms, and from 99 to 1 parts of a substantially linear synthetic copolymer containing from 98 to 50 parts by weight of a neutral monomer whose polymer is normally substantially incompatible with said linear polymeric carbonamide and from 2 to 50 parts by weight of an α,β-ethylenically unsaturated carboxylic acid, said neutral monomer being selected from the group consisting of butadiene-1,3, vinyl chloride and a mixture of butadiene-1,3 and methyl methacrylate.

3,274,290

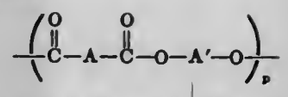


RIGID, SEGMENTED COPOLYESTERS HAVING RECURRING AROMATIC SULFONATE ESTER UNITS

Eugene P. Goldberg, Highland Park, and Frank Scardiglia, Arlington Heights, Ill., assignors to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois

No Drawing. Filed Oct. 25, 1963, Ser. No. 318,841
10 Claims. (Cl. 260—860)

1. A rigid tough linear segmented block copolymer consisting essentially of



(1) recurring aromatic carboxylate ester structural units of the formula

(2) recurring aromatic sulfonate ester structural units of the formula

$$+O_2S—Ar''—SO_2—O—Ar'''—O+_n$$

and (3) recurring aliphatic polyester structural units of the formula

wherein Ar, Ar', Ar'', and Ar''' are bivalent aromatic radicals, A and A' are bivalent aliphatic radicals, m and n are positive integers equal to at least one, and p is a positive integer equal to at least 5, said aliphatic polyester units of said copolymer having a molecular weight of between about 500 and about 20,000.

3,274,291

MIXTURES OF UNSATURATED POLYESTERS AND MONOMERIC ETHYLENE COMPOUNDS COPOLYMERIZABLE THEREWITH CONTAINING COBALT SALTS AND A MEMBER OF THE GROUP OF ARSINES, STIBENES, AND PHOSPHINES

Karl Raichle, Krefeld-Urdingen, and Hans Rudolph, Krefeld-Bockum, Germany, assignors to Farbenfabriken Bayer Aktiengesellschaft, Leverkusen, Germany, a German corporation

No Drawing. Filed June 8, 1962, Ser. No. 200,947
Claims priority, application Germany, July 5, 1961, F 34,347
10 Claims. (Cl. 260—863)

1. A polymerization mixture which is hardenable at room temperature by the addition of a ketone peroxide polymerization initiator comprising:

(A) An unsaturated polyester prepared from an α,β-unsaturated dicarboxylic acid and a polyhydric alcohol, said polyester having an acid number below about 50

(B) A monomeric ethylenically unsaturated compound co-polymerizable therewith

(C) A cobalt accelerator

(D) From 0.01 to 0.1 percent by weight of a member selected from the group consisting of phosphines, arsines and stibines and

(E) An acidic green-coloration inhibitor.

2. A polymerization mixture which is hardenable at room temperature by the addition of a ketone peroxide polymerization initiator comprising:

(A) An unsaturated polyester prepared from an α,β-unsaturated dicarboxylic acid and a polyhydric alcohol, said polyester having an acid number above about 50

(B) A monomeric ethylenically unsaturated compound co-polymerizable therewith

(C) A cobalt accelerator and

(D) From 0.01 to 0.1 percent by weight of a member selected from the group consisting of phosphines, arsines and stibines.

3,274,292
UNSATURATED POLYESTERS PREPARED FROM COMPLEX SULFUR-CONTAINING CARBOXYLIC ACIDS DERIVED FROM PETROLEUM

Louis A. Joo, Johnson City, Tenn., and Theodore H. Szawlowski, Wonder Lake, Ill., assignors, by mesne assignments, to Union Oil Company of California, Los Angeles, Calif., a corporation of California

No Drawing. Filed Dec. 26, 1962, Ser. No. 247,356
20 Claims. (Cl. 260—867)

1. The reaction product of a predominantly monocarboxylic acid fraction of mixed mono-, di- and polycarboxylic acids derived from solvent extracts obtained in the solvent extraction of mineral lubricating oils using a solvent selective for aromatic compounds by metalation of said solvent extracts to form the alkali metal adduct, carbonation of said adduct to form the alkali metal salt of the corresponding carboxylic acids, fractionation of said salt to recover the predominantly monocarboxylic acid salt and acidification of said salt fraction to form the free monocarboxylic acid fraction, said monocarboxylic acid fraction being characterized by an average molecular weight of about 300 to 750, and containing about 1.0 to 4.5 weight percent of combined sulfur in heterocyclic form and an average of 1.7 to 5.0 aromatic rings per mean aromatic molecule, and a polyol and an unsaturated dibasic acid under esterification conditions at a temperature of about 350° to 500° F.

3,274,293
CROSS-LINKED HALOGENOUS POLYESTER COMPOSITIONS PREPARED FROM ALKYLENE OXIDES AND MONOFUNCTIONAL HALOGENATED ALCOHOLS

Gunther Elfers, Grosse Ile, and Pauls Davis, Gibraltar, Mich., assignors to Wyandotte Chemicals Corporation, Wyandotte, Mich., a corporation of Michigan

No Drawing. Filed Dec. 28, 1964, Ser. No. 421,685
70 Claims. (Cl. 260—869)

1. A cross-linked polyester resin which is the reaction product of

(I) an ethylenically unsaturated polyester of

(1) a dicarboxylic organic anhydride selected from the group consisting of

(a) ethylenically unsaturated dicarboxylic acid anhydrides and

(b) mixtures of the ethylenically unsaturated dicarboxylic acid anhydride and a member of the group consisting of saturated dicarboxylic acid anhydrides and dicarboxylic acid anhydrides free of other than aromatic unsaturation, the total amount of ethylenically unsaturated dicarboxylic material being present in amount of at least about 40% by weight of the total amount of dicarboxylic material as defined in (b), and

(2) at least one vicinal alkylene oxide selected from the group consisting of

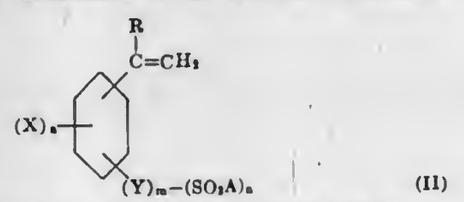
(a) an alkylene oxide containing from 2 to 18 carbon atoms inclusive, selected from the group consisting of saturated alkylene oxides which are free from other than aromatic unsaturation, and

(b) an alkylene oxide as defined in (a) but containing from 3 to 4 carbon atoms and at least 1 halogen atom, each halogen having from 1 to 2 alkyl groups attached to at least 1 carbon atom of the oxirane ring, said alkyl groups having up to 2 carbon atoms, and

(3) a halogenated monofunctional alcohol having the following general formula:

$$C_nH_{2n+1-z}Y_zOH$$

wherein n is an integer of from 1 to 11, z is an integer from 1 to 23, and Y is a halogen having an atomic weight of 19 to 80 inclusive,



(II) an ethylenically unsaturated cross-linking agent, said cross-linked polyester being characterized by a relatively high order of non-flammability and chemical resistance.

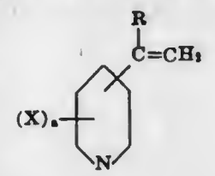
3,274,294
COMPOSITIONS COMPRISING GRAFT COPOLYMERS ON POLYESTER SUBSTRATES OF ONE OR MORE MONOMERS FROM THE GROUP INCLUDING VINYL LACTAMS, SULFONATED ALKENYL AND/OR α-HALO ALKENYL AROMATICS, SULFONATED OLEFINS, SULFONATED ACRYLATES AND METHACRYLATES, VINYL PYRIDINES, AMINATED ALKENYL AROMATICS, AMINATED ACRYLATES AND METHACRYLATES, AND MONOMERIC POLYGLYCOL ETHERS OF ALKENYL AROMATICS

George W. Stanton, Walnut Creek, and Teddy G. Traylor, Del Mar, Calif., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Filed June 22, 1962, Ser. No. 206,127
9 Claims. (Cl. 260—873)

1. Dye receptive graft copolymer composition compound of (1) a polyester polymer substrate which is a fiber-forming polymer having as an essential ingredient in the polymer chain recurring units of an aromatic nucleus having chemically attached thereto to carbon atoms in its chain, as graft copolymerized substituents thereon, a minor proportion of up to about 20 weight percent based on the weight of the composition, of units consisting of (2) a polymerized monomer selected from the group of monomers consisting of vinyl lactam monomers (I); sulfonated aromatic monomers of the structural formula:

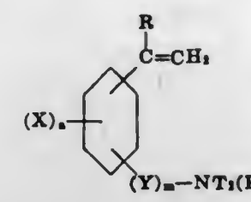
(II)



wherein R is selected from the group consisting of hydrogen, and methyl, X is individually selected from the group consisting of hydrogen, chlorine, bromine, and alkyl radicals containing from 1 to 8 carbon atoms, Y is selected from the group consisting of bivalent and trivalent hydrocarbon radicals containing 1 to 4 carbon atoms, A is selected from the group consisting of hydrogen, alkali metals, and alkyl radicals containing 1 to 5 carbon atoms, a is an integer from 1 to 4; m has a numerical value in whole units of 0 to 1, n is an integer from 1 to 2, sulfonated olefin monomers of the structural formula:

$$CH_2=CZ-(Y)_m-(SO_3A)_n \quad \text{(III)}$$

wherein Z is selected from the group consisting of hydrogen, chlorine, bromine, carboxyl radicals, carboxymethyl radicals, sulfo radicals, cyano radicals, aryl radicals containing from 6 to 12 carbon atoms, and alkyl radicals containing from 1 to 8 carbon atoms, and Y, A, m and n are as defined above for monomer (II); sulfonated acrylate and methacrylate monomers of the structural formula:

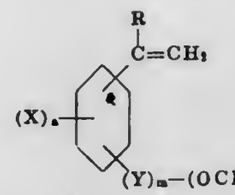


$$CH_2=CR-CO-Q-Y-(SO_3A)_n \quad \text{(IV)}$$

wherein Q is selected from the group consisting of divalent sulfur, oxygen and amide nitrogen, and R, Y, A and n are as defined above for monomer (II); vinyl pyridine monomers of the structural formula:

(V)

wherein R, X and a are as defined above for monomer (II); aminated alkenyl aromatic monomers of the structural formula:



(VI)

wherein T is independently selected from the group consisting of hydrogen, alkyl radicals from 1 to 4 carbon atoms and hydroxyethyl radicals, U is a common anion and R, X, Y, a and m are as defined above for monomer (II); aminated acrylate and methacrylate monomers of the structural formula:

$$CH_2=CR-CO-Q-Y-NT_2(RU)_m \quad \text{(VII)}$$

wherein R, Q, Y, T, U and m are as defined above for monomers (II), (IV) and (VI); and monomeric polyglycol ethers of alkenyl aromatics of the structural formula:

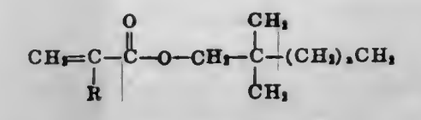
(VIII)

wherein b has an average numerical value between about 1 and 40, and R, X, Y, T, a and m are as defined above for monomers (II), (IV) and (VI).

3,274,295
BLOCK COPOLYMERS OF VINYLIDENE COMPOUNDS AND PERFLUORINATED NON-VINYL MONOMERS

William P. Baker, Jr., Chadds Ford, Pa., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Filed Oct. 13, 1965, Ser. No. 495,728
10 Claims. (Cl. 260—879)



1. A normally solid thermoplastic block copolymer having as a non-recurring central segment, a polymer of a monomer selected from the group consisting of conjugated dienes, esters of acrylic and alpha-substituted acrylic acids, ethylenically unsaturated nitriles, vinyl pyridines, methylene malonates and aryl-substituted olefins, said central segment being composed of at least 10 units of said monomer and having attached at each end a polymeric segment of a perfluorinated monomer selected from the group consisting of thiocarbonyl difluoride, tetrafluoroethylene epoxide and tetrafluoroethylene episulfide, said monomer being devoid of groups containing an active hydrogen atom as determined by the Zerewitinoff test, and said perfluorinated monomer constituting 0.5 to 98% of the sum of the moles of said block copolymer.

3,274,296
GRAFT POLYMERS OF 2,2-DIMETHYL ALKYL ACRYLATE MONOMER ON A POLYMERIC VINYLIDENE CHLORIDE BACKBONE

Hugh J. Hagemeyer, Jr., Alden E. Blood, and Marvin B. Edwards, Longview, Tex., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

No Drawing. Filed Sept. 12, 1963, Ser. No. 308,377
6 Claims. (Cl. 260—883)

1. A resinous graft copolymer of (1) from 5–55% by weight of a monomeric compound having the general formula:

wherein x represents an integer of from 1–11 and R represents a member selected from the group consisting of a hydrogen atom and a methyl group, and (2) from 95–45% by weight of a preformed copolymer consisting of at least 80% by weight of vinylidene chloride and not more than 20% by weight of at least one monoethylenically unsaturated compound containing a —CH=C< group.

2. A resinous graft copolymer of (1) from 15–45% by weight of a 2,2-dimethyl hexyl acrylate, and (2) from 85–55% by weight of a preformed copolymer consisting of not more than 80% by weight of vinylidene chloride and not more than 20% by weight of N-2,2-dimethylbutyl methacrylamide.

3,274,297
GRAFT POLYMERS OF VINYL CHLORIDE ON A BACKFORE COPOLYMER OF VINYL ALCOHOL AND VINYL 2,2-DIMETHYLALKANOATE

Hugh J. Hagemeyer, Jr., Alden E. Blood, and Marvin B. Edwards, Longview, Tex., assignors to Eastman Kodak Company, Rochester, N.Y., a corporation of New Jersey

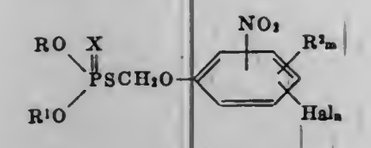
No Drawing. Filed Sept. 12, 1963, Ser. No. 308,374
8 Claims. (Cl. 260—884)

1. A resinous graft copolymer of (1) from 20–50% by weight of monomeric material selected from the group consisting of (a) vinyl chloride and (b) a mixture consisting of at least 70% by weight of vinyl chloride and the remainder of the vinyl ester of a 2,2-dimethylalkanoic acid containing from 5–16 carbon atoms, and (2) from 80–50% by weight of a preformed copolymer consisting of at least 50% by weight of vinyl alcohol and the remainder of the vinyl ester of a 2,2-dimethylalkanoic acid containing from 5–16 carbon atoms.

4. A resinous graft copolymer of (1) from 20–50% by weight of monomeric material selected from the group consisting of (a) vinyl chloride and (b) a mixture of at least 70% by weight of vinyl chloride and the remainder of the vinyl ester of a 2,2-dimethylalkanoic acid containing from 5–16 carbon atoms, (2) from 80–50% by weight of a preformed copolymer consisting of at least 50% by weight of vinyl alcohol and the remainder of the vinyl ester of a 2,2-dimethylalkanoic acid containing from 5–16 carbon atoms and (3) from 0.5–1.0% by weight of a cross-linking agent selected from the group consisting of divinylbenzene, diallyl phthalate, allyl acrylate, triallyl cyanurate and ethylene glycol diacrylate.

3,274,298
COATING COMPOSITION FOR COMPOSITE PACKAGING SHEETS

John T. Massengale, West Chester, and Walter T. Koch, Drexel Hill, Pa., assignors to FMC Corporation, Philadelphia, Pa., a corporation of Delaware



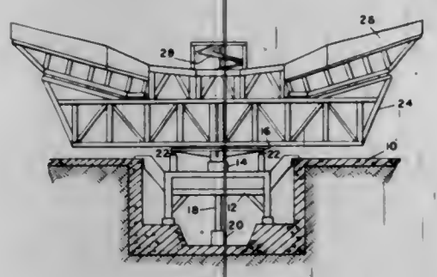
No Drawing. Filed June 1, 1964, Ser. No. 371,812
5 Claims. (Cl. 260—898)

1. A coating composition comprising an organic solvent solution of a blend of (1) from about 65 to 98% by weight of a copolymer of from 80 to 92 parts vinylidene chloride and from 20 to 8 parts acrylonitrile with (2) from about 35 to 2% by weight of an interpolymer of from 70 to 90 parts of vinylidene chloride, from 5 to 25 parts of a monomer selected from the group consisting of methacrylic acid, acrylic acid and mixtures thereof and

from 0 to 10 parts of a monomer selected from the group consisting of acrylonitrile, lower alkyl acrylates and lower alkyl methacrylates.

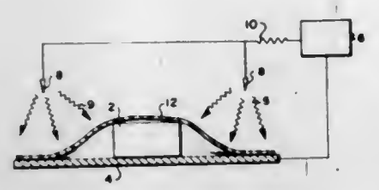
3,274,299
O,O-DIALKYL NITROPHENOXYMETHYL-PHOSPHOROTHIOATES
Edward N. Walsh, Chicago Heights, Ill., and John G. Brady, Campbell, Calif., assignors to Stauffer Chemical Company, New York, N.Y., a corporation of New York
No Drawing. Filed May 17, 1963, Ser. No. 281,324
5 Claims. (Cl. 260—951)

1. A compound having the formula:



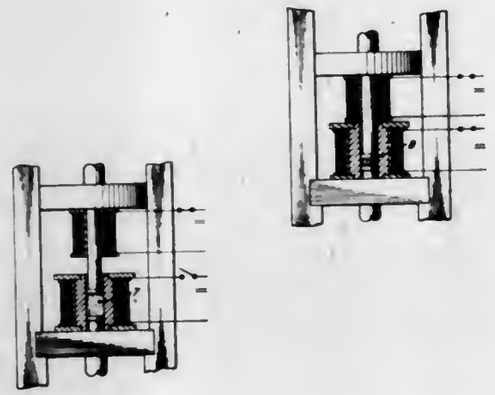
wherein R, R^1, and R^2 are 1 to 4 carbon alkyl, X is a member selected from the group consisting of oxygen and sulfur, Hal represents a halogen atom, and m and n are integers from 0 to 3 inclusive, with the sum of $m+n$ not greater than 3.

3,274,300
PREPARATION OF O,O-DIALKYL PHOSPHORODITHIOATES
John R. Van Wazer, La Due, and Kurt Moedritzer, Webster Groves, Mo., assignors to Monsanto Company, a corporation of Delaware
No Drawing. Filed Dec. 30, 1963, Ser. No. 334,610
5 Claims. (Cl. 260—981)



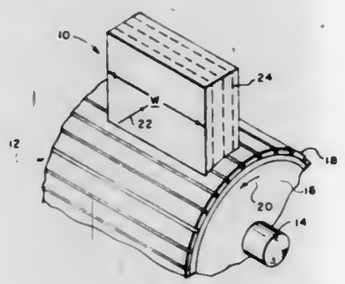
1. Process for the preparation of O,O-dialkyl phosphorodithioates which comprises mixing and contacting phosphorus sulfide as a solid solution with an excess of sulfur such that the total sulfur/phosphorus atomic ratio is from 2.6 to 4.0 with an alcohol having from 1 to 20 carbon atoms at a temperature which is substantially that of the boiling point of the said alcohol, the proportion of the said alcohol being in approximately stoichiometric relationship to the phosphorus present.

3,274,301
SPIN CASTING PARABOLOIDAL SURFACES
John F. Kulp, Jr., Malvern, Pa., assignor to General Electric Company, a corporation of New York
Filed Oct. 1, 1962, Ser. No. 227,182
5 Claims. (Cl. 264—1)



1. A method for producing a cast paraboloidal surface comprising:
depositing a liquid resin formulation in an open topped container;
said resin formulation including a volatile hardener;
maintaining above the surface of said resin formulation an atmosphere rich in said hardener; and
rotating said container at a substantially constant speed about a vertical axis while said resin formulation is permitted to cure.

3,274,302
METHOD OF EMPLOYING ELECTROSTATIC MEANS IN A HEAT SHRINKING PROCESS
Kelvin G. Anderson, Greer, and Ivan F. Churchill, Greenville, S.C., assignors to W. R. Grace & Co., Duncan, S.C., a corporation of Connecticut
Filed May 6, 1964, Ser. No. 365,272
6 Claims. (Cl. 264—22)

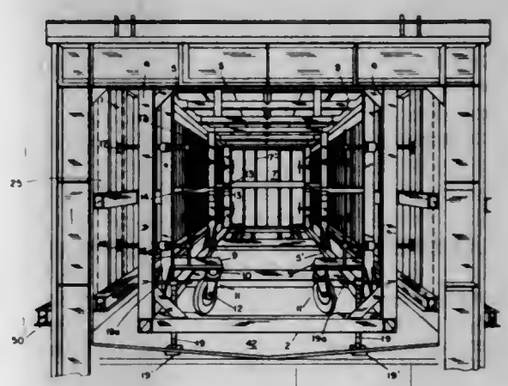


1. A method for heat shrinking a dielectric thermoplastic heat shrinkable material about an object comprising:
(a) placing said object on an electrically chargeable support,
(b) placing said material over at least a portion of said object, the peripheral portions of said material extending beyond the periphery of said object,
(c) electrostatically charging said material sufficient to attract the peripheral portions of said material toward said support and restrain movement of said material and,
(d) heating at least a portion of said material to heat shrinking temperatures sufficient for the shrink energy of the film to overcome the restraining force of the electrostatic charge and to shrink the material about at least a portion of the object.

3,274,303
METHOD AND APPARATUS FOR MAKING MAGNETICALLY ANISOTROPIC PERMANENT MAGNETS
Werner Müller, Bad Godesberg, Germany, assignor to Magnetfabrik Bonn Gewerkschaft Windhorst, Bonn, Germany
Filed Dec. 18, 1962, Ser. No. 245,610
Claims priority, application Germany, Dec. 21, 1961, M 51,256
3 Claims. (Cl. 264—24)

1. A method of making magnetically anisotropic permanent magnets comprising subjecting a powder of a permanent ferromagnetic material placed in a confined space to a magnetic force which lifts particles of said magnetic powder so as to expand said powder and render said particles more mobile, then applying a magnetic field across said expanded powder, thereby orienting said particles while in said mobile condition, and finally compacting said powder in said confined space while said magnetic field is applied.

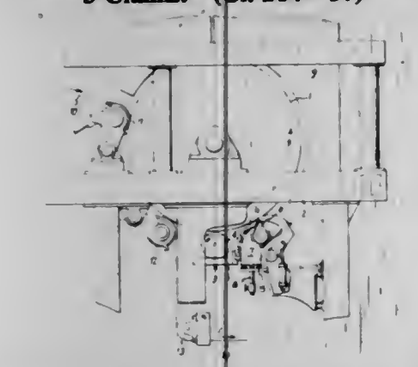
3,274,304
METHOD OF MAKING IMPURITY-TYPE SEMICONDUCTOR ELECTRICAL CONTACTS
Jackson C. Horton and Harry M. King, Huntsville, Ala., assignors to the United States of America as represented by the Administrator of the National Aeronautics and Space Administration
Filed Nov. 26, 1963, Ser. No. 326,299
3 Claims. (Cl. 264—27)



1. A method of making an impurity-type semiconductor electrical contact brush, comprising:
(a) mixing from 15 to 99 percent by volume of powdered molybdenum disulphide with from 1 to 85 percent by volume of a powdered metal selected from a group of copper, silver, and mixtures thereof;
(b) placing said mixture in a mold;
(c) compacting said mixture by pressure applied in one direction at approximately 3500 pounds per square inch;
(d) firing said mixture at a sufficiently high temperature and for a period of time to convert said mixture into a sintered block of overly doped anisotropic molybdenum disulphide;
(e) removing said block from said mold for cooling to ambient temperature;
(f) shaping said block into the desired form of an electrical contact brush so that its plane of laminations are substantially perpendicular to and have a maximum width along the surface to be contacted by said brush;
(g) passing an electrical current through said block of sufficient strength to product a temperature rise of from 80 to 100 degrees centigrade; and
(h) removing said electrical current and allowing said block to cool to ambient temperature thereby producing a lattic reorientation due to intrinsic heating and thereby lowering the specific resistivity of said brush.

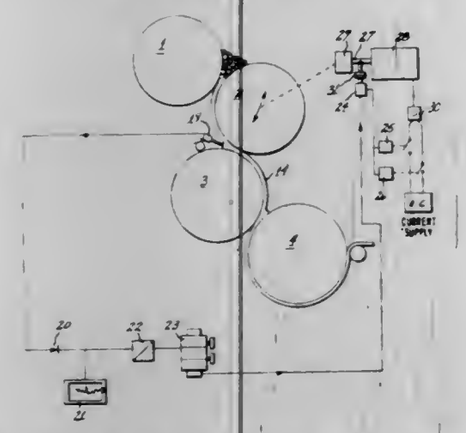
3,274,305
METHOD OF FORMING CONCRETE ROOFS
Thomas W. Short, Realty and Trust Bldg., Kerrville, Tex.
Filed Oct. 22, 1965, Ser. No. 501,277
8 Claims. (Cl. 264—31)

1. A method of forming a concrete roof by means of a trailer having a pair of longitudinally disposed upwardly extending support members operatively secured at their bases to the trailer and having a longitudinal bar extending between the upper ends of the support members with a pair of roof forms pivotally connected to the longitudinal bar wherein the roof forms assume a predetermined axis irrespective of the alignment of the trailer with respect to that axis comprising steps of:
transporting the trailer to a building site with the roof forms in a collapsed transporting position operatively and pivotally connected to the trailer, the axis of the trailer being disposed from the predetermined central axis of the roof forms;
stably supporting the trailer on the ground;
laterally adjusting with respect to the trailer the upper end of at least one support member independently of the upper end of the other support member so as to laterally align the central axis of the roof forms as defined by the longitudinal bar irrespective of the lateral misalignment of the trailer at the building site;
supporting the roof forms on the trailer while moving the roof forms into an upwardly extended position of support; and
pouring concrete on the upper surface of the roof forms to form a concrete roof.



3,274,306
METHOD FOR CASTING CONCRETE STRUCTURES
Lorenz Kesting, Lunen-Brambauer, Germany, assignor to Bauunternehmung Lorenz Kesting, Lunen-Brambauer, Germany, a corporation of Germany
Filed Jan. 8, 1964, Ser. No. 336,556
Claims priority, application Germany, Jan. 9, 1963, B 70,264
2 Claims. (Cl. 264—34)

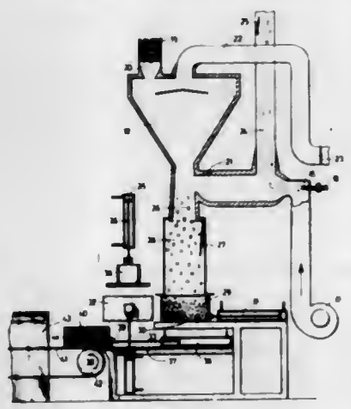
1. A method of producing concrete structures having a plurality of angularly adjoining walls, comprising the steps of:
(a) forming a generally flat concrete foundation slab having a plurality of edges;
(b) disposing a movable inner-form body having spreadable upright wall-forming panels and a roof-forming panel upon said foundation slab;
(c) shifting said wall-forming panels laterally to dispose them substantially in the region of said edges of said foundation slab and affixing outer-form members to said body in spaced relationship with said panels so as to define therewith mold chambers for the roof and walls of a structure to be cast with said mold chambers terminating at said edges of said slab;
(d) pouring concrete into said chambers and permitting said concrete to set therein to form walls of said structure in situ substantially contiguous with said slab and a roof substantially monolithically connected with said walls;
(e) detaching said outer-form members from said body and withdrawing said panels inwardly on said body from engagement with the walls and roof of the structure formed upon setting of said concrete; and



(f) shifting said body unitarily with said panels thereon out of said structure.

3,274,307
METHOD AND MEANS FOR CONTROLLING FOAMING OF CLAY COATING COMPOSITION DURING APPLICATION
Frank D. Bergstein, Wyoming, and Alfred B. Kleingers, Jr., and Leonard Back, Middletown, Ohio, assignors to Bergstein Packaging Trust, Middletown, Ohio, a corporation of Ohio
Filed Mar. 1, 1962, Ser. No. 176,605
3 Claims. (Cl. 264—37)

1. A method for removing foam and entrained air bubbles from a slurry of casting composition recovered as an incident of a casting operation, which method comprises continuously collecting the recovered slurry of casting composition in a vessel which is relatively deep as compared to its width, maintaining said vessel essentially filled with said casting composition, subjecting the vessel and the casting composition therein to vibration at a frequency on the order of from 2000 to 5000 vibrations per minute, and continuously withdrawing casting composition from the lowermost portion of said relatively deep vessel.



3,274,308
CALENDER BANK SIZE AUTOMATIC CONTROL SYSTEM
John Thomas Freeman, Freehold, N.J., and Carl William Sanders, Newark, Del., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Jan. 2, 1964, Ser. No. 335,220
7 Claims. (Cl. 264—40)

1. A calendar roll apparatus for continuously preparing viscous sheet material comprising
(A) detector means for signalling the bank size of said material formed by the nip of said calender roll;
(B) means of creating a deviation signal representing the difference between said bank size signal and a preset signal for the optimum bank size; and
(C) control means for governing the nip size by moving said calendar roll a distance dependent upon a correction signal representing the difference between a signal corresponding to the actual nip size and said deviation signal.

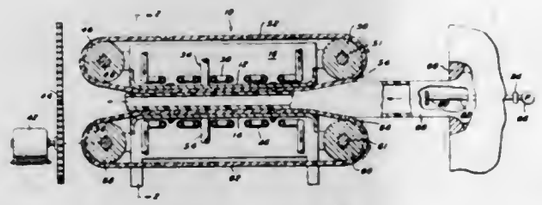
3. A method for preparing continuous sheets of photopolymeric material which comprises
(A) feeding said material between calendar rolls capable of being adjusted to change the nip size;
(B) producing a signal representing the actual calender bank size in said nip;
(C) comparing the actual bank signal with a preferred bank size signal and forming a deviation signal for any difference in said bank signals; and
(D) adjusting said calender roll nip utilizing said deviation signal to give said preferred calender roll bank size.

3,274,309
METHOD FOR PRODUCING BUILDING ELEMENTS AND ESPECIALLY BUILDING STONES OF SINTERED MATERIAL OR THE LIKE
Walter Schreieck, 52 Hauptstrasse, Trosdorf, Upper Franconia, Germany
Filed June 1, 1965, Ser. No. 460,434
2 Claims. (Cl. 264—42)

1. The method of producing light-weight building elements of predetermined size and shape and of cellular structure by molding granulated bloated mineral material after heating said material to a state wherein the interior of the granules is bloated while the outer surface is plasticized, comprising the steps of feeding a batch of unbloated granulated material into a reaction chamber, introducing a stream of hot gas into the chamber, introducing a stream of hot gas into the chamber, maintaining the granules of the batch in suspension in the stream of hot gas until the granules reach the state in which the interior is bloated and the outer surface plasticized, arresting the flow of the stream of hot gas into said reaction chamber, withdrawing the bloated batch from said reaction chamber, immediately filling the bloated granules of the batch into at least one mold of predetermined size and shape, compacting the granules within said mold for increasing the density of the molded material, cooling the molded material to a stable condition and removing the thus produced light-weight building element from the mold.

3,274,310
METHOD OF MAKING A POROUS CERAMIC PRODUCT
Lou Kohl, Palatine, Ill., assignor, by mesne assignments, to The Celotex Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Filed Mar. 19, 1964, Ser. No. 353,261
6 Claims. (Cl. 264—43)

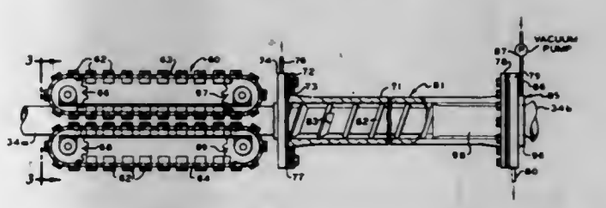
1. The method of making a porous ceramic product comprising the steps of forming a shaped wet mass of expanded mineral aggregate in particulate form carrying a thin aqueous clay coating of between 50 and 300×10^{-7} cm. in thickness on the particles, said mass having a water content of from about 9% to 26% by volume of the dry ingredients, placing said shaped wet mass into a furnace whose temperature is within the range of between 1450° F. and 1700° F., and maintaining said wet mass at a surface temperature within said range for a time period, the duration of said time period being from a minimum of 8 minutes at said temperature of 1700° F. to a maximum of 60 minutes at said temperature of 1450° F.



3,274,311
METHOD OF MOLDING ALUMINA
David R. Watson, Benton, Kizhakke G. Hrishikesan, Little Rock, and Jerome S. Deutscher, Benton, Ark., assignors to Reynolds Metals Company, Richmond, Va., a corporation of Delaware
No Drawing. Filed Apr. 25, 1963, Ser. No. 275,496
11 Claims. (Cl. 264—63)

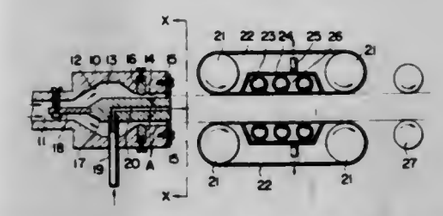
1. Process for the manufacture of a sintered alumina body which comprises the steps of forming a mixture of alumina and from about 0.5% to about 2.0% by weight of the alumina of at least one fatty acid, finely and intimately dry grinding said mixture, forming the ground mixture into a green compact, and firing said compact at a temperature not in excess of about 3000° F. to obtain said sintered alumina body.

3,274,312
PROCESS FOR PREPARING DYE-RECEPTIVE SHAPED ARTICLES
Mario Compostella, Emanuele Del Mauro, and Giovanni Latella, Terni, Italy, assignors to Montecatini Società Generale per l'Industria Mineraria e Chimica, Milan, Italy
No Drawing. Filed Dec. 17, 1962, Ser. No. 244,943
Claims priority, application Italy, Dec. 21, 1961, 22,809/61
7 Claims. (Cl. 264—78)



1. In the process for preparing dye-receptive shaped articles by extruding a mix containing (1) an olefin polymer and (2) a basic nitrogen polycondensate, obtained from (a) at least one amine selected from the group consisting of primary aliphatic amines containing 3–30 carbon atoms and secondary aliphatic amines containing 4–60 carbon atoms, (b) epichlorohydrin and (c) at least one member selected from the group consisting of aliphatic, aromatic and heterocyclic-bis secondary diamines, and stretching said shaped articles, the improvement which comprises transforming said mix into granules by sintering at a temperature of from 80° C. to about 170° C. before said extrusion step.

3,274,313
METHOD OF MAKING A HOLLOW ELONGATED PLASTIC ARTICLE
Harry J. Harp, Jr., Jenkintown, Pa., assignor to Union Carbide Corporation, a corporation of New York
Filed July 23, 1964, Ser. No. 387,265
4 Claims. (Cl. 264—89)

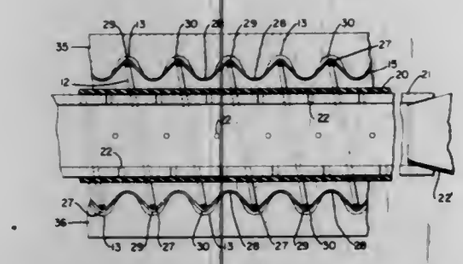


1. A method of making a hollow elongated article of a thin wall structure from a biaxial orientatable plastic material comprising the steps of extruding a hollow tubular member from said plastic material, directing said tubular member to a passage of the size and configuration of the article to be formed while passing it through a space which is sufficient to allow longitudinal stretching of said tubular member, maintaining a low pressure within said tubular member which is just sufficient to prevent its collapse as it is being passed through said space, stretching said tubular member in the longitudinal direction by pulling said tubular member through said space at a greater linear rate of speed than that at which it is extruded, passing said tubular member into said passage while maintaining it in the deformable state, drawing said tubular member against the walls of said passage by applying a vacuum around the periphery and along the length of said tubular member thereby reshaping it in the transverse direction to the size and configuration of the article to be formed, and cooling said tubular member as it is being reshaped within said passage so that said tubular member attains a state of rigidity prior to emergence from said passage.

3,274,314
THERMOPLASTIC FILM PRODUCTION
Jimmie E. Hudson, Bartlesville, Okla., and Clayton E. Ogier, Boulder, Colo., assignors to Phillips Petroleum Company, a corporation of Delaware
Filed June 13, 1963, Ser. No. 287,538
3 Claims. (Cl. 264—92)

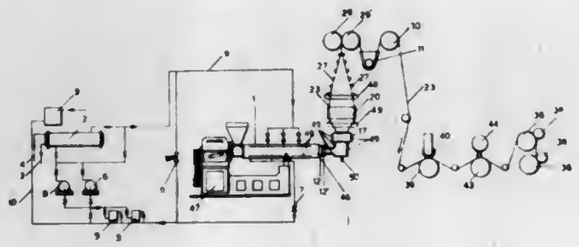
1. A process for eliminating longitudinal stretching of a thin flexible tubular film in a tubular heating zone which heats said tubular film to orientation temperature so that said film can be biaxially oriented beyond said heating zone, the process comprising creating a sufficient vacuum between said tube and the boundary of said tubular heating zone at the outlet end of said zone to draw said tubular film against said boundary to produce a drag on said film while in contact with said boundary, said drag being sufficient to substantially prevent longitudinal stretching of said film while in said heater, without substantial cooling of said film.

3,274,315
PROCESS FOR UNITIZED CONSTRUCTION OF SYNTHETIC RESIN BOARD OR CYLINDER
Yuzo Kawamura, Toyonaka-shi, Osaka-fu, Japan, assignor to Tokan Kogyo Co., Ltd.
Filed Feb. 25, 1963, Ser. No. 260,425
3 Claims. (Cl. 264—93)



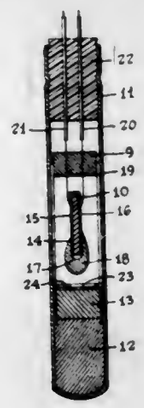
1. A method for making a resin board having a cellular structure of spaced spheres comprising the steps of extruding a thermoplastic resin in the cross-section selected, and injecting air into the extruding resin at spaced intervals of time to form said spheres.

2. A method for making a resin board having spaced boundary layers and a plurality of cells therebetween comprising the steps of continuously extruding a thermoplastic



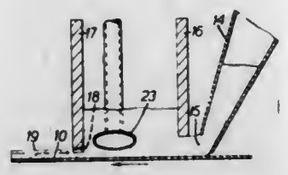
resin to produce a plurality of longitudinally extending chambers between spaced boundary layers, continuously injecting air under a predetermined pressure into the chambers formed by the extruding resin, stopping the movement of the extruded shape for a predetermined time while continuing to extrude resin to thereby form a dividing wall in each chamber defining one wall of a cell, then moving the extruded mass a distance equal to the preselected length of cell and forming additional dividing walls by stopping movement of the extruded shape for a predetermined time while continuing to extrude resin, and continuing the formation of dividing walls as aforesaid for the length of the board.

3,274,316
METHOD OF MAKING REINFORCED CORRUGATED HOSE
Paul A. Songer, Denver, Colo., assignor to The Gates Rubber Company, Denver, Colo., a corporation of Colorado
Filed July 20, 1964, Ser. No. 383,816
7 Claims. (Cl. 264—94)



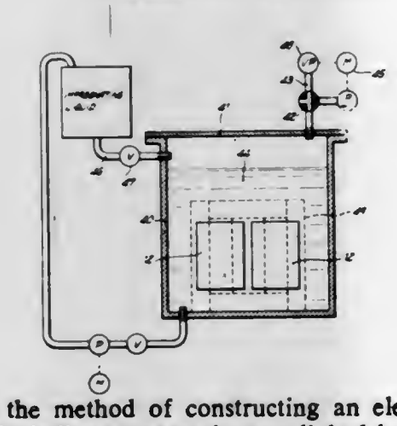
2. The method of manufacturing a spirally reinforced hose and molding said hose in a mold having a pitch defined by a spiral trough in the mold and having a diameter defined by the diameter of crests in the mold and by the diameter of troughs in the mold comprising the steps of: placing a spiral reinforcing member having axially spaced turns over a radially expandable form having on the surface thereof a spiral guide of a pitch identical to the pitch defined by the spiral trough of the mold; diametrically expanding said form to a diameter greater than the diameter defined by the crests of the mold but less than the diameter defined by the trough of the mold and aligning said reinforcing member with the axially spaced turns of the reinforcing member corresponding with the helical guide on the form; securing to the surface of said spiral reinforcing member a retention member thereby holding the spaced turns of the spiral reinforcing member in a fixed pitch and diametric relationship; separately forming a cylindrically shaped tube from elastomeric rubber and having a diameter less than the diameter of a cylinder described by the inner surface of the secured spiral reinforcing member; placing a length of said elastomeric tube around a hollow mandrel having orifices and to which hollow mandrel portion is attached a fluid pressure source; placing the secured spiral reinforcement over the elastomeric tube; enclosing the elastomeric tube with the secured spiral reinforcing member thereover between corrugated mold halves having smooth cylindrical end portions with the turns of the spiral reinforcing member in alignment with the troughs of the mold, the crests of which mold halves are of a diameter less than the diameter of the spiral reinforcing member but greater than the diameter of the elastomeric tube and the troughs of which are of a diameter greater than the diameter of the secured reinforcing member; simultaneously applying heat and fluid pressure to the interior of the elastomeric tube thereby forcing said elastomeric tube to conform to the mold interior and completely embedding said spiral reinforcement within the elastomeric tube and continuing said heating until component parts are completely vulcanized into a unitary hose structure.

3,274,317
METHOD AND APPARATUS FOR EXTRUSION OF PLASTIC MATERIAL
Mario Batosti, Milan, and Antonio Belloni, Padova, Italy, assignors, by mesne assignments, to Edison, Milan, Italy, a corporation of Italy
Filed July 26, 1963, Ser. No. 297,876
11 Claims. (Cl. 264—95)



1. The method of manufacturing tubular plastic material which comprises pumping a heat liquified plastic material into an extrusion means with a variable speed motor, extruding the heated plastic material through a die plate means, with external circumferential undulations, externally cooling said extrusion means, expanding said extruded material into a tubular configuration by blowing said extruded material with compressed air, flattening the expanded tube, cooling the extruded material in two separate stages subsequent to the blowing operation and prior to the flattening operation, additionally cooling the tube material during the flattening operation and subsequently subjecting the tube material to a water bath followed by winding said tube on spools.

3,274,318
METHOD OF MAKING STATIC-RESISTANT DETONATOR PLUG
Matthew L. Spillane, Tomaqua, and George J. Heimberger, Lehighton, Pa., assignors to Atlas Chemical Industries, Inc., Wilmington, Del., a corporation of Delaware
Original application Feb. 6, 1962, Ser. No. 171,421, now Patent No. 3,194,160, dated July 13, 1965. Divided and this application Oct. 8, 1964, Ser. No. 409,340
3 Claims. (Cl. 264—104)

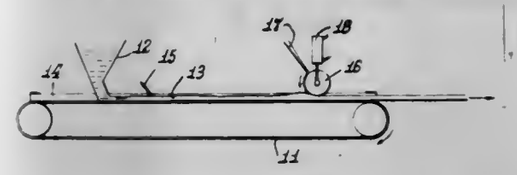


1. A method of producing a protective plug which comprises the steps of admixing finely divided aluminum with a melt of polyethylene, said aluminum present in amounts of from about 70 to about 80% by weight of the total mix, allowing the resultant mix to harden, grinding the hardened mix, and pressure forming by injection molding at a temperature above the melting point of the polyethylene to form a cohesive compacted mass.

3,274,319
MANUFACTURE OF RIBBED POROUS PLASTIC SHEETING
Joseph Clegg, Dagenham, Essex, England, assignor to Pritchett & Gold and E.P.S. Company Limited, Essex, England, a company of Great Britain
Filed Nov. 5, 1963, Ser. No. 321,505
Claims priority, application Great Britain, Nov. 7, 1962, 42,046/62
8 Claims. (Cl. 264—126)

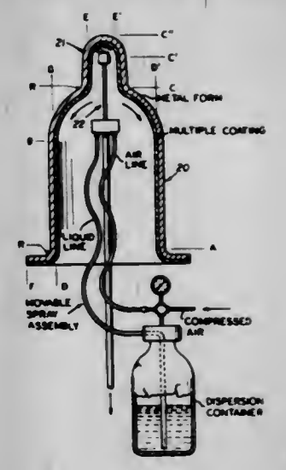
1. A method of producing plastic strip from a powder, which includes a layer of the powder on a travelling support under a stationary die which engages the powder to form the surface of the emerging layer, discharging air into the layer of powder approaching the die to render it fluid as it reaches the die and subsequently subjecting the layer to heat treatment to form the strip.

3,274,320
METHOD OF ENCAPSULATING TRANSFORMER
Hubert Reber, Zanesville, Ohio, assignor to McGraw-Edison Company, Milwaukee, Wis., a corporation of Delaware
Filed July 29, 1963, Ser. No. 298,108
3 Claims. (Cl. 264—135)



1. In the method of constructing an electrical transformer including a magnetic core linked by an encapsulated cylindrical coil having concentric layers of conductor turns, the steps of providing porous insulation between said conductor layers of said coil, immersing said coil in a liquid insulating dielectric impregnant, whereby said impregnant displaces air within the interstices of said coil, draining said liquid impregnant from said coil except that retained by capillary attraction within the interstices in said porous insulation, enveloping said coil in thermosetting encapsulating resin in liquid form, and curing said thermosetting resin.

3,274,321
METHOD OF MAKING CLEAR CELLULOSE FILMS FROM GREEN VISCOSE
John L. Justice, Wallingford, Pa., assignor, by mesne assignments, to FMC Corporation, San Jose, Calif., a corporation of Delaware
No Drawing. Filed Mar. 28, 1961, Ser. No. 98,734
4 Claims. (Cl. 264—189)

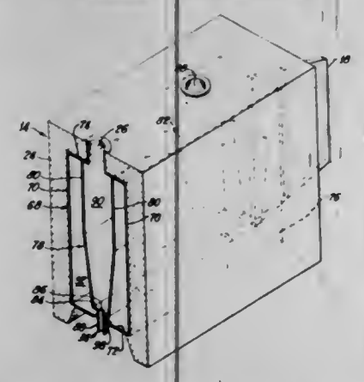


1. A method of forming clear films from green viscose comprising coagulating a pellicle of viscose having a common salt test index of at least 5 in a coagulating bath containing from about 0.5 to about 2% by weight based on the bath of an aldehyde selected from the group consisting of formaldehyde and glyoxal in the absence of zinc salts.

3,274,322
METHOD OF FLOW FORMING POLYURETHANE AND LIKE MATERIAL
John A. Scudder, Chicago, Ill., assignor to Chemechanical, Inc., South Holland, Ill., a corporation of Illinois
Filed Mar. 9, 1964, Ser. No. 350,194
8 Claims. (Cl. 264—213)

1. The method of forming belts, tires, O-rings, strips and similar products from polyurethane and like material comprising the successive steps of: flowing a quantity of polyurethane in a readily flowable state on to a supporting surface moving at a controlled rate of travel in relation to the flow rate of the polyurethane; subjecting the so applied polyurethane to a doctoring action thereby to effect a preliminary shaping of said product in a state of partial cure and having an exposed surface; flowing on to the exposed surface of the moving, preliminarily shaped polyurethane product a liquid force-transmitting medium; subjecting the preliminarily shaped polyurethane product to external pressure exerted on said exposed surface in a manner as effects dynamic flow of the polyurethane and final shaping of the preliminarily shaped product to that of the desired product by shear action developed and transmitted by and through said medium; and finally curing the finally shaped polyurethane product to a physically stable condition.

3,274,323
HIGH IMPERMEABILITY COATINGS AND SUPPORTED FABRICATED OBJECTS OF POLYTETRAFLUOROETHYLENE
John Petriello, North Babylon, N.Y., assignor to Dilectrix Corporation, Farmingdale, N.Y.
Filed May 3, 1962, Ser. No. 192,213
3 Claims. (Cl. 264—308)



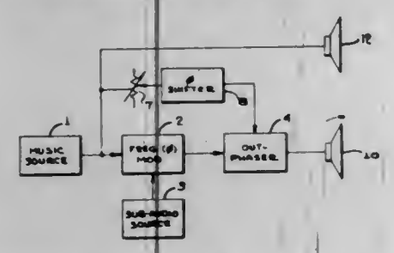
1. A process for producing a highly impermeable multilayer structure of fused polytetrafluoroethylene comprising the steps of baking each successive layer for a minimum of 5 minutes at the temperature of 380 to 385° C., followed by a final baking time of minimum of 60 minutes, and a maximum cooling rate to ambient conditions of 20 degrees centigrade per minute.

ELECTRICAL

3,274,324
APPARATUS FOR FORMING HEAT-SOFTENABLE MATERIALS

Charles J. Stalego, Newark, Ohio, assignor to Owens-Corning Fiberglas Corporation, a corporation of Delaware

Original application Oct. 30, 1961, Ser. No. 148,460, now Patent No. 3,192,023, dated June 29, 1965. Divided and this application Feb. 26, 1965, Ser. No. 446,445
7 Claims. (Cl. 13—6)

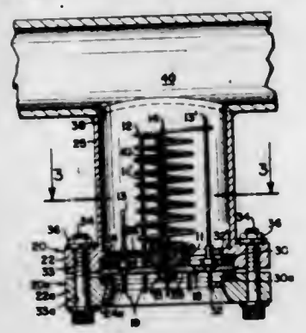


1. In apparatus for forming fibers from heat-softenable materials, a container for molten material, said container having a wall, a first planar aperture in said wall, container means including means defining a hollow elongated orifice having ends and a medial exterior portion between said ends, said medial exterior portion being disposed in said planar aperture in fluid sealing relation, and at least one second planar aperture in said wall in tangential contact with said exterior surface.

3,274,325
MUSIC ENHANCEMENT

Hyman Hurvitz, 1313 Juniper St. NW., Washington, D.C.

Filed May 17, 1963, Ser. No. 281,214
11 Claims. (Cl. 84—1.23)



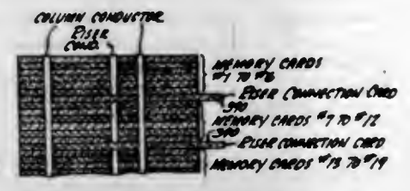
1. In combination, a source of a wide audio band representing music, modulation means responsive to said wide audio band for generating a modulated band containing at least said wide audio band and two side bands for each frequency of said wide audio band separated by a sub-audio separation, and means for at least partially out-phasing said audio wide band from said modulated band.

3,274,326
NUDE ION GAGE ASSEMBLY

Robert A. Morris, Commack, and Robert F. Salat, East Northport, N.Y., assignors to Vactronic Lab. Equipment, Inc., East Northport, N.Y.

Filed May 1, 1962, Ser. No. 191,499
5 Claims. (Cl. 174—18)

1. A nude ion gage assembly comprising:
a ceramic base having an upper and lower sealing surface that is smooth and substantially flat and provided with a plurality of apertures extending therethrough, said base serving as the mounting plate of an ion gage;
electrically conductive supports extending through said apertures;
means sealing said supports to said ceramic base;
first and second metal retainer members each having two smooth and substantially flat sealing surfaces, said members being of generally hollow configuration;
said retainer members being disposed in confronting relation, said base being interposed between said confronting retainer members whereby said conductive supports are disposed within the bore of at least one of said members;
a first annular member interposed between one of the sealing surfaces of said first retaining member and said upper sealing surface of said ceramic base;
a second annular member interposed between the other of the sealing surfaces thereof said second retainer member and said lower sealing surface of said ceramic base, said electrically conductive supports being disposed inwardly of said annular members;



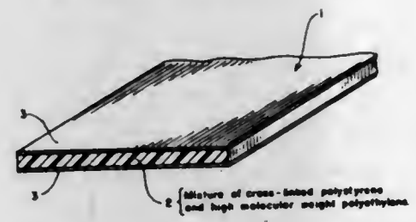
said first and second annular members having upper and lower axially extending annular knife edges abutting respective confronting sealing surfaces of said retaining members and said ceramic base, said annular members being formed of copper of a hardness less than that of said first and second retaining members and said ceramic base, respectively; and
clamping means urging said first and said second retaining members towards each other to thereby tightly abut said first annular member disposed between said upper surface of said ceramic base and said first retainer, and to also tightly abut said second annular member disposed between said lower surface of said ceramic base and said second retainer, whereby minute deformation of said respective upper and lower edges of said first and second annular members takes place without appreciable deformation of the sealing surface of said base and said retainer members, said annular members thereby serving as seals interposed between the respective areas inwardly of said annular members and the areas outwardly of said annular members.

3,274,327
MULTILAYER CIRCUIT CONNECTION

Hans F. Schnitzler, Levittown, N.J., assignor to Radio Corporation of America, a corporation of Delaware

Filed July 11, 1963, Ser. No. 294,302
8 Claims. (Cl. 174—68.5)

1. In combination,
a stack of insulator circuit cards, each having a printed circuit on one surface thereof, and each having a group of first holes in corresponding positions on the cards through which conductors pass which connect to the circuit on all cards, and each having a group of second holes in corresponding positions on the cards, the second holes receiving conductors which respectively connect to circuits on different cards, whereby the number of cards which can be stacked is normally limited by the number of second holes;

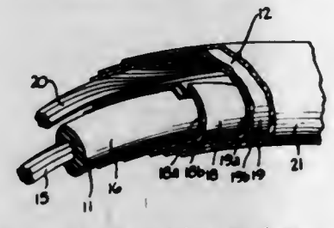


spacer cards located in the stack which are formed with holes in positions corresponding to the first holes in the circuit cards, with the conductors in the first holes passing therethrough, but which are imperforate and are formed with printed conductors in the areas of the spacer cards aligned with the second holes in the circuit cards; and
conductors in the second holes which engage the printed conductors of the spacer cards and the insulator circuit cards.

3,274,328
DIELECTRIC FOR CIRCUIT BOARD AND STRIP LINES

William J. Davis, Wyomissing, Pa., assignor, by mesne assignments, to The Polymer Corporation, a corporation of Pennsylvania

Filed June 6, 1963, Ser. No. 286,126
6 Claims. (Cl. 174—68.5)

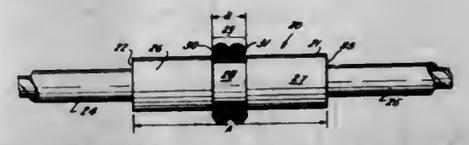


2. A low loss dielectric material consisting essentially of an intimate mixture of cross linked polystyrene and a high molecular weight, antioxidant-free polyethylene, said mixture being fused together into a form stable article.

3,274,329
SHIELDED CORDS

Frank E. Timmons, Richmond, Ind., assignor to Belden Manufacturing Company, Chicago, Ill., a corporation of Illinois

Filed May 6, 1964, Ser. No. 365,475
5 Claims. (Cl. 174—69)

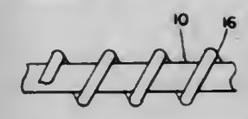


1. A shielded cord comprising at least one insulated wire, dual superimposed tapes spirally served about said insulated wire, said tapes each being served with longitudinal edge portions thereof overlapping and including an insulating layer and a metallic layer, the metallic layers being faced toward each other and an uninsulated drain wire disposed between said superimposed tapes in contact with both of said facing metallic layers.

3,274,330
INSULATED CABLE SPLICE

Stephen P. Becker, Poughkeepsie, N.Y., and Bertram A. Fulton, Lynnfield, Mass., assignors to Fargo Mfg. Company, Inc., Poughkeepsie, N.Y., a corporation of New York

Filed Apr. 24, 1964, Ser. No. 362,256
5 Claims. (Cl. 174—84)



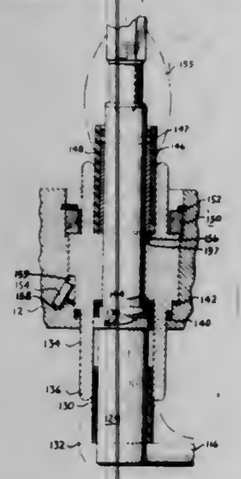
1. A cable connector for electrically connecting the facing ends of first and second cables including in combination a cylindrical body formed of an electrically conductive deformable material, first and second adjacent crimpable sections longitudinally displaced on said body, first and second cavities within said first and second crimpable sections respectively, first and second respective entrances to said cavities for receiving respective ends of said first and second cables, an elastomeric insulating sleeve having a longitudinal dimension greater than the longitudinal dimension of said connector, first and second ends of said insulating sleeve rolled toward one another providing a rolled length of said sleeve less than the length of said connector, a zone of said connector encircled by said sleeve longitudinally displaced from said first and second crimpable sections between said first cavity entrance and said first crimpable section whereby said cable ends can be retained within said respective crimpable sections and said sleeve extended to its full length overlying said connector and said cavity entrances to provide insulation of said sleeve and sealing at said cavity entrances said zone consisting of parallel cylindrical depressed portions of said connector providing parallel cylindrical channels receiving said first and second ends of said sleeve respectively in its rolled condition with said second end of said sleeve of greater length than said first end.

3,274,331
ELECTRICAL CONNECTOR WITH PRE-APPLIED SOLDER

Mark F. Quigley, 84 Beacon St., Boston, Mass.

Filed Oct. 12, 1960, Ser. No. 62,298
4 Claims. (Cl. 174—94)

1. As an article of manufacture, a flexible sleeve-like connector assembly for joining opposing related free ends of a pair of oppositely directed electrical leads consisting of an electrical conducting wire and heat responsive fluxed bonding material for effecting a mechanically bonded electrical connection between said sleeve-like connector unit and said respective electrical leads, said electrical conducting wire and said fluxed bonding material being helically coiled to form a flexible, hollow tube-like unit open at its ends and of an internal diameter adapted to grippingly encompass the respective free ends of the electrical leads to supportingly maintain said flexible sleeve-like connector and said electrical leads in position before and during application of heat thereto, said fluxed bonding material being disposed at least between turns of said conducting wire which are disposed to encompass the respective ends of said electrical leads whereby upon encircling association of said tube-like unit with the opposing related ends of said electrical leads and application of heat selectively to the opposite ends of said tube-like unit and the respec-



tive opposing ends of said electrical leads the fluxed bonding material will melt and flow to effect a mechanical bond and electrical connection between said conducting wire and said respective electrical leads, said fluxed bonding material comprising a flux carrying solder wire structurally distinct from said conducting wire in that the flux carrying solder wire is in independent side by side relationship to said conducting wire and at least portions of which are disposed between adjacent turns of said electrical conducting wire.

3,274,332
ELECTRICAL LEAD SEAL FOR PRESSURE VESSEL

Ralph O. Eis, Lawrence R. Tomhave, and James A. Walsh, Schenectady, N.Y., assignors to General Electric Company, a corporation of New York

Original application Dec. 4, 1962, Ser. No. 242,272. Divided and this application May 3, 1965, Ser. No. 471,779

1 Claim. (Cl. 174—152)

A readily disassembled electric conductor lead seal assembly insertable in a substantially cylindrical walled aperture in a pressure vessel, said assembly comprising:

(a) a cylindrical stud of conductive metal positioned coaxially within the aperture in the pressure vessel and having first and second ends oppositely protruding respectively therefrom;

(b) a metal sleeve on said first end secured by a removable pin to said stud, said metal sleeve extending partially into the aperture and having a tongue extending from the innermost extremity thereof;

(c) first and second axially spaced insulating sleeves on said metal sleeve and said second end of the stud, respectively;

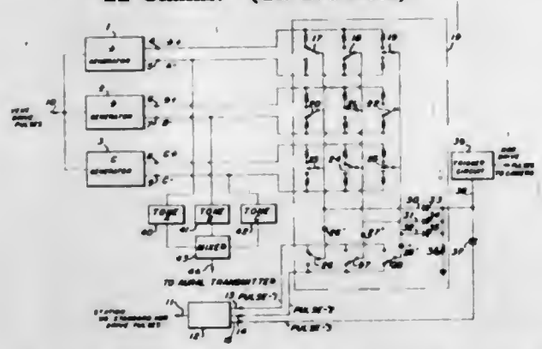
(d) a hollow ceramic sleeve having portions of the inner surface thereof in engagement with said first insulating sleeve, a central portion of said stud, and said second insulating sleeve, respectively;

(e) a groove in the inner surface of said ceramic sleeve accommodating said tongue to limit relative rotation between said stud and said ceramic sleeve;

(f) a shoulder on said stud intermediate said insulating sleeves and an O-ring engaging said shoulder to provide a pressure-tight seal between said stud and said ceramic sleeve;

(g) cooperating shoulders in the wall of said aperture and on said ceramic sleeve, respectively, and an O-ring between said cooperating shoulders providing a pressure-tight seal between the wall of said aperture and said ceramic sleeve; and

(h) means projecting from the wall of said aperture into a corresponding groove in said ceramic sleeve to limit relative rotation between said wall and said ceramic sleeve;



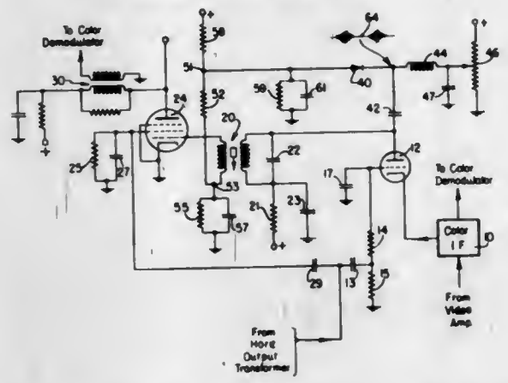
(i) whereby an insulated lead seal is provided without bonding or otherwise permanently fixing the principal components thereof together, facilitating ease of disassembly and component replacement.

3,274,333
SCRAMBLED TELEVISION SYSTEM

William J. Shanahan, New York, N.Y., assignor to Skiatron Electronics & Television Corporation, New York, N.Y., a corporation of New York

Filed Oct. 23, 1952, Ser. No. 316,485

22 Claims. (Cl. 178—5.1)



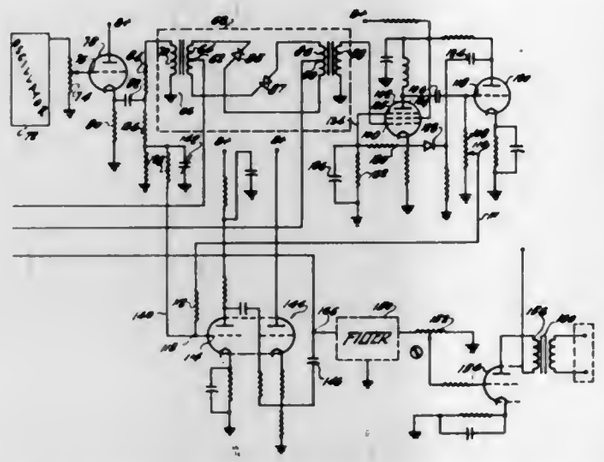
11. A replaceable element for a scrambled television system of the type having a transmitter and at least one receiver and wherein decoding is completed by injection of independently derived decoding information at the receiver, the element having at least one printed code circuit thereon forming said independent decoding information, and means secured to said element and obscuring at least a part of said one printed circuit for preventing detection of the code related to said printed circuit.

3,274,334
HUE CONTROL CIRCUITS FOR COLOR TELEVISION RECEIVERS

Robert B. Hansen, Arlington Heights, and Henry C. Waldschmidt, Matteson, Ill., assignors to Motorola, Inc., Chicago, Ill., a corporation of Illinois

Filed Oct. 28, 1963, Ser. No. 319,471

7 Claims. (Cl. 178—5.4)



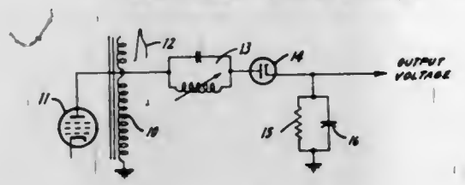
1. In a color television receiver for reproducing a color image in response to a received composite color television signal, which signal includes a chroma signal having color subcarrier sideband components and a color burst reference signal, said receiver including a color demodulator and a color burst separator for deriving a color burst signal from said chroma signal, said color burst separator including signal translating circuit means having a resonant circuit tuned to the frequency of said color burst reference signal for supplying same to said color demodulator, the combination including, a phase shifting network for shifting the phase of the color burst reference signal appearing across said resonant circuit, said phase shifting network including a diode and a capacitor connected in series and coupled across said resonant circuit, means for applying a fixed bias voltage to one side of said diode, and means for applying a variable bias voltage to the other side of said diode, said diode presenting a variable resistance in series with said capacitor to shift the phase of said color burst reference signal, said phase shift being determined by the conduction of said diode as established by the difference between said fixed bias voltage and said variable bias voltage, whereby said variable bias voltage provides hue control for said reproduced image.

3,274,335
FACSIMILE AUTOMATIC BACKGROUND CONTROL

Dudley Gray, Chicago, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia

Filed July 8, 1963, Ser. No. 293,429

17 Claims. (Cl. 178—7.1)



1. In a system for converting light variations into electric signals, the combination of a photoelectric device, means for directing light to be converted into said photoelectric device, a subcarrier-frequency signal source, a modulator circuit in which the output signals of said photoelectric device modulates the subcarrier-frequency signal, variable gain amplifying means for amplifying the modulated signal, means responsive to the maximum amplitude peaks of said amplifier output for inversely affecting the gain of said amplifying means, and means including said subcarrier signal source for summing the amplified modulated signal with a constant amplitude oppositely phased carrier-frequency signal, whereby the amplitude of the summation signal is indicative of said light variations.

3,274,336
HIGH VOLTAGE CIRCUIT

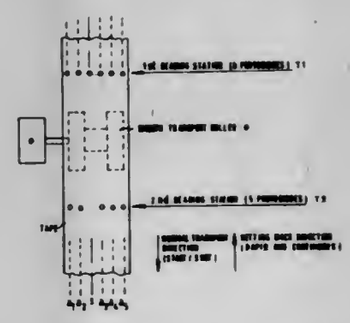
John P. Pietrolewicz, Pennsauken, N.J., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Delaware

Filed May 18, 1962, Ser. No. 195,785

16 Claims. (Cl. 178—7.5)

1. A circuit for providing a manually-variable high D.C. voltage from a source of time-spaced high-voltage pulses occurring at a predetermined frequency, comprising: a manually-tunable parallel-resonant circuit, a diode and a load impedance, all connected in series to said source, said resonant circuit being tunable over a range of frequencies; and means for deriving said high D.C. voltage from across said impedance.

12. In a television receiver having a deflection system, a direct-current (D.C.) voltage supply for providing a high voltage of adjustable magnitude comprising: means for deriving from said deflection system a recurring high-potential pulse having a recurrence frequency corresponding to a characteristic frequency of said deflection system; means for developing an alternating-current (A.C.) signal component having a frequency approximately equal to an integral multiple, greater than one, of the frequency of said pulse; a rectifier having a load circuit for developing a D.C. potential; means for concurrently applying said pulse and said A.C. component to said rectifier to develop in said load circuit a D.C. potential having a magnitude related to the combined magnitudes of said pulse and said A.C. component; and means for varying the relative phase of said pulse and said A.C. component to control the magnitude of the D.C. potential developed in said load circuit.



3,274,337
DEVICE FOR READING SIGNALS FROM A TAPE

Petrus Ludovicus Maria van Berkel, Voorburg, Netherlands, assignor to De Staat der Nederlanden, ten deze Vertegenwoordigd door de Directeur-Generaal der Posterijen, Telegrafie en Telefonie, The Hague, Netherlands

Filed Sept. 26, 1962, Ser. No. 226,358

Claims priority, application Netherlands, Oct. 2, 1961, 269,828

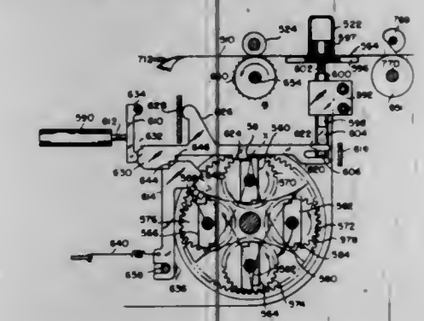
7 Claims. (Cl. 178—17)

1. A tape reading mechanism for a simplex telegraph circuit with automatic error detection and correction means, said tape containing groups of the same number of symbols which symbols are individually and successively transmitted by the telegraph circuit according to a protected code so that errors in each symbol can be immediately detected upon reception, said groups of symbols being associated with characteristic whereby between each group one of two answer-back signals are transmitted to indicate correct and incorrect reception of each group for controlling said error correction means, said mechanism compising:

(A) means (Tr3) for driving said tape forwardly in steps for successively reading each symbol of each group,

(B) means (*t*1) for stopping said driving means at the end of each group for the transmission of one of two answer-back signals,

(C) a trailing reading means (T1) and at least one forward reading means (T2) for reading said tape, each reading means being spaced apart from the other reading means along said tape a distance corresponding to that required for recording one group of symbols on said tape,



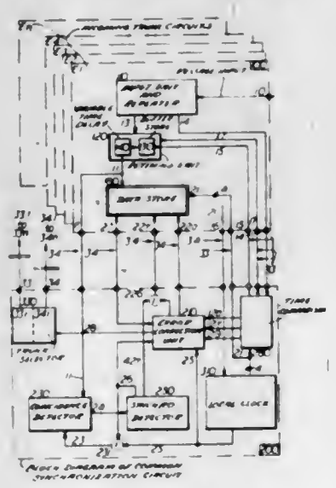
(D) means (10) for counting the number of symbols in each group,

(E) means (Tr1) for controlling said trailing reading means when an answer-back signal indicating correct reception has been received,
(F) means (HD, *g*) for immediately switching to and controlling said forward reading means when an answer-back signal indicating incorrect reception has been received,
(G) means (HD, *f*) for switching back to said trailing reading means after said group of signals has been repeated and the correct reception indicating answer-back signal therefor has been received, and
(H) means (Tr2) for controlling said driving means controlled by said counting means for reversing said tape the distance corresponding to said group, simultaneously with the switching back to said trailing reading means.

3,274,338
TELEGRAPHIC RECORDER HAVING PLANETARY OPERATOR

Clayton H. Clark, Mundelein, Ill., and Carl P. Anderson, Homer, N.Y., assignors to SCM Corporation, New York, N.Y., a corporation of New York

Original application Dec. 6, 1961, Ser. No. 157,540. Divided and this application May 14, 1964, Ser. No. 367,410
39 Claims. (Cl. 178—17)

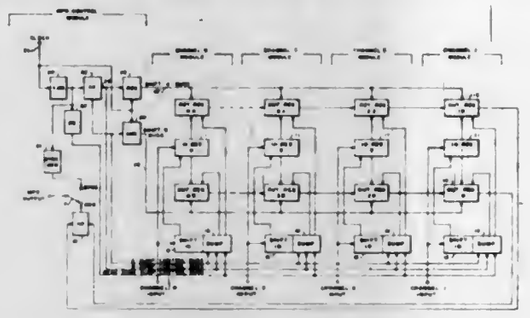


1. A recording device for receiving coded data information signals and recording manifestations of such data information on a record medium, comprising:
(a) a planetary mechanism including at least a carrier, a ring type sun gear and at least one planet component comprising a recording operator means rotatably mounted on said carrier and in gear meshed drive with said sun gear to that each rotation of said carrier causes said recording operator means to pass through at least one repetitive multiple peak cycloidal path;
(b) power means including an electric motor and drive means connected between said motor and said carrier to provide continual rotation of said carrier when said motor is energized;
(c) recording mechanism, adapted to impart record data on a record medium positioned adjacent said planetary mechanism, including at least one recording means disposed approximate the circular path which includes all of said cyclodial peaks and normally located adjacent a position of intersection with a peak of said cycloidal path;
(d) selecting means coacting with said recording means enabling a relative repositioning of said recording means into a predetermined cyclodial peak in the path of movement of said operator means to assure operative engagement of said operator means with said recording means at one of said cyclodial peak positions with a subsequent resetting of the position of said recording means to avoid operative engagement between said recording means and an operator means as the latter moves through the said one cyclodial peak; and
(e) feed means enabling a relative movement between a record medium and said recording mechanism to enable a successive spaced recording of data on the record medium.

3,274,339
TIME DIVISION MULTIPLEX TRANSMISSION SYSTEMS

Michel Jean Herry, Aulnay-sous-Bois, Jean Pierre Le Corre, Sainte-Genevieve-des-Bois, and Guy Raphael Yelloz, Paris, France, assignors to International Standard Electric Corporation, New York, N.Y., a corporation of Delaware

Filed May 9, 1962, Ser. No. 193,395
Claims priority, application France, May 10, 1961, 861,422, Patent 1,301,275
6 Claims. (Cl. 179—15)



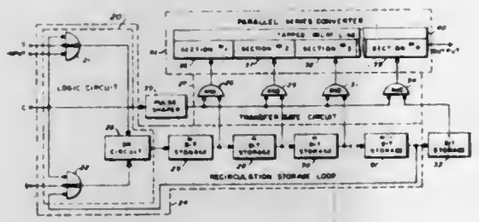
1. A pulse code modulation time division multiplex telephone switching system comprising a plurality of trunklines incoming from a distant location to an associated local trunk circuit, means whereby each of said trunklines carry a plurality of time positioned channels, means for transmitting samples of intelligence in pulse code modulated form over said lines during discrete time channels, the transmission characteristics of said lines sometimes causing time fluctuations of signals in said channels, means associated with each of said trunks for receiving and storing the pulse code modulations of said samples in locations corresponding to the time positions of channels carrying said intelligence, a local clock, means for cyclically connecting each incoming trunkline to a circuit for detecting synchronization variations between incoming signals and the output of said local clock, means in each of said trunk circuits for extracting a time reference signal from each of said incoming signals, means for comparing the output of said local clock to the extracted time signal, and means for retiming the pulse code modulations of incoming signal responsive to a detection of an excessive time fluctuation between said extracted reference signal and the output of said local clock, whereby said received signal reappears in the part of the time channel that is reserved for transmission of said intelligence.

3,274,340
DIGITAL DATA MULTIPLEXING AND DEMULTIPLEXING

John Michael Balderston and William G. Burke, Jr., Bowie, Md., assignors to ACF Industries, Incorporated, New York, N.Y., a corporation of New Jersey

Filed June 20, 1962, Ser. No. 203, 998
15 Claims. (Cl. 179—15)

1. A multiplexing system for digital data comprising, a multiplexer having a plurality of channels each having an input register capable of storing a predetermined number of pulses, different pulse data sources in said channels each connected to one of said registers, a plurality of first output shift registers each connected to one input register, a plurality of second output shift registers each connected to one input register, each output register having a number of stages connected in series and capable of storing the number of pulses stored by the input register to which it is connected, said input and output registers including gating means connecting the input register to each stage of the first and second output registers separately, all first output registers being connected in series, all second output registers being connected in series, an

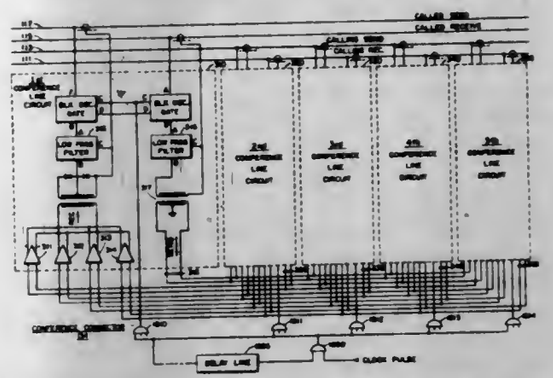


output circuit connected to the outputs of the first and second registers in parallel, dump control means for simultaneously transferring the pulses stored in the input registers through said gating means to the first output registers, means for serially shifting the pulses in said first output registers therethrough at a constant rate to the output circuit, dump control means for thereafter simultaneously transferring the pulses stored at a predetermined later time in the input register through said gating means to the second output registers, and means for serially shifting the pulses in said second output registers therethrough at a constant rate to said output circuit.

3,274,341
SERIES-PARALLEL RECIRCULATION TIME COMPRESSOR

Willard B. Allen, San Diego, Calif., assignor to the United States of America as represented by the Secretary of the Navy

Filed Dec. 17, 1962, Ser. No. 245,328
12 Claims. (Cl. 179—15.55)

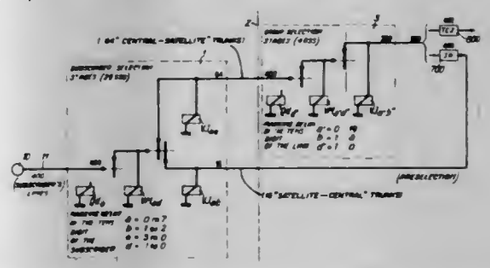


5. A series-parallel recirculation time compressor comprising in combination:
means for receiving, intermittently storing, and recirculating a binary signal within an electrical loop,
means for converting a plurality of parallel signals into a serial signal,
and means interconnecting the outputs of said receiving, storing, and recirculating means and the respective inputs of the aforesaid converting means for timely transferring the signals stored therein thereto.

3,274,342
COMMON CHANNEL COMMUNICATION SYSTEM CONFERENCE CIRCUIT

Barrie Brightman, Webster, N.Y., assignor, by mesne assignments, to Stromberg-Carlson Corporation, Rochester, N.Y., a corporation of Delaware

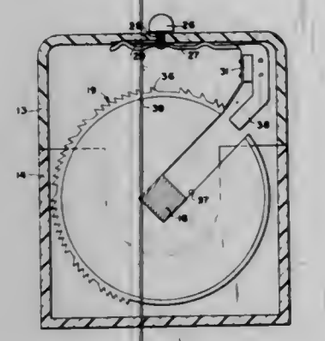
Filed Jan. 4, 1962, Ser. No. 164,247
7 Claims. (Cl. 179—18)



1. In a communication system, a first and second plurality of stations, a common communication channel, first means responsive to predetermined signals from a calling one of said first plurality of stations for connecting said calling one of said first plurality of stations and one of said second plurality of stations to said common communication channel in a time position in a repetitive time frame, said first means responsive to subsequent signals from said calling one of said first plurality of stations for connecting a selected called one of said first plurality of stations and a second one of said second plurality of stations to said common communication channel in an individual time position in said respective time frame, each of said second plurality of stations having an output signal terminal and a plurality of input signal terminals, and second means for connecting the output terminal of each of said second plurality of stations to a separate one of said input terminals on each of the other of said second plurality of stations.

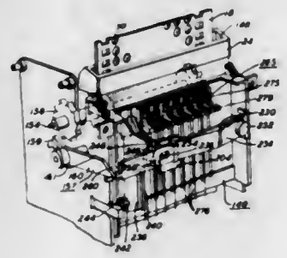
3,274,343
REMOTE STAGE SWITCHING NETWORK

Pierre M. Lucas, 20 Rue Henri-Tariel, Issy-les-Moulineaux, France, and Jean F. Duquesne, 41 Rue Esquirol, Paris, France



Filed June 28, 1963, Ser. No. 291,401
Claims priority, application France, June 30, 1962, 902,612
6 Claims. (Cl. 179—18)

1. An electronically controlled switching network comprising crossbar subscribers' selection stages forming satellite exchanges and crossbar group selection stages forming a central exchange spaced apart from one another, junctors located in said central exchange constituting terminal circuits of preselection routes through the subscribers' selection stages and input circuits of final routes through the group selection stages and subscribers' selection stages in cascade, satellite-central trunks between said subscribers' selection stages and said junctors, connection lines between said junctors and said group selection



stages, central-satellite trunks between said group selection stages and said subscribers' selection stages, said subscribers' selection stages having row electromagnets and column electromagnets operating crosspoints connecting subscribers to said junctors and said central-satellite trunks to subscribers, said group selection stages having row electromagnets and column electromagnets operating crosspoints connecting said junctors to said central-satellite trunks, a subscriber searching device, first means controlled by said subscriber searching device for operating the row electromagnets of the subscribers' selection stages, a central-satellite trunk searching device, second means controlled by said central-satellite trunk searching device for operating the row electromagnets of the group selection stages, a plurality of preselection wires between the subscribers' selection stages and the junctors, means controlled by said first row electromagnet operating means for marking a number of said preselection wires, a first electronic selector for selecting one among said marked preselection wires and marking the junctor connected thereto, whereby the column electromagnets of the subscribers' selection stages adapted to connect a given calling subscriber to the marked junctor are derived from the selected preselection wire, a first plurality of final selection wires between the subscribers' selection stages and the group selection stages, means controlled by said first row electromagnet operating means for marking a number of said first plurality of final selection wires, a second plurality of final selection wires inside the group selection stages, means controlled by said second row electromagnet operating means for marking a number of said second plurality of final selection wires, a second electronic selector for selecting one first and one second wire among said marked final selection wires whereby the column electromagnets of the subscribers' selection stages and of the group selection stages adapted to connect a given called subscriber to the marked junctor are derived from the selected final selection wires and means for energizing said column electromagnets.

3,274,344
AUTOMATIC DIALING DEVICE
Charles C. Young, New Rochelle, N.Y., assignor, by mesne assignments, to Prestodial, Inc., New York, N.Y., a corporation of New York
Filed June 14, 1963, Ser. No. 287,856
8 Claims. (Cl. 179—90)

7. An automatic dialing mechanism comprising, a shaft, means for rotating said shaft, at least one code storage means mounted on said shaft, said code storage means being a circular cam having teeth placed sequentially on the periphery thereof in accordance with the coded information to be stored, said cam having a square slot therein which extends from the periphery through the center for mounting said cam on said shaft, said cam having a shoulder for maintaining said switch means in a contact position with said teeth, said shaft being square shaped in that portion upon which said code storage means is mounted, a means for positioning said code storage means relative to said shaft, a switch means mounted so as to be in contact relationship with one of said code storage means and a pulsing means connected to said switch means whereby the actuation of said switch means by any of said code storage means sequentially pulses said pulsing means in accordance with the stored information on said code storage means.

3,274,345
CALL TRANSMITTER
James H. Ham, Jr., and Willard E. Hostetler, Indianapolis, James F. Ritchey, Carmel, and Warren R. Tolman, Indianapolis, Ind.; said Tolman assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York, and said Ham, Hostetler, and Ritchey assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed July 1, 1963, Ser. No. 291,770
3 Claims. (Cl. 179—90)

3. An integrated call and data transmitter permitting either manual or automatic operation, the automatic operation being responsive to a code bearing medium having each digit of a number to be called or data to be transmitted spacedly encoded thereon, the call and data transmitter comprising:

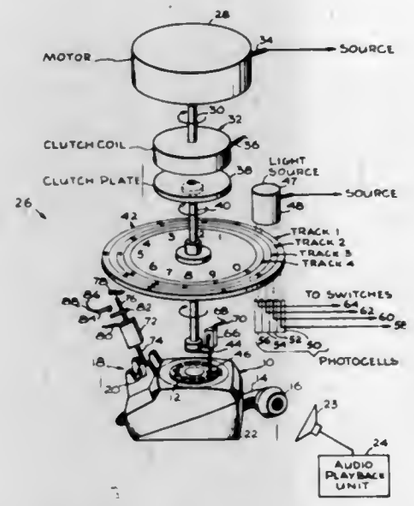
an alternating current signal generator including a resonant circuit adapted to resonate at discrete frequencies, an amplifying means for sustaining the resonating of the resonant circuit, and switching means for enabling the amplifying means;

manual means for operating the signal generator comprising a plurality of pushbuttons, each pushbutton being associated with a different digit, and each pushbutton being operative to select a discrete frequency of the resonant circuit and actuate the switching means; and

automatic means for operating the signal generator comprising means for sensing the coding on the code bearing medium, means for moving the code bearing medium and the sensing means relative to one another, means for initiating the operation of the moving means, the actuation of the initiating means operating the switching means, and the relative movement between the code bearing medium and the sensing means causing the periodic actuation of the sensing means by the coding on the code bearing medium, the actuated sensing means being operative to select a discrete frequency of the resonant circuit.

3,274,346
AUTOMATIC TELEPHONE DIALING APPARATUS
Maurice Silber, 16129 Tupper Ave., Los Angeles, Calif.
Continuation of application Ser. No. 155,609, Nov. 29, 1961. This application Aug. 5, 1965, Ser. No. 480,544
7 Claims. (Cl. 179—90)

1. Apparatus for successively rotating the rotatable dial of a telephone to positions respectively determined



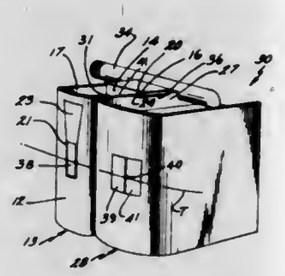
by a series of coded digits stored in a memory device comprising:

a shaft;

finger means extending from said shaft and inserted into a hole in said dial for coupling said shaft to said dial;

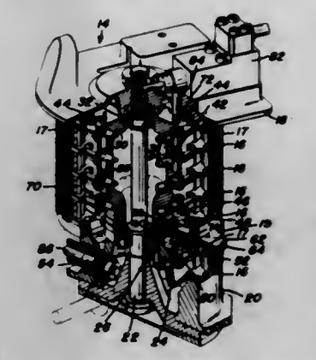
a control circuit including first and second sets of switches;

read means associated with said memory device for controlling the orientation of said first set of switches in accordance with said stored digits;



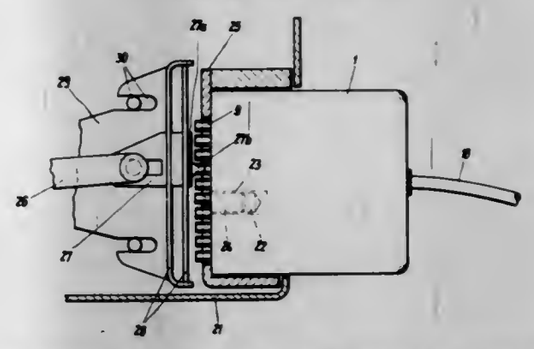
coded means carried by said shaft operatively coupled to said second set of switches for controlling the orientation of said second set of switches in accordance with the rotational position of said shaft;

rotating means operatively engageable with said shaft for rotating said shaft; and



means responsive to a predetermined orientation relationship between said first and second sets of switches for disengaging said rotating means from said shaft.

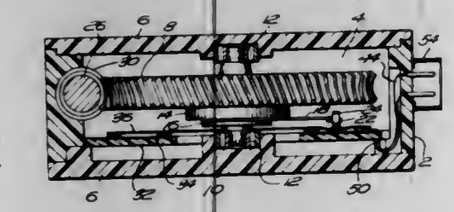
3,274,347
MEANS FOR MOUNTING AN ERASER HEAD TO A RECORD HEAD
Leo W. Page, Potterville, Mich., assignor to Michigan Magnetics, Inc., Vermontville, Mich., a corporation of Michigan
Filed Mar. 4, 1963, Ser. No. 262,524
4 Claims. (Cl. 179—100.2)



1. A head assembly for tape recorders, comprising: a first head having a shield member disposed in a plane generally normal to the plane of a tape passing over said head; and a second head having prong means flexibly formed thereon, said prongs extending laterally from said second head; said prong means being dimensioned to engage edges of said shield member to hold said second head in a fixed predeterminable position with respect to said first head.

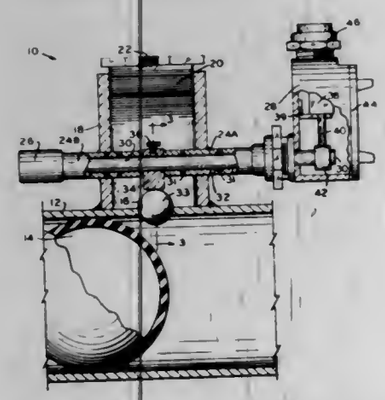
3,274,348
LOAD STATUS INDICATOR
Arthur G. Blomquist, Golden Valley, Ludolph Larsen, Minneapolis, Milton C. Neuman, Champlin, and Palmer G. Wermager, Robbinsdale, Minn., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed May 22, 1962, Ser. No. 197,565
7 Claims. (Cl. 200—5)

1. A device for indicating the contents of a storage area comprising a plurality of groups of switches each group thereof corresponding to a predetermined portion of said storage area, a switch actuator for each switch, a cam assembly including a plurality of positionable cams selectively engageable with said actuators, and mechanical and hydraulic means on said device for transmitting motions of storage area monitoring apparatus to said cams whereby the presence and condition of objects stored in a predetermined portion of said storage area is indicated by resultant switch actuation.



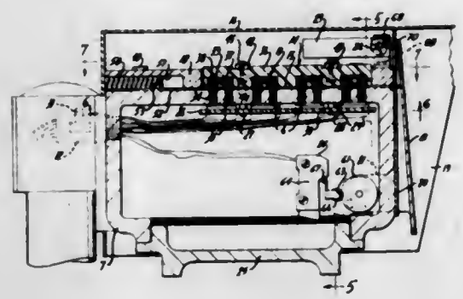
3,274,349
MEMORY AND CONTROL DEVICE FOR COMPUTING MACHINES OR THE LIKE
Horst Priebs, Bielefeld, Germany, assignor to Anker-Werke Aktiengesellschaft, Bielefeld, Germany, a corporation of Germany
Filed Jan. 28, 1964, Ser. No. 341,167
Claims priority, application Germany, Feb. 2, 1963, A 42,233
7 Claims. (Cl. 200—5)

1. A business-machine memory device for reading and storing data from respective positions of displaceable machine elements, comprising a multiplicity of electrically conducting switching members arranged in parallel rows, each row corresponding to one of the respective displaceable machine elements to be responded to, and the number of members in each row corresponding to the maximum of the bits of data storable in said row; a housing structure common to said switching members and having a front face from which said rows of members are accessible externally of the housing, said housing forming a plug-in connector detachably seatable in a business machine with said front face positioned to face the displaceable machine elements to be responded to; said switching members in each row being selectively actuable by one of the respective machine elements in the seated



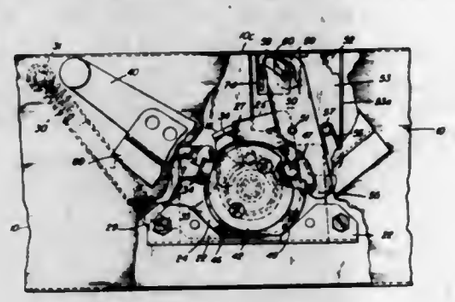
conditions of said housing; an interlock mechanism for each of said rows of members connected in said housing with the members of said respective rows of members for retaining previously selected members in each of said rows actuated until actuation in the respective rows of other ones of said members, said mechanisms being adapted to release said previously selected members when said other ones of said members are actuated; and electric leads connected to said members and extending out of said housing for providing selectively closed circuits depending upon which of said switching members are activated at a time.

3,274,350
FRICTIONLESS CONTACT CONSTRUCTION FOR ELECTRICAL DEVICES
Eugene H. Mongeau, Harvard, Mass., assignor to Acton Laboratories, Inc., Acton, Mass., a corporation of Massachusetts
Filed Mar. 18, 1964, Ser. No. 352,929
12 Claims. (Cl. 200—11)



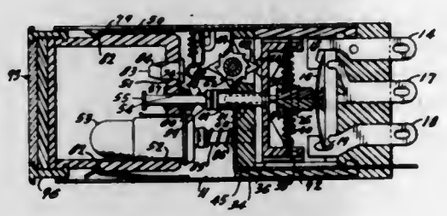
9. A switch comprising a stiff sheet of insulating material having on one surface thereof a conductive element, a diaphragm of laminated construction positioned parallel to and spaced from said conductive element, said sheet and the edges of said diaphragm sealed together, said diaphragm comprising an inner layer of gold and an outer layer of a hard high fatigue resistant spring alloy essentially comprising cobalt, nickel, chromium and iron, and a band of a flexible insulating material cemented to the outer surface of said alloy layer.

3,274,351
SWITCH FOR DETECTING PISTON IN FLUID FLOW LINE
Joseph C. Halpine and Bernard M. Moroney, Tulsa, Okla., assignors to Halmor Industries, Inc., Tulsa, Okla., a corporation of Oklahoma
Filed Dec. 13, 1963, Ser. No. 330,434
2 Claims. (Cl. 200—61.41)



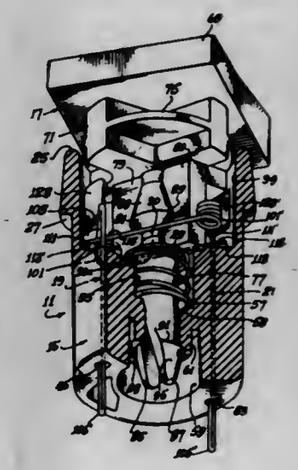
1. A piston detector switch adapted to be positioned on a pipe having a small diameter opening in the upper surface thereof to detect the passage of a piston in the pipe moving in either direction, said piston detector switch comprising:
a hollow upstanding body member sealably affixed to said pipe encompassing said opening in said pipe;
a tubular shaft housing affixed to and communicating with the interior of said body member and extending substantially in a plane parallel the plane of said pipe;
a shaft rotatively supported in said shaft housing having one end thereof extending within said hollow body member;
a ball of a diameter slightly larger than the diameter of said opening in said pipe, said ball loosely and rotatively positioned in said opening in said pipe and within said hollow body member whereby a portion of said ball normally protrudes within the interior of said pipe;
an actuator cam member affixed at one end to said shaft within said hollow body member, said actuator cam member extending to engage the upper surface of said ball whereby the displacement of said ball rotates said shaft;
an enclosed switch housing supported to and communicating with said tubular shaft housing, the other end of said shaft terminating within said switch housing;
a microswitch having an actuator plunger extending therefrom, the microswitch supported in said switch housing and adjacent said shaft; and
a switch cam affixed to said shaft within said housing, said cam engaging said switch actuator plunger to depress said actuator plunger upon the rotation of said shaft by the displacement of said ball.

3,274,352
MAGNETIC CARD READER
Robert W. Ryno and Gilbert A. Schwibinger, Milwaukee, Wis., assignors to A. O. Smith Corporation, Milwaukee, Wis., a corporation of New York
Filed July 6, 1964, Ser. No. 380,347
11 Claims. (Cl. 200—46)



11. A control apparatus responsive to one of a plurality of code cards each of which carries a plurality of flux controlling means arranged in different patterns within a general pattern comprising,
a plurality of magnetically actuated switches arranged in a predetermined spaced planar pattern corresponding to said general pattern and having terminal means for connection in a code circuit,
a plurality of magnets mounted in a spaced aligned generally parallel plane with respect to said plane of the switches and in the same general pattern with a predetermined constant gap therebetween, said magnets establishing individual operating flux fields coupled one each to each of the several switches and operable to actuate the same, and
support means for supporting any one of said code cards within the gap between the switches and the magnets and establishing actuation of the switches in accordance with the pattern of the flux controlling means whereby only certain selected switches are actuated by each code card to provide a related coded output.

3,274,353
COVER AND SWITCH INTERLOCK
Daniel F. Daly, Newington, and Joseph M. O'Malley, West Hartford, Conn., assignors to The Arrow-Hart & Hegeman Electric Company, Hartford, Conn., a corporation of Connecticut
Continuation of application Ser. No. 2,395, Jan. 14, 1960. This application June 5, 1963, Ser. No. 286,443
9 Claims. (Cl. 200—50)

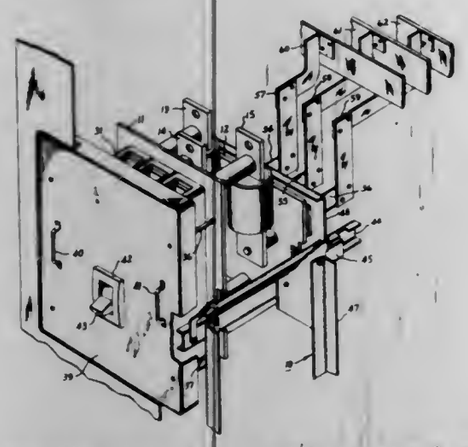


4. The combination of electric switch operating mechanism with a box having an openable cover, comprising contact operating means within the box movable between two positions, means including manual operating means operable from outside the box to operate said contact operating means, latching means entirely within the box operable by said manual operating means, said latching means and said manual operating means being movable into three positions, means on the cover engaged by said latching means to hold the cover closed when said manual operating means and said latching means are in one position, and other means on said cover and latching means whereby said manual operating means upon movement into a third position operates said other means to hold said cover closed while said manual operating means and said latching means are in said third position.

3,274,354
SWITCH MECHANISM
Curtis Ray Stevens, La Mirada, Calif., assignor to Master Specialties Company, Gardena, Calif., a corporation of California
Filed July 15, 1964, Ser. No. 382,912
15 Claims. (Cl. 200—76)

1. A switch comprising: a housing having a forwardly and rearwardly extending chamber, two pairs of facing contacts, said contacts lying generally in a forwardly and rearwardly extending plane with one contact of each pair being positioned generally forwardly of the other contact of each pair, a laterally extensive one-piece switch blade having opposite ends positioned between the facing contacts of respective pairs of contacts, a switch blade holder loosely supporting the center of said switch blade, and an overcenter device actuating said switch blade holder to snap said blade between a position wherein said switch blade engages the forward members of each pair of contacts to a position wherein said switch blade engages the rear members of each pair of contacts, the contacts of one pair of facing contacts being formed by a generally U-shaped notch in a single contact member.

3,274,355
CAM OPERATED SNAP SWITCH HAVING WIRE CONTACTS
James R. Francy, Los Angeles, Calif., assignor to Scantlin Electronics, Inc., Los Angeles, Calif., a corporation of Delaware
Filed Feb. 8, 1965, Ser. No. 430,954
14 Claims. (Cl. 200—77)

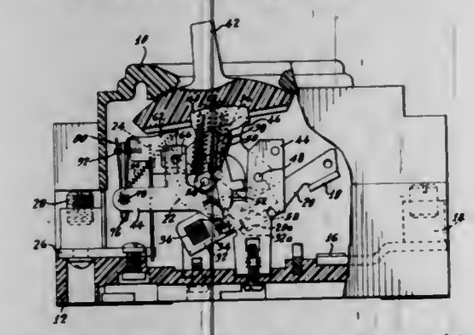


1. A switch comprising:
a switch housing;
an actuator shaft mounted for movement in said housing;
a fixed contact mounted in said housing adjacent said actuator shaft, said fixed contact being free of physical integration with said actuator shaft;
a conductive wire in said housing substantially rigidly mounted at one section of its length, at least a portion of said wire between said section and one end thereof defining a movable arm which extends generally transversely of said actuator shaft, said arm being engageable with said actuator shaft and carrying a movable contact, said fixed contact being mounted in the path of movement of said movable contact, said movable contact being engageable with said fixed contact;
means for biasing said arm toward said actuator shaft; and
cam means on said actuator shaft engageable with said arm and responsive to said movement of said actuator shaft for snapping said movable contact into and out of engagement with said fixed contact.

3,274,356
DRAW-OUT FUSED SWITCH-GEAR APPARATUS
Joseph Edwin Godfrey, West Hartford, Conn., assignor to General Electric Company, a corporation of New York
Filed Mar. 1, 1965, Ser. No. 435,876
5 Claims. (Cl. 200—114)

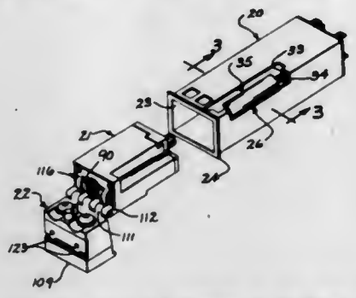
1. Draw-out electrical switching apparatus comprising:
(a) a front insulating plate having a front and rear surface;
(b) a rear insulating plate having a front and rear surface;
(c) means rigidly interconnecting said front and rear insulating plates in parallel spaced relation to each other to form a draw-out frame assembly;
(d) a plurality of rear line terminals mounted on said rear surface of said rear insulating plate;
(e) a plurality of rear load terminals mounted on said rear surface of said rear insulating plate;
(f) a plurality of front line terminals mounted on said front surface of said front insulating plate;
(g) a plurality of front load terminals mounted on said front surface of said front insulating plate;

(h) a plurality of electrical conducting means between said front and rear insulating plates each interconnecting one of said front line terminals and a corresponding one of said rear line terminals by means extending through said front and rear insulating plates respectively;



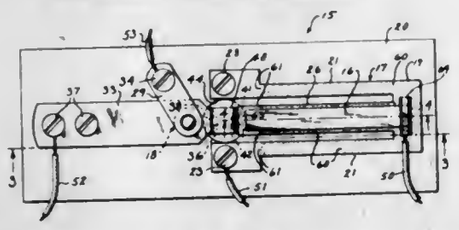
(i) a plurality of electrical fuses supported between said insulating plates and each connected between one of said front load terminals and a corresponding one of said rear load terminals by conductive means extending through said front and rear insulating plates respectively,

(j) an electrical circuit control device mounted on said front surface of said front insulating plate and interconnected between said front line terminals and said front load terminals, and



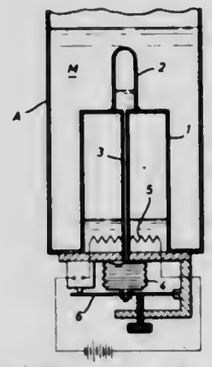
(k) means carried by said frame assembly for slidably guiding said assembly for movement with respect to a relatively stationary support structure.

3,274,357
CIRCUIT BREAKER HAVING AMBIENT TEMPERATURE COMPENSATION
Alfred E. Maier, Colonia, and Henry S. Wingard, Cranford, N.J., assignors to Federal Pacific Electric Company, a corporation of Delaware
Filed Dec. 1, 1964, Ser. No. 415,117
9 Claims. (Cl. 200—116)



1. A circuit breaker having a pair of separable contacts, operating means for opening and closing said contacts, said operating means including a releasable member, means releasable restraining said releasable member, and a current responsive bimetal for causing said restraining means to effect automatic opening of the contacts by said operating means in response to an overcurrent, said releasable restraining means including a trip member, a pair of ambient temperature responsive bimetals having confronting secured ends fixed to said trip member and having confronting movable ends, said movable ends having means providing only transverse constraint therebetween, said trip member and said temperature compensating bimetals constituting means for transmitting tripping forces applied by said current responsive bimetal in the direction to release said releasable member, said ambient temperature compensating bimetals being mounted to deflect in the same direction as one another and being disposed to provide compensation for the effects on said current-responsive bimetal produced by ambient temperature changes.

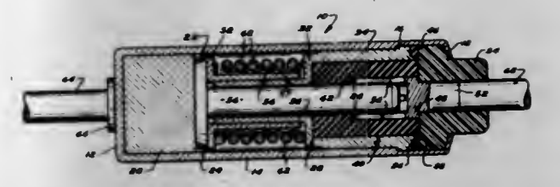
3,274,358
INDICATOR LIGHT HAVING A PIVOTALLY-CONNECTED LIGHT HOUSING BLOCK AND A LENS COVER SECTION SLIDABLY MOUNTED THEREON
Don M. Hallerberg, San Pedro, Calif., assignor to Master Specialties Company, Gardena, Calif., a corporation of California
Filed July 29, 1963, Ser. No. 298,090
8 Claims. (Cl. 200—121)



1. In an electrical lamp assembly, a hollow light block having an end surface which surrounds an internal lamp receiving opening, said light block having a pair of external opposite side surfaces which are generally parallel and which contain parallel grooves therein, a filter section overlying the end surface of said light block, said filter section having shoulder portions which abut the sidewalls of said internal opening and prevent relative movement therebetween, and a lens cover section overlying said filter section, said lens cover section having one side which does not appreciably overlie side surfaces of said filter section and light block, an opposite side surface which overlies the opposite side of said lens cover section and light block, and a pair of connecting sides which are provided with channel sections which project into said parallel grooves in the external surface of said light block to lock said filter section and lens cover section in place.

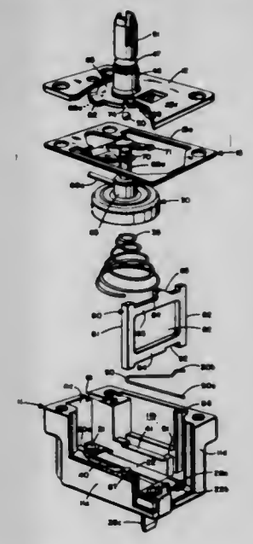
3,274,359
THERMAL RELAY
Richard E. Riebs, Hales Corners, Wis., assignor to McGraw-Edison Company, Milwaukee, Wis., a corporation of Delaware
Filed Dec. 30, 1963, Ser. No. 334,402
2 Claims. (Cl. 200—122)

1. A thermal relay including a flat elongated generally E-shaped bimetallic element having three adjacent disposed substantially parallel legs, one end of each of said legs being joined by a common end portion, a first coating covering a substantial elongate portion of one surface of the central one of said legs and extending from said one end to a terminal position short of the other end thereof, said first coating comprising an electrical insulating material, a second elongate coating disposed on said central leg and consisting of electrical resistance material, said second coating being disposed on said first coating and extending from the one end of said central leg past said terminal position and onto the other end of said element for electrically engaging said element, said first coating electrical insulating the remainder of said resistance coating from said element, first electrical terminal means electrically connected to said resistance coating adjacent said one end, and second electrical terminal means connected to the other end of one of the outer ones of said legs.



3,274,360
TEMPERATURE-RESPONSIVE CONTROL MECHANISM FOR HEATING APPARATUS
Willi Brandl, Schurbungert 12, Zurich, Switzerland
Filed May 26, 1964, Ser. No. 370,257
Claims priority, application Germany, May 28, 1963, B 72,081
4 Claims. (Cl. 200—122)

1. A control mechanism for a heating apparatus comprising a container holding a medium to be heated, an evacuated chamber disposed within said container surrounded by said medium and partly filled with a liquid, a heating element in said chamber effective, when energized, to generate steam from said liquid and thereby to heat the walls of said chamber, said heated walls being effective to heat said medium, energizing means for said heating element, disconnectable means forming an operative connection between said energizing means and said heating element, actuating means for said disconnectable means effective to interrupt said connection and halt the energization of said heating element only upon the successive attainment of predetermined temperatures in said chamber and of said medium, control means for said actuating means comprising a heat sensitive element having a lower part disposed within said chamber and an upper part within said medium, said parts being interconnected and including means producing pressure on said actuating means varying in accordance with the temperatures of said parts, said parts being influenced by the temperatures of said chamber and said medium, respectively, one of said parts being operatively connected with said actuating means, said two parts comprising means facilitating said successive attainment of said predetermined temperatures, first in said chamber and subsequently of said medium, said last-named means including differences in the relative surface areas of said two parts.



3,274,361
THERMAL FUSE UTILIZING AN ELECTRICALLY CONDUCTIVE PELLET
Gerald F. Ebensteiner and Gregory J. Rusinyak, Minneapolis, Minn., assignors, by mesne assignments, to United-Carr Incorporated, Boston, Mass., a corporation of Delaware
Filed Apr. 7, 1965, Ser. No. 446,225
4 Claims. (Cl. 200—123)

1. A thermal fuse comprising an elongated casing, a fusible pellet of electrically conductive material disposed within said casing at one end thereof, a fixed electrical contact element disposed within said casing at the other end thereof, a movable contact element having an enlarged head engaging said pellet and a shank having its free end engaging said fixed contact, a fixed sleeve member having a tubular baffle portion closely encircling said shank, said shank being free to slide relative to said baffle portion, a movable sleeve member having a tubular baffle

portion closely encircling said first baffle portion provided with a flange abutting said enlarged head, said second baffle portion being free to slide relative to said first baffle portion, and a coil spring acting against said flange so as to bias said movable contact element toward said pellet and away from said fixed contact to effect separation of said contact elements when said pellet becomes molten due to a sufficient rise in temperature.

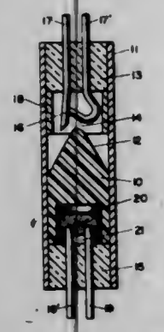
3,274,362
ADJUSTABLE FLUID PRESSURE OPERATED ELECTRIC SWITCH
Charles Frendock, Red Bank, N.J., assignor to The Wilcolator Company, Elizabeth, N.J., a corporation of Delaware
Filed July 15, 1964, Ser. No. 382,799
4 Claims. (Cl. 200—140)

1. A condition responsive switch comprising:

(a) housing means including a hollow body and a cover secured thereto,

(b) contact means in said housing means,

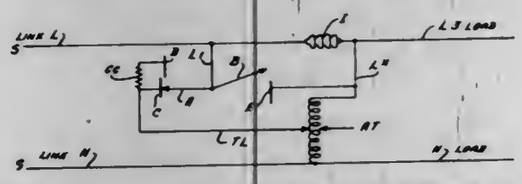
(c) condition responsive expansible power means in said housing means for operating said contact means in response to predetermined condition changes,



(d) a control shaft extending through said cover and rotatable to vary contact operating response of said power means to said predetermined condition changes,

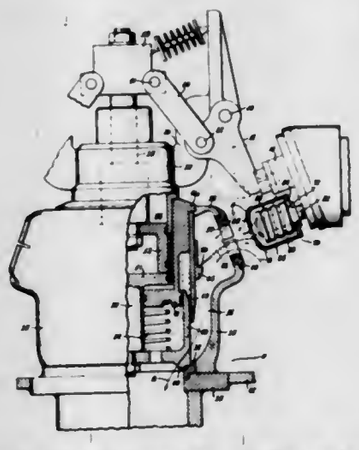
(e) a washer mounted on said shaft by a splined connection for axial movement and rotation therewith, said washer having a aperture in one face thereof,

(f) biasing means comprising a pair of spring arms each supported at one end and extending on opposite sides of said shaft and engaging said one surface of said washer for urging said washer into engagement with said cover for frictionally opposing rotation of said shaft, and



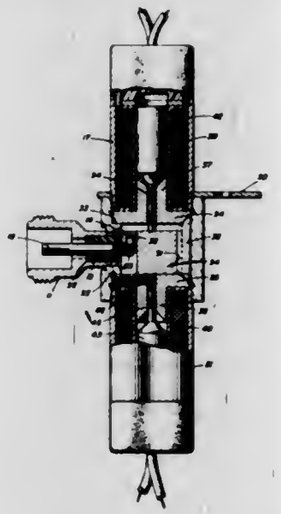
(g) one of said spring arms having a raised part engaging said washer and adapted to at least partially enter said aperture when said washer is rotated to bring said aperture into registration with said raised part to provide tactile indication of at least one rotative position of said shaft.

3,274,363
ELECTRICAL SWITCH HAVING DEFORMABLE CONTACT MEMBERS
Robert McGirr, Orwigsburg, and Benjamin A. Gay, Tamaqua, Pa., assignors to Atlas Chemical Industries, Inc., Wilmington, Del., a corporation of Delaware
Filed Oct. 8, 1962, Ser. No. 228,923
2 Claims. (Cl. 200—142)



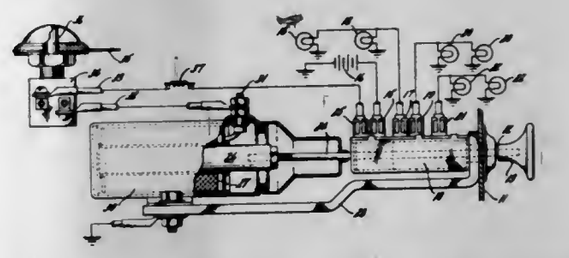
1. A normally closed switch comprising
an outer shell,
a symmetrical pointed wedge member the sides of which converge to an apex and moveable along a line positioned within said shell,
a pair of contacting electrode members positioned and permanently secured within said shell,
at least a portion of one electrode member of said pair bent back on itself and positioned across the path of travel of the point of said wedge member and so slanted with respect to the path of travel of said wedge member as to be pried away from the other electrode member upon movement of said wedge,
said portion composed of a metal deformable into a permanent set,
said wedge member moveable
from a first position wherein the wedge member is not disruptive of contact between said electrodes
to a second position wherein the wedge member contacts said portion and deforms said portion into a permanent set and permanently separates said electrode members by wedging the nonconducting striking surface of said wedge therebetween, and
electrically actuated squib means to drive said wedge member from said first position to said second position.

3,274,364
BY-PASS SWITCH FOR OPERATION WITHOUT INTERRUPTING SERVICE
Robert S. Sullivan, Lahore, West Pakistan, Pakistan, and Thomas B. Ortwig, Florissant, Mo., assignors to Kearney-National Inc., a corporation of Delaware
Filed Apr. 30, 1962, Ser. No. 190,880
6 Claims. (Cl. 200—146)



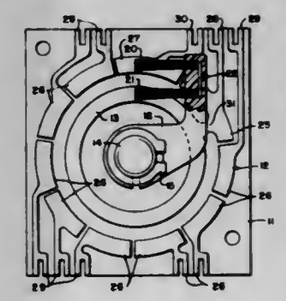
1. In a disconnect type of electric switch the combination comprising, (1) a base, (2) a pair of insulators mounted in spaced relation on said base, (3) a fixed contact supported by each of said insulators, (4) a third insulator located between said pair of insulators and supporting a hinge connection, (5) a movable contact member rockably supported on said hinge mounting for movement of its opposite ends alternately into and out of engagement with said fixed contacts, (6) an electric terminal connection to said movable contact, (7) an electric terminal connection to each of said fixed contacts, (8) an auxiliary contact mounted on said switch and permanently electrically connected with one of (3) and (4), (9) an impedance element permanently electrically connected in series circuit relation between said auxiliary contact and the one of (3) and (4) to which said auxiliary contact is permanently electrically connected, and (10) means operative during rocking movement of said movable contact member in the direction which breaks its engagement with one of said fixed contacts and makes its engagement with the other of said fixed contacts to successively:
(a) complete an electrical circuit from said movable contact member through said auxiliary contact to energize said impedance element before said movable contact member breaks engagement with said one fixed contact,
(b) break engagement between said movable contact member and said one fixed contact while free of contact with the other fixed contact,
(c) make engagement between said movable contact member with the other fixed contact while said auxiliary contact maintains the said impedance element energized, and
(d) break the electrical circuit through said auxiliary contact and said impedance while said movable contact member is in engagement with said other fixed contact.

3,274,365
GAS BLAST CIRCUIT BREAKER OF THE AXIAL BLAST TYPE WITH MAGNETIC MEANS FOR ROTATING AN ARC TERMINAL
John W. Beatty, Newtown Square, Pa., assignor to General Electric Company, a corporation of New York
Filed Aug. 16, 1963, Ser. No. 302,613
8 Claims. (Cl. 200—148)



1. An electric circuit breaker of the axial-blast, gas-blast type comprising:
(a) a pair of electrodes between which an arc is established during circuit interruption,
(b) an orifice having an opening through which said arc is adapted to extend when present between said electrodes,
(c) means for causing a stream of gas to pass through said orifice opening axially of the arc about the periphery of said arc,
(d) portions of said gas stream flowing closely adjacent to the outer periphery of the electrode located upstream from said orifice but separating from the surface of said electrode in a region facing the orifice opening, whereby to define a stagnation zone in said latter region,
(e) said arc having an upstream terminal that is held captive in said stagnation zone during a circuit interrupting operation,
(f) magnetic means for rotating said upstream terminal about a point on said upstream electrode while said upstream arc terminal is held captive in said stagnation zone,
(f') said upstream electrode comprising a generally cup-shaped member surrounding said magnetic means with the base of said cup-shaped member facing downstream with said stagnation zone positioned on said base, means for forcing current flowing through said cup-shaped member to an arc terminal in said stagnation zone to flow from the outer periphery of said cup-shaped member radially inwardly, thereby developing a radially-inwardly acting magnetic force on said arc to help hold the arc in said stagnation zone.
(g) said cup-shaped member having a central region of said base disposed within said stagnation zone in which said magnetic means has relatively weak arc rotating abilities,
(h) and means for preventing entry of said upstream arc terminal into said central region.

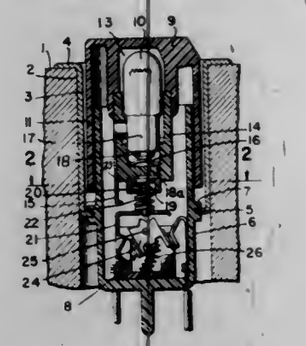
3,274,366
CONSTANT IMPEDANCE COAXIAL LINE SWITCH
Russell E. Horton, Forestville, Conn., assignor to The Bendix Corporation, Farmington, Conn., a corporation of Delaware
Filed July 27, 1964, Ser. No. 385,281
6 Claims. (Cl. 200—153)



1. A single pole-double throw switch for coaxial lines comprising:
a hollow switch body,
connectors for an input coaxial line and a pair of output coaxial lines either of which may be selectively connected to said input line, said connectors providing extensions for the inner conductors of said lines to enter said switch body at the same level,
a first contact element within said body at a higher level than said extended inner conductors and overlying the ends of the extensions for said input line and one of said output lines,
a second contact element within said body at a lower level than said extended inner conductors and underlying the ends of the extensions for said input line and the other of said output lines,
a carrier supporting both of said contact elements with vertical spacing sufficient for said first contact element to clear said input and said one output ends upon engagement of said second contact element with said input and said other output ends, and
means for vertically reciprocating said carrier to establish alternate connection of said input line to one or the other of said output lines.

3,274,367
AUTOMOBILE LIGHT SWITCH
William R. Clark, 10800 Cumberland Road, Noblesville, Ind.
Filed July 6, 1964, Ser. No. 380,229
7 Claims. (Cl. 200—161)

1. In an automobile having a closed body and exterior lights controlled by a switch located within the automobile body and embodying a main reciprocable control member having first and second end portions projecting in opposite directions from a switch housing, said first end portion being within the automobile body to permit the control member to be moved between a first position in which the switch turns the lights off and a second position in which it turns the lights on, the combination with said main control member of a movable auxiliary control member having a portion located outside the automobile body, and means operatively connected to the second end portion of said main control member and actuatable by movement of said auxiliary control member for moving said main control member from its second to its first position, said means being inoperative to move the main control member from its first to its second position.



3,274,368
LAMINATED DISTRIBUTOR BRUSH
Jerome L. De Boo, Barrington, and Geoffrey B. Lutz, Evanston, Ill., assignors to Teletype Corporation, Skokie, Ill., a corporation of Delaware
Filed Dec. 29, 1964, Ser. No. 421,877
8 Claims. (Cl. 200—166)

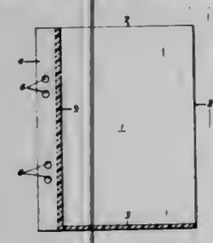
1. The combination with a plurality of brush contacting surfaces, of a distributor brush comprising:
a first layer of generally L-shaped, resilient wires positioned adjacent each other in a substantially straight row;
a second layer of generally L-shaped, resilient wires positioned adjacent each other in a substantially straight row, and

means holding the layers in a position where they bear upon the contacting surfaces with sufficient force to flex all of the wires of both layers and to merge the two layers into a single row of wires.

3,274,369
SERVICE SIGNAL LIGHT
John B. Quinn, 450 N. Rossmore Ave., Los Angeles, Calif.
Filed Nov. 12, 1964, Ser. No. 412,279
7 Claims. (Cl. 200—167)

1. A service signal light adapted to be mounted within a service counter for providing light beams of different intensity at least two directions comprising

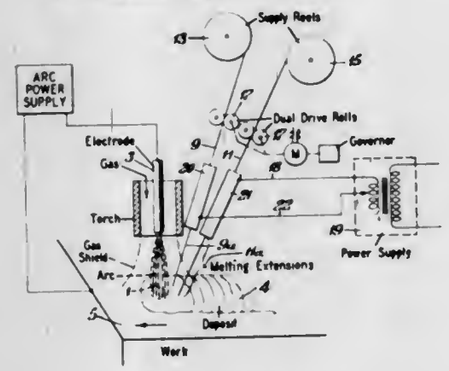
elongated button means having a first end with a substantially central cavity therein, said first end having a plurality of areas with different light transmitting properties therethrough, said button means having a second end forming a skirt,



a light bulb mounted within said cavity and adjacent said first end of said button means for emitting light through said areas of said first end,

mounting means coupled within said button means for maintaining said light bulb within said cavity and having electrical contacts coupled with contacts of said bulb,

casing means, at least said second end of said button means being mounted substantially coaxially with respect to said casing means, and



switch means mounted in said casing means, said mounting means coupling said button means with said switch means to operate said switch means to "on" and "off" positions upon successive movements of said button means, and said contact means of said mounting means adapted to complete an energizing circuit to said bulb through said switch means.

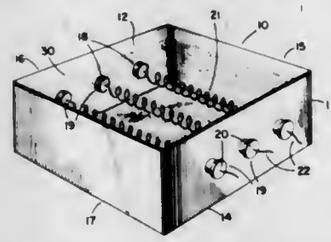
3,274,370
HIGH FREQUENCY WELDING APPARATUS
Eckhard Klaus Heine, Stockholm, Sweden, assignor to Olof Fridlund, Molndal, Sweden, a manufacturer
Filed Jan. 3, 1964, Ser. No. 335,494
Claims priority, application Sweden, Jan. 14, 1963, 399/63
3 Claims. (Cl. 219—10.53)

1. High frequency welding apparatus for welding in one single operation step of a cover or the like of very thin double-folded pastic material, one edge of which has a thicker plastic edge-strip, characterized by the one welding electrode being constituted of an L-shaped tool, where the one branch which is located closest to the thicker material and intended for the welding thereof to the thin plastic films is completely uncovered and where the other branch which is intended for the welding of two thin plastic films to each other is covered by a rubber layer, the opposite electrode in both cases being covered by a layer of a material, which is isolating with respect to the high frequency to such an extent, that a break-down is avoided, and which is heat isolating and has a high loss-factor.

3,274,371
METHOD OF DEPOSITING METAL
August F. Manz, Union, and John F. Saenger, Jr., Springfield, N.J., assignors to Union Carbide Corporation, a corporation of New York
Filed June 1, 1965, Ser. No. 460,441
25 Claims. (Cl. 219—137)

1. Process for depositing metal which comprises:

(a) heating a zone of a workpiece with an energy source having a magnetic field associated therewith;



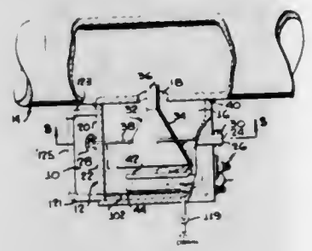
(b) feeding at least two consumable wires into the so-heated zone;

(c) providing current through said wires in the extension portions thereof;

(d) positioning such wires in the vicinity of such energy source so that the magnetic field of such energy source interacts in a predetermined mode with the magnetic fields created by said current flowing in said wires;

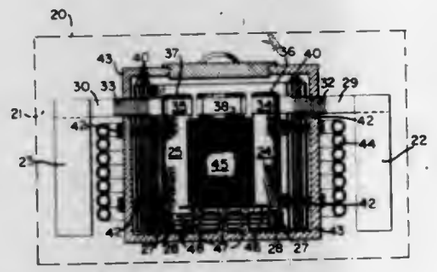
(e) controlling the feed rate, the current, and the extension of said wires so that such wires melt in the so-heated zone without the establishment of an arc off the ends of said wires.

3,274,372
SOLID VAPORIZATION
Rudolph Frank, La Mirada, Calif., assignor to Electro-Optical Systems, Inc., Pasadena, Calif.
Filed July 27, 1964, Ser. No. 385,509
2 Claims. (Cl. 219—271)



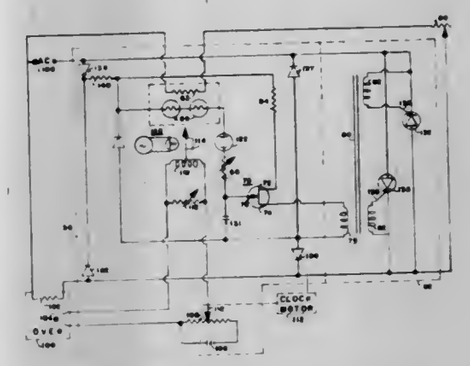
1. A simple, efficient vaporizer adapted to deposit a thin film of vaporized solid uniformly over a large area without the emission of solid particles comprising:

(a) a shallow refractory container having a large area open top, said container having a top area of at least about four square inches and a depth of less than about one inch; and



(b) a series of at least three spaced helical coils mounted in said container substantially halfway between the top and bottom of said container and extending substantially parallel to the bottom wall of said container and substantially parallel to each other, said coils being adapted to be completely enclosed by the solid charge in said container and to heat said solid charge internally adjacent to but spaced from its top surface over substantially the same area as the top surface.

3,274,373
STEAM DRAIN AND REHEAT DEVICE
James W. Maddox, Newport News, Va., assignor to Newport News Shipbuilding and Dry Dock Company, Newport News, Va., a corporation of Virginia
Filed Sept. 10, 1963, Ser. No. 307,860
10 Claims. (Cl. 219—272)



1. A liquid heating and vaporizing device comprising a closed bottom receptacle having its upper end open and adapted to be connected to and in communication with the low point of a vapor container, said receptacle comprising upper and lower sections, joined in a hermetically sealed joint, an open ended conical baffle in said receptacle, means supporting said baffle in spaced relation to the bottom and sides of the receptacle, said means including radially extending arms on said baffle, the ends of which are secured to the sides of the receptacle at said joint, and electrically controlled heating and vaporizing means positioned in said receptacle beneath the said baffle and substantially within the vertical projection of the peripheral lower edge thereof.

3,274,374
ELECTRICAL HEATING ELEMENTS
Wilfrid G. Matheson, Marblehead, James P. Clune, Danvers, and Theodore J. Pricenski, Ipswich, Mass., assignors to Sylvania Electric Products Inc., a corporation of Delaware
Filed May 7, 1963, Ser. No. 278,660
11 Claims. (Cl. 219—426)

5. In a high temperature electric discharge furnace having a hollow cathode disposed therein, the improvement which comprises: an anode disposed inside said cathode and spaced therefrom, said anode being a generally cylindrical plexus formed of a multiplicity of intertwisted helical convolutions of refractory metal wires.

3,274,375
THERMOSTATIC OVEN CONTROLLER WITH AUTOMATIC RESET
Philip B. Beltz, Wilmington, Del., assignor, by mesne assignments, to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California
Filed Apr. 16, 1964, Ser. No. 360,205
6 Claims. (Cl. 219—501)

1. A temperature control system comprising:

an oven,

an electrical heating means for said oven,

temperature control means for sensing when the temperature of said oven deviates from a set point,

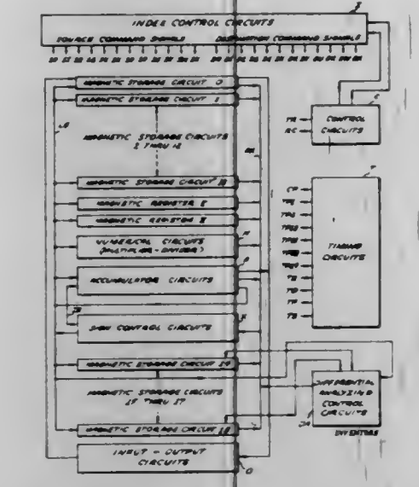
power means adapted to receive alternating current energy,

a switch having a pair of current conducting electrodes and a gate electrode, said current conducting electrodes interconnecting said power means and said heating means,

a timing capacitor,

means for periodically charging said timing capacitor at a varying rate.

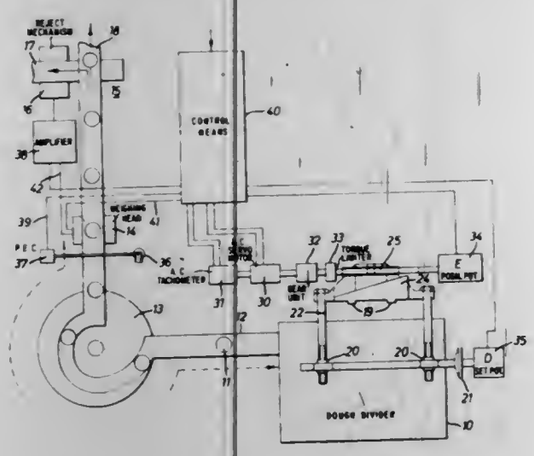
means for varying the magnitude of said rate including a resistance element having a negative temperature coefficient of resistance and a variable impedance means responsive to said temperature control means serially connected to said timing capacitor,



trigger circuit means connected to said timing capacitor for passing a gating signal to said gate electrode whenever the charge across said timing capacitor equals a predetermined value, and

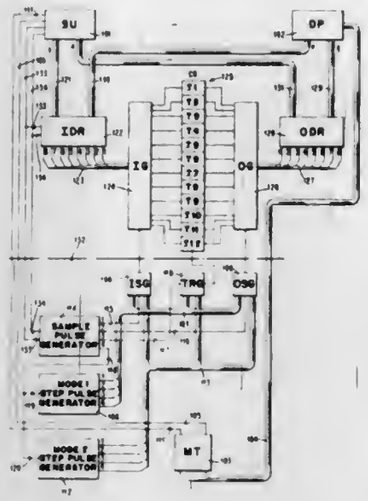
additional heating means responsive to the energy supplied to said electrical heating means for varying the temperature of said resistance element, thereby to vary the response characteristic of said oven to temperature changes.

3,274,376
DIGITAL DIFFERENTIAL ANALYZER IN CONJUNCTION WITH A GENERAL PURPOSE COMPUTER
David C. Evans and Maurice W. Horrell, Playa Del Rey, Calif., assignors to The Bendix Corporation, a corporation of Delaware
Filed May 18, 1955, Ser. No. 509,271
19 Claims. (Cl. 235—150.31)



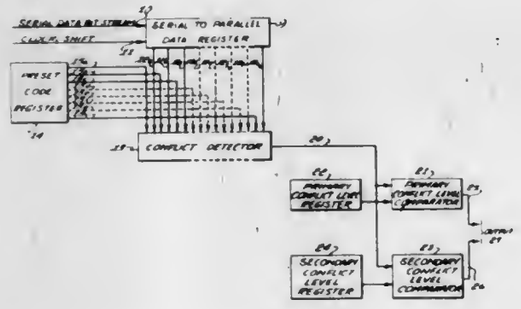
2. A computing system comprising: a plurality of storage means for storing signal representations of numerical information; arithmetic circuit means for performing arithmetic and logic operations with respect to signal representations of numerical information whereby to form representations of the results of said arithmetic operations; integration control means for combining signal

representations of numerical information such as to effect the performance of the process of integration of numerical information so combined whereby to form representations of results of said process of integration; an input-output system adapted to receive and transmit various



signal representations of numerical information; and transfer means for selectively effecting the movement of signal representations of numerical information between said storage means, said arithmetic circuit means, said integration control means, and said input-output system.

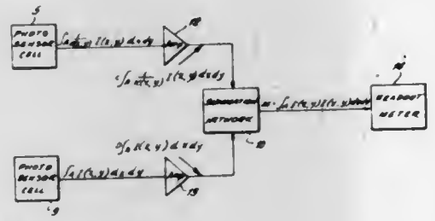
3,274,377
INTEGRATED ERROR CORRECTING SYSTEMS
Peter P. Morison, Cambridge, England, assignor to Spillers Limited, a British company
Filed Aug. 14, 1962, Ser. No. 216,823
Claims priority, application Great Britain, Aug. 17, 1961, 29,669/61
21 Claims. (Cl. 235—151.13)



1. An error correcting system comprising integrating means responsive to a predetermined number of successive error signals each indicative of the degree and direction of departure of selected characteristics of a unit or package from a predetermined desired value and providing an integrated output signal determined by the sum of said error signals, a storage means, a first servo mechanism responsive to said integrated output signal for driving said storage means and a second servo mechanism adapted to be connected to apparatus to be controlled and responsive to said storage means for effecting an error correcting adjustment of said apparatus.

3,274,378
DATA TRANSFER AND CONVERSION CIRCUIT
John K. Crawford and Chester M. Pietras, Poughkeepsie, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 28, 1961, Ser. No. 162,788
9 Claims. (Cl. 235—154)

1. A data transfer and conversion circuit for converting a first group of bytes, each having a particular number of binary bits to a second group of bytes, said groups having the same number of bits, but their respective bytes having different numbers of binary bits with a non-integer multiple relationship, comprising:
a conversion register having a plurality of bit storage positions, said register having a maximum bit storage capacity which is less in number than the number of bits in each of said first or second group, said positions being inactive when available for storage of binary bits, or active when unavailable for storage of binary bits;
means for gating each byte of said first group in succession to selected inactive register positions thereby rendering them active;
and means for selectively gating output bytes in succession from active register positions.



3,274,379
DIGITAL DATA CORRELATOR
Karl Hinrichs, Fullerton, Calif., assignor to Beckman Instruments, Inc., a corporation of California
Filed Apr. 15, 1963, Ser. No. 273,010
18 Claims. (Cl. 235—177)

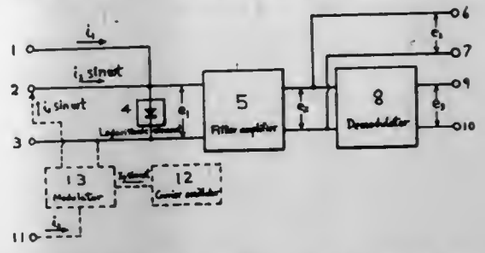
16. A digital data correlator comprising
means for registering a group of n bits in an incoming bit stream,

means for registering a group of n bits corresponding to a predetermined code pattern,
means for determining the number of conflicts between said respective bit groups,
means for presetting a first conflict level,
first means for comparing the number of conflicts with said first preset conflict level,
means for presetting a second conflict level, and
means for comparing the number of conflicts with said second preset conflict level.

3,274,380
OPTICAL-ANALOG INTEGRATOR
Saul Moskowitz, Brooklyn, N.Y., assignor to Kollsman Instrument Corporation, Elmhurst, N.Y., a corporation of New York
Filed May 4, 1962, Ser. No. 192,526
2 Claims. (Cl. 235—183)

1. An optical-analog integrator for evaluating integrals of the form:

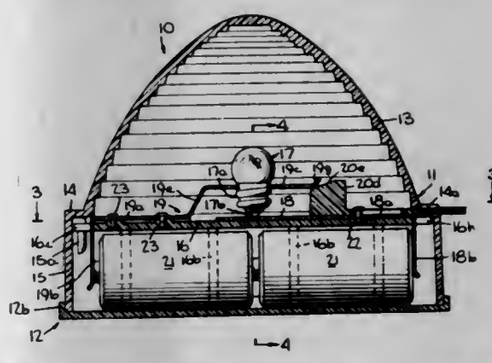
$$M=\int_A f(x,y)\ I(x,y)dxdy$$



wherein $f(x,y)$ is a noninfinite function of variables x and y over an area A, and $I(x,y)$ is a variable intensity distribution over the area A comprising first means for producing an image of an object, second means for producing an image of said object, an optical filter having a variable density, and first and second photosensitive means responsive to the intensity of radiation from said first and second image-producing means; said optical filter being interposed between said first image-producing means and its said respective photosensitive device; the output of said first and second photosensitive devices each being connected to amplifying means and a common summation means; the output of said summation means being equivalent to the evaluation of said integral; said optical filter representing the function $1/K(x,y)$ over the area of said first means for producing an image; said first photosensitive device having an output related to:

$$\int_A (1/K(x,y))I(x,y)dxdy$$

said second photosensitive device related to: $\int_A I(x,y)dxdy$.

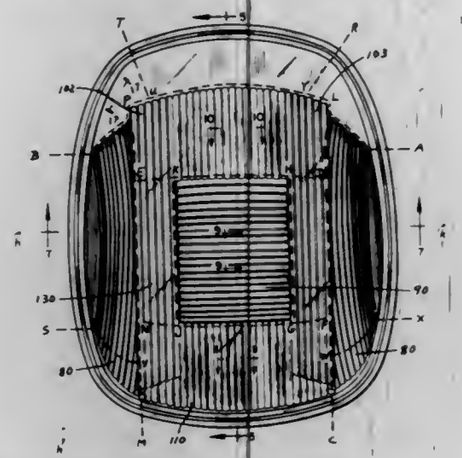


3,274,381
DIVISION CIRCUIT
Noboru Amano, Mito-City, and Naoaki Wakayama, Naka-gun, Ibaraki-ken, Japan, assignors to Nihon Genshiryoku Kenkyu Sho, Tokyo, Japan, a corporation of Japan
Filed Sept. 11, 1962, Ser. No. 222,834
Claims priority, application Japan, Nov. 18, 1961, 36/41,655
5 Claims. (Cl. 235—196)

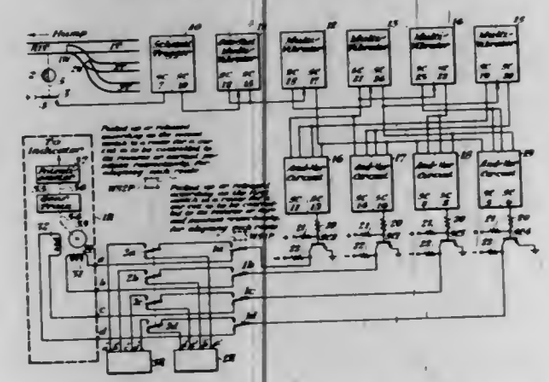
1. A division circuit comprising means to introduce an alternating current proportional to a dividend and a current proportional to a divisor simultaneously into a logarithmic element, the voltage across said element being proportional to the logarithm of the current flowing through said element, means to pass only the component of the A.C. fundamental wave from the voltage

appearing across said element, and means to amplify and to demodulate said component.

3,274,382
PORTABLE BATTERY POWERED SAFETY LIGHT AND REFLECTOR PLATE CONSTRUCTION THEREFOR
Lazzaro A. Fattori, 84 Rose Ave., Woodcliff Lake, N.J.
Filed May 1, 1964, Ser. No. 364,242
6 Claims. (Cl. 240—10.6)



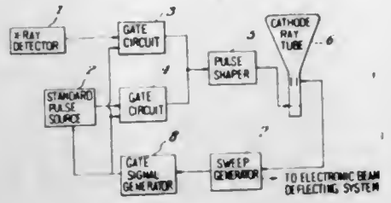
1. A portable battery powered safety light having a two-piece casing of molded plastic comprising a light transmitting dome-shaped housing open at a bottom thereof and fitted with a removable bottom closure plate, a reflector plate of molded plastic mounted in said housing spaced above said bottom closure plate and having a dome-facing surface and an opposite bottom-facing surface, the latter having snap-in battery supporting means, a battery mounted in said supporting means, said dome-facing surface mounting a lamp, a switch and conductor elements to the battery, said switch having operating means extending through an opening in said housing, said reflector plate, battery, lamp and switch forming an operative removable unit, the latter being removable through said housing open bottom upon removal of said closure plate, and means cooperating with said housing and reflector plate for snap-in removal and retention of the latter in said mounted position in the housing.



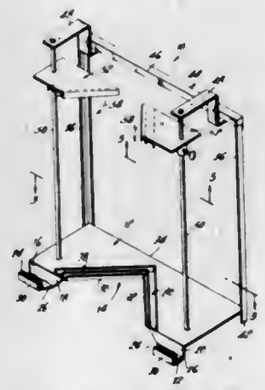
3,274,383
LUMINAIRE
William H. Dorman, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y., a corporation of New York
Filed June 1, 1964, Ser. No. 371,273
7 Claims. (Cl. 240—106)

1. A refractor of a generally semi-ovate form having a generally flat rim forming its periphery, said refractor being symmetric about a longitudinal plane perpendicular to the plane of said rim, said refractor comprising on each side of said longitudinal plane a side portion, said side portions being symmetric about said longitudinal plane, each said side portion comprising an inner surface and an outer surface, one of said surfaces comprising a plurality of prisms having edges lying in planes substantially perpendicular to said longitudinal plane and having convex surfaces and the other said surface comprising a

plurality of prisms having edges in the form of arcs of circles which are concave in the direction of said rim and which have centers at points on the sides of said rim opposite said arcs and having bases at their sides nearest said rim.



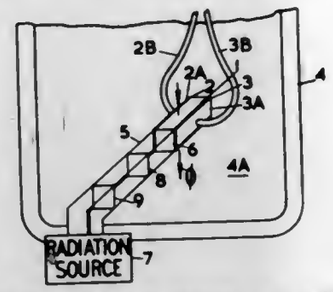
3,274,384
RAILWAY CAR COUNTER
William A. Robison, Jr., Pittsburgh, and Adolf G. Pokrant, Braddock Hills, Pa., assignors to Westinghouse Air Brake Company, Wilmerding, Pa., a corporation of Pennsylvania
Filed July 12, 1962, Ser. No. 209,341
9 Claims. (Cl. 246—247)



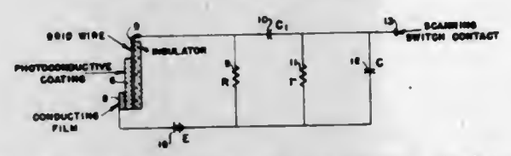
1. A railway car counting system for a storage track comprising,
means for producing a signal representative of each axle of each railway car entering the storage track,
solid state electronic means responsive to each signal for counting the number of cars routed to said storage track,
and means including a motor having a pair of stator windings and a rotor responsive to said counting means for producing an output representing the number of empty car spaces remaining in said storage track.

3,274,385
SCANNING X-RAY MICROANALYSER
Hiroshi Tomita, Iwata-shi, Japan, assignor to Kabushiki Kaisha Hitachi Seisakusho, Tokyo, Japan, a joint-stock company of Japan
Filed Feb. 18, 1963, Ser. No. 259,211
Claims priority, application Japan, Feb. 23, 1962, 37/6,436
4 Claims. (Cl. 250—49.5)

1. A scanning X-ray microanalyser comprising a cathode-ray tube for producing scanned X-ray image in a first part of the screen of said cathode ray tube, means for producing standard pulses of predetermined counting rate, and means for creating, in a second part of the screen of said cathode-ray tube, at least, one image with standard brightness for comparison with the brightness of the scanned X-ray image, said image being created in response to said standard pulses.



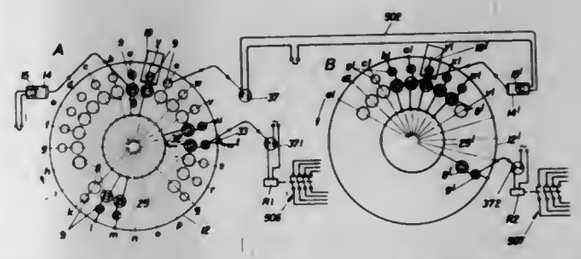
3,274,386
APPARATUS FOR PRODUCING WIDE ANGLE X-RAY PHOTOGRAPHS
Leon J. Corbin, 1369 Rosedale Ave., Bronx, N.Y.
Filed May 14, 1962, Ser. No. 194,492
3 Claims. (Cl. 250—66)



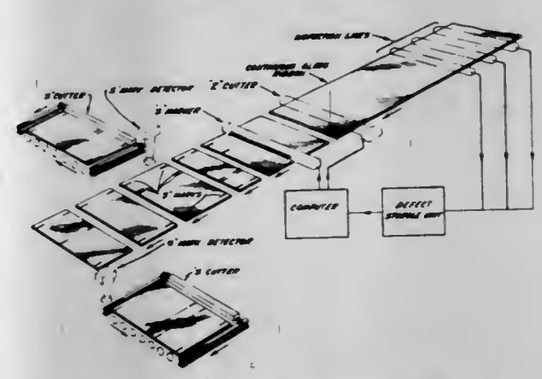
1. A radiography film cassette fixture comprising an elongated base provided with a pair of track means disposed in substantially right angular relation, a pair of laterally spaced track means extending parallel to the longitudinal axis of said base, and a pair of bracket means each provided with a track means, and means mounting said bracket means for vertical adjustment relative to said base and for angular adjustment relative to said base for selectively positioning each bracket track means in overlying alignment with one of said angularly related track means and with one of said laterally spaced track means whereby to selectively position a film cassette between each bracket track means and the associated one of said angularly related track means or to position film cassette between said pair of laterally spaced track means and both of said bracket track means.

3,274,387
INFRARED DETECTOR COMPRISING A COOLED SEMI-CONDUCTOR DISPOSED IN A MAGNETIC FIELD
Ernest Henry Putley, Malvern, England, assignor to National Research Development Corporation, London, England
Filed Aug. 21, 1961, Ser. No. 132,913
Claims priority, application Great Britain, Aug. 22, 1960, 28,946/60
15 Claims. (Cl. 250—83.3)

1. A photoconductive cell for detecting radiation in the waveband 0.1 to 8 mm. comprising, in combination, a mass of very pure semiconductor material having conduction leads connected thereto to establish a current path through said material, means for establishing a magnetic field of at least 2000 gauss through the mass at least substantially normal to said current path defined in the material by the conduction leads, means for cooling the semiconductor mass, and radiation transmitting means for transmitting radiation from at least part of the waveband 0.1 to 8 mm. to a region of the current path in the mass traversed by the magnetic field.



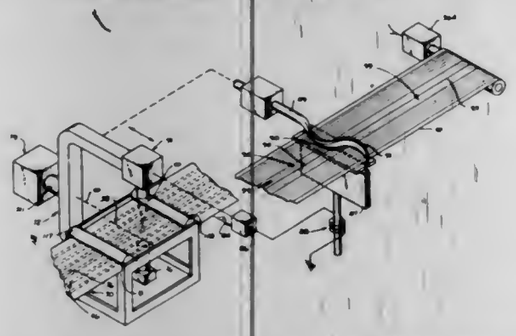
3,274,388
INFRARED DETECTOR AND SYSTEM FOR TRANSIENT SIGNALS
Maurice Distel, Red Bank, N.J., assignor to the United States of America as represented by the Secretary of the Army
Filed July 28, 1950, Ser. No. 176,512
9 Claims. (Cl. 250—83.3)



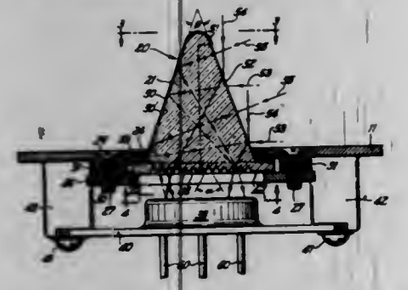
9. A radiation detecting and translating device comprising a plurality of horizontally aligned photoconductive elements having a maximum sensitivity in the infrared radiation band between 0.8 and 5 microns; a source of potential connected to said elements; a separate load impedance in series with each of said elements and said source of potential; output means for each of said impedances, each output means comprising a resistance-capacitance circuit for blocking the relatively steady voltage caused by background radiation and for passing the varying voltage caused by transient radiation, and a storage capacitor connected to be charged by said varying voltage; and means for sequentially scanning said storage capacitors including a multielement make-break type switch.

3,274,389
ELECTRIC IMPULSE STORING DEVICES AND PACKAGING MACHINES COMPRISING SUCH DEVICES
Alfred Schmermund, 62 Kornerstrasse, Gevelsberg, Westphalia, Germany
Filed Mar. 7, 1963, Ser. No. 263,594
Claims priority, application Germany, Mar. 10, 1962, Sch 31,107
8 Claims. (Cl. 250—205)

1. An electric impulse storing device comprising a rotatable member, means for rotating said member, a plurality of main photocells, an equal plurality of electric circuits, an equal plurality of electric main light sources, said main photocells and said main light sources being fixed to said rotatable member, in a circular configuration about the axis of rotation of said member, each of said main light sources being associated with one of said main photocells for illuminating the same, and being arranged in axial opposition to its associated photocell, each of said electric circuits including one of said main light sources and its associated main photocell for energizing a main light source when its associated photocell is illuminated, input means including a stationary electric auxiliary light source arranged to be energized in response to an electric impulse to be stored, said main light sources and said associated photocells being rotatable jointly with said rotatable member relatively to and past said auxiliary light source which is arranged for illuminating. When energized, an adjacent one of said plurality of photocells, a stationary auxiliary photocell arranged for being illuminated by any one of said main light sources when energized and when in a predetermined first position relative to said auxiliary photocell, an auxiliary electric circuit, which includes said auxiliary photocell, for creating a control effect in dependence on the illumination of said auxiliary photocell, means for intercepting light from any one of said main light sources to its associated main photocell when in a predetermined second position subsequent to said first position, and angularly displaceable mounting means for setting the angular spacing between said auxiliary light source and said auxiliary photocell to vary the time during which electric impulses are stored.

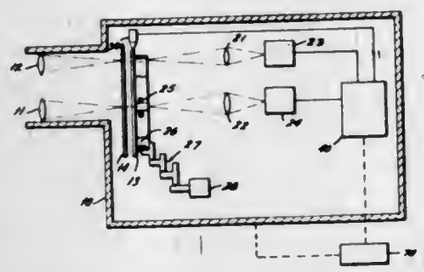


3,274,390
GLASS CUTTING CONTROL APPARATUS
Forrest K. Umbel, Verona, Pa., assignor to Pittsburgh Plate Glass Company, Allegheny County, Pa., a corporation of Pennsylvania
Filed June 16, 1961, Ser. No. 125,329
7 Claims. (Cl. 250—219)



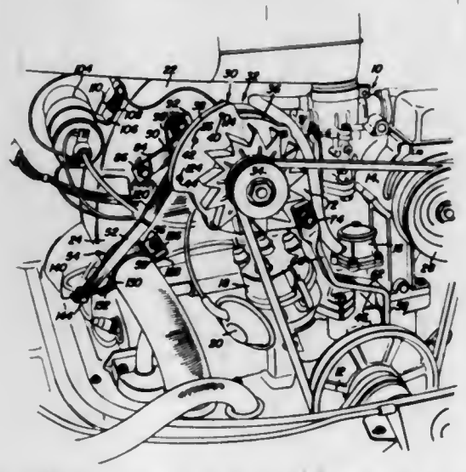
2. In apparatus for reading information from a continuously moving record where bits of data are stored at a series of points comprising a set on said record, the combination comprising, detection means for producing a signal denoting either the presence or absence of bits of data at each data point passing said detection means, pulse generating means operated in accord with said record movement for generating a synchronizing pulse as each data point passes said detection means, a set of output channels corresponding, respectively, to said record data points, means operated by said synchronizing pulses for feeding successive signals from said detection means to the respective channels corresponding to the data points, and means for adjusting the rate of emission of pulses from said pulse generating means to synchronize the latter with said record movement.

3,274,391
APPARATUS FOR MONITORING THE SPACING BETWEEN A PLURALITY OF ELEMENTS ARRANGED IN A SERIES
Alfred Heinz, Raritan Township, Hunterdon County, N.J., assignor to Western Electric Company Incorporated, New York, N.Y., a corporation of New York
Filed June 1, 1964, Ser. No. 371,617
15 Claims. (Cl. 250—219)



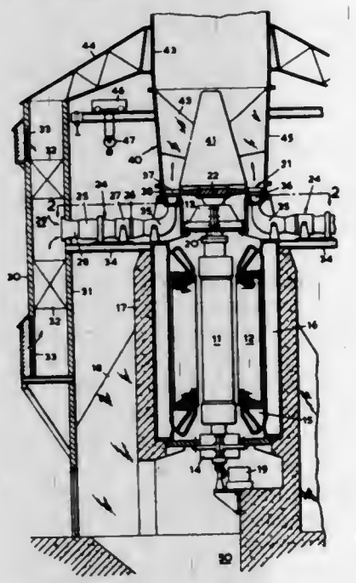
1. Apparatus for monitoring the spacing of a plurality of elements arranged in a series, which comprises:
means for directing a beam of radiation toward one of the elements;
drive means for causing relative movement at a selected rate between the elements and said directing means to render the elements effective to modify said beam of radiation and produce a train of pulses of radiation at a rate indicative of the spacing of the elements;
recording means having a section for receiving marks, the reception of said marks by said section being indicative of a predetermined spacing of the elements;
means actuated by said drive means at a rate proportional to said selected rate for cyclically conditioning said section for reception of said marks; and
means responsive to said train of pulses for marking said conditioned section to indicate conformity of the spacing of the elements to said predetermined spacing.

3,274,392
LIGHT COLLECTOR FOR PHOTOSENSITIVE LUMINAIRE CONTROL
Donald W. Harling, Milwaukee, Wis., assignor to McGraw-Edison Company, Milwaukee, Wis., a corporation of Delaware
Filed Aug. 22, 1963, Ser. No. 303,810
6 Claims. (Cl. 250—227)



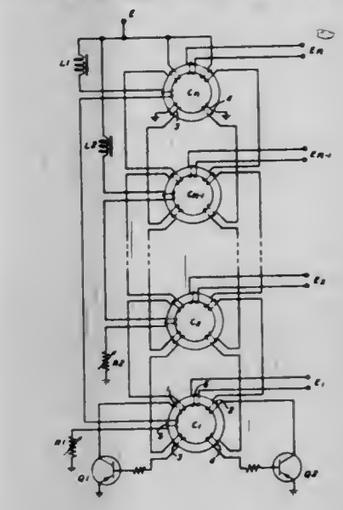
5. A luminaire having an outer housing, an aperture in said housing, a photosensitive cell disposed within said housing and adjacent said aperture, a light collecting member consisting of a solid body of transparent material having a substantially symmetrical conical configuration, said light collecting member extending through said aperture and having its base disposed within said housing and in opposed relation to said photosensitive cell, one side of the conical portion of said light collecting member having a reflective surface provided thereon so that light rays may enter said collector only through the opposite side thereof and so that said light rays will be reflected toward said base portion by said reflective surface, said base portion having a plurality of annular V-in-cross-section concentric grooves formed therein, the apex angle of said conical light collecting member being approximately 40 degrees and the apex angle of each of the grooves being approximately 60 degrees.

3,274,393
SINGLE MODULATION STAR TRACKER
Jacob S. Zuckerbraun, New York, N.Y., assignor to Kollsman Instrument Corporation, Elmhurst, N.Y., a corporation of New York
Filed Oct. 10, 1962, Ser. No. 229,645
9 Claims. (Cl. 250—233)



1. A tracking mechanism for tracking a source of radiation comprising a telescope objective means, a scanning means, and a photosensing means; said scanning means comprising a raster movable with respect to a masked aperture, said aperture being centered in the optical axis of said telescope objective means; said raster having a series of spaced lines opaque to said radiation spaced by areas transparent to said radiation; said aperture having a width equal to the width of one opaque area plus one transparent area of said raster; said photosensing means receiving the radiation passed through said aperture and modulated by said raster; said raster disk being rotated at a constant speed with respect to said aperture.

3,274,394
ALTERNATOR MOUNTING ASSEMBLY FOR VEHICLES
Roland R. Maheu, Minot, Maine
(767 Minot Ave., Auburn, Maine)
Filed July 24, 1964, Ser. No. 384,979
4 Claims. (Cl. 290—1)



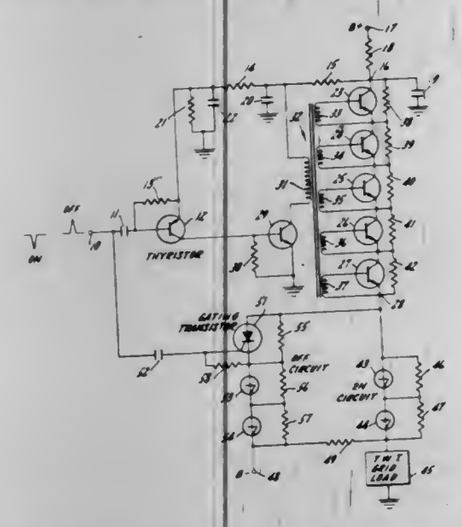
1. In combination, a generator including a mounting case and a rotatable input shaft journaled from said case for rotation about an axis extending between opposite ends of said case with one end of said shaft projecting outwardly of one end of said case and having a driven wheel thereon, an internal combustion engine of the type including an output shaft having a drive wheel thereon and a fan shroud spaced axially in one direction along said shaft relative to said drive wheel and including a first portion spaced laterally to one side of the axis or rotation of said output shaft and extending transversely thereof and a second portion projecting away from said first portion in the opposite direction, and a generator mounting assembly for mounting said generator in the area spaced laterally to said one side of the last-mentioned axis and disposed between parallel planes containing said drive wheel and said portions of said shroud, respectively, with the axis of rotation of said input shaft generally paralleling the axis of rotation of said output shaft and said wheels aligned with each other, said mounting assembly including a first elongated bracket secured between said case and said engine and second and third elongated brackets secured between said case and said shroud, said first bracket extending at generally right angles relative to said axes and extending between said case and said engine and generally paralleling and disposed on one side of and adjacent a plane containing said shafts adjacent said second bracket being secured to and extending between said case and said first portion of said shroud and generally paralleling said axes, and said third bracket being secured to and extending between said case and said second portion of said shroud, disposed on the side of the last-mentioned plane remote from said first bracket, and extending at generally right angles relative to said axes and said last-mentioned plane.

3,274,395
TURBOGENERATORS
Waheeb Rizk, Whetstone, England, assignor to The English Electric Company Limited, London, England, a British company
Filed Mar. 2, 1964, Ser. No. 348,723
Claims priority, application Great Britain, Mar. 8, 1963, 9,290/63
5 Claims. (Cl. 290—52)

1. A stationary turbogenerator installation including an electric generator having a vertically-disposed generator stator and a generator rotor mounted to rotate about a vertical axis in said stator, an axial-flow turbine having a turbine rotor and a turbine stator, said turbine rotor being above said generator rotor and including a shaft directly connected to said generator rotor to rotate therewith about said vertical axis, and said turbine rotor further including a ring of rotor blades, said turbine stator having a ring of stationary nozzle guide vanes cooperating with said ring of rotor blades and below said rotor blades, at least three gas turbine gas-producer units spaced around said vertical axis, each gas turbine gas-producer unit having an air intake, a compressor, combustion equipment, a turbine, and an exhaust in flow series, a plurality of curved ducts each having a circular inlet portion connected to the exhaust of a gas-turbine gas producer unit and each having an arcuate annularly-extending outlet portion defining a vertical flow passage below said ring of nozzle guide vanes and registering with part of said ring of nozzle guide vanes to discharge directly thereto, and exhaust stack means disposed above said turbine rotor.

3,274,396
MULTI-WAVEFORM GENERATOR
John M. Eubanks, Greensboro, N.C., assignor to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed May 16, 1962, Ser. No. 195,227
6 Claims. (Cl. 307—88)

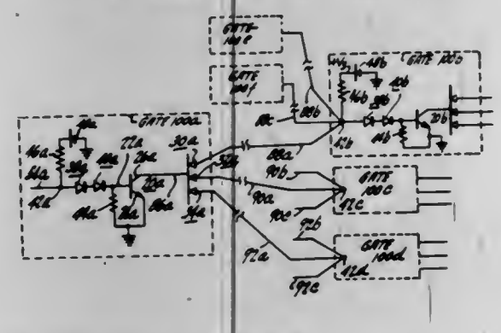
1. A multi-waveform generator of the relaxation oscillator type comprising two circuit branches in which current repetitively flows first in one branch and then in the other one, a plurality of saturable cores each having a hysteresis characteristic such that it is capable of being switched to either of two opposite states of saturation through an unsaturated portion of said characteristic, means initially biasing a first group of said cores to different degrees of saturation in one of their two saturable states and a second group comprising an equal number of the remaining cores to different degrees of saturation in the other of their saturable states, means coupling all of said cores to said two circuit branches so that an increasing current in one of said branches successively switches all of said cores from a first one of their said states to the other one and an increasing current in the other branch successively switches all of them back again to said first state, and an output winding on at least one of said cores in which a voltage pulse is generated each time the core is switched from one saturable state to the other.



3,274,397
SOLID STATE AND HYBRID MODULATORS
Earl H. Heckman, Severna Park, and Martin L. Jones, Baltimore, Md., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Feb. 18, 1963, Ser. No. 259,470
9 Claims. (Cl. 307—88.5)

1. A modulating circuit comprising:
a load circuit having a negative bias thereon from a negative voltage source through a biasing resistor;
a first circuit including a plurality of 4-layer semiconductor switching diodes in a series string coupled in series with a first electron emission means having

conduction control electrode means, this series string of diodes and electron emission means being coupled between a positive voltage source and said load circuit with said first electron emission means adjacent said voltage source and said diodes adjacent said load;



induction means coupling said series string of diodes and electron emission means to switch same into conduction upon the application of a first pulse thereto;

a second circuit including a second electron emission means having conduction electrodes coupled to said diodes and first electron emission means string and

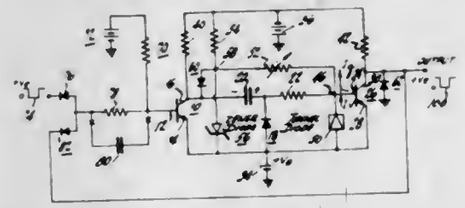
to said negative voltage source, said second electron emission means also having a conduction control electrode coupled to receive a second pulse thereon to place said second electron emission means into conduction to apply said negative voltage source to said diodes and first electron emission string switching off conduction from said positive voltage source through said string and to said load circuit reducing the voltage across said biasing resistor to said biasing voltage whereby switching of conduction and nonconduction in said diodes and first electron emission means string produces modulating voltages on said load circuit having fast rise and fall leading and trailing edges.

3,274,398
LOGIC CIRCUITS
Morton Silverberg, Riverton, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Apr. 1, 1963, Ser. No. 269,500
14 Claims. (Cl. 307—88.5)

11. The combination comprising:

a first logic circuit including a transistor connected in the grounded emitter configuration and having a base and a collector; an input node; at least one level shift diode connected between the input node and the base and having a diffusion capacitance that varies as a function of diode current, said diode also having an operating region of substantially constant voltage; bias means connected between said node and circuit ground for normally biasing the transistor into saturation, said level shift diode clamping the voltage at said node at V_1 volts when the transistor is in saturation; and a number of output diodes each having one electrode integral with said collector and being poled to pass collector current, the voltage at the other electrode of each of said output diodes having a value $|V_2| \neq |V_1|$ when the transistor is in saturation;

a signal line having its output end connected at said input node and having a finite characteristic impedance Z_0;



a plurality of switch means each being connected to a different tap along the length of said signal line and each being selectively operable between an open condition and a closed condition in which a voltage of V_2 volts is applied at the respective tap; and

said bias means supplying a current

$$I \cong \frac{V_1 - V_2}{Z_0}$$

to said signal line when any of said input switches is in the closed condition.

3,274,399
TRIGGER CIRCUIT
Alfredo S. Sheng, Cherry Hill, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Oct. 25, 1963, Ser. No. 318,940
6 Claims. (Cl. 307—88.5)

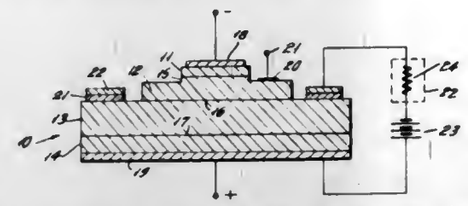
3. The combination comprising:

a first amplifying device and a second amplifying device each having control, output and common electrodes;

means for applying operating potentials between the output and common electrodes of each said amplifying device;

a capacitor and an element of resistance serially connected between the output electrode of the first amplifying device and the control electrode of the second amplifying device;

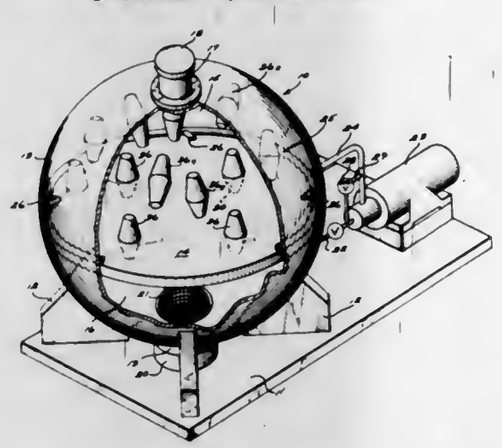
a negative resistance diode connected between the control and common electrodes of said second amplifying device;



bias means connected at the control electrode of said second amplifying device;

feedback means connected between the output electrode of the second amplifying device and the control electrode of the first amplifying device; and

means for applying an input signal at the control electrode of said first amplifying device.



3,274,400
TEMPERATURE COMPENSATED SILICON CONTROLLED RECTIFIER
Harold Weinstein, Van Nuys, Calif., assignor to International Rectifier Corporation, El Segundo, Calif., a corporation of California
Filed Jan. 17, 1964, Ser. No. 338,473
1 Claim. (Cl. 307—88.5)

A semiconductor device comprising a wafer of semiconductor material having a first, second, third and fourth conductivity layers of alternate N and P conductivity types defining first, second and third junctions; a cathode electrode connected to said first layer and insulated from said second, third and fourth layers; a gate electrode connected to said second layer and insulated from said first, third and fourth layers; a dielectric layer connected to a portion of said third layer and an anode

electrode connected to said fourth layer and insulated from said first, second and third layers; said dielectric layer having a conductive layer thereon; and circuit means including a voltage source and a temperature sensitive impedance in series therewith; said circuit means being connected across said conductive layer and said anode electrode.

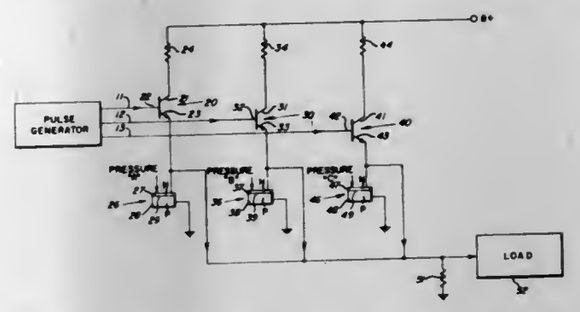
3,274,401
SELF-REPAIRING AND SELF-SUSTAINING SYSTEM
Richard R. Landers, Beachwood, Ohio, assignor to Thompson Ramo Wooldridge Inc., Cleveland, Ohio, a corporation of Ohio
Filed Nov. 20, 1961, Ser. No. 153,445
8 Claims. (Cl. 307—92)

1. A self-repairing and sustaining system comprising

(a) a source of energy,

(b) a work load,

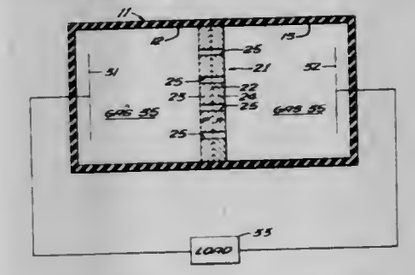
(c) a circuit for receiving energy from said source and transmitting the same to said work load,



(d) an operating element in said circuit rendered inoperative and displaceable therefrom in response to failure therein,

(e) at least one additional operative element in said system but not in said circuit, and

(f) means automatically operative to displace said operating element when rendered inoperative and to replace the same with an operative element and comprising a fluid medium for moving said additional operative element into the position in said circuit of the element rendered inoperative.

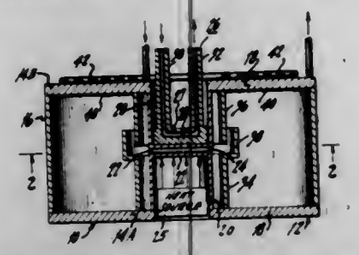


3,274,402
SENSING AND MULTIPLEXING SYSTEMS
Clark F. Crocker, South Sudbury, Mass., assignor to Raytheon Company, Lexington, Mass., a corporation of Delaware
Filed Apr. 29, 1963, Ser. No. 276,561
4 Claims. (Cl. 307—119)

2. A system comprising a plurality of parallel connected diode force sensors coupled to a common load, said force sensors including a barrier region responsive to a force being applied to said sensor, generator means for selectively producing signals, a source of reference potential, a plurality of transistor switches each having base, collector, and emitter electrodes, each of said base electrodes connected to said generator means, each of said collector electrodes connected to said source of reference potential, each of said emitter electrodes con-

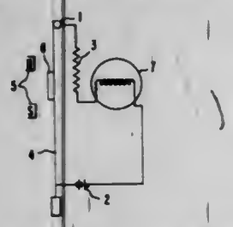
nected to a different one of said sensors, each of said signals causing one of said transistor switches to conduct for selectively electrically biasing the connected semiconductor sensor in a reverse breakdown condition to place the connected sensor in a low impedance condition thereby shunting said sensor in the low impedance condition to said common load, said transistor switches being normally in the nonconductive condition for maintaining said sensors in a high impedance condition.

3,274,403
GASEOUS THERMOCOUPLE UTILIZING A SEMICONDUCTOR
Lloyd T. De Vore, Santa Barbara, Calif., assignor to Hoffman Electronics Corporation, a corporation of California
Filed May 26, 1961, Ser. No. 112,969
6 Claims. (Cl. 310—4)



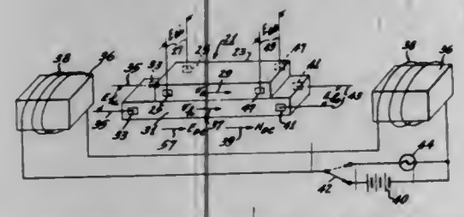
1. A gaseous thermocouple comprising: a chamber divided into first and second compartments by a semiconductor having p-type and n-type regions separated by a p-n junction, said semiconductor being pierced by a plurality of perforations, and said semiconductor being sufficiently thin to permit the passage of positive ions through said perforations; an easily ionizable gas in each of said first and second compartments; first and second electrode surfaces in said first and second compartments, respectively; and means for coupling each electrode surface to an external load.

3,274,404
ELECTRON TUBES AND METHODS OF OPERATION THEREOF FOR ENERGY CONVERSION
Arie L. Eichenbaum, Levittown, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Filed Nov. 30, 1961, Ser. No. 156,064
12 Claims. (Cl. 310—4)



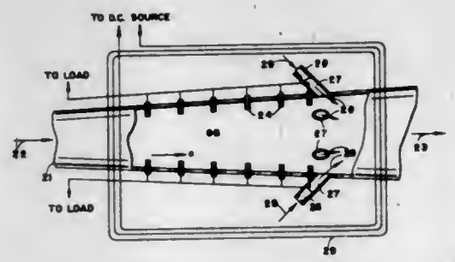
1. The method of operating an electron tube comprising two similar juxtaposed electrodes at least one of which comprises thermionic electron emissive material, comprising the steps of heating said one electrode and

the emissive material thereof to an operating temperature above that at which said material evaporates substantially while maintaining the other electrode at a lower temperature than said evaporation temperature to receive the condensate of said evaporated material thereon,



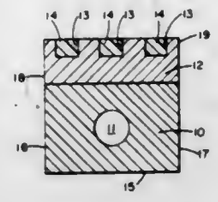
and thereafter heating said other electrode and the emissive material thus condensed thereon to an operating temperature above that at which said material evaporates while maintaining the said one electrode at a lower temperature than said evaporation temperature to receive condensate of said material thereon.

3,274,405
ENERGY CONVERSION DEVICES
Thomas J. Swoboda, Chester County, Pa., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Filed Mar. 17, 1964, Ser. No. 352,539
12 Claims. (Cl. 310—4)



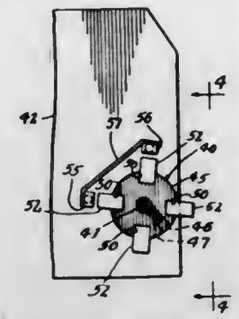
1. A device for producing useful work in the form of at least one of mechanical energy and electrical energy from applied heat energy which comprises a structure having an energy-transforming component which undergoes a reversible first-order solid-phase-to-solid-phase transition within a narrow temperature range below its Curie point, said transition resulting in a sharp change in the magnetic saturation induction, electrical resistivity and dimension of said energy-transforming component, said structure having means responsive to at least one of said magnetic saturation induction, electrical resistivity and dimension for converting said applied heat energy to at least one of mechanical energy and electrical energy.

3,274,406
ACOUSTIC-ELECTROMAGNETIC DEVICE
Henry S. Sommers, Jr., Princeton, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Jan. 31, 1963, Ser. No. 255,237
17 Claims. (Cl. 310—8.1)



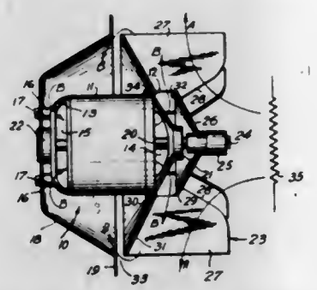
1. An acoustic-electromagnetic device comprising means for generating an acoustic wave, a piezoelectric medium for supporting the propagation of said acoustic wave along a path therein and means for supporting the propagation of an electromagnetic wave with at least a component thereof propagating in said path in the same direction as said acoustic wave, said electromagnetic wave supporting means having associated therewith magnetic field means for maintaining said electromagnetic wave at a velocity related to the velocity of said acoustic wave for selectively transferring energy from one of said waves to the other.

3,274,407
APPARATUS FOR MAGNETOHYDRODYNAMICALLY GENERATING ELECTRIC ENERGY
Thomas R. Brogan, Arlington, Mass., assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed Feb. 2, 1961, Ser. No. 86,818
6 Claims. (Cl. 310—11)



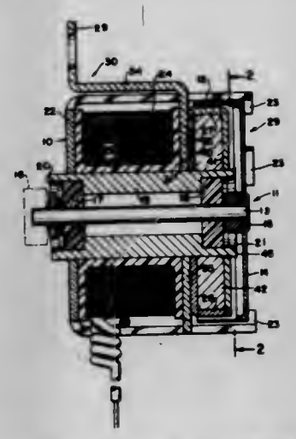
1. In a magnetohydrodynamic generator, apparatus for reducing short circuit end effects adjacent the downstream terminal point of oppositely disposed electrodes located within a duct for conveying a hot, electrically conductive gas through a magnetic field at an angle to said electrodes comprising: a plurality of hollow members extending through and secured to opposite sides of said duct at about the downstream terminal zone of said electrodes; and means for maintaining said members at a reduced temperature with respect to the temperature of said gas whereby as a portion of said gas passes over each said members its conductivity is decreased to reduce the flow of current therethrough.

3,274,408
HIGH TEMPERATURE ANISOTROPIC NONCONSUMABLE ELECTRODE
Jean F. Louis, Brookline, Mass., assignor to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed May 14, 1963, Ser. No. 280,273
13 Claims. (Cl. 310—11)



7. An electrode for conducting electrical current in an MHD device between a conductor and a hot electrically-conductive gas having a temperature of about 2000° F. comprising:
(a) an elongated and relatively narrow electrically conductive metallic member having at least one recess extending substantially the length of said member; and
(b) a heat resistant filler material electrically conductive at the operating temperature of said gas and an insulator at a temperature substantially less than the said operating temperature of said gas fixedly disposed in said recess and exposed to said gas.

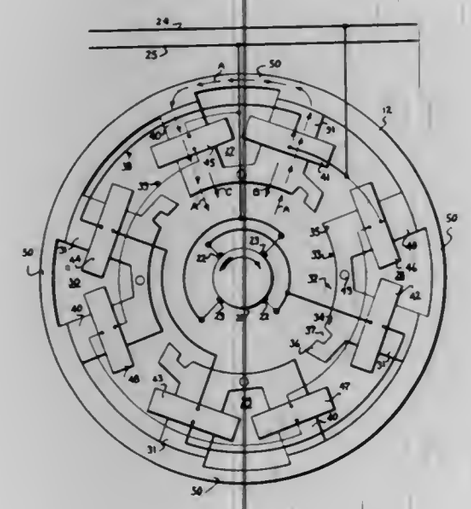
3,274,409
REED DRIVING MECHANISM
George D. Henninger, Chicago, Ill., assignor to Amglo Corporation, Chicago, Ill., a corporation of Illinois
Filed June 7, 1963, Ser. No. 286,262
1 Claim. (Cl. 310—46)



Reed driving mechanism for a direct current constant speed motor having a switch-actuating vibrating reed with a bar of magnetic material at its free end, said mechanism comprising:
magnet holding means of nonmagnetic material adapted to be mounted rigidly on the motor shaft adjacent the free end of said reed;
a plurality of bar magnets secured to said magnet holding means in uniformly spaced relation circumferentially, an end of each bar magnet located to travel adjacent the bar of magnetic material at the free end of said reed and thereby drive the reed at its characteristic frequency of vibration;
a magnetic means in effective relation with the travel path of said bar magnets for causing said magnet holding means to come to rest with a magnet in proximity to the bar of magnetic material on said reed, said magnetic means including a plurality of bars of magnetic material parallel to, and spaced radially outwardly from the travel path of, said bar magnets, the angular separation of said bars being substantially the same as that of the bar magnets that are adjacent said bars when said magnet holding means comes to rest; and
a plate of magnetic material connecting said bars of magnetic material.

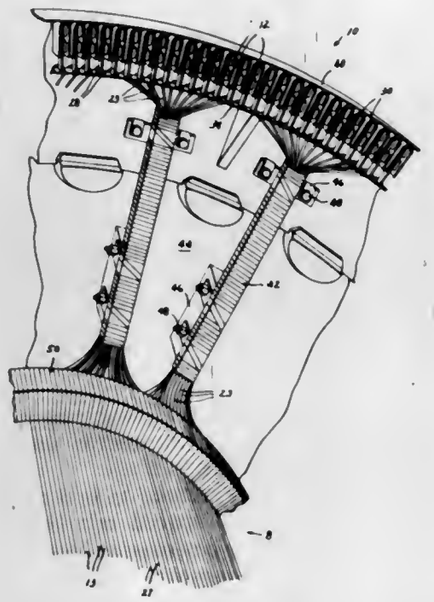
3,274,410
COOLING ARRANGEMENT FOR MOTOR-FAN UNIT
Jean Ivan Ragnar Bolvie, Stockholm, Sweden, assignor to Aktiebolaget Electrolux, Stockholm, Sweden, a corporation of Sweden
Filed Dec. 17, 1963, Ser. No. 331,266
Claims priority, application Sweden, Dec. 21, 1962, 13,886/62
11 Claims. (Cl. 310—62)

1. In combination with an electric motor having a rotatable shaft extending from one end; a fan wheel comprising a central disk secured on said shaft and being spaced from said one end of the motor, and fan blades extending outward from the edge of said disk and projecting axially beyond said edge at the side of said disk facing toward said one end of the motor so that, upon rotation of said fan wheel, said blades create a vacuum intermediate said disk and said one end of the motor for producing a continuous flow of cooling air through the motor from the other end of the latter to said one end, the motor being of the enclosed type having a housing with bearing brackets at the opposite ends in which said shaft is supported, said bearing brackets having openings therein for permitting said flow of cooling air through the motor, said fan wheel further including an annular plate joined to said blades and having its inner periphery axially spaced from the edge of said disk in the direction toward said one end of the motor so as to define a first annular gap between said edge of the disk and said inner periphery of the annular plate for the outward passage therethrough of the flow of cooling air, said inner periphery of the annular plate extending closely around the bearing bracket of the motor at said one end of the latter; and further comprising a shell opening axially and receiving said motor with said one end of the latter extending from the shell, said shell having an edge extending along the outer periphery of said annular plate and spaced from the latter to define a second annular gap therebetween through which air is drawn into said shell to make up said flow of cooling air through the motor with said air drawn into the shell being constituted at least in part, of air passing outwardly from said first annular gap.



3,274,411
MICRO-MINIATURE MOTOR STRUCTURE
Richard J. Kavanaugh, Bristol, Conn., assignor to Consolidated Electronics Industries Corporation, Waterbury, Conn., a corporation of Delaware
Filed Apr. 1, 1964, Ser. No. 356,410
6 Claims. (Cl. 310—164)

1. In a minature hysteresis-type synchronous motor having a cylindrical core, a rotor, a magnet winding mounted on and surrounding the front portion of the core, an outer cylindrical field ring enclosing said magnet in flux linking relation with said magnet winding and having rearwardly axially projecting integral outer pole elements arrayed in a first cylindrical configuration, said outer pole elements defining a predetermined number of symmetrically arrayed spaces therebetween, a stator subassembly comprising:
(a) a mounting strap having a central disc-like portion and at least one radially extending reference portion associated therewith,
(b) a first inner pole piece having a plurality of symmetrically arrayed rearwardly projecting inner pole elements,
(c) a second inner pole piece having a plurality of symmertcially arrayed forwardly projecting inner pole elements,
(d) said inner pole elements being laterally butted to define a plurality of inner pole element pairs equal in number to the spaces between said outer poles.

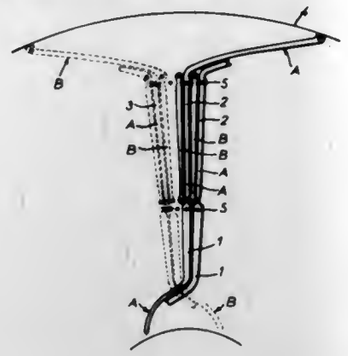


(e) said disc-like portion having a plurality of lineup teeth each having an outer width substantially equal to the width of the spaces between the outer pole elements in said cylindrical field ring,
(f) said lineup teeth and said reference portion being equiangularly spaced about the periphery of said disc-like portion to coincide with said spaces between the outer pole elements,
(g) said reference portion being a width substantially equal to the combined width of said inner pole element pairs,
(h) said disc-like portion having a central bore therein,
(i) one of said inner pole pieces being affixed to said mounting strap with at least one of its pole elements flush with an edge of said reference portion,
(j) said strap being supported on said core with said inner pole elements in flux linking relation with said winding and with said lineup teeth in the spaces between said outer pole elements,
(k) whereby said inner butted pole elements are aligned in a second cylindrical configuration symmetrically opposite the spaces between said outer pole elements.

3,274,412
COMPOUND DIRECT CURRENT MOTORS
Alec Fisher, Erie, Pa., assignor to General Electric Company, a corporation of New York
Filed Sept. 18, 1963, Ser. No. 309,837
5 Claims. (Cl. 310—186)

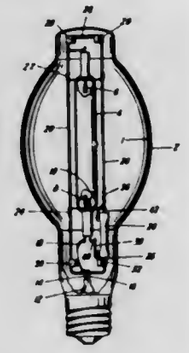
1. A compound direct current motor comprising:
(a) an armature;
(b) a plurality of magnetizable members arranged to coact with said armature, each of said members including a core and a pole shoe region terminating near said armature and defining spaced apart, mechanically integrated main and commutating pole shoes;
(c) first magnetic excitation means arranged on a first core portion of each of said magnetizable members for providing a magnetomotive force which is proportional to motor current, said means being a winding connected in series with the armature circuit of said motor and providing commutating pole shoe flux and a component of the main pole shoe flux;
(d) and a second magnetic excitation means associated with each of said magnetizable members, said second magnetic excitation means being a permanent magnet disposed adjacent and in contact with a portion of the main pole shoe of each of said magnetizable members.

3,275,413
COMMUTATOR RISER CONSTRUCTION
Theodore R. Adriance, Jr., Delanson, and Edward P. Smith, Schenectady, N.Y., assignors to General Electric Company, a corporation of New York
Filed Dec. 4, 1963, Ser. No. 327,922
6 Claims. (Cl. 310—234)



4. A rotor for a dynamoelectric machine comprising:
a shaft supporting a commutator and an armature having coils in slots disposed in its peripheral surface,
commutator riser-like connections interconnecting segments in the commutator with leads extending axially outwardly from the coils in the armature,
said commutator comprising a multiplicity of individual segments having a projection on one end thereof and being spaced by insulation from a similar projection on the next adjacent commutator segment,
a banding tape wound on the outer peripheral surface of the projections for preventing commutator segment displacement during armature operation,
said riser-like connections comprising a multiplicity of flexible conductors assembled into separate groups and each being attached at one end to a projection and at its other end to the corresponding lead for a coil in the armature,
said riser-like connections extending inwardly in a general axial direction from both the commutator projections and the coil leads,
means assembling the riser-like connections in each of said groups into an integrated mass, and
a bracket securing each of said groups of riser-like connections to said armature for preventing their displacement during armature operation.

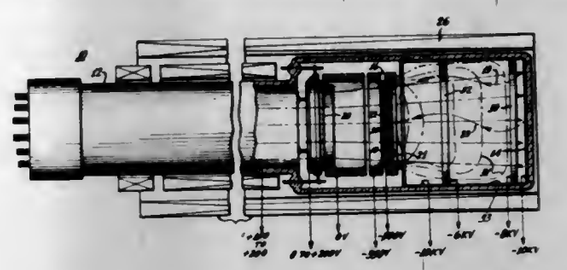
3,274,414
ELECTRICAL WINDINGS
René A. Bidard, Paris, France, assignor to Compagnie Electro-Mecanique, Paris, France, a company of France
Filed Oct. 4, 1963, Ser. No. 313,929
Claims priority, application France, Oct. 11, 1962, 911,958
5 Claims. (Cl. 310—268)



1. An electrical winding assembly comprising a thin support of insulating material having two substantially planar parallel faces, a multiplicity of bare lamellar electric conductors extending flat on said faces, at least a lengthwise portion of each conductor being divided into associated portions of reduced width, half of said portions

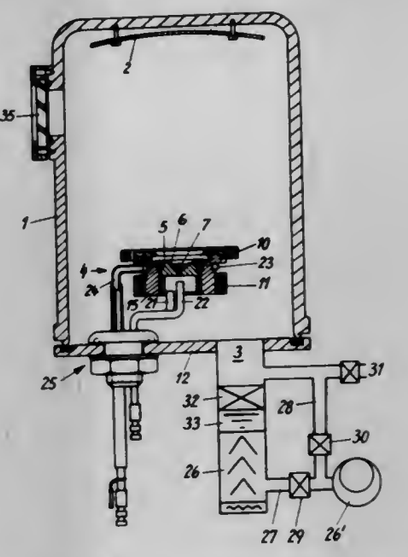
of each conductor extending over the opposite faces of said support, means extending from one face of said insulating support to the other face thereof for connecting said conductors to each other at the ends thereof, and

means extending through said insulating support for electrically interconnecting said associated portions of each respective conductor to minimize eddy current losses in operation.



3,274,415
GASEOUS DISCHARGE LAMP WITH A REDUCED AND UNREDUCED ACTUATOR
Martha J. B. Thomas, Woburn, Mass., and Frank P. Durkee, Derry, N.H., assignors to Sylvania Electric Products Inc., a corporation of Delaware
Filed Dec. 31, 1963, Ser. No. 334,767
8 Claims. (Cl. 313—25)

1. A high pressure mercury lamp comprising a mercury arc tube, an outer jacket around said arc tube, said outer jacket containing on its inside wall a coating which includes an ultraviolet excitable phosphor and means for supporting said arc tube and supplying operating current thereto, at least a part of said coating comprising a phosphate and an unreduced activator, and said outer jacket containing a source of reducing agent in an amount effective to reduce said unreduced activator to activating state and thereby produce additional activated phosphor during operation of the lamp.



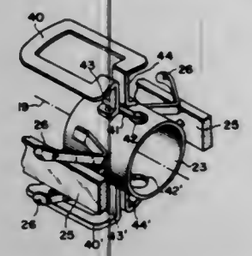
3,274,416
IMAGE INTENSIFIER TYPE CAMERA TUBE WITH POTENTIAL FIELD CORRECTING MEANS
Alexander A. Rotow, Lancaster, Pa., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed Sept. 27, 1961, Ser. No. 141,135
5 Claims. (Cl. 313—65)

5. An image intensifying section of an image sensitive device comprising a planar shaped photocathode, a focal plane for photoelectrons from said photocathode, a tubular electrode having one end adjacent to said photocathode and the other end adjacent to said focal plane, said focal plane being substantially parallel to and spaced from said photocathode, at least two potential field-correcting electrodes spaced inwardly from said tubular elec-

trode and around the path of photoelectrons in their transit from said photocathode to said focal plane.

3,274,417
ELECTRONIC EVAPORATOR
René Haefer, 8483 Kollbrum, Zurich, Switzerland, and Erich Zollinger, 9496 Balzers, Churerstr. 326, Balzers, Liechtenstein
Filed May 29, 1963, Ser. No. 284,198
Claims priority, application Switzerland, May 30, 1962, 6,572/62
9 Claims. (Cl. 313—75)

1. In an electronic evaporator for the evaporation of substances in a high vacuum:
an anode having an outer end,
a cathode formed in a substantially regular closed shape to produce an electron beam having a substantially closed periphery coaxial with said anode and disposed radially outwardly of said anode and axially inwardly from the outer end of said anode,
an auxiliary electrode surrounding said cathode and formed to limit the initial direction of electrons emitted from said cathode to angles less than 90 degrees with respect to the axis of said anode, and
means for establishing a potential difference between said cathode and said anode to deflect said electrons toward the end of said anode.



3,274,418
FIELD CONCENTRATOR HAVING CONDUCTIVE LOOP PROXIMATE BEAM
Charles Burton Crumly, Palo Alto, Calif., assignor to Zenith Radio Corporation, Chicago, Ill., a corporation of Delaware
Filed Nov. 8, 1963, Ser. No. 322,452
6 Claims. (Cl. 313—75)

1. A field concentrator for a magnetically deflected cathode-ray tube having an envelope with an electron gun

located at one end for developing and directing an electron beam along a given path to a screen located at the other end, said concentrator comprising:

a first conductive loop positioned closely adjacent the periphery of a particular section of said envelope to be inductively coupled to a deflection yoke surrounding said section of said envelope;

a second conductive loop disposed substantially parallel and in closed proximity to said beam path;

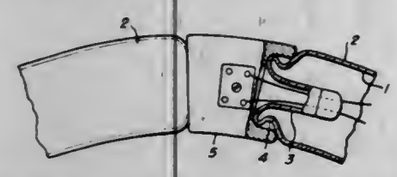
and a pair of conductors serially connecting said first and second loops to define therewith a shorted turn, said second loop being dimensioned to have a flux density very high compared to that of said first loop so that the magnetic flux of said shorted turn is concentrated within said second loop and directed across said beam path.

3,274,419

FLEXIBLE ELECTROLUMINESCENT LAMP HAVING TRANSPARENT METAL-COATED STRANDS AS THE LIGHT TRANSMITTING ELECTRODE

Harold H. Roth, Bay City, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

Filed Jan. 23, 1962, Ser. No. 168,221
8 Claims. (Cl. 313—108)



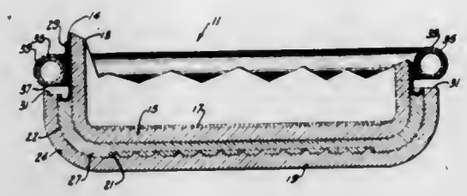
1. A flexible electroluminescent lamp of improved efficiency consisting of a layer comprising a flexible solidified intimate intermixture of a phosphor and a resinous dielectric material, said layer provided with flexible electrical conducting sheets adhered to the opposing faces thereof, at least one of said sheets being a light-transmitting mat composed of transparent metal-coated, spaced-apart strands selected from the class consisting of synthetic and natural fibers.

3,274,420

ANNULAR FLUORESCENT LAMPS

Akira Kameyama, Yokohama, Tetsuo Funabashi, Tokyo, Ichiro Kusakawa and Jiro Watanabe, Yokohama, Takashi Hayao, Tokyo, Yoshihisa Takashima, Kawasaki-shi, and Nisaburo Maruyama, Tokyo, Japan, assignors to Tokyo Shibaura Electric Co., Ltd., Kawasaki-shi, Japan, a corporation of Japan

Filed Sept. 27, 1961, Ser. No. 141,108
2 Claims. (Cl. 313—109)



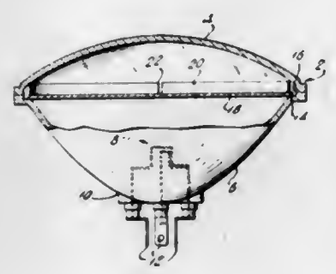
1. An annular fluorescent lamp comprising a glass tube of circular form with the opposite ends disposed in opposed relation; nodal gripping formations comprising a circumferential ridge on said tube at the opposite ends thereof; said tube having on its inside a fluorescent layer coated prior to the bending of the tube; and, a one piece light transmitting base means snapped onto the opposite tube ends.

3,274,421

READ-OUT DEVICE HAVING BONDING MATERIAL BETWEEN A FACE PANEL AND A COVER PANEL

Alfred D. Johnson, Seneca Falls, N.Y., assignor to Sylvania Electric Products Inc., a corporation of Delaware

Filed Dec. 26, 1961, Ser. No. 162,052
3 Claims. (Cl. 313—109.5)



1. A read-out device having a laminated viewing area comprising a substantially transparent face panel having a given index of refraction for providing a display, a substantially transparent cover panel for said face panel having an index of refraction substantially corresponding to that of said face panel, said cover panel having a graticule formed on the internal surface for observation from the external surface thereof, a substantially transparent bonding material having an index of refraction substantially corresponding to that of said panels and disposed intermediate said panels, said bonding material supporting said panels relative to one another in alignment to provide orientation of the graticuled cover panel with the axis of the face panel display to enable conjunctive comparison of the graticule and the display image during external viewing.

3,274,422

COLORED SEALED BEAM LAMP AND METHOD OF MAKING THE SAME

Walter E. Carpenter, Cedar Grove, N.J., assignor to Tung-Sol Industries, Inc., Newark, N.J., a corporation of Delaware

Filed May 6, 1963, Ser. No. 278,363
9 Claims. (Cl. 313—111)

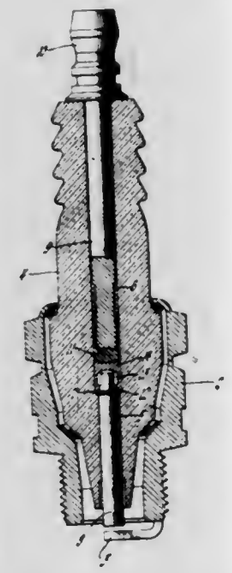
6. A sealed beam lamp comprising:

(a) a reflector with a concave reflecting face;

(b) a filament positioned within the reflecting face;

(c) a lens positioned over the reflecting face to form an envelope surrounding the filament;

(d) a filter with two faces which is between the lens and the filament with the periphery of one of the faces positioned against the interior surface of the envelope; and



(e) a strip of spring material adjacent the periphery of the filter with one edge of the strip against the interior of the envelope and the other edge of the strip against the other face of the filter to hold the first mentioned face of the filter against the interior wall of the envelope.

3,274,423

SPARK PLUG WITH MULTIPLE CONDUCTIVE SEALS

Patrick N. Kesten, Davison, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

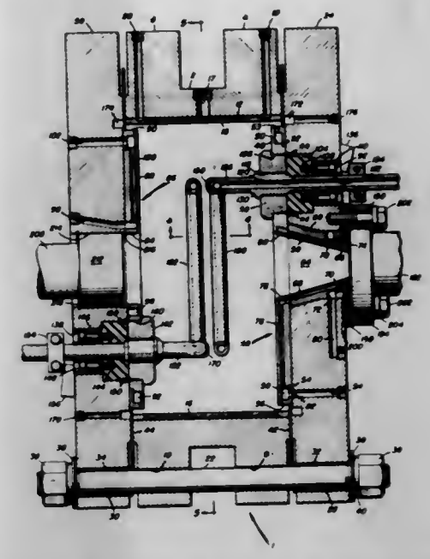
Filed Mar. 5, 1962, Ser. No. 177,423
4 Claims. (Cl. 313—145)

2. A spark plug comprising an insulator having a centerbore therethrough, said centerbore having a lower portion of relatively small diameter, an upper portion of enlarged diameter and an annular shoulder at the junction of said portions, an elongated silver electrode in the lower portion of said centerbore having a firing tip portion at the lower end thereof and an enlargement at the upper end thereof positioned in said upper centerbore portion and abutting said annular shoulder, said silver electrode having a plurality of ribs above said enlargement a pressed seal in the upper portion of said centerbore and a mass of tightly packed metal powder in said centerbore below said seal surrounding said ribs, said mass minimizing the tendency of said silver electrode to extrude during the manufacture of said plug of said silver electrode.

3,274,424

DISCONTINUOUS ELECTRODE ARC PLASMA GENERATOR

Edgar A. Bunt, Kensington, Lloyd O. Kauffman, Jr., Baltimore, Herman L. Olsen, Derwood, and Spencer D. Raezer, Rockville, Md., assignors to the United States of America as represented by the Secretary of the Navy



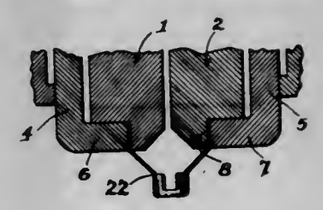
Filed Jan. 10, 1963, Ser. No. 250,722
11 Claims. (Cl. 313—231)

1. An arc plasma generator, comprising:

a pressure vessel defining a chamber therein,

a pair of identical, ring-like electrodes supported within said chamber in confronting relationship, each electrode having a discontinuity therein and the discontinuity in one electrode being displaced from the discontinuity in the other electrode,

means for supplying electric current to said electrodes, and



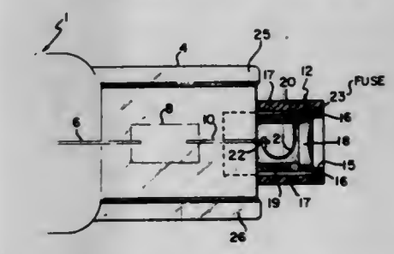
ramp means on each electrode on both sides of the discontinuity therein and disposed to project toward the confronting surface of the other electrode so as to decrease the arcing distance between said electrodes.

3,274,425

FILAMENT FOR ELECTRON GUN

David Sciaky, Chicago, Ill., assignor to Welding Research, Inc., Chicago, Ill., a corporation of Illinois

Filed July 31, 1964, Ser. No. 386,725
7 Claims. (Cl. 313—237)



1. An electron emitting element comprising a strip of metal having a shape which provides a pair of spaced clamping portions and a central cylindrical section connecting with the clamping portions.

3,274,426

ELECTRIC LAMP WITH FUSE

Robert F. Scoledge, Danvers, and Robert P. Bonazoli, Hamilton, Mass., assignors to Sylvania Electric Products Inc., a corporation of Delaware

Filed May 7, 1962, Ser. No. 192,724
4 Claims. (Cl. 313—318)

1. An electric lamp comprising an envelope having at least one flattened end, a lead-in conductor extending through said end, a hollow insulating end cap having an opening with a rim at one end of said cap and being

slotted at the other end to fit over said flattened end of said envelope, contact means, a fuse inside said end cap and connected between said contact means and said lead-in conductor, an insulating cylinder inside said end cap and enclosing the outside end of said lead-in conductor and at least part of said fuse, said insulating cylinder forcing said contact means against the internal rim of said cap.

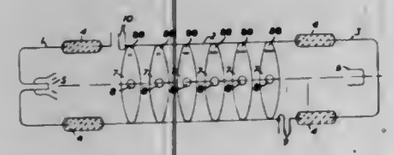
3,274,427
SELF-STARTING ARC LAMP

Raymond E. Paquette, Sunnyvale, and Charles H. Keller, Los Altos, Calif., assignors to Pek Labs, Inc., Sunnyvale, Calif., a corporation of California

Filed Mar. 15, 1965, Ser. No. 439,757
The portion of the term of the patent subsequent to June 14, 1983, has been disclaimed
12 Claims. (Cl. 314—34)

1. A self-starting arc lamp comprising:

a sealed envelope having disposed therein an anode and a cathode which are spaced apart to define an arc gap therebetween;



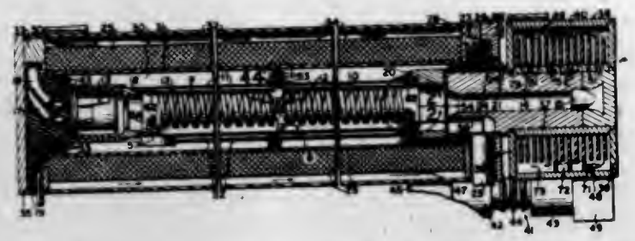
connector means coupled to said anode and to said cathode and passing through said sealed envelope for applying electrical operating power across said anode and cathode; and

a consumable, conductive bridgewire of substantially uniform cross section disposed axially across said arc gap and having opposite end portions conductively coupled to said anode and said cathode respectively, the cross sectional area of said bridgewire being selected sufficiently small to fuse upon the application of electrical operating power across said anode and cathode which corresponds to the normal operating power for sustaining an arc between said anode and said cathode.

3,274,428
TRAVELLING WAVE TUBE WITH BAND PASS SLOW WAVE STRUCTURE WHOSE FREQUENCY CHARACTERISTIC CHANGES ALONG ITS LENGTH

Neville Wreford Harris, Great Baddow, Essex, England, assignor to English Electric Valve Company Limited, London, England, a British company

Filed Apr. 1, 1963, Ser. No. 269,388
2 Claims. (Cl. 315—3.6)



1. A backward wave travelling wave tube having an electron gun, a collector electrode positioned to receive the electrons of an electron beam projected from said gun, and intermediate between the gun and the collector electrode, a series of partition members transverse to the electron beam path and each having a main hole positioned to pass said beam, all said main holes being aligned, and a further aperture which is offset with respect to the main hole, all said further apertures being aligned with an alignment substantially parallel to the main hole alignment, the further apertures reducing in size from partition member to partition member from a maximum size in a partition member nearer the collector electrode to a minimum size in a partition member nearer the gun.

3,274,429
HIGH FREQUENCY ELECTRON DISCHARGE DEVICE WITH HEAT DISSIPATION MEANS

Stanley F. Swiadek, Sunnyvale, Calif., assignor to Varian Associates, Palo Alto, Calif., a corporation of California

Filed Mar. 18, 1963, Ser. No. 265,633
13 Claims. (Cl. 315—3.6)

1. A high frequency electron discharge device comprising,

(a) electron gun means for generating and directing an electron beam along a predetermined path, within said device,

(b) collector means for collecting said electron beam disposed at the end of said predetermined path,

(c) first and second spaced-apart slow wave circuits positioned in axial alignment along said path between the gun and collector,

(d) a first plurality of elongated dielectric rods positioned around and extending along said first slow wave circuit for supporting said first circuit in the device, and

(e) a second plurality of elongated dielectric rods positioned around and extending along said second slow wave circuit for supporting said second circuit in the device,

(f) said first slow wave circuit fixedly attached to said first plurality of elongated dielectric rods only at one end portion of said first slow wave circuit and,

(g) said second slow wave circuit fixedly attached to said second plurality of elongated dielectric rods only at one end portion of said second slow wave circuit, the other ends of said slow wave circuits being free to move relative to the associated support rods,

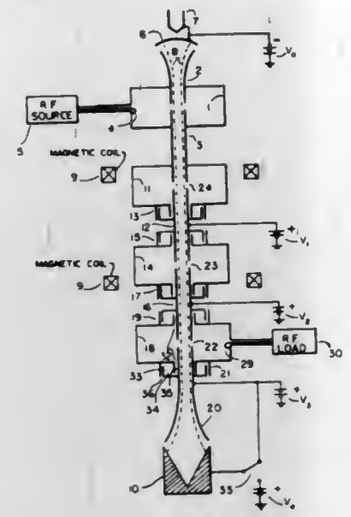
(h) said first slow wave circuit being a helix which is glazed to said plurality of support rods only at the end portions of said first helix furthest removed from said electron gun means,

(i) said second slow wave circuit being a helix which is glazed to said plurality of support rods only at the end portions of said second helix furthest removed from said collector means,

(j) a main body shell surrounding said first and said second helices and said first and said second plurality of elongated dielectric rods, said main body shell forming a portion of a vacuum tight enclosure about said first and said second helix circuits and said first and said second plurality of elongated dielectric rods,

(k) magnetic beam focusing means surrounding said main body shell and spaced therefrom along the length of said shell, and

(l) a plurality of minute, generally spherical shaped heat conductive members disposed between said main body shell and said focusing means.



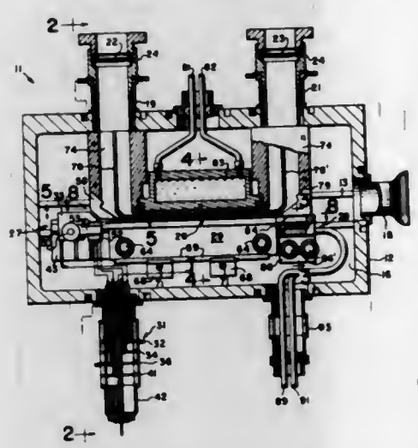
3,274,430
BIASED-GAP KLYSTRON

Ibrahim El-Hefni, North Andover, Mass., assignor to Massachusetts Institute of Technology, Cambridge, Mass., a corporation of Massachusetts

Filed Aug. 1, 1963, Ser. No. 299,350
7 Claims. (Cl. 315—5.41)

1. An electron beam modulation device comprising, an electron beam source for providing a beam having a defined axis, a plurality of cavities of the reentrant type, said

cavities having drift tube sections as their reentrant portions through which the beam passes, said drift tube sections of each cavity being in axial alignment and in spaced apart relation to form a gap, said gap being a part of said cavity, whereby an R.F. electric field within said cav-

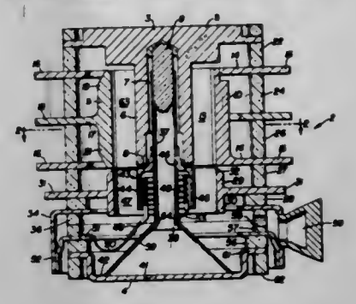


ity provides an R.F. electric potential across said gap to act on said beam, means for applying a D.C. potential across at least one of said gaps to provide a D.C. electric field across the gap acting upon the beam to increase its velocity, and a collector for termination of said beam.

3,274,431
CROSSED FIELD HIGH FREQUENCY ELECTRON DISCHARGE APPARATUS

Ronald L. Bell, Woodside, and Gordon S. Kino and Joseph K. Mann, Palo Alto, Calif., assignors to Varian Associates, Palo Alto, Calif., a corporation of California

Filed July 3, 1961, Ser. No. 121,378
18 Claims. (Cl. 315—39.3)

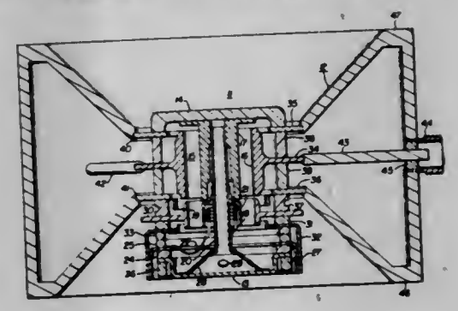


1. A high-frequency apparatus comprising an electron gun said gun being adapted and arranged to generate an electron beam, a slow-wave structure, and a collector, said slow-wave structure comprising an interdigital line including a plurality of fingers mounted on spaced parallel support walls, said fingers being interdigitated, adjacent fingers being affixed to opposite walls at the one end of said fingers and free at the other end thereof and said fingers being tapered along the length thereof, said taper being such that the cross-section of said fingers is considerably reduced at the mid-portion of the length thereof relative to cross section at the fixed end thereof, said fingers having a relatively minute change in cross section from approximately said mid-portion thereof to said free end thereof.

3,274,432
VOLTAGE-TUNABLE MAGNETRON

Dale L. Peterson, Santa Clara, Calif., assignor, by mesne assignments, to Varian Associates, a corporation of California

Filed Mar. 27, 1962, Ser. No. 182,836
11 Claims. (Cl. 315—39.63)

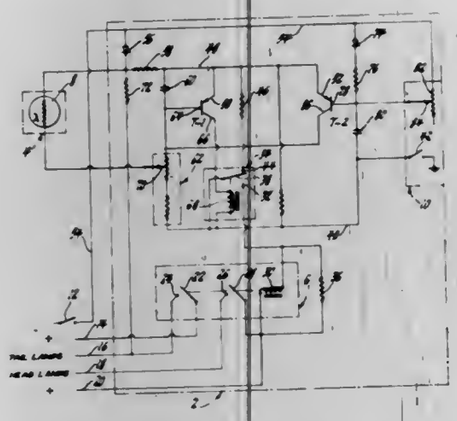


1. A voltage-tunable magnetron comprising an evacuated envelope including a composite hollow intermediate envelope portion and first and second metallic end cap structures hermetically closing opposite ends of the intermediate envelope portion, said first metallic end cap structure including a collector electrode having a dielectric post fixed thereon and an elongated hollow metallic extension surrounding the dielectric post and extending into the hollow intermediate envelope portion to constitute a cold cathode therewithin, an anode within the envelope having circumferentially spaced longitudinally extending interdigital segments radially spaced from the cold cathode to define therewith an annular interaction space, a support member fixed to the second end cap structure adjacent one of its ends and adjacent its other end engaging the dielectric post, an indirectly heated cathode axially displaced from the anode and rigidly supported on the support member in thermally and electrically insulated relation with respect to the cold cathode, heater means to energize the cathode, and a tubular control electrode arranged concentrically about the cathode.

3,274,433
MAGNETRON AND RADIO FREQUENCY CIRCUITRY THEREFOR

Dale L. Peterson, Santa Clara, Calif., assignor, by mesne assignments, to Varian Associates, a corporation of California

Continuation of application Ser. No. 280,324, May 14, 1963. This application July 22, 1965, Ser. No. 480,228
4 Claims. (Cl. 315—39.73)

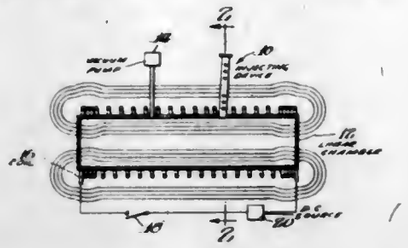


1. A radio frequency circuit for an electron discharge device, said electron discharge device having at least three radio frequency terminals one of which is electrically isolated from the other terminals of said discharge device, comprising: a resonant cavity adapted to surround said electron discharge device and being coupled to said other terminals, and at least one elongated conductive rod the size of which can influence the Q and resonant frequency of said cavity coupled to and radially extending in its elongated direction between said electrically isolated terminal and a portion of said surrounding resonant cavity.

3,274,434
TIME DELAY AND DAYLIGHT INHIBITING MEANS FOR CONTROLLING AUTOMOTIVE LIGHTING SYSTEMS

Charles W. Miller, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Oct. 7, 1963, Ser. No. 314,164
4 Claims. (Cl. 315—82)



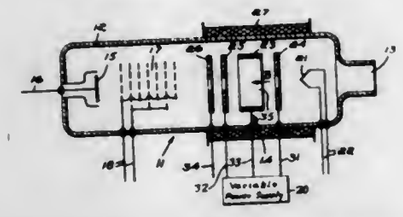
1. In a control system, a source of electrical power, a load circuit, a main relay switching means interconnecting the source of electrical power and the load to control energized periods thereof, a control circuit connected to the main relay switching means to control the same including light sensitive means, a control relay connected to said main relay switching means to control the same, a transistor having a base, emitter and collector electrodes, biasing means connected to said base and emitter electrodes and to the source of electrical power to provide proper operating voltages therefor, said light sensitive means being connected to the base electrode biasing means to vary the bias thereon with ambient light changes, said collector electrode being connected to said control relay means so that conduction of the transistor controls the energization of the control relay and in turn the main relay switching means to energize and de-energize the load circuit dependent upon changes in ambient light on the light sensitive means, a second transistor having an input and an output circuit, said output circuit being connected to the source of electrical power and to the base biasing means for the first transistor, time delay means connected to the input circuit for the second transistor and to the source of electrical power to change the bias on the input circuit when voltage is removed from the input connection to cause the second transistor to become conductive after a predetermined time and alter the base bias on the first transistor to reduce conduction therethrough and de-energize the control relay.

3,274,435
METHOD OF INJECTING AND TRAPPING PARTICLES IN A STATIC MAGNETIC CONFINING FIELD BY BUNCHING PARTICLES IN A BEAM

Donald W. Kerst, La Jolla, Calif., assignor to General Dynamics Corporation, New York, N.Y., a corporation of Delaware

Filed Feb. 16, 1960, Ser. No. 9,046
5 Claims. (Cl. 315—111)

1. A method of injecting particles into an evacuated gas-tight chamber from a source of particles external of said chamber and trapping the particles in said chamber in a static magnetic confining field established therein, said magnetic confining field being shaped as by magnetic mirrors or toroidal magnetic coils substantially to trap the particles three-dimensionally against escape in any direction, said method comprising subjecting a beam of particles from said source to phase bundling whereby the particles are organized into discrete bunches, and injecting the bunches of particles into the chamber at an angle



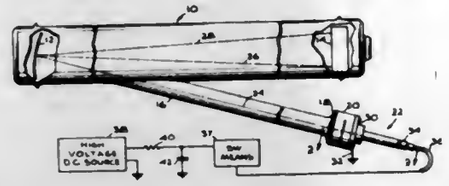
to said confining field whereby the bunches become disorganized within the chamber thereby trapping particles in the field.

3,274,436
ION SOURCE WITH SELECTIVE HOT OR COLD CATHODE

Günter Reich, Vochemer Str. 9, Cologne-Zollstock, Germany

Filed Jan. 23, 1963, Ser. No. 253,360
Claims priority, application Germany, Jan. 31, 1962, L 41,094
3 Claims. (Cl. 315—111)

1. An ion beam apparatus comprising an ion source having a hollow open ended cylindrical anode electrode, an ion beam utilizing device positioned adjacent one open end of said hollow open ended cylindrical anode electrode and including an ion collector electrode adapted to collect ions transmitted by said ion source, a thermionic cathode electrode positioned adjacent the opposite open end of said hollow open ended cylindrical anode electrode, said ion source further including a first plate electrode positioned between said ion beam utilizing device and said cylindrical anode electrode and a second plate electrode positioned between said thermionic cathode electrode and said hollow cylindrical anode electrode, said first plate electrode having an aperture adapted to transmit ions passing between said cylindrical anode electrode and said ion beam utilizing device, said second plate electrode having an aperture adapted to transmit electrons between said thermionic cathode electrode and said cylindrical anode electrode, magnetic means adapted to apply a magnetic field through said cylindrical anode electrode, and variable power supply means connected to said ion source and adapted to permit selective energization of said ion source as either an ion focusing anode for said thermionic cathode electrode or as a cold cathode ion source.



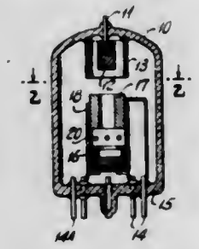
3,274,437
HIGH INTENSITY RADIANT ENERGY SOURCE

Frithjof N. Mastrup, Manhattan Beach, Calif., assignor to Thompson Ramo Wooldridge Inc., Redondo Beach, Calif., a corporation of Ohio

Filed Nov. 20, 1963, Ser. No. 325,084
8 Claims. (Cl. 315—111)

2. In an apparatus for generating pulses of light energy:
a pair of spaced electrodes;
circuit means for applying electrical potential between said electrodes to produce short time duration arc discharges therebetween with the time between successive discharges being relatively long as compared to the time duration of a given arc discharge;

insulating means extending from one of said electrodes to the other and defining an arc discharge passageway in which said arc discharges occur;
said insulating means having passageway wall portions which include an electric arc responsive gas-evolving substance which is characterized in that the gases released therefrom, when heated by intense electrical discharge therethrough, emit radiation substantially corresponding to that of a black body

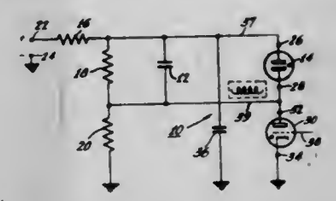


having a temperature of the order of at least 18,000 degrees Kelvin, so that during each successive arc discharge said gases are pressurized within said passageway to temporarily provide a high temperature light emitting plasma therein;
and evacuation means for exhausting the evolved gases from said passageway to provide a pressure substantially lower than atmospheric therein prior to the next successive arc discharge.

3,274,438
THYRATRON AND CIRCUIT THEREFOR

Philip Hirshfield, Passaic, N.J., assignor to Tung-Sol Electric Inc., a corporation of Delaware

Filed Aug. 17, 1962, Ser. No. 217,724
5 Claims. (Cl. 315—206)



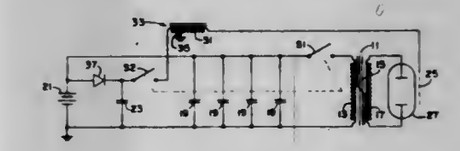
1. A thyratron and circuit therefor comprising: a gaseous discharge device including a sealed envelope containing an anode, a cathode, a firing electrode, and an auxiliary anode positioned adjacent to the cathode and exterior to the space between the anode and cathode; a charging circuit which includes a source of electric power, a diode rectifier, a storage capacitor, and a coupling circuit connected to a load; a discharge circuit including in series said storage capacitor, said coupling circuit, and the anode-cathode circuit of said discharge device; a firing circuit which includes circuit means in series with a capacitor for impressing a positive voltage pulse upon the firing electrode of the discharge device; and an auxiliary anode circuit connected between the auxiliary anode and the cathode which applies a positive potential to the auxiliary anode after the device has been made conductive.

3,274,439
CIRCUITS FOR DISCHARGING A CAPACITOR THROUGH AN ARC DISCHARGE DEVICE

Brainard E. Tompkins, Yardville, N.J., assignor to Radio Corporation of America, a corporation of Delaware

Filed Oct. 30, 1961, Ser. No. 148,589
9 Claims. (Cl. 315—237)

1. A circuit for discharging a capacitor through a normally non-conductive discharge device having two terminals connected in circuit, said discharge device having a predetermined break-down voltage, said circuit having positive and negative terminals for receiving a unidirectional voltage therebetween, means connecting said capacitor between said positive and negative terminals to charge said capacitor from said voltage, relatively low resistance means connecting said capacitor between said terminals of said discharge device, at least one of said low resistance means having inductive reactance and being connected to one of said terminals of said discharge device, and means including a normally nonconductive switching device connected between a terminal of said

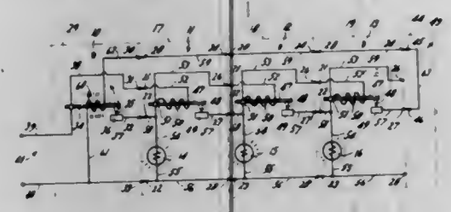


source of voltage and said one terminal of said discharge device to cause to be self-induced in said low resistance means having inductive reactance, when said switching device is rendered conductive, a triggering voltage having a waveform whose rise time is substantially zero, said one terminal of said discharge device being connected to said negative terminal through said low resistance means having inductive reactance, and said triggering voltage being sufficient to cause said discharge device to conduct when added to the voltage across said capacitor in a charged state.

3,274,440
PHOTOFLASH OPTICAL PUMPING CIRCUIT

Morton Stimler, Hyattsville, Md., assignor to the United States of America as represented by the Secretary of the Navy

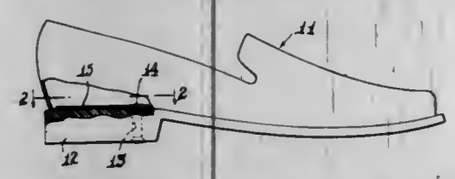
Filed Mar. 22, 1963, Ser. No. 267,371
1 Claim. (Cl. 315—239)



An electronic flash tube power supply circuit comprising,
a bank of parallel-connected capacitors,
a trigger capacitor,
a saturable core first transformer having a primary winding,
a secondary winding, and a saturable core,
an electrontic flash tube having an anode, a cathode and an ignition electrode,
a D.C. voltage source having one terminal thereof at ground potential,
a first switch means having an open position and a closed position,
a second switch means having an open position and a closed position; said second switch means mechanically coupled to said first switch means in a manner to close .5 millisecond after said first switch means is closed,
means serially interconnecting said first switch means and said bank of parallel-connected capacitors to the primary winding of said first transformer,
means connecting the secondary winding of said first transformer to the anode and the cathode of said electronic flash tube,
a second transformer having a single winding with a tap thereon, said tap being connected to apply a ground potential thereto,

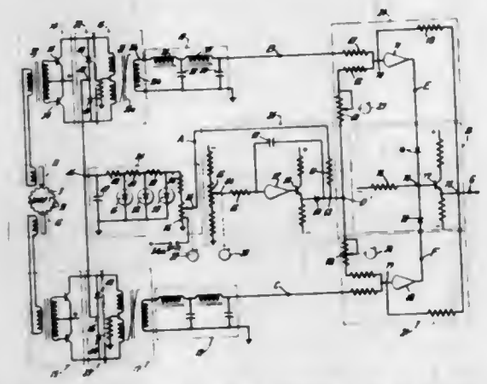
means serially interconnecting the winding of said second transformer, said trigger capacitor and said second switch means to the ignition electrode of said electronic flash tube,

means connecting said bank of parallel connected capacitors to said D.C. voltage source, and



diode means connecting said trigger capacitor to said source of D.C. voltage.

3,274,441
SEQUENTIAL ELECTRICAL LIGHTING ARRANGEMENT
Fedor Benedik, 19 E. 76th St., New York, N.Y.
Filed Oct. 9, 1961, Ser. No. 143,641
6 Claims. (Cl. 315—323)



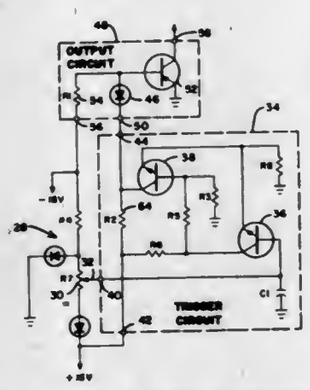
1. A sequential lighting arrangement for successively energizing a plurality of electric lamps, comprising a plurality of switches each including a pair of normally closed contacts, a heat-sensitive element coupled to one of said contacts for opening said contacts upon the application of heat thereto, and a heater element intimately associated with said heat-sensitive element, circuit means connecting all of the pairs of switch contacts in series with one terminal of a source of electrical current to provide a first bus line, means connecting each heater element across the pair of contacts of the preceding switch to place said heater element in the first bus line for energization thereof when the pair of contacts of the preceding switch are open and the bus line is completed to said preceding switch, a second bus line connected to the other terminal of said current source, and means connecting each of said lamps in parallel between the second bus line and one of the contacts of a switch in the first bus line independently of said heater elements for energization of said lamp when the bus line is completed to said connected contact.

3,274,442
CONDUCTIVE FOOTWEAR
James R. Peel, 406 N. Iowa St., Villa Park, Ill.
Filed Nov. 19, 1963, Ser. No. 324,625
1 Claim. (Cl. 317—2)

A static discharging shoe including a sole and a heel portion, a thin layer of electrically conductive material overlying the inside surface of the heel portion only, said electrically conductive material being adapted to have direct contact with the heel of the wearer, an electrically conductive element extending through the heel portion and having electrical contact at one of its ends with the electrically conductive material, said electrically conductive element having its other end exposed on the outside bottom face of said heel portion, the conductivity of said thin layer of electrically conductive material varying significantly in accordance with changes in thickness of the material of several thousandths of an inch, said thin layer of electrically conductive material having a predetermined conductivity established by the thickness of the material employed, said thickness being selected in accordance with the conductivity desired.

3,274,443
REDUNDANT SPEED CONTROL SYSTEM
Markus A. Eggenberger and Paul H. Troutman, Schenectady, N.Y., assignors to General Electric Company, a corporation of New York
Filed Dec. 5, 1963, Ser. No. 328,281
5 Claims. (Cl. 317—5)

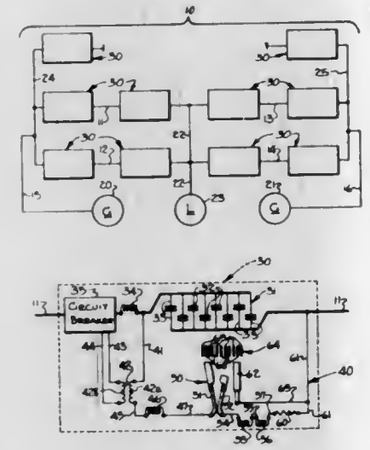
1. A redundant speed control system for a prime mover having servo means controlling the operation thereof in response to an electrical speed error signal representing deviation from a desired speed, comprising:



first and second means responsive to prime mover speed generating first and second electrical signals respectively proportional to actual speed,

third means generating a third selectable constant electrical signal representing a desired prime mover speed,

fourth and fifth means summing the first signal with the third signal and summing the second signal with the third signal respectively to produce two speed error signals representing the difference between actual and desired prime mover speeds, and



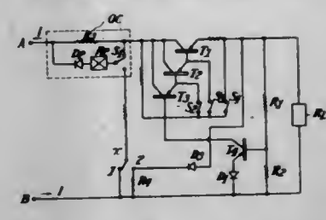
common gating means receiving both of said error signals from the fourth and fifth means and enabling only the error signal calling for the lower speed of the prime mover to actuate said servo means.

3,274,444
SIGNAL RESPONSIVE APPARATUS
Thomas K. Boudreau, New Brighton, and Albert Z. Kaszynski, St. Paul, Minn., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Apr. 17, 1963, Ser. No. 273,632
15 Claims. (Cl. 317—9)

1. In a data processing system having a plurality of circuit means each characterized by static operation capability according to a quiescent operating point which is determined in part by the energy level of D.C. energy supplies for the circuit means, said quiescent operating point being in a reliable operation range extending between predesignated upper and lower voltage limits, said circuit means further characterized by dynamic operation in response to signal changes applied thereto, a power failure sensing circuit comprising: circuit means for constantly monitoring the levels of the D.C. energy supplies, said circuit means including voltage threshold sensing means having reference voltage isolation means, said thresholds sensing means developing a signal change when any of the respective D.C. energy supplies reaches predetermined levels approaching said limits; control circuit means for activating predetermined operation sequences; and means for applying said developed signal change to said control circuit means to effect preselected dynamic operations thereof in a period of time less than that during which the D.C. energy level reaches one of said limits from said predetermined level.

3,274,445
METHOD AND MEANS FOR INCREASING VOLTAGE CAPABILITY AND IMPROVING THE OPERATION OF AN ELECTRICAL TRANSMISSION SYSTEM
Herman B. Wolf, Charlotte, N.C., assignor to R. H. Bouligny, Inc., Charlotte, N.C., a corporation of North Carolina
Filed July 25, 1963, Ser. No. 297,560
13 Claims. (Cl. 317—12)

1. In an electrical transmission system having a plurality of transmission lines connected as a transmission network to sources of electrical energy and to loads, said transmission lines having a given basic insulation level which prevents frequent faults therein at a given normal operating voltage; the improvement comprising means for increasing the permissible normal operating voltage impressible on said transmission lines without the necessity of increasing the basic insulation level thereof and for improving the operation of the transmission system comprising



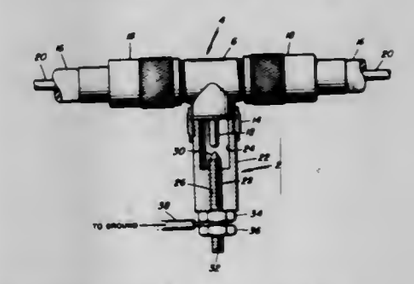
(a) a set of capacitors connected in each of said transmission lines at each end thereof, said capacitors serving to substantially offset reactance of the transmission lines and to substantially eliminate voltage dip occasioned by a fault,

(b) protective means connected in shunting relation to each of said sets of capacitors and normally being inoperative upon normal voltage and current conditions in said transmission lines, but being operable in response to a predetermined voltage rise across said capacitors due to the occurrence of a fault in the transmission line for shunting said capacitors to protect the same from damage, due to excessive voltage,

(c) current limiting means connected in said transmission lines in series with each of said sets of capacitors and having an ohmic value no greater than the ohmic value of the capacitive reactance of said set of capacitors in series therewith so that said capacitors render said current limiting means ineffective during normal operating current conditions, said current limiting means becoming effective upon the shunting of the capacitors by said protective means for limiting the current flowing in the faulted circuit to a predetermined value, and

(d) circuit breaking means connected in said transmission lines at each end thereof and in series with each of said sets of capacitors for interrupting the faulted circuit in response to fault current flowing in said transmission lines.

3,274,446
DARLINGTON CONFIGURATION TRANSISTOR CIRCUIT
Minoru Nagata, Kodaira-shi, Japan, assignor to Kabushiki Kaisha Hitachi Seisakusho, Tokyo-to, Japan, a joint-stock company of Japan
Filed Jan. 3, 1963, Ser. No. 249,275
Claims priority, application Japan, Jan. 8, 1962, 37/251, 37/252
5 Claims. (Cl. 317—33)

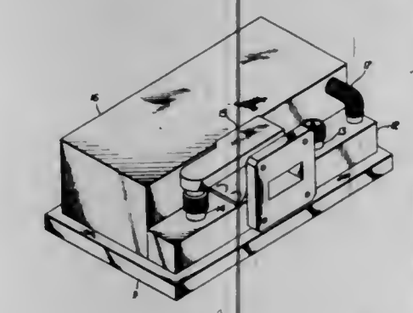


1. A Darlington configuration transistor circuit consisting of a combination of a plurality of transistors, which comprises:

a circuit construction having at least two transistors wherein the emitter of a second transistor is directly connected to the base of a first transistor and the collectors of said respective transistors are connected in common;

and switching means inserted between the base of said second transistor and the emittters of said respective transistors, whereby, when said switching means are simultaneously closed, the connection between the emitters of said respective transistors and the base of said second transistor in said circuit construction is shorted to cut-off said Darlington transistor circuit.

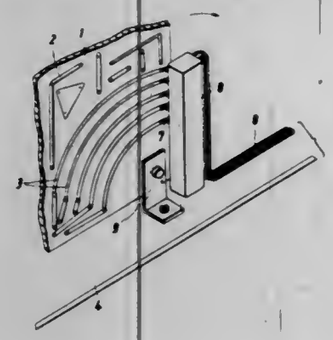
3,274,447
COAXIAL CABLE LIGHTNING ARRESTER
Noel R. Nelson, 12813 Camellia Drive, Takoma Park, Md.
Filed Mar. 14, 1963, Ser. No. 265,191
12 Claims. (Cl. 317—61)



1. A lightning arrester fitting adapted for connection to one leg of a branched coaxial cable connector said leg having a center conductor extending therefrom, said arrester fitting comprising a body, means for securing said body to said connector leg, conductor means within said

body forming an air gap with said center conductor, and means on the outside of said body for connecting said conductor means with ground.

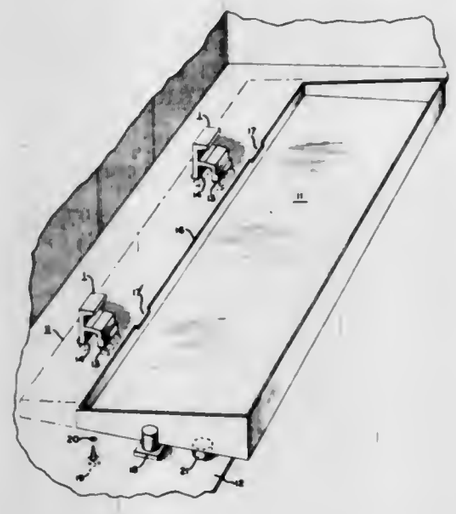
3,274,448
ELECTRON DISCHARGE DEVICE AND POWER SUPPLY ASSEMBLY



Murray I. Disman, Sunnyvale, and Charles M. Eallonardo, Cupertino, Calif., assignors, by mesne assignments, to Varian Associates, a corporation of California
Filed Mar. 9, 1964, Ser. No. 350,293
15 Claims. (Cl. 317—100)

1. An electron tube and power supply assembly comprising: a first hermetically sealed container, an electron tube having a vacuum envelope enclosed within said first container, a second hermetically sealed container, a power supply for providing operating voltages for said electron tube enclosed within said second container, a flexible tubular member having one of its ends hermetically secured to said first container adjacent an opening therein and its other end hermetically secured to said second container adjacent an opening therein thereby providing a passageway between the interior of said first and said second containers, means for applying operating potential to said electron tube coupled to said power supply and extending through said tubular member to said electron tube contained within said first container, and an inert gas enclosed within said first and second containers and said tubular member.

3,274,449
ELECTRICAL APPARATUS COMPRISING PRINTED CIRCUIT BOARDS



Werner Pioch, Darmstadt-Eberstadt, Germany, assignor to Fernseh G.m.b.H., Darmstadt, Germany
Filed Nov. 12, 1963, Ser. No. 322,629
Claims priority, application Germany, Nov. 13, 1962, F 38,298
10 Claims. (Cl. 317—101)

1. An electrical apparatus of the character described comprising, in combination, stationary support means; a printed circuit board supported on said support means for pivotable movement about an axis; a plurality of arcuate contact means fixedly connected to said circuit board for pivotal movement therewith and arranged concentrically with said axis; a plurality of resilient contact means carried by said support means and respectively resiliently contacting said plurality of arcuate contact means; connection means electrically connecting each of said plurality of arcuate contact means to respective points of a printed circuit on said printed circuit board; and conductor means connected to each of said plurality of resilient contact means.

3,274,450
INSULATIVE SPACER FOR TELEVISION CHASSIS

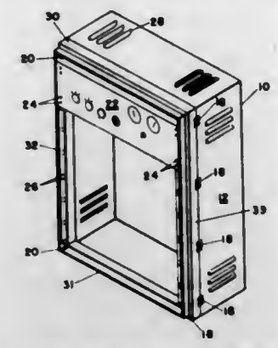
Donald J. Siebold, North Syracuse, N.Y., assignor to General Electric Company, a corporation of New York
Filed Feb. 19, 1965, Ser. No. 434,010
4 Claims. (Cl. 317—101)

1. In a television receiver having a cabinet structure and an internally located chassis, apparatus mounting said chassis in electrically insulated spaced relationship to said cabinet comprising;

(a) a plurality of insulative spacing members, each member including,

(1) a first leg portion having a top and bottom thereof, said bottom of said first leg portion being pivotally received by a first aperture in said cabinet,

(2) a second leg portion having a top and bottom thereof, said bottom of said second leg portion being received by a second aperture in said cabinet in locking engagement therewith,

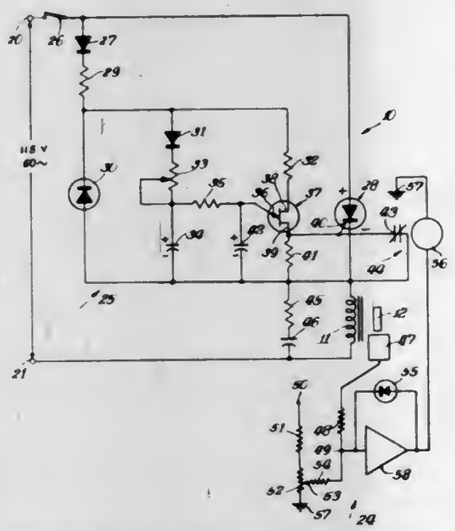


(3) a first integral transverse portion joining said top of said first leg portion to an intermediate point of said second leg portion, and

(4) a second integral transverse portion extending from the top of said second leg portion and overlying said first transverse portion in spaced relationship therewith to define a channel receiving the edge of said chassis.

3,274,451
ELECTRONIC EQUIPMENT CABINET

Max Laity, 2032 37th St., Rock Island, Ill.
Filed Feb. 13, 1964, Ser. No. 344,700
8 Claims. (317—122)



1. A cabinet comprising a vertical frame substantially rectangular in shape formed by a plurality of members joined at their ends, said frame members having a channel shaped cross section, the open side of each member facing the same direction and being covered with one or more plates, forming a rectangular conduit, said frame also forming part of the cabinet exterior, and a cabinet cover

open on one side, the outer perimeter of said open side conforming to and being attached to the outer perimeter of said frame.

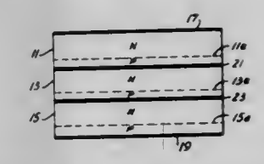
3,274,452
DEGAUSSER

Lewis G. Landes, Wilmette, Ill., assignor to Barnes & Reinecke, Incorporated, a corporation of Delaware
Filed Mar. 12, 1963, Ser. No. 264,596
11 Claims. (Cl. 317—157.5)

5. Apparatus for controlledly degaussing a magnetic element, comprising: a degausser coil; and means for providing in said degausser coil a current of seriatim increasing-maximum-amplitude, damped sine wave pulses with a finite time interval between said pulses.

3,274,453
SEMICONDUCTOR INTEGRATED STRUCTURES AND METHODS FOR THE FABRICATION THEREOF

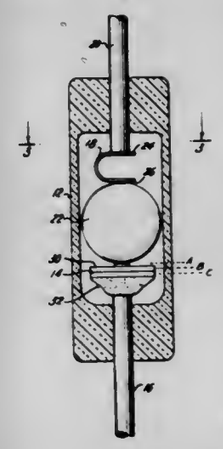
Thomas V. Sikina, Willow Grove, Pa., assignor, by mesne assignments, to Philco Corporation, Philadelphia, Pa., a corporation of Delaware
Filed Feb. 20, 1961, Ser. No. 90,580
5 Claims. (Cl. 317—234)



1. A microminiaturized semiconductor counter circuit assembly comprising a wafer of high-resistivity gallium arsenide having a thin, strongly P-type surface layer, a plurality of pairs of alloyed metal connections to said surface layer, each of said pairs comprising one ohmic

and one rectifying connection associated to form a tunnel diode, an adherent, electrically insulating surround of solidified material extending over said surface layer and between said connections, the surface of said surround and the external surfaces of said connections forming a common planar surface, and a plurality of deposited metallic interconnections adhering to said planar surface, each of said interconnections extending between said rectifying connection of one of said pairs and said ohmic connection of another of said pairs.

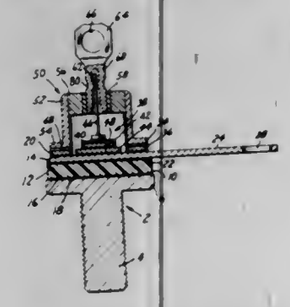
3,274,454
SEMICONDUCTOR MULTI-STACK FOR REGULATING CHARGING OF CURRENT PRODUCING CELLS



Rolf R. Haberecht, Indianapolis, Ind., assignor to P. R. Mallory & Co., Inc., Indianapolis, Ind., a corporation of Delaware
Filed Sept. 21, 1961, Ser. No. 139,704
6 Claims. (Cl. 317—234)

1. A composite stacked semiconductor device having a gating characteristic occurring at a distinct voltage level comprising: a plurality of individual semiconductor rectifier wafers respectively having an N zone and a P zone therein forming a PN junction, the transverse end surface of each of said zones being substantially planar, said wafers stacked together in series; and a layer of conductive metal of the order of 0.1 mil in thickness integrally bonded to and separating a P zone of one wafer from an N zone of another wafer.

3,274,455
CONTACT FOR SOLID STATE DIODE

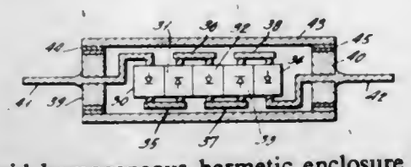


Stanley Pessok, West Orange, N.J., assignor to General Instrument Corporation, Newark, N.J., a corporation of New Jersey
Filed July 27, 1962, Ser. No. 212,933
3 Claims. (Cl. 317—234)

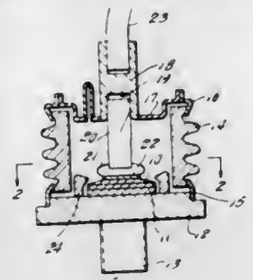
1. A silicon junction diode comprising a cylindrical glass envelope, a semiconductor junction and lead sealed in one end of the cylinder, a contact spring and lead sealed in the other end of the cylinder, and a metal sphere formed of a metal of no greater weight than a metal selected from the group consisting of aluminum, nickel, silver or lead-silver alloy disposed directly between the spring and the surface of the junction, said sphere having a diameter closely approaching the inside

diameter of the cylinder, there being no metal band to the ball, and said junction being a silicon junction of the mesa type with a centrally located mesa.

3,274,456
RECTIFIER ASSEMBLY AND METHOD OF MAKING SAME
Marvin S. Pittler and Johnway Chu, Teaneck, N.J., assignors to General Instrument Corporation, Newark, N.J., a corporation of New Jersey
Filed Nov. 21, 1962, Ser. No. 239,255
7 Claims. (Cl. 317—234)



1. A rectifier assembly comprising an insulating body, a conductive body on and solder-secured to said insulating body, having at least a portion inside the periphery of said insulating body, and having a terminal part extending from said portion to a point laterally beyond said insulating body, a rectifying unit solder-secured to said portion of said conductive body and in electrically conductive relation therewith, said rectifying unit being located inside the periphery of said insulating body, a metal ring surrounding and radially spaced from said rectifying unit, said ring being mounted on and solder-secured to said conductive body and having a portion inside the periphery of said insulating body, and a cap covering said rectifying unit and having a peripheral part resting on and weld-secured to said portion of said ring.

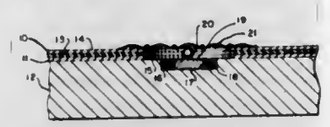


7. The method of assembling a rectifying assembly which comprises positioning a conductive body on an insulating body so that at least a portion of said conductive body is inside the periphery of said insulating body and soldering said conductive body to said insulating body in that position, said conductive body having a plurality of terminal parts extending therefrom laterally beyond said insulating body, soldering a metal ring to said conductive body, said ring having a portion substantially inside the periphery of said insulating body, soldering a rectifier unit to and in electrically conductive relation with said portion of said conductive body and inside and radially spaced from said ring, placing a cap over said rectifier unit with a peripheral flange part of said cap resting on said portion of said ring, making electrical connection to said peripheral cap portion, making electrical connection to said ring via said plurality of terminal parts, and welding said peripheral cap part to said ring portion by electricity supplied through said electrical connections while physically supporting said peripheral cap part and said ring portion by said insulating body.

3,274,457
SEMICONDUCTOR ENCAPSULATED AND SEALED WITHIN HOUSING
Joe Wislocky, El Segundo, Calif., assignor to International Rectifier Corporation, El Segundo, Calif., a corporation of California
Filed Feb. 26, 1963, Ser. No. 261,109
4 Claims. (Cl. 317—234)

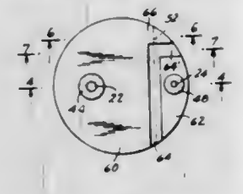
1. In combination; a semiconductor wafer, a homogeneous hermetic enclosure for said semiconductor wafer having leads from said wafer extending therethrough, and a second hermetic enclosure enclosing said homogeneous enclosure and having leads extending therefrom which are at least electrically continuous with said leads of said wafer; said homogeneous hermetic enclosure being cylindrical; said second hermetic enclosure comprising a cylindrical wall portion having a front-end portion and rear-end portion at the respective ends thereof; the interior of said second hermetic enclosure being spaced from the exterior of said homogeneous hermetic enclosure to define a volume between the interior surface of said second hermetic enclosure and the exterior of said homogeneous hermetic enclosure; said cylindrical wall portion and its said front and rear-end portions defining a gas tight seal between the exterior of said second hermetic enclosure and said volume interior of said second hermetic enclosure.

3,274,458
EXTREMELY HIGH VOLTAGE SILICON DEVICE
John L. Boyer and Frank W. Parrish, El Segundo, Calif., assignors to International Rectifier Corporation, El Segundo, Calif., a corporation of California
Filed Apr. 2, 1964, Ser. No. 356,716
13 Claims. (Cl. 317—234)



1. A high voltage semiconductor device comprising a wafer of semiconductor material having at least one junction therein, a conductive support base for said wafer and being connected to one surface portion of said wafer, an insulation cylinder having one end thereof mechanically connected to said conductive support base, and an upper terminal structure electrically connected to a surface portion of said wafer opposite to said one surface portion and mechanically connected to the opposite end of said insulation cylinder; said mechanical connection between said one end and said opposite end of said insulation cylinder to said conductive support base and said upper terminal structure defining a hermetically sealed housing for said wafer; and a corona shield; said corona shield comprising a conductive ring surrounding the upper periphery of said wafer and being connected to said conductive base, said conductive ring being radially interposed between said upper periphery of said wafer and said insulation cylinder.

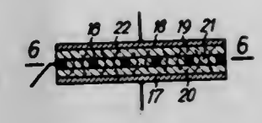
3,274,459
LOW IMPEDANCE COUPLED TRANSMISSION LINE AND SOLID STATE TUNNEL DIODE STRUCTURE
Fred Sterzer, Princeton, N.J., assignor to the United States of America as represented by the Secretary of the Army
Filed May 7, 1964, Ser. No. 365,847
5 Claims. (Cl. 317—234)



1. A voltage controlled negative resistance solid state diode assembly comprising an electrically conductive base plate having thickness sufficient to impart rigidity to the assembly and having at least one flat surface, a stripline

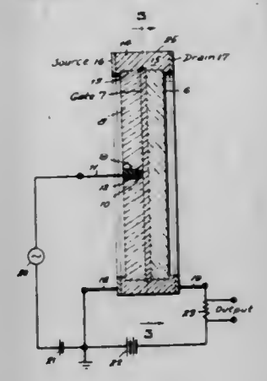
transmission line composed of two thin layers of conducting material separated by a thin dielectric layer, one layer being a ground plane conductor and the other a conductor strip, said ground plane conductor being electrically surface united to the flat surface of said base plate, a chamber formed in said base plate opening toward said stripline, a semiconductor crystal having a high concentration of free charge carriers and secured in said chamber with a nonrectifying low impedance union said crystal having its top surface substantially in the plane

of the flat surface of said base plate, a second chamber above and communicating with the first chamber and formed by cutting an aperture through said stripline, a small pellet of conductive material no longer than the thickness of said stripline in said second chamber engaging said crystal, a tunnel diode junction at the contact point between the crystal and pellet composed of an alloy of the materials of said contact point and a bridging conductor covering said second chamber and having an ohmic connection with said pellet and the conductor strip of said stripline.



3,274,460
CONTROLLED RECTIFIER COMPRISING A RESISTIVE PLATING INTERCONNECTING ADJACENT N AND P LAYERS
Stanley Pessok, West Orange, N.J., assignor to General Instrument Corporation, Newark, N.J., a corporation of New Jersey
Filed July 27, 1962, Ser. No. 212,974
5 Claims. (Cl. 317—235)

1. A controlled power rectifier comprising a silicon semiconductor having P, N and P layers, an anode terminal on one side, a cathode terminal lead and a gate terminal lead on the other side, a diffused N layer on the cathode side covering a substantial portion less than all of the P layer surface, metal plating for soldering of the cathode terminal lead on the N surface portion, metal plating for soldering of the gate lead on the P surface portion, there being a gap in the metal plating between the said N and P surface portions, the plating at one point of limited area being carried over the said gap from one portion to the other providing a resistive connection between the two portions.



3,274,461
HIGH FREQUENCY AND POWER FIELD EFFECT TRANSISTOR WITH MESH-LIKE GATE STRUCTURE
Stanislas Teszner, 49 Rue de la Tour, Paris, France
Filed Dec. 11, 1962, Ser. No. 243,793
Claims priority, application France, Dec. 16, 1961, 822,222
13 Claims. (Cl. 317—235)

1. A field-effect translating device comprising a semiconductor plate having two parallel great faces including a first zone of a given conductivity type contiguous with the first face thereof, a second zone having first portions of the type of conductivity opposite to said given conductivity type formed by a first impurity of said opposite type of conductivity and large diffusion coefficient diffused from said second face and unaltered second portions of said given type of conductivity, said first and second portions respectively forming mesh-like channels and a wire-like gate, a third zone generally of said given type of conductivity having first portions adjacent said wire-like gate, heavily doped in said given type and formed by a second impurity of said given type of conductivity and

small diffusion coefficient diffused from said second face and second portions slightly doped in said given type and formed both by the said first impurity of said opposite type of conductivity and large diffusion coefficient and the said second impurity of said given type of conductivity and small diffusion coefficient diffused from said second face, source and drain connections respectively to said first and third zones and a gate connection to said wire-like gate.

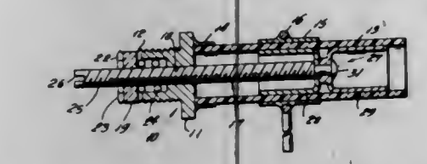
3,274,462
STRUCTURAL CONFIGURATION FOR FIELD-EFFECT AND JUNCTION TRANSISTORS
Keats A. Pullen, Jr., Rte. 1, Box 381, Kingsville, Md.
Filed Nov. 13, 1963, Ser. No. 323,511
2 Claims. (Cl. 317—235)

1. A field-effect transistor comprising, in combination, a basic assembly consisting of a body of intrinsic semiconductor having two parallel major surfaces and a peripheral surface, a layer of one type of polar impurity formed in said body on one of said major surfaces and extending to said peripheral surface and forming a part thereof, a layer of single crystal semiconductor formed on the said layer of one type of polar impurity and also constituting a part of said peripheral surface, a channel in the form of an open annulus consisting of opposite type polar impurity formed in said basic assembly adjacent said peripheral surface, said channel extending along its longitudinal axis through the basic assembly in perpendicular relationship to said layer of one type polar impurity whereby said layer of one type polar impurity is divided providing a first gate extending inwardly of said peripheral surface to one side of said channel and a second gate in contact with the side of said channel opposite to said one side, said channel having a distribution of conductivity of maximum adjacent said first and second gates and diminishing in a direction toward the center of said channel from each of said gates, a source comprising an ohmic contact formed to one annular end of said channel, a drain comprising an ohmic contact formed to the opposite annular end of said channel, said gate positioned in the basic assembly immediately adjacent to said source.

3,274,463
SYMMETRICALLY SWITCHING INTEGRATED SEMICONDUCTOR DEVICES

Jearld L. Hutson, Richardson, Tex., assignor to Electronic Control Corporation, Dallas, Tex., a corporation of Texas

Filed Feb. 11, 1964, Ser. No. 343,987
29 Claims. (Cl. 317—235)

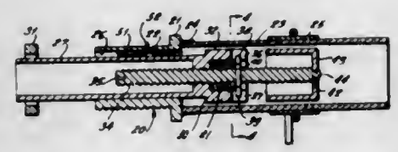


1. A duojunction transistor comprising a semiconductor body of one-type conductivity having a region of opposite-type conductivity at each end thereof forming a PN junction therewith, a contact for each region shunting such region to the body along the PN junction, an area of opposite-type conductivity adjacent to each region penetrating a portion of said body between its end and forming PN junctions therewith, each area being within a diffusion length for minority carriers in said body from the region of its adjacency and beyond such diffusion length from each other, and electrical contacts to each said area.

3,274,464
TEMPERATURE COMPENSATING TRIMMER CAPACITOR

Hugo Selden, Brooklyn, N.Y., assignor to JFD Electronics Corporation, Brooklyn, N.Y., a corporation of New York

Filed Nov. 3, 1964, Ser. No. 408,483
5 Claims. (Cl. 317—248



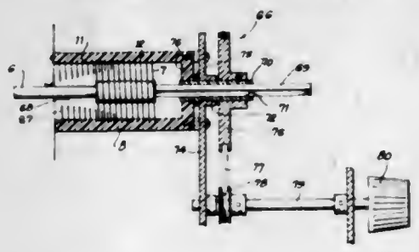
1. A trimmer capacitor comprising a bushing having an opening therein, a hollow dielectric cylinder secured to said bushing, an adjustment screw means connected to said bushing and extending through said opening in said bushing and into said hollow dielectric cylinder, an electrode band surrounding said dielectric cylinder, and a piston assembly connected to the end of said adjustment screw and movable within said dielectric cylinder; said piston assembly comprising a first and second coaxial piston; each of said first and second pistons comprising thin walled cylinders having a closed end portion; said closed end portions of each of said pistons being adjacent to one another; said adjustment screw extending into said first piston and being connected to central portions of closed end portions of each of said first and second pistons; said first piston being of a material having a first temperature coefficient of expansion; said second piston being of a material having a second and different temperature coefficient of expansion than said material of said first piston.

3,274,465
TWO-POSITION TRIMMER CAPACITOR

Ralph Spielman, Brooklyn, N.Y., and David Taub, Paris, France, assignors to JFD Electronics Corporation, Brooklyn, N.Y., a corporation of New York

Filed May 25, 1965, Ser. No. 458,690
5 Claims. (Cl. 317—249)

1. A two-position trimmer capacitor; said two-position trimmer capacitor comprising a support bushing having an opening therethrough, a dielectric cylinder connected to said support bushing and extending coaxially therewith, an electrode band secured to said dielectric cylinder, a conductive piston coaxially positioned in said dielectric cylinder and axially movable within said dielectric cylinder, an elongated support shaft extending through said opening in said support bushing and connected to said piston at one end thereof, and support means connected between said elongated support shaft and the interior of said opening in said support bushing; said support means including an axially extending square portion defining an axially slidable connection between said support bushing and said elongated support shaft; said support means including a threaded portion defining a rotatable threaded connection between said support bushing and said elongated support shaft; first and second stop means for limiting the axial sliding movement of

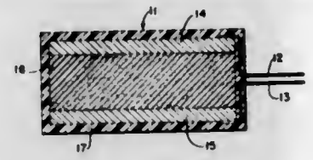


said elongated support shaft between respective first and second spaced positions with respect to said support bushing, said first stop means comprising a nut movable into engagement with said support bushing and threadably adjustable with respect to said elongated adjustment screw, said second stop means being movable into engagement with said support means and being operatively connected to said elongated support shaft; said opening in said support bushing comprising a shaft having a square tubular portion extending through said rectangular opening in said support bushing; said elongated support shaft being a threaded circular shaft; said support means including an internally threaded portion for threadably receiving said elongated support shaft.

3,274,466
VARIABLE CAPACITOR

William B. Kincaid, Nashville, Tenn., assignor to Aladdin Industries, Incorporated, Chicago, Ill., a corporation of Illinois

Filed Oct. 4, 1963, Ser. No. 314,031
1 Claim. (Cl. 317—252)

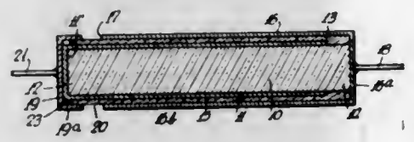


In a variable capacitor, the combination comprising a supporting cylinder made of insulating material and having an axial bore therein, said cylinder being formed with double internal screw threads extending along the inside of said bore, said double threads providing first and second parallel internal helical grooves along said bore, a conductive helical radial stator plate having its outer edge received and supported in said first helical groove, said stator plate having an axial opening therein, a rotor having an axial shaft extending through said opening, a conductive radial helical rotor plate secured to said shaft and having its outer edge received in said second helical groove, said shaft and said rotor plate being rotatable to move said rotor plate along said second helical groove to vary the extent to which said rotor plate meshes with said stator plate, said shaft and said rotor plate being spaced from said stator plate, a drive member having a non-circular opening therein, said shaft having a correspondingly non-circular drive portion slidably received within said non-circular opening, and means supporting said drive member for rotation while restraining axial movement thereof, said stator plate being tapered in radial width along the length thereof.

3,274,467
CERAMIC CAPACITOR

Ernest G. Graf, North Tonawanda, N.Y., assignor to National Lead Company, New York, N.Y., a corporation of New Jersey

Filed May 17, 1963, Ser. No. 281,301
12 Claims. (Cl. 317—258)

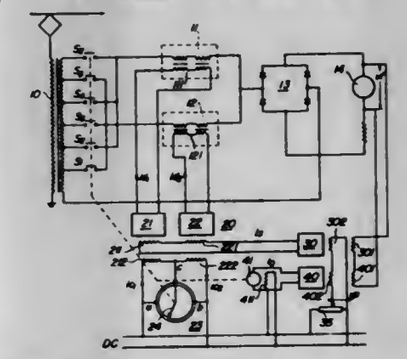


1. A ceramic capacitor having a capacity of at least about 10,000 pfd./cm.² and a suitably low dissipation factor comprising a semi-conductive, sintered ceramic body formed from a mixture of titania and a pentavalent modifying oxide selected from the group consisting of Nb_2O_5 and Sb_2O_5, and a pair of spaced metallic electrodes attached to said body, at least one of said electrodes having a non-ohmic contact with said body.

3,274,468
ELECTRIC CAPACITOR AND METHOD FOR PRODUCING THE SAME

Antonio Ruiz Rodriguez and Robert Emanuel Stapleton, Franklinville, N.Y., assignors to Aerovox Corporation, a corporation of Massachusetts

Filed Oct. 7, 1954, Ser. No. 460,797
15 Claims. (Cl. 317—258)



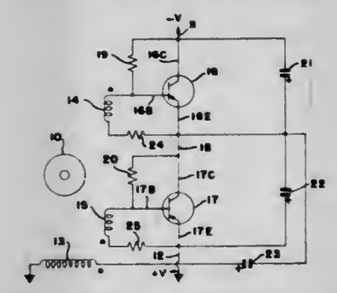
1. A monolithic ceramic capacitor consisting of a ceramic core having an inner electrode of metal sufficiently refractory to withstand the firing temperature of the ceramic, exposing one end of and substantially completely covering and bonded to substantially the entire remaining surface area including the other end of the core, a ceramic dielectric film substantially covering and directly bonded to substantially the entire outer surface of said inner electrode other than the portion thereof covering said other end of the core and an outer electrode covering said ceramic dielectric film and bonded to substantially the entire area thereof, said capacitor having an insulating coating with terminals accessible therethrough and connected respectively to said inner and outer electrodes, said ceramic and inner electrodes being substantially inert with respect to each other.

9. The method of preparing a ceramic capacitor which comprises applying to the surface of a core of green ceramic, a suspension of metal over substantially the entire surface of the core other than one end portion thereof, drying the suspension, coating the metal coated core with a slip of ceramic dielectric composition corresponding to that of the core, drying the slip coating, firing the unit to the maturing temperature of the dielectric coating, applying a metal electrode over the common end of the core and slip and over nearly the entire length of the outer surface of the slip, leaving exposed the end portion of the slip at the extremity of the core opposed to that beyond the extremity of the inner electrode, drying and firing the unit, and effecting terminal connections respectively at the extremity of the outer electrode and at the extremity of the inner electrode at opposed ends of the core.

3,274,469
TRANSFORMER FED NON-ARCING MOTOR ACCELERATION CONTROL FOR AN ELECTRIC CAR INCLUDING ANTI-SLIP CIRCUITRY

Takashi Tsuboi, Fumio Masutomi, and Yoshimitsu Onoda, Katsuta-shi, Ibaragi, Japan, assignors to Hitachi, Ltd., Tokyo, Japan, a corporation of Japan

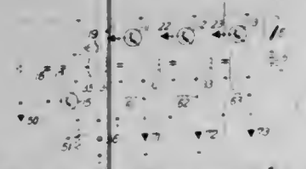
Filed May 6, 1963, Ser. No. 278,251
Claims priority, application Japan, May 11, 1962, 37/18,594
15 Claims. (Cl. 318—52)



1. An electric car controlling apparatus for switching the supply voltage of the motor and preventing damage due to slippage thereof, comprising a main transformer supplied from an alternating-current trolley and having a plurality of voltage taps in the output, a direct-current traction motor, connecting means operatively connecting a selected one of said taps with said traction motor including rectifier means operable to rectify the A.C. current from said transformer into D.C. current and at least one pair of supply voltage regulating means operatively interposed between said transformer and said rectifier means, switching control means operable to change said voltage taps under substantially non-arcing condition while controlling said supply voltage regulating means, means operatively connected with said motor for producing a voltage proportional to the speed thereof, and a slip-preventing circuit means operable to sense said voltage proportional to the speed of the motor and operatively connected with said supply voltage regulating means to raise the impedance of all of said supply voltage regulating means in accordance with the sensed output.

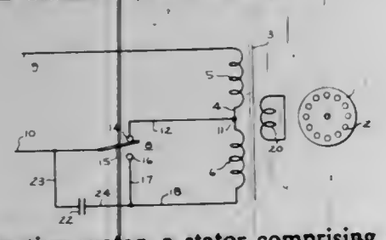
3,274,470
BRUSHLESS MOTOR MEANS

Bernard J. Gershen, Edison, N.J., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware



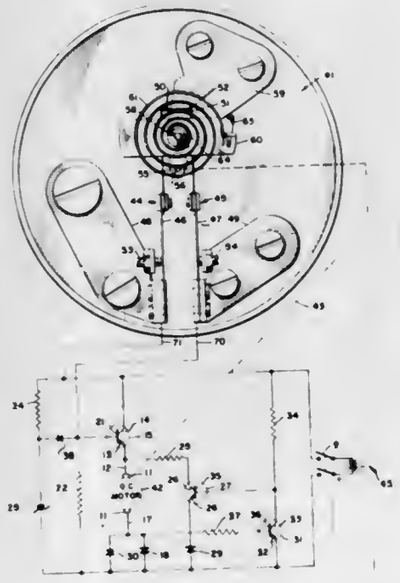
Filed Dec. 5, 1963, Ser. No. 328,273
2 Claims. (Cl. 318—138)

1. Energizing arrangement from a direct current supply line source for D.-C. to D.-C. convertor as well as D.-C. to A.-C. inverter means, comprising, electromagnetic core means shared by four winding portions includ-



ing a main winding portion, a pair of feedback winding portions and an additional output winding portion all fixed in location, a pair of semi-conductor means each having base, collector and emitter portions thereof, each feedback winding portion having connection between base and emitter portions of respective semi-conductor means, an emitter portion of one semi-conductor means being connected to a collector of the other semi-conductor means in a common juncture also shared by capacitance means at least in series with said main winding portion which is connected to a connection of one side of supply line and emitter portion of one of said semi-conductor means which a remaining side of supply line source is connected to collector portion of said other semi-conductor means, and a pair of rectifier means connected to opposite ends of said additional winding portion also having a tap connection thereto for direct current output therefrom and having alternating current output directly from opposite ends of said additional winding portion.

3,274,471
DIRECT CURRENT MOTOR WITH TRANSISTORIZED POWER SUPPLY
Helmut Moczala, Berlin-Grunewald, Germany, assignor to Licentia Patent-Verwaltungs-G.m.b.H., Frankfurt am Main, Germany
Filed Sept. 1, 1964, Ser. No. 393,572
Claims priority, application Germany, Sept. 6, 1963, L 45,797
8 Claims. (Cl. 318—138)

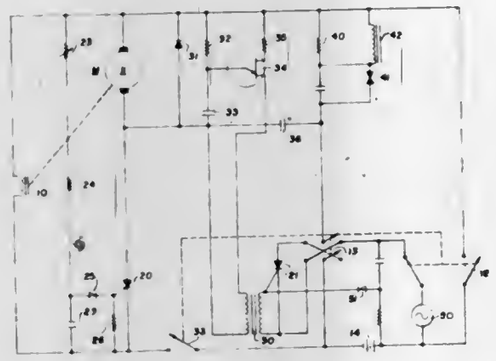


5. In a D.C. motor having a stator and a rotor, armature windings, a power supply, armature transistors connecting the power supply to the armature windings, a control circuit connected to the armature transistors for controlling the same in dependence upon the relative angular position between the stator and rotor, the control circuit including an oscillatory circuit incorporating a control transistor, and speed regulating means connected to the control circuit for applying thereto a tachometer potential, dependent on the rotational speed of the motor, which renders the control circuit ineffective at a given predetermined rotational speed, the improvement that said tachometer potential is derived from said armature windings while the same are blocked from said power supply by said armature transistors.

3,274,472
TWO SPEED INDUCTION MOTOR
John P. Slattery, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Filed Oct. 3, 1963, Ser. No. 313,652
2 Claims. (Cl. 318—200)

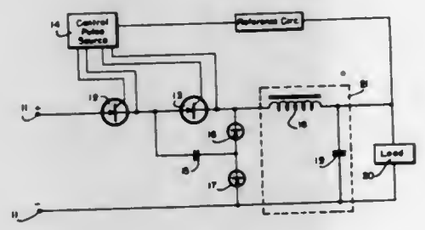
1. In an induction motor, a stator comprising a single phase winding consisting of first and second series-connected coil sections mutually coupled to each other, a capacitor, switch means movable to either of two operative positions for connecting said first section to a source alternating current power and for connecting said capacitor across said second section in one position and to series connect both of said sections to said source of power and short said capacitor in said second position whereby said motor starts and runs at a high speed with power factor correction when said switch is in its first position and at a low speed when said switch is in its second position.

3,274,473
STARTING AND DAMPING CIRCUITRY FOR A TRANSISTORIZED GOVERNING SYSTEM
Bruce H. Kamens, Thomaston, Conn., assignor to Consolidated Electronics Industries Corp., Waterbury, Conn., a corporation of Delaware
Filed Aug. 13, 1963, Ser. No. 301,735
10 Claims. (Cl. 318—311)



1. A failsafe starting system for a D.C. motor having a pair of chronometrically controlled governor contacts for controlling the energization of the motor to maintain its speed at a predetermined value, comprising
(a) a D.C. source in series with said motor,
(b) governing means controllable by said chronometrically controlled contacts for varying the current supplied to said motor,
(c) an auxiliary starting voltage means insuring a voltage to be supplied across the armature of the D.C. motor when said contacts are open,
(d) said auxiliary voltage means having less effective E.M.F. than the back E.M.F. generated by said motor at said predetermined speed,
(e) said auxiliary voltage therefore having effect during the starting of said motor when said contacts are open, but having no effect on the operation of said motor in the range of said predetermined value.

3,274,474
CONTROLLED RECTIFIER SUPPLY FOR MOTOR SPEED SYSTEM
Ronald C. Dow, Garland, Tex., assignor to Power Engineering, Inc., Richardson, Tex., a corporation of Texas
Filed Sept. 3, 1963, Ser. No. 305,956
4 Claims. (Cl. 318—332)

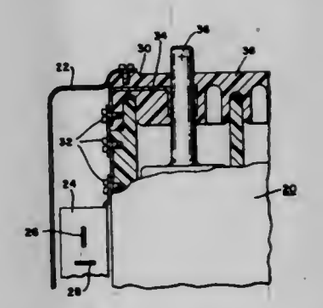


4. A polyspeed variable motor drive from a unidirectional current source which comprises:
(a) a first circuit including a field winding connected across said source,
(b) a second circuit including a controlled rectifier in series with the armature of said motor connected across said source,

(c) a third circuit connected across said source and to said first controlled rectifier and including timing means to render said rectifier conductive at time intervals dependent upon the setting of said timing means,
(d) a fourth circuit connected across said source including a second controlled rectifier poled the same as said first controlled rectifier and connected in series with a pair of normally closed relay contacts and a resistor,
(e) a condenser connected at one terminal to the juncture between the first controlled rectifier and said armature and at the other terminal to the juncture between the second controlled rectifier and said normally closed contacts,

(f) a timing circuit connected across said armature and responsive to current flow through said armature for firing said second controlled rectifier a predetermined time interval after each initiation of current flow through said armature, and
(g) energizing means for said normally closed contacts responsive to current flow through said second controlled rectifier of a predetermined condition for opening said normally closed contacts to terminate control of current flow through said second controlled rectifier.

3,274,475
CONVERTER CIRCUIT
Eliasz Poss, Easthaven, Conn., assignor to Electronic Energy Conversion Corporation, New York, N.Y.
Filed Feb. 5, 1963, Ser. No. 256,281
5 Claims. (Cl. 320—1)



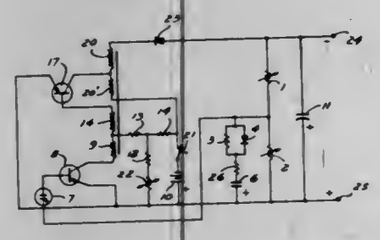
1. An electrical converter circuit for supplying controllable direct current from an uncontrolled source of electrical energy, said circuit comprising a capacitor, means for charging said capacitor in a first direction, means for passing said charging current through a load in said first direction, means for selectively discharging said capacitor in a second direction, means for passing said discharging current through a load in said first direction, and means for selectively determining the times during which said capacitor is charged and discharged.

3,274,476
ARTICLE CARRYING BELT
Paul Wildum, 450 West End Ave., New York, N.Y.
Filed Oct. 30, 1963, Ser. No. 320,065
10 Claims. (Cl. 320—2)

1. An article carrying belt comprising an elongated flat belt member having means at the opposite ends thereof for detachably interconnecting the opposite ends of said belt member, means on said belt member forming a plurality of laterally adjacent article holding compartments disposed longitudinally of said belt member between the interconnecting means at the opposite ends thereof, said compartment forming means comprising an elongated molded plastic web, said molded web including a longitudinally extending medial portion formed to provide a plurality of laterally adjacent, individual walled compartments closed at the top, bottom and on one side thereof, the other side thereof being open, and a pair of longitudinally extending marginal portions integral with and extending from opposite sides of said medial portion, each of said marginal portions being folded about the respective side edges of said belt member to locate said medial portion in opposed relation to one side of said belt member, said one side of the belt member closing the open side of each of the walled compartments of said web, means for mounting said molded web on said belt member, the folded marginal portions thereof being disposed in opposed relation to the other side of said belt member, and means for detachably interconnecting the opposed edge portions of the marginal portions of said plastic web whereby one of said marginal portions may be rolled back over one side edge of said belt member to expose the individual compartments for removal of articles therefrom or insertion of articles therein.

3,274,477
STORAGE BATTERY
Donald L. Boyes, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Filed July 31, 1963, Ser. No. 299,041
5 Claims. (Cl. 320—35)

1. The combination comprising a storage battery including a case and positive and negative battery terminals, a voltage regulator mounted in direct and intimate heat exchange contact with said storage battery and including a circuit controlling element, internal elec-



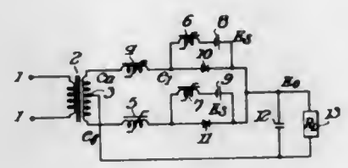
trical connecting means molded directly into said case for connecting one terminal of said storage battery to said voltage regulator, said circuit controlling element being sensitive to changes in temperature of said battery whereby said voltage regulator controls the charging rate to said battery from a charging device remote therefrom to maintain the charging rate at the optimum value with respect to the temperature for charging said battery.

3,274,478

DIRECT CURRENT CONVERTER ARRANGEMENT

Siegfried Hollmann and Heinz Engelstätter, Frankfurt am Main, and Karl Buresch, Offenbach-Bieber, Germany, assignors to Braun Aktiengesellschaft, Frankfurt am Main, Germany

Filed May 7, 1962, Ser. No. 192,848
Claims priority, application Germany, May 6, 1961, B 62,412
8 Claims. (Cl. 321—18)



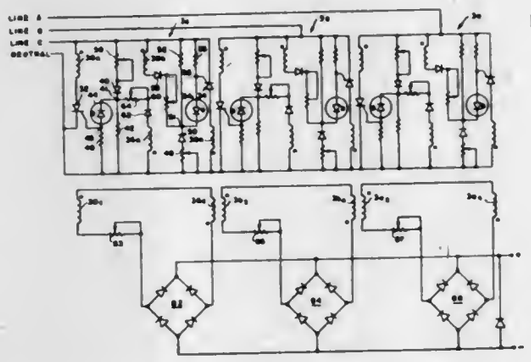
1. A direct current converter arrangement for deriving a comparatively high direct voltage output from a source of comparatively lower direct voltage, comprising, in combination, a source of direct voltage of predetermined magnitude; transistor oscillator means including a step-up transformer having a primary winding in circuit with said source, a feedback winding, and a secondary winding, and a main transistor having three electrodes, of which one is connected to said primary winding and a second one is connected to one end of said feedback winding, and a control transistor means having a control electrode and two operative electrodes, the latter being connected between the third electrode of said main transistor and the other end of said feedback winding; a storage capacitor means and a first diode means so connected in series with each other between one terminal of said secondary winding and one terminal of said source that said storage capacitor is chargeable thereby to a desired output voltage, the terminals of said storage capacitor means constituting the direct voltage output terminals of the converter arrangement; voltage divider means connected in parallel with said storage capacitor means and having an intermediate tapping point; glow lamp means ignitable when said storage capacitor means is charged to said desired output voltage, one electrode of said glow lamp means being connected to said tapping point of said voltage divider means, the other electrodes of said glow lamp means being connected to said control electrode of said control transistor means so that said control transistor means causes the oscillation of said oscillator means to stop when said glow lamp means is ignited and to start when said glow lamp means is extinguished; and a series-combination of a second diode means and an impulse capacitor means connected between said tapping point of said voltage divider means and one of said operative electrodes of said control transistor means, said second diode means being arranged with such polarity that said impulse capacitor means is charged via the reverse resistance of said second diode means when the potential at said tapping point drops below a predetermined value, and that it is discharged via the forward resistance of said second diode means when the potential at said tapping point exceeds a predetermined value.

3,274,479

RECTIFYING APPARATUS FOR PRODUCING CONSTANT VOLTAGE

Toshio Kurimura, Setagaya-ku, Tokyo-to, and Kazuomi Yamamura, Yoyogi, Shibuya-ku, Tokyo-to, Japan, assignors to Kokusai Denshin Denwa Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 15, 1962, Ser. No. 230,534
Claims priority, application Japan, Oct. 23, 1961, 36/37,984
10 Claims. (Cl. 321—25)



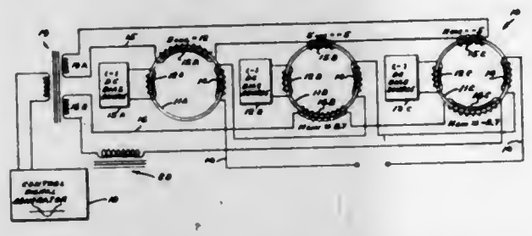
1. A rectifying apparatus for developing constant voltage outputs comprising: an alternating current source having terminals, rectifying means comprising series connected circuits, each series circuit comprising a saturable reactor and a rectifier connected in series, each series circuit connected at one end thereof to a corresponding terminal of said alternating-current power source supplying power to be rectified and connected at the other end thereof to a junction common to said series-connected circuits, control means comprising series-connected control circuits each comprising an auxiliary saturable reactor and a direct-current power source, and each control circuit connected in parallel with one of the said rectifiers of said rectifying means for causing the saturable reactors of the said rectifying means to accomplish control of the suppressing phase of the current to be rectified with respect to the alternating-current voltage to be rectified.

3,274,480

CONTROL ARRANGEMENT FOR LIMITING THE PEAK INSTANTANEOUS VOLTAGE FROM AN A.C. POWER SOURCE

Loren H. Walker, Waynesboro, Va., assignor to General Electric Company, a corporation of New York

Filed Oct. 12, 1962, Ser. No. 230,139
15 Claims. (Cl. 321—61)



1. In combination with an alternating current power source, a parallel arrangement of first and second oppositely poled gate controlled rectifiers connected across said source, first means connected across said source for providing gating signals to said first gate controlled rectifier in response to half cycles of output from said source of one polarity which exceed a chosen value, second means connected across said source for providing gating signals to said second gate controlled rectifier in response to half cycles of output from said source of the opposite polarity and which exceed said chosen value, means responsive to conductivity in said first gate controlled rectifier during half cycles of said opposite polarity for producing a potential in additive relationship with the output of said second signal gating means to provide gating signals to said second gate controlled rectifier, and means responsive to conduction in said second gate controlled rectifier during half cycles of said one polarity for producing a potential in additive relationship with the output of said first signal gating means to provide gating signals to said first gate controlled rectifier.

3,274,481

FREQUENCY MULTIPLIER CIRCUIT

Dallas H. Lien, Indianapolis, Ind., assignor to Western Electric Company, Incorporated, New York, N.Y., a corporation of New York

Filed May 2, 1962, Ser. No. 191,912
5 Claims. (Cl. 321—68)

1. A frequency multiplier circuit for providing a composite alternating output signal having a frequency that is a multiple of the frequency of an alternating input signal, which comprises:

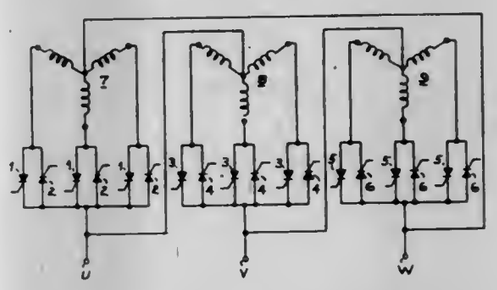
a series of saturable magnetic devices;

biasing means for applying magnetizing force to the magnetic devices which bias the magnetic devices beyond a primary saturated state, the magnetizing forces applied to the magnetic devices by the biasing means having sufficient amplitudes and having the required polarities to drive the magnetic devices from selected nonsaturated states to the primary saturated states;

a pair of control windings wound about the magnetic devices so as to be electromagnetically associated therewith and connected to the source of the input signal so that magnetizing forces are applied to the magnetic devices in response to the application of the input signal thereto, each control winding having periodic characteristic variations in the winding pattern which are distinct from but bear a predetermined relationship to the periodic characteristic variations in the winding pattern of the other control winding so that a different combination of control winding patterns is established on each magnetic device;

means associated with one of the control windings for shifting the phase of the input signal from the source one-quarter wave length so that the resultant signals applied to the two control windings are one-quarter wave length out of phase with respect to each other, maximum magnetizing forces being sequentially applied to succeeding ones of the magnetic devices during each cycle of the input signal in response to the application of the input signal to the control windings, the maximum magnetizing forces having sufficient amplitudes and having the required polarities to overcome the effects of the biasing means and drive the magnetic devices from the primary saturated states to selected nonsaturated states, each magnetic device being driven from the selected nonsaturated state to the primary saturated state by the biasing means subsequent to being driven from the primary saturated state to the selected nonsaturated state and each magnetic device being driven from the primary saturated state to the selected nonsaturated state and back to the primary saturated state before the next succeeding magnetic device is driven through the same cycle of operation; and

an output conductor so wound on the magnetic devices that an output signal is induced therein when a magnetic device is driven from one state of magnetization to another state of magnetization whereby a composite alternating output signal is induced in the output conductor during each cycle of the input signal which has a frequency equal to the input signal frequency times the number of magnetic devices, the output signal induced in the output conductor when a magnetic device is driven from the primary saturated state to the selected nonsaturated state being opposite in polarity to the output signal induced therein when a magnetic device is driven from the selected nonsaturated state to the primary saturated state.

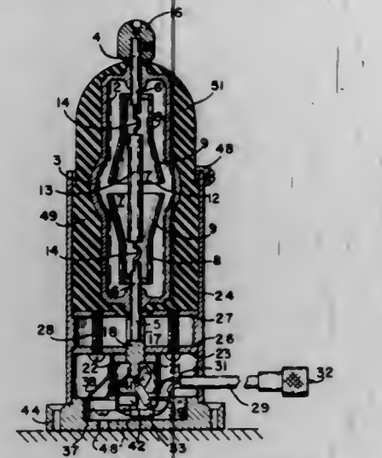


3,274,482

FREQUENCY CHANGER FOR FREQUENCY CONVERSION OF THREE PHASE ALTERNATING CURRENTS

Manfred Depenbrock, Mannheim-Almenhof, Germany, assignor to Brown, Boveri & Cie Aktiengesellschaft, Mannheim, Germany, a joint-stock company

Filed June 13, 1962, Ser. No. 202,183
Claims priority, application Germany, June 13, 1961, B 62,874
6 Claims. (Cl. 321—69)



1. In a frequency changer for frequency conversion of three-phase alternating currents, particularly for the production of lower frequency three-phase alternating currents from three-phase alternating currents of mains frequency, the combination comprising three groups of six rectifiers each corresponding to the three phases, said rectifiers being of the controllable type, means arranging the six rectifiers of each group in three pairs with the rectifiers of each pair arranged anti-parallel, said rectifier pairs being connected respectively to the corresponding windings of a three-phase supply transformer operating at the mains frequency, means connecting said three groups of rectifiers in delta formation, the supply of the lower frequency three-phase alternating currents to the consumer being tapped at the angle points of said delta formation, and means controlling operation of said rectifiers of each group such that at any given moment only two rectifiers of each six-rectifier group are free to conduct current while the other four rectifiers of that group are blocked and prevented from conducting current.

3,274,483
PARALLEL RESISTANCE-CAPACITANCE VOLTAGE DIVIDER

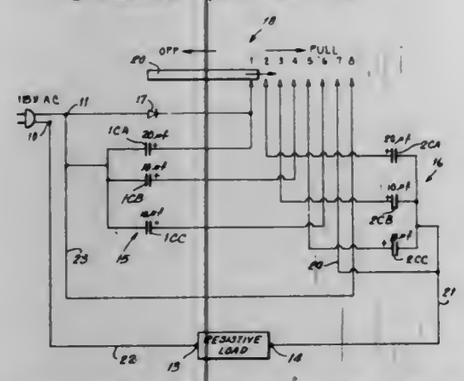
Ronald V. Tetz, Los Gatos, Calif., assignor to Jennings Radio Manufacturing Corporation, San Jose, Calif., a corporation of Delaware

Filed Oct. 29, 1962, Ser. No. 233,762
11 Claims. (Cl. 323—74)

9. A parallel resistance-capacitance voltage divider comprising:

(a) an envelope including a pair of terminal leads extending into the envelope and having their inner ends spaced apart,

(b) an electrically resistive element conductively connecting the spaced apart inner ends of said terminal leads,



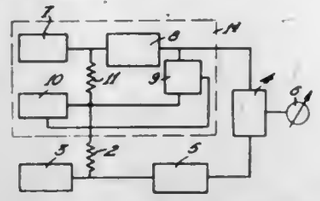
(c) a pair of opposed capacitor electrodes supported within the envelope and electrically connected to the terminal leads in parallel with the resistive element, and

(d) connection means including a low voltage capacitor to electrically connect one of the terminal leads to an associated measuring device.

3,274,484
POWER CONTROL NETWORK

Robert C. Gebhardt, Parsippany, N.J., and John S. Lory, 6700 192nd St., Flushing 65, N.Y.; said Gebhardt assignor to said Lory

Filed May 5, 1964, Ser. No. 365,078
8 Claims. (Cl. 323—93)

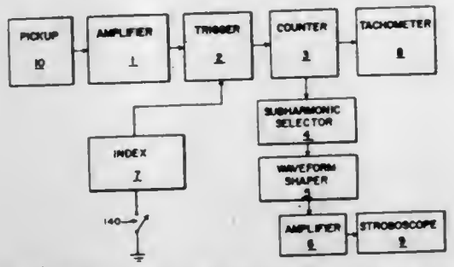


1. An alternating current power control network for resistive loads comprising terminals for an alternating current power source, terminals for a resistive load, variable means having first and second groups of reactive components, a diode, and cumulative switch means and conductors arranged for connecting the load and said reactance means in series to the power source and for connecting said diode in parallel with said first group of components and for connecting said diode in series with said second group of components to thereby vary the power supplied to the load.

3,274,485
APPARATUS FOR MEASURING MAGNETIC FIELD GRADIENTS BY NUCLEAR RESONANCE, AND APPLICATIONS THEREOF

André Denis, Herblay, and Guy Ripart, Plessis-Robinson, France, assignors to Sud-Aviation Société Nationale de Constructions, Paris, France

Filed July 18, 1962, Ser. No. 210,729
Claims priority, application France, July 20, 1961, 868,434, Patent 1,305,456
3 Claims. (Cl. 324—.5)

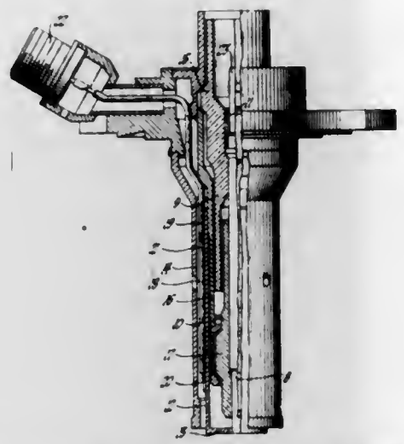


1. Apparatus for measuring by nuclear resonance the gradient of a magnetic field between two predetermined points comprising, in combination, a proton-frequency oscillator located at one of the predetermined points and only subjected to the action of the magnetic field the gradient of which is to be measured, weak coupling means connected to said proton-frequency oscillator at the output thereof, a proton resonance probe located at the other of the predetermined points and fed by said proton-frequency oscillator through said weak coupling means, means connected to said proton-frequency oscillator and said proton probe at the outputs thereof for generating a current which is a function of the phase shift between the output signals of said oscillator and of said probe and thereby a function of the magnetic field gradient between said predetermined points, and a device sensitive to a current value and connected to said current generating means.

3,274,486
AUTOMATIC SYNCHRONIZED STROBOSCOPE

Leon M. Gould, Los Angeles, Calif., and Warren D. Paley, Great Neck, N.Y., assignors, by mesne assignments, to the United States of America as represented by the Secretary of the Army

Filed Mar. 1, 1963, Ser. No. 262,279
3 Claims. (Cl. 324—16)

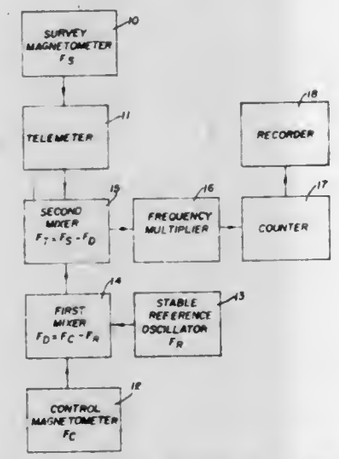


1. A stroboscope system for investigating rotation comprising a pickup device providing a source of pulses whose repetition rate is an integer times the rotational speed of the mechanism being observed, amplifying means connected to said pickup device and producing an amplified pulse output, trigger means connected to said amplifying means for producing shaped pulses, preset electronic counter means having input means connected to said trigger means for counting said pulses, a subharmonic selector circuit comprising a monostable multivibrator connected to said preset counter means producing output pulses of predetermined length in response to the output of said preset electronic counter means, a waveform shaper connected to said selector circuit which modifies said predetermined pulse, a strobe lamp, further amplifier means, said further amplifier means coupling said waveshaper with said strobe lamp, and an indexing pulse generator, said indexing pulse generator connected to said trigger means whereby pulses are provided to advance the observation aspect of said stroboscope system.

3,274,487
IGNITER PLUG WITH SPARK-SENSING MEANS

William J. Johnston, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Filed Aug. 15, 1961, Ser. No. 131,678
4 Claims. (Cl. 324—17)

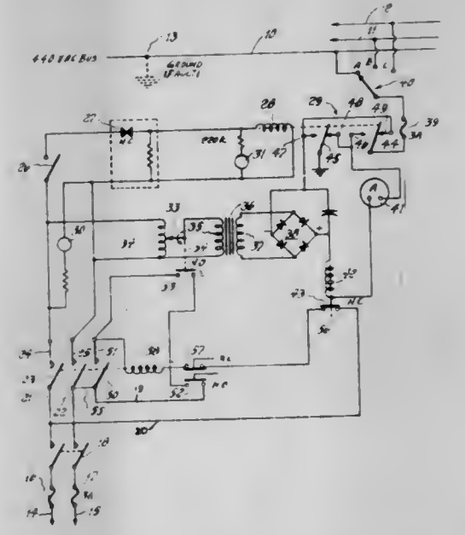


1. An igniter plug having a pair of electrodes with end portions in spaced relationship to provide a spark gap therebetween, one of said electrodes having a second portion thereof electrically grounded, means for indicating whether arcing is occurring in said gap, said means including a pair of electrical conductors connected to the grounded electrode at spaced points thereon located along the axis of said grounded electrode between said end portion and said second portion to indicate any voltage drop across said spaced points.

3,274,488
APPARATUS FOR MEASURING MAGNETIC INTENSITY WITH COMPENSATION FOR DIURNAL VARIATIONS

Stephen Washkurak and Peter Sawatzky, Ottawa, Ontario, Canada, assignors to Her Majesty the Queen in right of Canada, as represented by the Minister of Mines and Technical Surveys

Filed Mar. 22, 1963, Ser. No. 267,133
Claims priority, application Canada, Mar. 30, 1962, 845,684
3 Claims. (Cl. 324—43)



1. Magnetic intensity survey apparatus comprising a mobile survey magnetometer adapted to produce a signal of which the frequency F_S is indicative of magnetic intensity in the vicinity of the survey magnetometer, a control magnetometer for use at a location remote from that of the survey magnetometer and adapted to produce a signal of which the frequency F_C is indicative of diurnal variations in magnetic intensity, a source of a stable reference signal having a frequency F_R, first mixer means having input connections to the control magnetometer and to the source of stable reference signal and adapted to produce at its output a signal of frequency F_D equal to F_C minus F_R, second mixer means having input connections to the output of the first mixer means and to the output of telemeter means adapted to transmit the signal from said mobile survey magnetometer, said second mixer means being adapted to produce at its output a signal of frequency F_T equal to F_S minus F_D, and means adapted to indicate the frequency F_T of the output signal of the second mixer means.

3,274,489
CABLE FAULT LOCATOR FOR UNGROUNDED ELECTRICAL SYSTEMS INCLUDING MEANS FOR APPLYING A SQUARE WAVE TO THE CABLE UNDER TEST

Samuel H. Behr, 1046 Pembroke St., Uniondale, N.Y.

Filed Jan. 20, 1964, Ser. No. 339,037
4 Claims. (Cl. 324—52)

1. A ground fault locator device for use on an ungrounded electrical system including several conductor wires comprising:

(a) a relay having a coil and a triple pole-single throw switch said TP–ST switch having first, second and third poles and first, second and third stationary contacts, said second and third poles being electrically connected,

(b) a source of A.C. connected across said first and second of said poles of said TP–ST switch,

(c) a second relay having a coil and a double pole-double throw switch,

(d) a thermal relay for alternately opening and shorting circuiting a line in which it is placed,

(e) a first series circuit path having included therein said thermal contactor, said first and second stationary contacts of said TP–ST switch, said coil of said second relay,

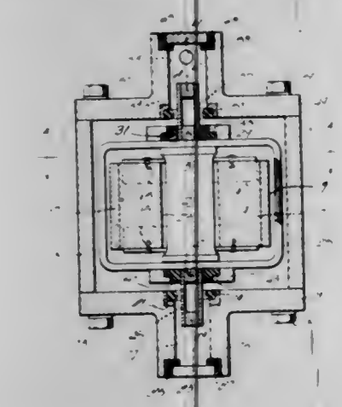
(f) a normally open start switch,

(g) a second series path having included therein said first pole of said TP–ST switch, said coil of said TP–ST switch, said third stationary contact of said

TP–ST switch, said start switch, said third pole of said TP–ST switch,

(h) rectifier means having its input connected across said first and second stationary contacts and its output connected across paralleled stationary contacts of said DP–DT switch,

(i) one of the poles of said DP–DT switch being grounded and the other pole provided with connection means to a wire of said electrical system along which a ground is to be located,



(j) detector means movable along a wire for detecting the changing polarity current in said wire whereby a ground fault can be located therein.

3,274,490

FLUID DAMPED PERMANENT MAGNET CORE METER MOVEMENT WITH A FLOAT SUPPORTED AND FILAR SUSPENDED COIL

Harry G. Swanson, Tewksbury, Mass., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy

Filed Nov. 23, 1962, Ser. No. 239,851
1 Claim. (Cl. 324—154)

A permanent magnet core type electrical measuring instrument comprising:

(a) a housing including a cylindrical flux return portion constructed of a magnetically permeable material and end covers constructed of a non-magnetically permeable material;

(b) an annular transversely magnetized permanent magnet core;

(c) non-mangetic arcuate sector plates which position the annular core within the housing so as to provide a uniform air gap between the core and the cylindrical portion of the housing;

(d) pole pieces secured to diametrically opposed peripheral pole portions of the core;

(e) a fluid of predetermined specific gravity which fills the housing;

(f) a hollow cylindrical float rotatably mounted within the opening of the annular core and extending axially only slightly beyond the ends of the core;

(g) an electrical coil symmetrically mounted across opposite ends of the float and encircling the core, in an extended radial plane of the core portions of individual conductors of the coil being disposed in the air gap between the core and the housing;

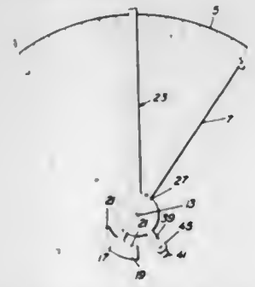
(h) electrically conductive trunnions secured to opposite ends of the float along the extended axis of the float;

(i) an annular ringstone bearing mounted on the housing and encircling each trunnion;

(j) an electrical connector disposed in the housing on the extended axis of the core opposite each trunnion;

(k) an electrically conductive torsion wire connected between each juxtaposed electrical connector and trunnion;

(l) a mirror secured to one torsion wire;



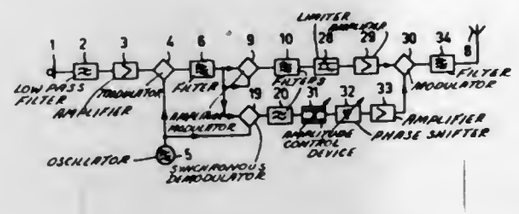
(m) and means for electrically connecting one end of the coil to one trunnion and the other end of the coil to the other trunnion.

3,274,491

INDICATING METER COMBINED WITH ADJUSTABLE COUPLED COILS WHICH ARE SELECTIVELY DECOUPLED BY A POINTER SUPPORTED VANE

Robert J. Mulligan, Hamden, and Harry C. Quick, Jr., Weston, Conn., assignors to International Instruments, Incorporated, Orange, Conn., a corporation of Connecticut

Filed Sept. 29, 1961, Ser. No. 141,869
3 Claims. (Cl. 324—157)



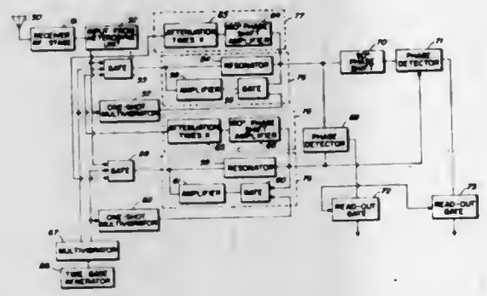
1. A control meter, including in combination, a meter movement and a scale, a meter pointer supported on and moved by said meter movement, said meter pointer including a portion extending forwardly from said meter movement and adapted to traverse and indicate over the full scale, and said meter pointer including a rearwardly extending portion from said meter movement which is aligned and movable with said forwardly extending position, a vane fixed on said rearwardly extending portion and said vane being elongated in a direction generally perpendicular to the longitudinal axis of said rearwardly and forwardly extending portions of said meter pointer, and a set point arm assembly pivotally mounted at the center of said meter movement and independently movable relative to said meter pointer, said set point arm assembly having a forwardly extending portion terminating adjacent said scale for manual adjustment to predetermined points on the scale, and said set point arm assembly including a rearwardly extending portion movable with the forwardly extending portion thereof, said rearwardly extending portion of the set point arm assembly being offset with respect to the longitudinal axis of the forwardly extending portion thereof, a pair of spaced electromagnetically coupled coils fixed on the rearwardly extending portion of said set point arm assembly positioned for travel of said vane therebetween, the offset of said rearwardly extending portion of said set point arm assembly relative to the forwardly extending portion thereof and the dimensions of the vane being such that the vane will be positioned between and shielding the coils from the time the meter pointer reaches and is aligned with the forwardly extending portion of said set point arm assembly in its indicating travel of the scale and also said vane will be positioned between and shielding both of said coils during its indicating travel from its position in alignment with the set point arm to a full scale indication, whereby a control function is in one condition until the meter pointer reaches and is aligned with the forwardly extending portion of said set point arm assembly in its indicating travel of the scale, and is in the opposite condition in its further travel of the scale beyond said aligned position of the meter pointer with the forwardly extending portion of said set point arm assembly.

3,274,492

TRANSMITTING DEVICE FOR THE TRANSMISSION OF AMPLITUDE-MODULATED OSCILLATIONS

Theodorus Jozef Van Kessel and Joannes Maria Albertus Uijen, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware

Filed Apr. 9, 1962, Ser. No. 186,255
Claims priority, application Netherlands, May 16, 1961, 264,824
8 Claims. (Cl. 325—137)



1. A transmitter for transmitting compatible single sideband signals of the type comprising a carrier oscillation of predetermined frequency and a single sideband thereof modulated with information signals, said transmitter comprising a source of a first single sideband signal including a first carrier of half said predetermined frequency and only one sideband thereof modulated with an information signal, amplitude modulator means, first and second signal paths connected to said amplitude modulator means, means for applying said first single sideband signal to said first and second signal paths whereby the signals applied to said modulator means by way of said first and second paths are multiplied in said modulator means and means for transmitting the output of said amplitude modulator means in the signal band at said predetermined frequency.

3,274,493

CIRCUIT FOR REMOVING DISTORTION IN A TIME SYNCHRONOUS PHASE MODULATION RECEIVER

Kenneth H. Renshaw, Costa Mesa, Calif., assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

Filed June 13, 1963, Ser. No. 287,676
5 Claims. (Cl. 325—320)

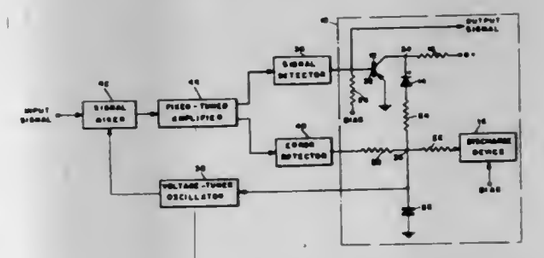
1. In a receiver for receiving time synchronous phasors in which a small portion of each phasor has been carried over into the next succeeding phasor owing to the inherent inability to change phase instantaneously, said receiver comprising:

a pair of resonator means tuned to the phasor frequency,

means for generating timing signals at the bit rate of the received phasors,

gating means responsive to the timing signals to drive said pair of resonator means alternately with the received phasors, each of said resonator means being constructed to ring during the phasor period immediately following the driving period thereof,

and means for quenching each of said pair of resonator means at the end of their ringing periods,



feedback means connecting the output of each of the resonator means to the input of the other resonator means during the driving period of said other resonator means, said feedback means constructed to cancel out the distorting carry-over portion of the phasor immediately preceding the phasor driving said other resonator means.

3,274,494

SEARCH GENERATOR

Oliver C. Stanley, San Diego, Calif., assignor to The Ryan Aeronautical Company, San Diego, Calif.

Filed Feb. 27, 1963, Ser. No. 261,312
4 Claims. (Cl. 325—420)

1. In an automatic frequency tracking circuit, apparatus comprising:

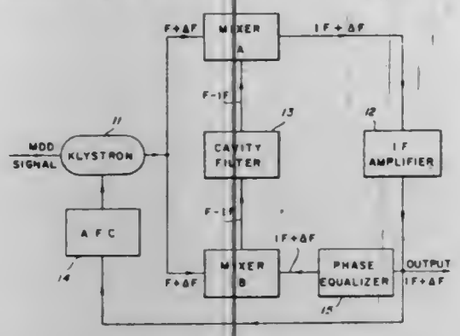
an oscillator having tuning means including a voltage variable tuning capacitor, so that changing voltage applied to said capacitor changes the frequency of the oscillator;

a first charging circuit connected to charge said capacitor when an input signal to the charging circuit is absent, said first charging circuit including a transistor having an emitter connected to ground, a collector connected through a series load resistor to a D.C. source, and a base connected to the output of a signal detector, whereby said transistor is cut off when said signal detector has no output and conducts when said signal detector has an output, a zener diode connected to said collector, and a resistor connected in series with said zener diode and said tuning capacitor, whereby said zener diode conducts and said tuning capaictor charges when said transistor is cut off, and said zener diode is cut off, interrupting the charging circuit, when said transistor conducts;

a second charging circuit connected to charge and discharge said capacitor when an input signal to said first charging circuit is present; and

a discharge circuit connected to discharge said capacitor when the charge from said first charging circuit reaches a predetermined magnitude.

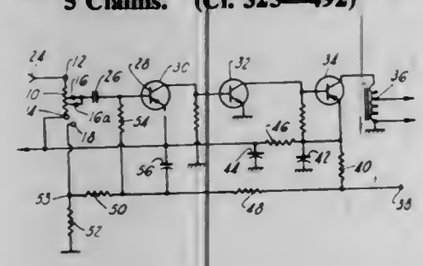
3,274,495



FREQUENCY CONVERSION CIRCUIT

Edward Bellem, Ottawa, Ontario, Canada, assignor to Northern Electric Company Limited, Montreal, Quebec, Canada

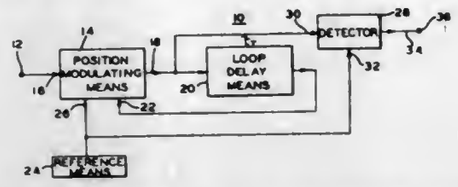
Filed Nov. 7, 1962, Ser. No. 235,970
11 Claims. (Cl. 325—434)



8. Apparatus for deriving from a first frequency modulated signal of higher frequency a second frequency modulated signal of lower frequency having the same frequency deviation as the signal of the higher frequency, comprising first mixing means adapted to mix the first

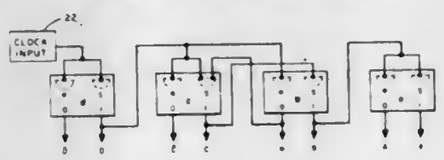
signal with a signal of fixed frequency equal to the difference between the higher frequency and the lower frequency thereby to produce said second signal, means for

amplifying the second signal, and second mixing means for mixing the amplified second signal with said first signal thereby to produce said fixed frequency signal.



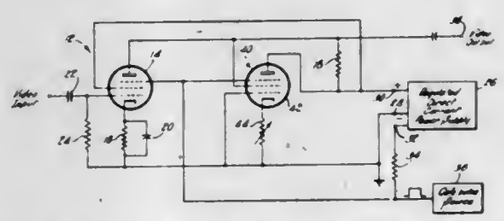
3,274,496
ON-OFF SWITCHING ARRANGEMENT FOR TRANSISTOR RADIOS
Basil P. Hooten, Jr., and Raivo Vest, Baltimore, Md., assignors to The Bendix Corporation, Baltimore, Md., a corporation of Delaware
Filed Apr. 17, 1963, Ser. No. 273,749
5 Claims. (Cl. 325—492)

2. In a transistor powered radio receiver,
a source of direct current power,
filtering means connected to said source providing a source of filtered direct current power at a potential somewhat lower than said first source,
amplifying means including at least one transistor having its emitter connected to said source of filtered direct current power and its base connected to said first named source,
and a volume control potentiometer including a resistance element having one end connected to said source of filtered direct current power and a wiper connected in the circuit of said base:
switch means for turning said receiver on and off including a contact connected in the circuit of said base and so constructed and arranged with respect to said wiper that movement of said wiper to its said one end connects said source of filtered direct current power to the circuit of said base such that said transistor is biased to cut-off and said amplifying means is effectively turned off.



3,274,497
PULSE POSITION MODULATION SWEEP INTEGRATOR SYSTEM
Mark S. Zimmerman, Philadelphia, Pa., assignor to General Atronics Corporation, Montgomery County, Pa., a corporation of Pennsylvania
Filed Sept. 22, 1960, Ser. No. 57,838
15 Claims. (Cl. 328—37)

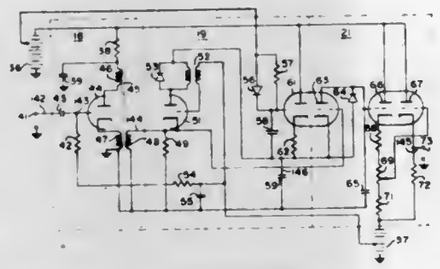
1. A system for sweep integrating signals subject to occurrence with variable amplitudes at predetermined time-positions within a given period said system comprising: a closed signal loop providing for signals circulating around said loop a time delay substantially equal to said period, means for injecting into said loop signals for circulation around said loop; and means for varying the



time-positions of different ones of said injected signals in accordance with the variations in amplitudes of different ones of said variable amplitude signals.

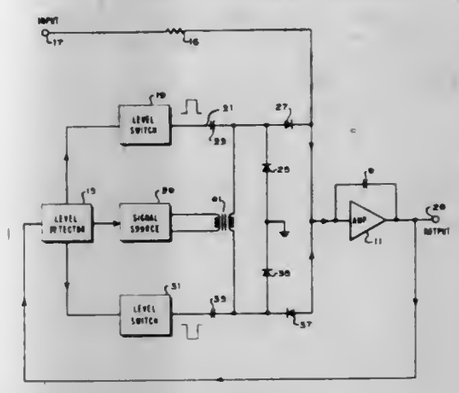
3,274,498
TWELVE-STATE TIMING PULSE GENERATOR USING TRAILING-EDGE TRIGGERING
David L. Jones, Kensington, Md., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Army
Filed Feb. 26, 1964, Ser. No. 347,635
9 Claims. (Cl. 328—42)

1. A timing pulse generator comprising in combination first, second, third and fourth flip-flop means each having a set input and a reset input; a logic AND gate means operatively coupled to the set input of said second flip-flop means; a source of clock input pulses connected directly to the set and the reset inputs of said first flip-flop means; connections from an output of said first flip-flop means to the reset input of said second flip-flop means, to a first input of said AND gate means, and to the reset input of said third flip-flop means; connections from an output of the second flip-flop means to the set input of said third flip-flop means; connections from one output of the third flip-flop means to a second input of said AND gate means; and connections from another output of said third flip-flop means to the set and reset inputs of said fourth flip-flop means.



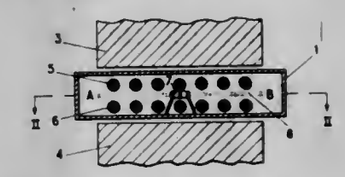
3,274,499
VIDEO GATE WITH PEDESTAL CANCELLATION
Winfield R. Koch, Marlton, N.J., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Aug. 13, 1963, Ser. No. 301,927
1 Claim. (Cl. 328—99)

A circuit for switching broad band radio frequency signals in a radar equipment comprising:
(a) a first pentode,
(b) a load resistor connected to the anode of the pentode,
(c) a bias resistor shunted by a radio frequency bypass capacitor connected to the cathode of the pentode,
(d) a direct current source having a reference terminal, a positive terminal and a negative terminal,



(e) the positive terminal being connected to the screen grid and to the load resistor,
(f) the reference terminal being connected to the bias resistor,
(g) a resistor connected between the suppressor grid and the negative terminal, the potential of the negative terminal relative to the reference terminal being sufficient to cut off the pentode,
(h) a signal coupling circuit including a capacitor connected to the control grid and a resistor connected between the control grid and the reference terminal of the direct current source,
(i) a second pentode substantially identical to the first pentode,
(j) the anode of the second pentode being connected to the positive terminal ot the direct current source,
(k) the suppressor grid of the second pentode being connected in common with the suppressor grid of the first pentode,
(l) the screen grid of the second pentode being connected to the anode of the first pentode,
(m) the control grid of the second pentode being connected to the reference terminal of the direct current source,
(n) an adjustable bias resistor connected to the cathode of the second pentode and the reference terminal of the direct current source,
(o) whereby a predetermined level of direct current is drawn through the load resistor by the screen grid of the second pentode, and whereby when a positive rectangular pulse of predetermined amplitude is coupled to the suppressor grids of both pentodes, the first pentode draws anode current and the screen current of the second pentode is reduced in a relationship whereby the direct current component through the load resistor is essentially constant and the output of the circuit is essentially free of transient spikes, and whereby the bias resistor for the second pentode is adjustable to minimize switching pedestal.

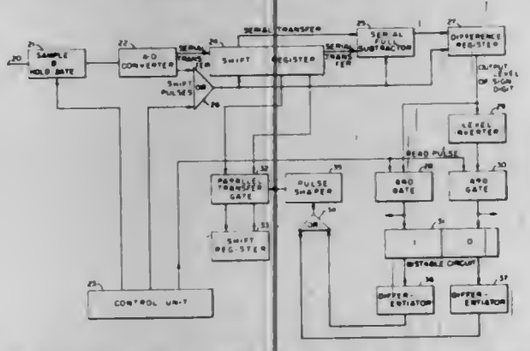
3,274,500
APPARATUS TO MEASURE THE PERIOD OF AN INPUT SIGNAL
Phillip S. Bengston, Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy
Original application Mar. 4, 1960, Ser. No. 12,876, now Patent No. 3,158,845, dated Nov. 24, 1964. Divided and this application Aug. 31, 1964, Ser. No. 399,955
8 Claims. (Cl. 328—108)



1. Apparatus to measure the period of a signal comprising first means to produce positive and negative pulses for each cycle of a signal applied thereto, generator means coupled to said first means to initiate a saw-tooth voltage in response to a pulse of one polarity, said sawtooth voltage having a peak value and sampling means coupled to said first means and to said generation means for sampling the saw-tooth voltage when the pulse of the other polarity occurs, whereby an output produced by said sampling means is indicative of the period of the signal applied to said first means.

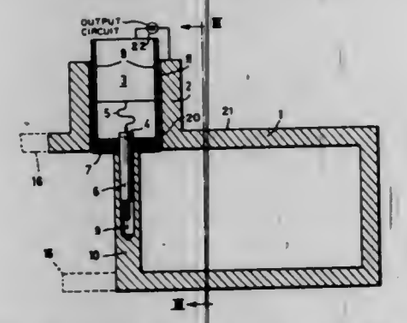
3,274,501
VOLTAGE TO FREQUENCY CONVERTER
Edward A. Heinsen, Sunnyvale, Calif., assignor to Hewlett-Packard Company, Palo Alto, Calif., a corporation of California
Filed Jan. 3, 1964, Ser. No. 335,540
4 Claims. (Cl. 328—127)

3. Signal apparatus comprising:
an integrator having an input and an output;
first and second capacitors;
circuit means connecting the output of said integrator and one terminal of each of said first and second capacitors for varying the voltage on said one terminal of one of said first and second capacitors from a first level to another level and back to said first level in response to the output of said integrator of a selected polarity attaining a predetermined value;
first and second pairs of unidirectional conduction elements serially connected between the other terminals of said first and second capacitors;
a source of current connected to said elements for supplying forward conduction current through the first pair of said elements during charging of one of said first and second capacitors and through the second pair of said elements during discharge of said one of the first and second capacitors; and
means including said first pair of elements coupling the other terminals of said first and second capacitors and the input of said integrator.



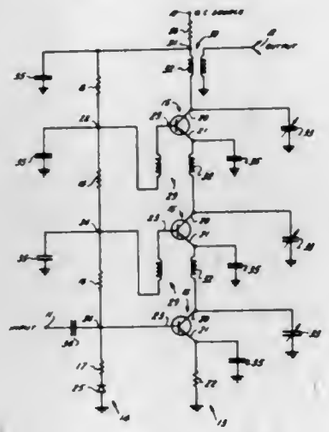
3,274,502
PARTICLE ACCELERATOR
Jacques Pinel and Georges Mourier, Paris, France, assignors to CSF Compagnie Generale de Telegraphie Sans Fil, Paris, France
Filed Dec. 21, 1962, Ser. No. 246,449
Claims priority, application France, Jan. 10, 1962, 884,375, Patent 1,318,737; May 3, 1962, 896,281
8 Claims. (Cl. 328—234)

1. A cyclotron comprising: an acceleration chamber, a source of charged particles located substantially within the center of said chamber, first means for establishing within said chamber a constant unidirectional magnetic field, and second means for establishing a high frequency electric field substantially perpendicularly to said magnetic field substantially within the entire interor space of said chamber including a wave delaying structure disposed within said chamber, and a source of high frequency coupled to said delay structure, said delay structure including two series of substantially parallel bars disposed



adjacent to substantially the entire path of said charged particles in planes on either sides thereof substantially perpendicular to said magnetic field.

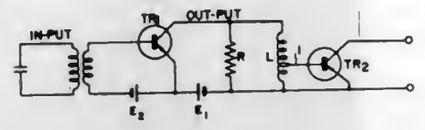
3,274,503
DIGITAL DIFFERENTIATOR FOR AMPLITUDE MODULATED CARRIER
Herbert L. Peterson, 5521 24th Ave., Hillcrest Heights, Md., and William J. Finney, Lakeside Terrace, Rte. 1, Box 570, Accokeek, Md.
Filed Nov. 30, 1962, Ser. No. 241,450
3 Claims. (Cl. 329—104)



1. A detector for modulated carrier waves comprising:
sampling means for sampling the amplitude of the carrier at a rate greater than the frequency of said carrier,
analog-to-digital converter means coupled to said sampling means for converting samples from said sampling means to digital form,
first storage means operatively coupled to said analog-to-digital converter for storing at least one of said samples and a subsequent sample,
subtractor means coupled to the output of said storage means for extracting a difference sample equal to the difference between two successive samples,
second storage means for storing at least one of said samples,
gating means for coupling said first storage means to said second storage means, and
circuit means operatively coupled between said subtractor means and said gating means for opening said gating means when the sign of said difference sample changes to transfer the sample from said first storage means to said second storage means.

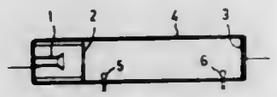
3,274,504
MICRO-WAVE DETECTOR
Frans Christiaan de Ronde, Emmasingel, Eindhoven, Netherlands, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Mar. 4, 1964, Ser. No. 349,407
Claims priority, application Netherlands, Mar. 21, 1963, 290,518
7 Claims. (Cl. 329—160)

1. Means for detecting high frequency oscillations in a waveguide, comprising a waveguide for conveying high frequency oscillations, said waveguide having a rectangular cross-section with first and second adjacent side walls, said first side wall having a first aperture at the junction of said first and second side walls, unidirectional current means having first and second terminals, means connecting said first terminal to said second side wall in the transverse plane of said waveguide which extends through said first aperture, capacitor means for coupling said second terminal to said first side wall in said plane, said second side wall having second and third apertures on opposite sides of said first aperture with respect to the longitudinal direction of said waveguide, whereby wall currents in said waveguide flow through said unidirectional current means, and output circuit means connected between said second terminal and said first side wall.



3,274,505
SERIES TRANSISTOR CIRCUIT WITH SELECTIVELY COUPLED STAGES
Arnold Frisch, Brooklyn, Lawrence H. Weiss, Forest Hills, and Morris Engelson, Brooklyn, N.Y., assignors, by mesne assignments, to Tektronix, Inc., Beaverton, Oreg., a corporation of Oregon
Filed Feb. 28, 1964, Ser. No. 348,121
9 Claims. (Cl. 330—18)

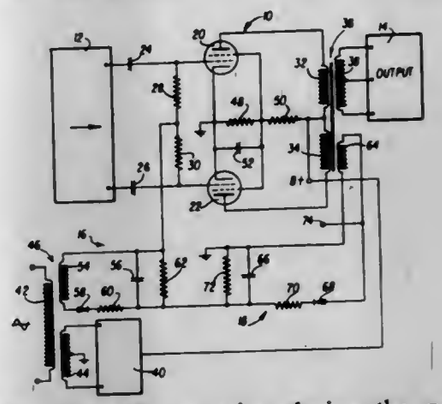
1. A transistor arrangement for use with a source of relatively high direct current voltage, comprising a transistor circuit for amplifying alternating current signals at alternating current signal frequencies, and a bias-resistor circuit connected in parallel with said transistor circuit across said source, said transistor circuit including a plurality of transistors connected in series energized relationship for direct currents from said source, said bias-resistor circuit including a bias reisstor for each of said transistors, said bias resistors being connected in series, means for coupling the junctions between said bias resistors to said transistors for the purpose of biasing said transistors, means for decoupling said junctions at said alternating current signal frequencies and for decoupling said transistors in said series energized relationship at said alternating current signal frequencies, and separate means for coupling the output of selected of said transistors to the input of selected other of said transistors at said alternating current signal frequencies.



3,274,506
TRANSISTOR TYPE BROAD BAND AMPLIFIER UTILIZING A CHOKE COIL
Hisao Maeda, 211 Minamisenzoku-machi, Ota-ku, Tokyo-to, Japan
Filed May 29, 1963, Ser. No. 284,231
Claims priority, application Japan, June 13, 1962, 37/30,442
1 Claim. (Cl. 330—21)

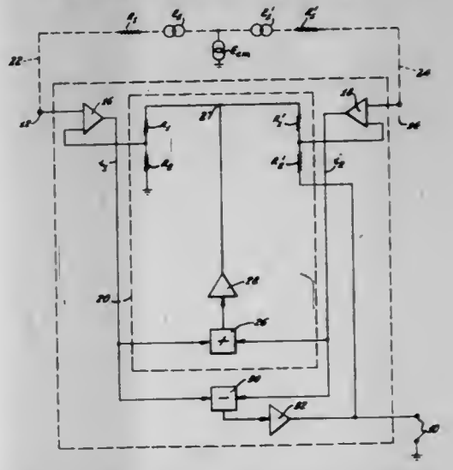
In a multistage transistor type broad band amplifier circuit consisting of at least two stages in which at least the preceding amplifier circuit stage includes a load resistance connected in parallel to the output circuit thereof, the improvement consisting of a network connected between the output terminal of said preceding stage and the base of the transistor of the succeeding stage, said

network consisting of a high frequency choke coil connected in parallel to said load resistance; said choke coil provided with a tap and said tap connected to the base of the transistor of the succeeding amplifier circuit stage.



3,274,507
ELECTRON BEAM PLASMA AMPLIFIER WITH A WAVE-GUIDE COUPLING
Karl Richard Ulrich Weimer and Marinus Teunis Vlaardingerbroek, Emmasingel, Eindhoven, Netherlands, assignors to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware
Filed Jan. 8, 1962, Ser. No. 164,762
Claims priority, application Netherlands, Jan. 13, 1961, 260,047
3 Claims. (Cl. 330—41)

1. An electron beam plasma amplifier comprising an envelope containing an ionizable gaseous medium, means within said envelope for generating an electron beam, first and second electrodes directly in the path of the electron beam defining a plasma discharge space and for generating a plasma, coupling means for introducing an input signal of given frequency directly into said plasma discharge space, said plasma having a plasma frequency which is at least equal to the signal frequency, the signal being amplified by interaction between the electron beam and the plasma, and output coupling means for extracting an amplified signal from said plasma discharge space, said output coupling means being positioned more remote from said electron beam generating means than said input coupling means, at least one of said coupling means being a wave-guide coupler and being positioned in the plasma discharge space.



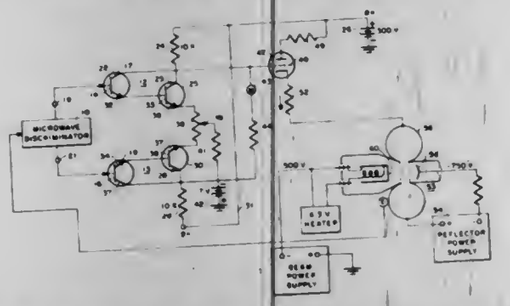
3,274,508
POWER AMPLIFIER INCLUDING BIASING MEANS FOR REDUCING STANDBY POWER DISSIPATION
Norman H. Reeve, Racine, Wis., assignor to Webster Electric Company, Racine, Wis., a corporation of Wisconsin
Filed Oct. 14, 1963, Ser. No. 315,859
4 Claims. (Cl. 330—96)

1. An amplifier for use with a signal source comprising an amplifier stage including a pair of beam power tubes in push-pull configuration and having input control elements coupled to the signal source, said amplifier stage having an output circuit, a signal utilizing means coupled to the output circuit of said amplifier stage, a fixed value potential source connected to the input control elements for applying a negative bias of about 55 volts to the amplifier stage to substantially reduce no-signal plate dissipation while introducing an appreciable amount of signal distortion when a signal is applied to the input control elements, and control means coupled to the output circuit of said amplifier stage and to said input control elements and responsive solely to the amplified signal supplied to the signal utilizing means for reducing the bias applied to the input control elements to bias the amplifier stage

for normal class AB operation during the periods in which a signal is applied to the input control element, said control means including series connected rectifying and capacitive means arranged to develop a positive bias effective to reduce said negative bias to about 40 volts.

3,274,509
DIFFERENTIAL AMPLIFIER
Stewart C. Brown, 10354 Oklahoma Ave., Chatsworth, Calif.
Filed Apr. 22, 1960, Ser. No. 23,964
9 Claims. (Cl. 330—116)

1. A differential amplifier for amplifying a differential intelligence signal applied across a pair of associated input terminals while suppressing common mode signals applied simultaneously at the input terminals, said differential amplifier comprising: a pair of input circuits coupled respectively to said input terminals, each of said input circuits being responsive to the differential intelligence signal and the common mode signal applied to its associated input terminal for producing a composite output signal representative of the signals applied thereto; first means coupled to receive the output signal from at least one of said input circuits, said first means being responsive to applied output signals for generating an error signal representative of the common mode signal; a first feedback circuit coupling said first means and said input circuits, said first feedback circuit including a resistance network connected to receive said error signal and to apply said error signal to said input circuits to compensate for the common mode signals applied thereto; second means coupled to receive the output signal from at least the other of said input circuits and operable in response to applied output signals for producing an output intelligence signal corresponding to the input



differential intelligence signal; and a second feedback circuit coupling said second means and at least one of said input circuits through said resistance network for applying to apply said output intelligence signal to at least one of said pair of input circuits for controlling the gain imparted to the applied input differential intelligence signals.

3,274,510

AUTOMATIC FREQUENCY CONTROL FOR KLYSTRON COUPLING REGULATOR TUBE TO KLYSTRON SHELL

Clifford G. Dorn, Corona, and Harold B. Dunkelberger, Riverside, Calif., assignors to the United States of America as represented by the Secretary of the Navy

Filed Nov. 24, 1964, Ser. No. 413,660
3 Claims. (Cl. 331—6)

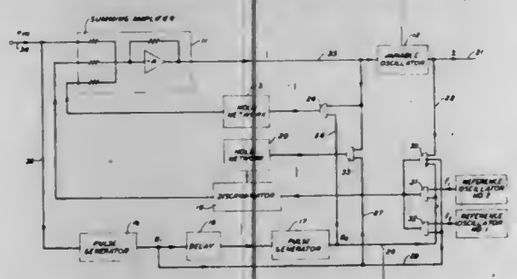
1. In a circuit for controlling the output frequency of a klystron oscillator, the combination comprising:

(a) sensing means coupled to said klystron for producing an output signal proportional to deviations of the output frequency of said oscillator from a predetermined value,

(b) differential amplifier means coupled to said sensing means for amplifying said output signal,

(c) a reference voltage source,

(d) a series regulator tube connected between one side of said reference voltage source and the shell of said klystron,



(e) said series regulator tube having an input coupled to the output of said amplifier and being coupled through the electron flow stream of said klystron to the other side of said reference voltage source and being responsive to the output signal from said sensing means for controlling the output frequency of said klystron.

3,274,511

FREQUENCY STABILIZED SWEEP FREQUENCY GENERATOR

John C. Dale, Chester, and Peter S. Fuss, Randolph Township, Morris County, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York

Filed Dec. 30, 1963, Ser. No. 334,655
8 Claims. (Cl. 331—10)

2. A stabilized signal generator responsive to an applied input signal comprising:

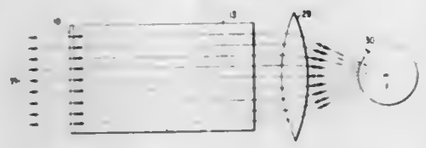
means for generating an output signal having a frequency which varies as a function of the magnitude of a control signal applied to its input,

discriminator means for developing a first signal proportionate to the frequency of an applied signal,

a reference oscillator,

means for applying said output signal to said discriminator means and periodically substituting a signal from said reference oscillator,

means for developing simultaneously with the substitution of a reference signal from said oscillator, an error signal separate and distinct from said first signal proportionate to the drift in magnitude of an algebraic summation of said input signal, said control signal and said first signal from the magnitude of a signal developed by said discriminator means,



and summing means responsive to said input, said first and said error signal for developing said control signal.

3,274,512

RESONATOR FOR RADIATION GENERATED BY STIMULATED EMISSION

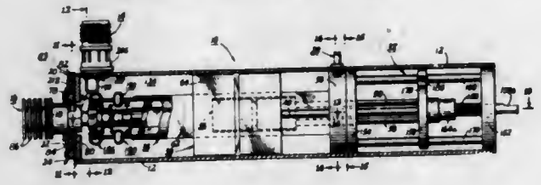
Akira Okaya, Rockville, Md., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York

Filed Mar. 6, 1963, Ser. No. 263,329
8 Claims. (Cl. 331—94.5)

1. In a device for enhancing the production of selected directional modes of radiation generated by stimulated emission, the combination comprising:

means for inducing stimulated emission of radiation, including a source of pumping energy and an active medium emitting radiation by stimulation when acted upon by pumping energy from said source;

refraction means located in the path of radiation emitted from said active medium for diverting a selected directional mode of said emitted radiation along a converging path to a fixed focal location on the side of said refraction means away from said active medium; and



convex reflection means interposed between said refraction means and said focal location for reflecting radiation of said selected mode back to said refraction means along a diverging path coincident to said converging path, thereby directing said radiation of said selected mode back into said active medium along a path coincident to its path of emission.

3,274,513

BROAD BAND TUNABLE MICROWAVE OSCILLATOR WITH SUBSTANTIALLY CONSTANT OUTPUT POWER CHARACTERISTICS

Benjamin F. Gregory, Tampa, Fla., assignor to Trak Microwave Corporation, Tampa, Fla.

Filed Oct. 30, 1963, Ser. No. 325,833
3 Claims. (Cl. 331—98)

1. A microwave oscillator comprising, in combination,

(A) a high frequency triode having plate, grid and cathode terminals,

(B) a tubular conductive outer shell

(C) a by-pass capacitor for electrically coupling said plate terminal to said shell, said bypass capacitor comprising

(1) as one plate thereof, a terminal member in electrical contacting engagement with said plate terminal of said triode, said member having

(a) an annular groove formed in a surface thereof, and

(b) an attenuating material disposed in said groove

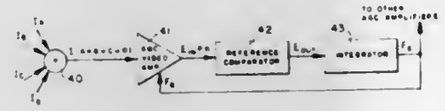
(2) a dielectric medium interposed between said surface of said terminal member and a portion of said shell constituting the other plate of said bypass capacitor,

(3) whereby said bypass capacitor is lossive at the low end of the frequency band

(D) a tubular conductive cathode line member coaxially disposed within said shell and electrically connected to said cathode terminal,

(E) a tubular conductive grid line member coaxially disposed intermediate said shell and said cathode line member,

(F) a first annular tuning choke slidingly disposed between said outer shell and said grid line member to define a plate coaxial line,



(G) output circuit means for coupling said plate coaxial line to an output load.

3,274,514

PULSE COMPARATOR AND CONVERTER

Orson G. Foulger, Goleta, Calif., assignor to the United States of America as represented by the Secretary of the Navy

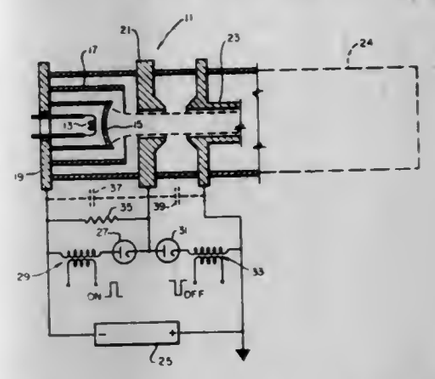
Filed Feb. 18, 1964, Ser. No. 346,062
1 Claim. (Cl. 332—1)

A signal conversion apparatus for deriving, from an input signal of unknown periodicity, or aperiodic, and consisting of variable-amplitude input pulses, signal conversion apparatus output pulses having time-widths and polarities corresponding to the magnitude and algebraic sense, respectively, of amplitude difference of input pulse amplitude relative to a predetermined reference amplitude, said apparatus comprising:

(a) a reference channel operating to be triggered by said input pulses to provide reference channel output pulses of fixed polarity, fixed amplitude and fixed time-width;

(b) a signal channel operating to convert said input pulses to signal channel output pulses of fixed polarity, of fixed amplitude, and of time-widths varying directly with input pulse amplitude, said signal channel output pulses having a time-width range embracing a reference time-width corresponding to an input pulse having said predetermined reference amplitude;

(c) means for equalizing the amplitudes of said reference channel and signal channel output pulses; and



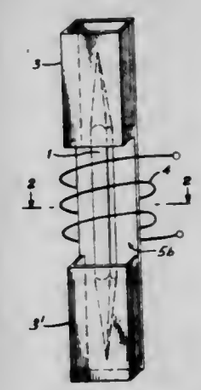
(d) an amplitude summer for combining corresponding reference channel and signal channel output pulses, after their amplitudes are equalized, to provide signal conversion apparatus output pulses of time-widths and polarities corresponding to the magnitude and algebraic sense, respectively, of signal channel output pulse time-width relative to reference channel output pulse time-width.

3,274,515

PULSER FOR MODULATED ANODE TUBES

George M. W. Badger, Menlo Park, Calif., assignor, by mesne assignments, to Varian Associates, a corporation of California

Filed Dec. 31, 1962, Ser. No. 248,464
7 Claims. (Cl. 332—7)

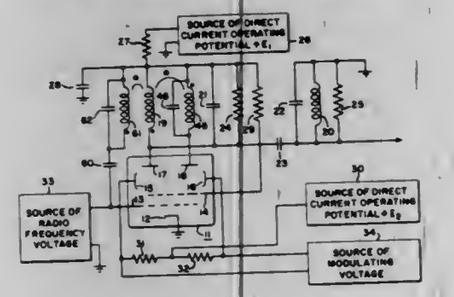


1. A pulser for a modulating anode tube of the type including a cathode, an anode and a modulating means comprising means for applying a source of accelerating voltage between the cathode and anode, a first series combination including a switching transformer and a diode connected between the cathode and modulating means, a second series combination including a second switching transformer and diode connected between the modulating means and a source of potential positive with respect to the cathode, and means for selectively applying switching pulses to said transformers whereby the modulating anode tube may be selectively turned "on" or "off."

3,274,516

FERRITE DEVICES FOR THE MODULATION AND SWITCHING OF MICROWAVES

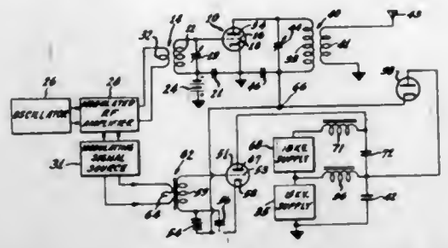
Ernst Neckenbürger, Hamburg-Stellingen, Germany, assignor to North American Philips Company, Inc., New York, N.Y., a corporation of Delaware



Filed May 25, 1965, Ser. No. 458,704
Claims priority, application Germany, Mar. 21, 1960, P 24,656, P 24,657
13 Claims. (Cl. 332—51)

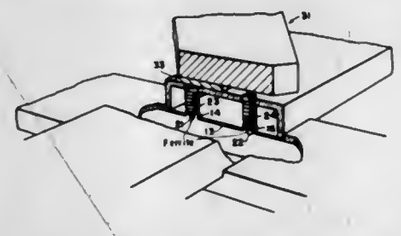
1. A modulation device for high frequency waves comprising a ferrite bar, a source of microwave energy, means applying said microwave energy to said bar, a modulating coil surrounding said bar for providing a longitudinal magnetic field in said bar, a conducting plate extending parallel to said bar inside said coil and spaced from said bar, said plate comprising the sole conductive means between said coil and bar, said first and second rectangular waveguide sections positioned coaxially with said bar, said plate forming an extension of one wall of each of said waveguide sections, said bar having sufficiently large cross-sectional dimensions that said energy is conducted dielectrically without substantial transverse field extension and

sufficiently small cross-sectional dimensions that said plate substantially prevents rotation of the polarization plane of waves in said bar.



3,274,517
BEAM DEFLECTION TUBE MODULATION CIRCUIT WITH MEANS FOR SUPPRESSING UNDESIRABLE ALTERNATING OUTPUT
Edward I. Lynch, Syracuse, N.Y., assignor to General Electric Company, a corporation of New York
Filed July 25, 1962, Ser. No. 212,251
8 Claims. (Cl. 332—58)

1. A modulation circuit comprising:
(A) a beam deflection electron discharge amplifying device having a cathode electrode, first and second anode electrodes, an electron beam intensity control electrode, and first and second deflector electrodes;
(B) an output load circuit coupled between said first anode and cathode electrodes;
(C) means coupled to said control electrode for providing alternating intensity modulation at a frequency f_1 of an electron beam generated by said device;
(D) means for providing and coupling a modulating voltage between said first and second deflector electrodes;
(E) means providing direct current operating potentials for said device;
(F) said amplifying device having a current i_1 and a corresponding current i_2 flowing therein; said current i_1 comprising the total electron beam current flowing between the cathode and first anode electrode and said current i_2 comprising the total electron beam current flowing between the cathode and the second anode electrode;
(G) said current i_1 generating an alternating output voltage in said output load circuit; and
(H) means connected between said second anode and cathode electrodes responsive to said current i_2 for automatically suppressing the alternating output voltage when said current i_1 has a preselected amplitude smaller than the amplitude of said corresponding current i_2.

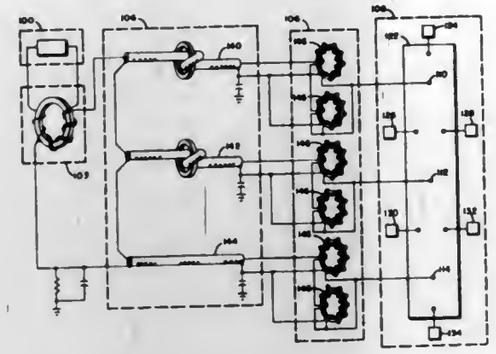


3,274,518
MODULATION SYSTEM
Merle V. Hoover, Lancaster, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Filed Jan. 29, 1964, Ser. No. 340,882
9 Claims. (Cl. 332—60)

1. An amplitude modulation system for a modulated carrier wave and a modulation signal, comprising,
an R-F amplifier,
means to couple said modulated carrier wave to said R-F amplifier for amplification of said modulated carrier wave,
a modulation amplifier for amplifying said modulation signal,
means to bias said modulation amplifier to cut-off below a predetermined modulation signal amplitude, and
means coupling said modulation amplifier to said R-F amplifier to control the amplification of said R-F

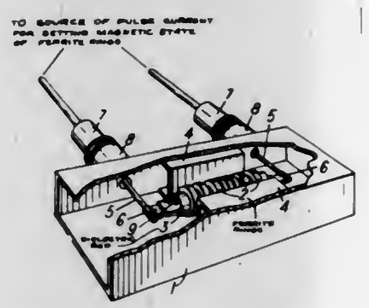
amplifier at modulation signal amplitudes in excess of said predetermined modulating signal amplitude.

3,274,519
FREQUENCY SELECTIVE COUPLING DEVICE HAVING FERRITE ELEMENTS BIASED TO DIFFERENT RESONANT FREQUENCIES
Leslie Nathanson, Boston, Mass., assignor to Laboratory for Electronics, Inc., Boston, Mass., a corporation of Delaware
Filed Feb. 5, 1964, Ser. No. 342,608
8 Claims. (Cl. 333—1.1)



1. A frequency selective coupling device for electromagnetic waves, comprising a pair of rectangular waveguides disposed in overlapping relation so as to form a wall junction in which one of the broad walls of a first of the guides intersects at right angles with one of the broad walls of the second guide, a first of said guides having an input port and the second of said guides having a pair of output ports, said junction being provided with a pair of apertures communicating between the interiors of said guides at first and second locations, and said locations being displaced in the same direction with respect to the longitudinal axis of said second guide and in opposite directions with respect to the longitudinal axis of said first guide; a pair of ferrite coupling elements, means to mount said elements at the respective locations defined by said apertures, and means to produce a D.C. magnetic field acting upon said ferrite elements substantially at right angles to the plane of the intersection of said walls, said ferrite elements being adapted to resonate at slightly differing frequencies in the presence of said field.

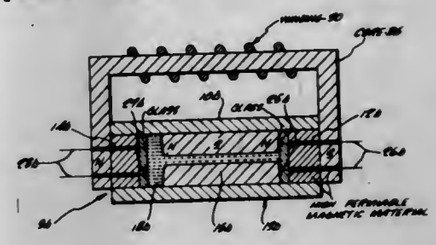
3,274,520
HIGH FREQUENCY PULSE BRANCHING AND COUPLING NETWORK
Charles W. Eddy, St. Paul, and Le Roy A. Prohofsky, Minneapolis, Minn., assignors to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Oct. 11, 1965, Ser. No. 500,465
8 Claims. (Cl. 333—9)



1. An impedance transformation device for coupling a high output impedance generator of a high frequency signal to a low impedance bus-bar distribution system, comprising in combination:
a plurality of cores of magnetic material;
a current dividing network including a plurality of transmission lines, one portion of each but one of said transmission lines coupled to a separate one of said cores;

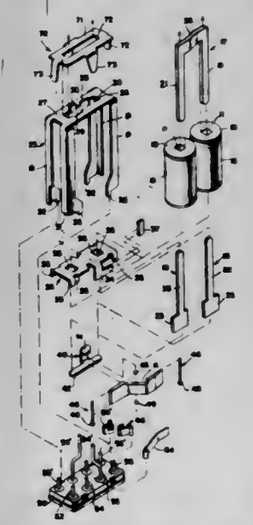
a bus-bar;
a plurality of impedance transformers;
an input transformer the output of which is coupled to the input of said current dividing network;

the output of said current dividing network split with each output coupled to a different one of said impedance transformers;
the outputs of said impedance transformers coupled to respective different portions of said bus-bar.



3,274,521
MICROWAVE PHASE SHIFTER
Oswald Nourse, Lee on Solent, England, assignor to National Research Development Corporation, London, England, a corporation of Great Britain
Filed Sept. 12, 1963, Ser. No. 308,488
Claims priority, application Great Britain, Sept. 19, 1962, 35,651/62
5 Claims. (Cl. 333—24.1)

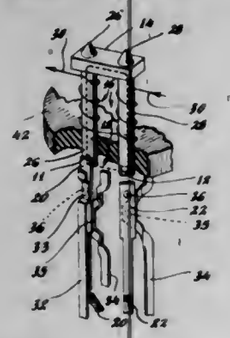
1. A mircowave phase shifter for pulsed operation comprising a hollow waveguide of rectangular cross-section having within it a cylindrical dielectric rod disposed with its longitudinal axis coincident wth the longitudinal axis of the waveguide, an assemblage of circular rings of ferrite threaded on said rod and mounted thereon in predetermined locations along it, a metal strip along said rod and external leads connected to the strip for the conduction of pulsing current through said strip, and constriction of the wider internal cross dimension of the waveguide, which constriction extends along the region occupied by the ferrite ring assemblage to enhance the effective phase shift resulting from magnetization of the ferrite rings by the pulsing current.



3,274,522
BISTABLE ELEMENT
Peter V. N. Heller, P.O. Box 147, Dana Point, Calif.
Filed Jan. 15, 1962, Ser. No. 166,151
14 Claims. (Cl. 335—5)

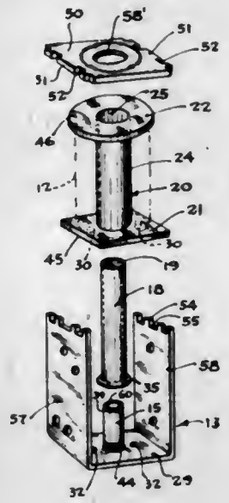
1. A bistable element comprising:
(a) a container having a chamber with at least one side wall and at least one end wall adjacent each end of said side wall for enclosing said chamber,
(b) a member slidably mounted in said chamber having an outer surface of substantially the same shape as said side wall and closely fitting against said side wall but being shorter than the length thereof in between said end walls causing a void space in said chamber and comprising,
(1) a passageway for inter-connecting the void space at the ends of said member, and

(c) a quantity of mercury at least substantially filling said void space said chamber walls and member being adapted so that movement of said member to either end wall of said chamber causes substantially all of said quantity of mercury in between such chamber end wall and said member to be moved out therefrom and moved through said passageway into a position in between the other end wall of said chamber and said member, surface tension of said mercury maintaining said member at the opposite end wall of said chamber from said quantity of mercury.



3,274,523
ELECTROMAGNETIC SWITCHING RELAY HAVING A THREE PIECE U-SHAPED CORE
Eric W. Bayer, Rocky Hill, and Joseph W. Bentz, Middletown, Conn., assignors to Allied Control Company, Inc., New York, N.Y., a corporation of New York
Filed Mar. 2, 1964, Ser. No. 348,404
6 Claims. (Cl. 335—121)

1. In an electromagnetic device, a frame comprising spaced upper and lower plates, a plurality of spaced upstanding legs secured to the plates and projecting below the lower plate, a pair of upstanding magnetizing coils positioned within the confines of the plates and the legs, a core assembly comprising a first member secured to the frame and including a web disposed above the coils and a pair of spaced arms depending from the web, each arm extending through a corresponding coil, and a pair of second members, each second member including a portion which extends through a corresponding coil and a portion which is wider than the first-mentioned portion and which is disposed beneath the lower plate and serves as a pole piece, each second member bearing against and being secured to a corresponding arm of

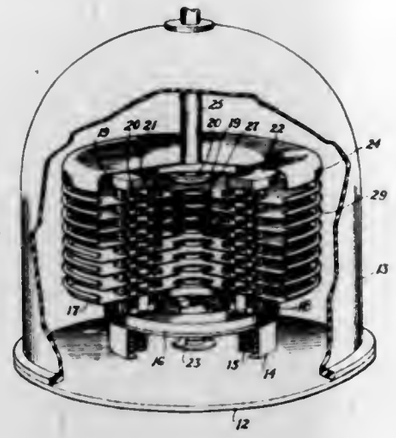


the first member, an armature unit positioned below and secured to the lower plate comprising an armature that is pivotal relative to the frame and that includes a pair of spaced parts each of which is cooperatively associated with a corresponding pole piece, biasing means normally urging the armature in one direction of rotation relative to the frame and maintaining said armature parts in a position away from the pole pieces, the armature being adapted, upon energization of the coil, to be moved in a reverse direction against the action of the biasing means by magnetic attraction between the pole pieces and said armature parts, and a plurality of spaced resilient fingers carried by and projecting generally outwardly of the frame, said fingers being adapted to effect frictional engagement with the inner surface of the side wall of a cover unit that is adapted to encase parts of the device.

3,274,524
ELECTROMAGNETIC REED RELAY
Nathan H. Magida, Westport, and Walter W. Bachle, Wilton, Conn., assignors to Thermosen, Incorporated, Stamford, Conn.
Filed Mar. 25, 1964, Ser. No. 354,616
11 Claims. (Cl. 335—152)

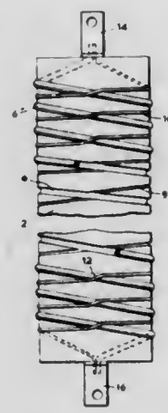
1. An electromagnetic circuit control device comprising, in combination:
(A) a sealed cylindrical enclosure;
(B) a plurality of elongated flexible reed members of ferromagnetic metal;
  (a) said reeds being insulatingly supported in one end wall of said enclosure and extending into the enclosure in a substantially cylindrical array concentric with the enclosure axis;
(C) a plurality of support arm members of non-magnetic metal insulatingly supported in said one end wall and extending into the enclosure in a substantially cylindrical array concentric with the reed array;
(D) electrical contacts on adjacent surfaces of said reeds and support arms at locations thereon remote from said one end wall;
(E) a plurality of magnetic devices each comprising:
  (a) first and second cores respectively providing at one end first and second pole pieces; and
  (b) a coupler bar of flux conductive material connecting the other ends of said cores;
  (c) said coupler bar forming with said first and second cores a U structure projecting at its opposite ends through the other end wall of said enclosure to dispose said pole pieces within said enclosure separated by an air gap;
(F) said magnetic devices being arrayed about said enclosure axis to provide within said enclosure a corresponding plurality of sets of pole pieces arrayed about said axis;
(G) a separate coil means for each magnetic device comprising an electrically conductive wire wound about the portions of the cores of that device disposed outside of said enclosure and arranged when energized to impart opposite polarization to the pole pieces of that device, whereby to establish for that device a magnetic circuit sequentially including one of said pole pieces, the related core, the coupler bar, the other core, the other pole piece and said air gap;
(H) the number and the relative radial and circumferential positioning of said reeds and said pole pieces within said enclosure being such as to dispose the free ends of a pair of reeds adjacent the respective pole pieces of each pole piece set; and
(I) means for passing electrical current selectively through each of said wires, whereby to attract the reed pair ajacent the pole piece set of the related magnetic device toward the respective pole pieces of that set to move the contacts on said reed pair relative to the contacts on the related support arms so as to perform switching operations with respect to electrical circuits including those contacts.

3,274,525
SOLENOID DEVICE HAVING A NON-ROTATABLY MOUNTED COIL BOBBIN
Robert L. Valleau, Morton Grove, Ill., assignor to Comar Electric Company, Chicago, Ill., a corporation of Illinois
Filed Aug. 28, 1964, Ser. No. 392,697
4 Claims. (Cl. 335—255)



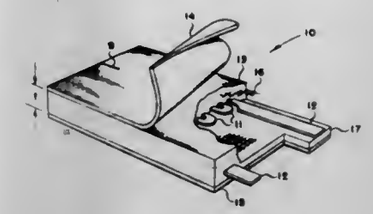
1. A solenoid comprising a frame having a base wall and a pair of interconnecting side walls extending from and joined at respective ends to said base wall, a cylindrical plunger stop secured to said base wall, a bobbin having a hollow central body and a pair of attached headers at the opposite ends thereof, said bobbin having a coil, an elongated guide tube fitted over said plunger stop, said central body of said bobbin being loosely fitted over and said guide tube with one header thereof disposed adjacent said base wall, a solenoid plunger arranged within said guide tube for sliding movement, and said one header and the base wall having interlocked projections and openings to secure said bobbin against rotation.

3,274,526
INSULATING CORE TRANSFORMERS
Roy M. Emanuelson, Reading, Mass., assignor to High Voltage Engineering Corporation, Burlington, Mass., a corporation of Massachusetts
Filed July 17, 1963, Ser. No. 295,698
8 Claims. (Cl. 336—60)



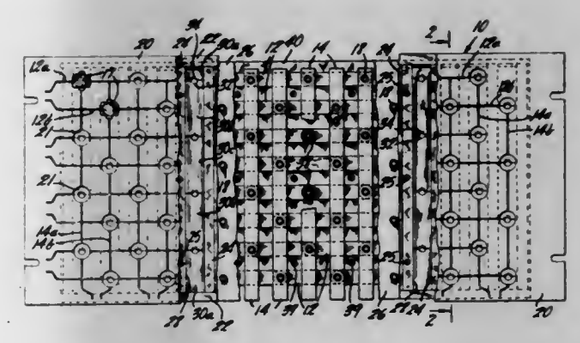
1. An electromagnetic transformer comprising at least one primary coil, at least two secondary coils serially arranged in operable relationship with each primary coil, a closed magnetic circuit including a plurality of grooved core segments of permeable material, there being at least

one core segment associated with each secondary coil, means for insulating each core segment from adjacent segments, a hermetic non-metallic tank enclosing said electromagnetic transformer, a pressurized insulating gas atmosphere residing therein, fluid cooling means disposed



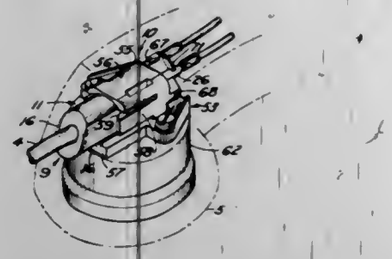
within said tank, and means for circulating said insulating gas atmosphere through the grooves of said core segments and through said fluid cooling means, said grooves extending through each core segment in a direction transverse to the direction of the magnetic flux in said core segment.

3,274,527
CONCENTRIC HELICAL COILS WITH ELECTRICALLY CONNECTED CROSSOVER POINTS
Alfred Alexander Robinson, Stafford, England, assignor to The English Electric Company Limited, London, England, a British company
Filed June 3, 1964, Ser. No. 372,275
Claims priority, application Great Britain, June 5, 1963, 22,460/63
6 Claims. (Cl. 336—69)



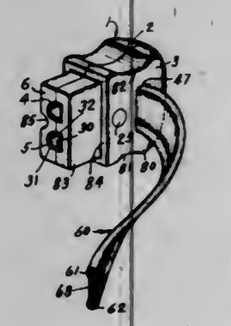
1. An inductor comprising
two terminals,
first and second helical coils each connected between said two terminals and wound about a common axis so as to cross over one another at a plurality of points, said first coil having a relatively high resistance and said second coil having a relatively low resistance, and
conecting means interconnecting the first and second coils at selected ones of said points whereby selected lengths of said second coil are shunted by the resistance possessed by elected lengths of said first coil.

3,274,528
STRAIN MEASURING DEVICE
Leslie H. Bermann, Northridge, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Filed Mar. 23, 1964, Ser. No. 353,660
6 Claims. (Cl. 338—2)



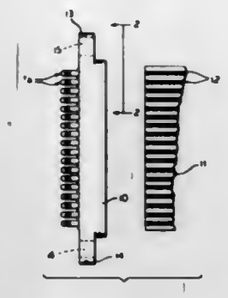
1. An electrical strain measuring device capable of being pressed onto a receiving surface, comprising
a sheet of polymerizable adhesive polymerized to a B-stage cure, at least one surface of said sheet having the characteristic of being adhesively bonded to said receiving surface upon substantial completion of polymerization of said adhesive;
an impermeable backing strip, in contact with, and extending over said one surface of said sheet;
a planarly disposed strain-responsive sensing conductor, coplanarly encapsulated within said sheet, the resistance of said sensing conductor being responsive to strain transmitted from said receiving surface through said polymerized adhesive; and
a pair of lead conductors each having a first end connected to a corresponding terminus of said sensing conductor and a second end extending through, and beyond, a boundary of said sheet.

3,274,529
CROSS-BAR DISTRIBUTION PANEL
David Berdan, Freehold, N.J., assignor to Buck Engineering Company, Inc., Freehold, N.J., a corporation of New Jersey
Filed Feb. 12, 1964, Ser. No. 344,443
6 Claims. (Cl. 339—18)



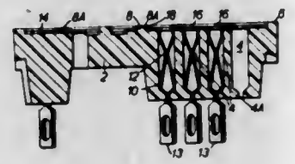
1. A crossbar distribution panel, comprising a front panel structure, a plurality of first spaced-apart conductors mounted on said panel structure, a plurality of second spaced-apart conductors mounted on said panel structure and insulated from and crossing the first conductors, said first and second conductors having means defining aligned openings at their crossover points, said front panel having corresponding openings therein, pin means positionable in said openings in the panel and into said aligned openings for interconnecting a selected first conductor to a selected second conductor, and means arranged in the front panel for blocking the positioning of said pin means into any more than a predetermined number of openings in any one of said first conductors simultaneously.

3,274,530
TINSEL WIRE CONNECTOR
Charles E. Michaely, 9132 Greenwood Ave., Des Plaines, Ill.
Filed Nov. 5, 1963, Ser. No. 321,492
4 Claims. (Cl. 339—97)



1. A plug member for an electrical connector comprising a body member having an opening therethrough, said body member having an annular portion of reduced diameter at its rearward end, said annular portion having a series of axially extending grooves in its outer surface extending from its rearward end toward its forward end, a strain relief member disposed within said opening, said relief member having an axial passage therethrough, a plurality of wires extending through said passage, each of said wires having an insulating covering, the outer end of each of said wires being folded back to engage the bottom surface of one of said grooves, a collar encircling said annular portion and engaging said insulating covering of said wires to hold said wires in engagement with said body member, and said body member and said strain relief member having means cooperating to hold said members in assembly, and said strain relief member having elements gripping said wires to minimize a pull-strain thereon, said strain relief member and said collar cooperating to hold the wires firmly in said grooves, said grooves being of greater dimensions than said wires and being adapted to receive a mating contact and for making electrical connection therewith by removal of the insulation from the wires upon movement of the mating contact into the grooves.

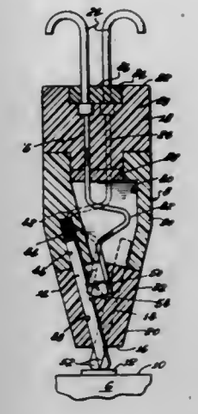
3,274,531
ELECTRICAL CONNECTOR
Francis K. Bourhenne, Lawndale, Calif., assignor to Sierra Electric Corporation, Gardena, Calif., a corporation of California
Filed Mar. 16, 1964, Ser. No. 352,034
1 Claim. (Cl. 339—99)



An electrical connector, for insulated wire cable, including: a casing, a flexible arm within said casing, said casing formed with a restricted cable entrance and with an enlarged cavity having an offset wall, said flexible arm designed to swing toward the restricted cable entrance to bend the cable out of line against the offset wall to effect a strain relief and a penetration of the insulation to contact the cable wire.

3,274,532
CONNECTOR FOR PRINTED WIRE BOARD
William J. Engel, Chicago, Ill., assignor to United-Carr Incorporated, a corporation of Delaware
Continuation of application Ser. No. 794,013, Feb. 18, 1959. This application Mar. 17, 1964, Ser. No. 353,319
2 Claims. (Cl. 339—176)

1. In combination with a connector body part having a longitudinally extending channel and a transversely oriented contact receiving cavity intersecting said channel, said cavity having a bottom wall and opposed end walls and an opening extending upwardly into said cavity through the bottom wall adjacent each end wall thereof, a pair of contact members mounted within said cavity adjacent each end wall in spaced, opposed relationship to one another and adapted to receive a longitudinally oriented male member in frictionally gripped relationship therebetween with at least one of said contact members adapted to be electrically coupled with said male member, each of said contact members including a spring leg portion juxtaposed to each end wall of the cavity and extending through said opening and terminating in a free end outside the cavity thereof, each of said spring leg portions being inclined slightly upwardly and inwardly from a point adjacent the bottom wall of said cavity and forming a first flexure zone thereat, each of said spring leg portions at the outside free end thereof being adapted to be connected to an electrical conductor, a contact portion having an upper portion and a lower portion secured at one end to the other end of each of said spring leg portions with the upper portion of each contact portion extending inwardly and downwardly in the direction of one another, the point of jointure of each of said upper portions to each spring leg portion forming a second flexure zone thereat, the lower portion of each contact portion extending downwardly from said upper portion in generally spaced parallel relationship to the spring leg portion and to each other for a distance sufficient to form a passageway between the lower portion of each contact portion having a substantial contacting surface which will frictionally engage a male member when inserted into the passageway, the width between said lower portions being normally less than the width of the male member to be inserted therein, a leaf spring portion integrally joined at one end to the free end of each of said lower portions of said contact portions and extending upwardly and inwardly from the lower portion of each contact portion in the direction of its corresponding leg portion, each of said first flexure points normally biasing each spring leg and its contact portion in the direction away from the juxtaposed cavity end wall with each of said first flexure points being relatively pliant as a result of the length of each leg portion so as to be overcome by a relatively small force applied against each contact portion upon initial insertion of the male member into said channel to move each of said leg portions and contact portions inwardly in the direction of the respective end walls of the cavity; said second flexure zone of each contact member being relatively stiff as a result of the shortness of the upper contact portion of each contact portion and the formed passageway between the lower portions and the leaf spring portion so as to be overcome only by a greater force applied against such contact portion by said male member subsequent to the initial insertion thereof into said cavity by the relatively small force.

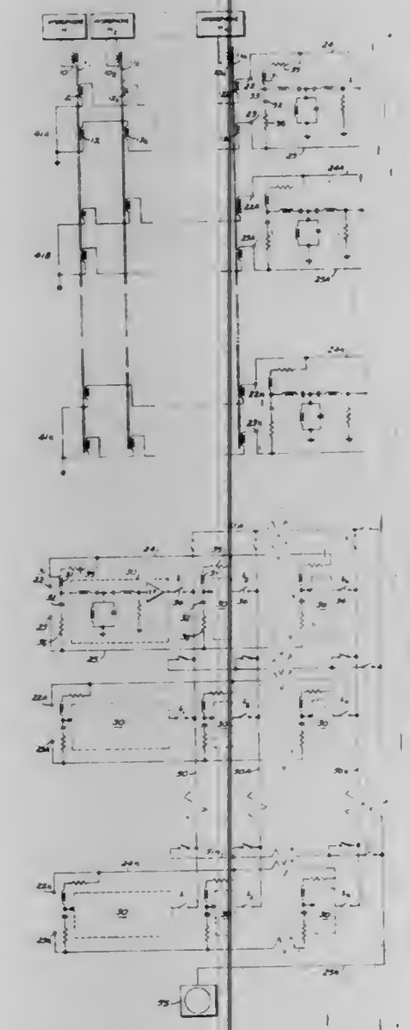


3,274,533
ELECTRIC SOCKET CONNECTORS
James E. Apted, London, and George F. N. Oliver, Bean, near Dartford, Kent, England, assignors to Oliver Pell Control Limited
Filed June 26, 1964, Ser. No. 378,188
Claims priority, application Great Britain, July 1, 1963, 25,986/63
4 Claims. (Cl. 339—192)

1. An electrical socket connector including a moulded body of electrically insulating, synthetic resin plastic, material having a plurality of apertures therein, each aperture extending completely through the body from the upper surface to the lower and having a portion of reduced cross section at its lower end, the body having an integral, continuous rim extending around its periphery and projecting above the upper surface of the body and a plurality of integral upstanding pips on the said upper surface, a plurality of female spring contacts each housed in one of the said apertures, each said contact having a pair of opposed arms which bear resiliently against the sides of the aperture, and having a lower portion of reduced cross-section projecting downwardly through the reduced portion of the said aperture, the lower portion of the contact below the lower surface of the body forming a terminal and being adapted to retain the contact against upward movement out of its aperture, and a cover plate which is thin relative to the thickness of the body, the said cover plate being located laterally by the rim on the body, having holes to receive the said pips, which are deformed to form rivet like heads which retain the plate to the body, the said plate also being formed with apertures which register with those in the body but are of lesser width so that the edges of the apertures in the plate overlie and thereby protect the upper end edges of the arm of the spring contacts.

3,274,534
ELECTRICAL CONNECTOR
William K. Shortridge, Anaheim, Calif., assignor to General Dynamics Corporation, Pomona, Calif., a corporation of Delaware
Filed Dec. 2, 1963, Ser. No. 327,457
15 Claims. (Cl. 339—196)

1. An electrical connector comprising, in combination:
(a) a housing having an upper surface and a lower surface;
(b) output terminals positioned at said housing upper surface;
(c) contact pins spaced longitudinally of the housing and receivable therein for independent movement angular to the housing vertical axis to and from retracted positions within said housing and extended positions of protrusion from said housing lower surface;
(d) contact leads extending between each of said output terminals and respective associated contact pins; and
(e) biasing means urging said pins independently into said positions of protrusion beyond the housing lower surface and permitting said pins retraction into said housing, such that the pins wipingly engage circuit terminals positioned thereagainst to force said pins into retracting movement.

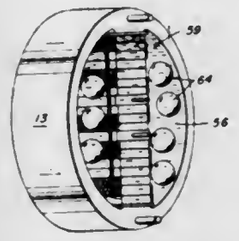


3,274,535
PROPAGATION VELOCITY CORRECTION FOR DOPPLER LOG
Edwin E. Turner, Newport, R.I., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Filed Sept. 14, 1964, Ser. No. 396,439
6 Claims. (Cl. 340—3)

1. In a system for determining the velocity of a vehicle moving through a fluid medium of the type wherein a sound beam of a given frequency is radiated from said vehicle at a given depression angle with the horizontal and the echo signal which is thereafter reflected from the bottom is compared with the radiated signal to produce a Doppler shift signal indicative of said velocity, the improvement of
automatically varying the depression angle at which said sound beam is radiated in response to changes in the temperature of the surrounding fluid medium, thereby to compensate for changes in the velocity of sound propagation occurring as a result of said temperature changes.

3,274,536
BROAD BAND MULTIPLE BEAM FORMING DEVICE
Frank R. Abbott and James A. Peugh, San Diego, Calif., assignors to the United States of America as represented by the Secretary of the Navy
Filed Aug. 31, 1964, Ser. No. 393,462
4 Claims. (Cl. 340—6)

2. A beam steering system for defining a plurality of differently aimed signal beams, said system comprising:
an array of uniformly spaced transducers,

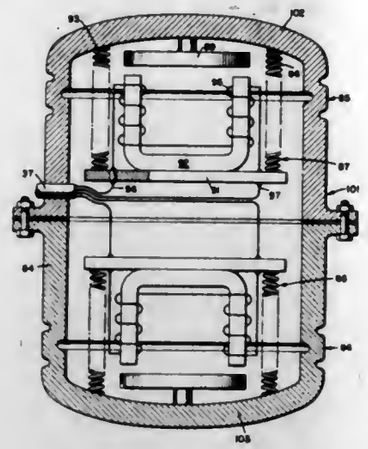


means associated with each transducer for deriving a voltage proportional to sin ϕ_n, where ϕ_n is the phase shift seen by the nth transducer relative to an arbitrary fixed point in said array,
means associated with each transducer for deriving a voltage proportional to cos ϕ_n, where ϕ_n is the phase shift seen by the nth transducer relative to said arbitrary fixed point,
means for adding the derived sin voltages,
means for adding the derived cos voltages,

means for relatively shifting 90° the phase of the resultants of said voltages,
a plurality of filters capable of passing different discrete bands of frequencies coupled to said phase shifting means, and
means for selectively displaying the output voltages of said filters.

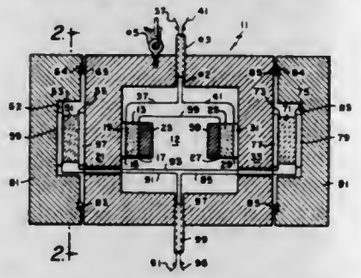
3,274,537
FLEXURAL-EXTENSIONAL ELECTRO-MECHANICAL TRANSDUCER
William J. Toulis, 1100 E. Broad St., Columbus, Ohio
Filed Oct. 17, 1963, Ser. No. 317,095
7 Claims. (Cl. 340—8)

1. A composite electromecanical transducer comprising in combination:
a plurality of open-ended tubular diaphragm members of identical non-circular cross sections, each of said tubular diaphragm members being adapted to vibrate in the flexural mode and said plurality of tubular diaphragm members being joined and sealed end-to-end,
electrically-actuable electromechanical converter means, individual to an disposed within each of said diaphragm members in thrust-transmitting relationship therewith and vibratile in the longitudinal mode of vibration in response to actuating electrical signals,
closure means sealed across both ends of the tubular diaphragm means,
electrical conductors connected to each of said electromechanical converter means for actuating the respective electromechanical converter means,
means for uniting said diaphragms and closure means so that said diaphragms and said closure means constitutes a transducer cavity,
means for automatically equalizing the pressure within said transducer cavity with external hydrostatic pressure,
each converter means comprising a stack of electromechanical-active elements each of which is adapted to alternately expand and contract along the longitudinal axis of said stack in response to the application of said electromechanically-active elements of an electric signal of fluctuating intensity, the longitudinal ends of said stack being in thrust-transmitting relationship with its associated diaphragm member;



electrode means, operatively interconnecting each of said electromechanically-active elements to said electrical conductors for bringing each of said electromechanically-active elements under the operative influence of the actuating fluctuating electrical signal carried by said electrically-conductive actuating means;
insulator means, intermediate the respective longitudinal ends of said stack of electromechanically-active elements and the diaphragm member associated therewith, for electrically insulating said stack of electromechanically-active elements from said associated diaphragm member; and
heat dissipating means, connected to each of the electromechanically-active elements in said stack for conducting heat away from said electromechanically-active elements, said heat-dissipating means, in part, consisting of wire mesh-like structure for accelerating the dissipation of heat away from said electromechanically-active elements.

3,274,538
ELECTROACOUSTIC TRANSDUCER
Benjamin L. Snavely, Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy
Original application Sept. 19, 1960, Ser. No. 57,085, now Patent No. 3,219,969, dated Nov. 23, 1965. Divided and this application Oct. 30, 1963, Ser. No. 326,652
4 Claims. (Cl. 340—8)

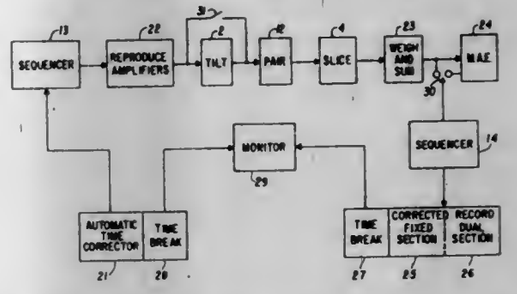


1. An underwater acoustic transducer comprising,
hollow cup-shaped elements secured together to form a closed compliant shell, each cup-shaped element having a bottom and side surface,

motivating means in each of said cup-shaped elements coupled to said bottom surfaces for movement thereof, said side surfaces being of sufficient softness to

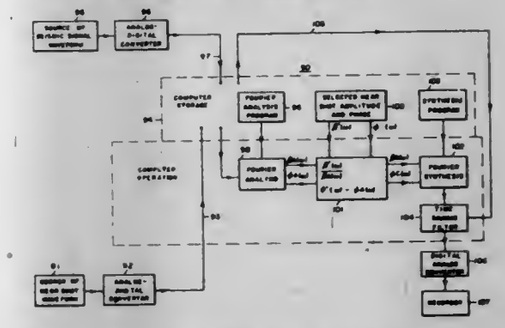
compress when the bottom surfaces are actuated by said motivating means.

3,274,539
TRANSDUCER FOR SIMULTANEOUS MEASUREMENT OF PHYSICAL PHENOMENA OF SOUND WAVE
Alan O. Sykes, 304 Mashie Drive, Vienna, Va.
Filed Nov. 30, 1964, Ser. No. 414,929
10 Claims. (Cl. 340—10)



1. A transducer for simultaneously measuring a plurality of characteristics of a sonic wave at the same point in space comprising:
a first means for sensing a first physical characteristic of a sonic wave at a given point in space;
a hollow housing, said first means for sensing a physical characteristic of a sonic wave on a given point in space mounted within said hollow housing; and
a second means for sensing a second physical characteristic of a sonic wave at a given point in space rigidly mounted on the outside of said hollow housing.

3,274,540
HIGH ENERGY SONIC AND ULTRA-SONIC MAGNETOSTRICTION TRANSDUCER
Leonard J. Melhart, Oxon Hill, Md., assignor to the United States of America as represented by the Secretary of the Navy
Filed Dec. 30, 1964, Ser. No. 422,465
5 Claims. (Cl. 340—11)

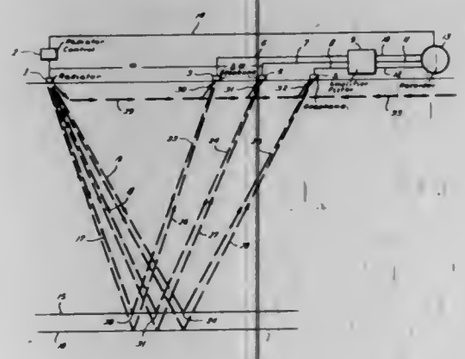


1. A transducer comprising:
a stack of identical laminations of magnetostrictive material pressed tightly together to form a transducer core, and
an elongated tubular element axially split through one side to form a single turn coil,
said single turn coil surrounding at least one portion of said transducer core.

3,274,541
SEISMIC VELOCITY FILTERING
Peter Embree, Farmers Branch, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex., a corporation of Delaware
Filed Feb. 15, 1963, Ser. No. 258,782
26 Claims. (Cl. 340—15.5)

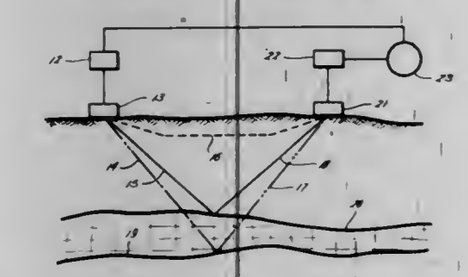
1. A method of processing seismic traces to indicate the presence, inside a predetermined time delay range, of signals in each trace having a time delay with respect to signals in another trace, wherein each trace is a function of its spatial origin in relation to the spatial origin of each other trace, comprising the steps of:
(a) weighting each trace in relation to each other as a function of their respective spatial origins,
(b) bidirectionally time shifting each trace in relation to each other as functions of their respective spatial origins and the predetermined time delay range,
(c) and compositing all the weighted and time shifted traces to produce a composite output indicative of the presence, inside the predetermined time delay range, of signals in each trace having a time delay with respect to signals in another trace.

3,274,542
METHODS OF BAND-EQUALIZING SEISMOGRAMS
William H. Ruehle, Dallas, Tex., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Filed Mar. 25, 1963, Ser. No. 267,592
4 Claims. (Cl. 340—15.5)



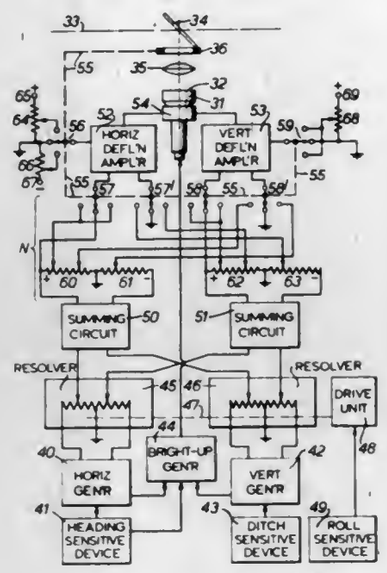
4. A method of producing from seismic signals generated in response to separate input seismic energies applied at different shot points improved seismic signals that would be generated if all were produced from a reference input seismic energy, comprising the steps of:
(a) generating a first signal having an amplitude-frequency spectrum $\beta A(\omega)$ representative of the amplitude-frequency spectrum of one of the input seismic energies,
(b) generating a second signal having an amplitude-frequency spectrum $\beta'(\omega)$ representative of the reference input seismic energy,

(c) comparing said first and second signals to produce a filter whose impulse response in the frequency domain is characterized by an amplitude-frequency spectrum of $\beta'(\omega)/\beta A(\omega)$, and



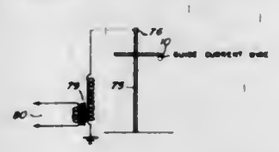
(d) applying to said filter the seismic signal generated in response to said one of said input seismic energies to produce an improved seismic signal.

3,274,543
MEANS AND METHOD OF DISTINGUISHING SEISMIC SIGNALS
Burton McCollum, Houston, Tex.; P. R. Rowe and Bank of The Southwest National Association, Houston, Tex., executors of said Burton McCollum, deceased
Filed Oct. 11, 1963, Ser. No. 315,620
17 Claims. (Cl. 340—15.5)



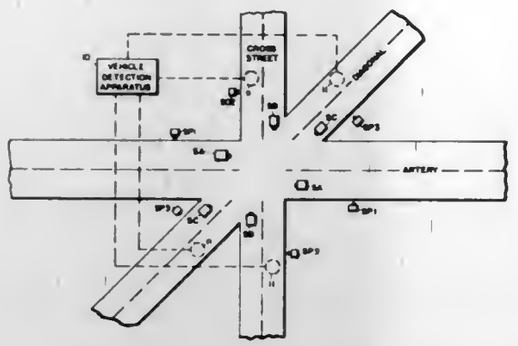
1. The method of seismic prospecting comprising radiating in the earth at least one truncated wave train signal of fixed frequency and amplitude and predetermined duration, detecting subsurface reflections of said signal, subjecting the detected signal reflections to signal frequency band suppression of the type to leave unsuppressed the terminal pulses of wave trains at said signal frequency, and recording the residual terminal pulses of the detected signal reflections.

3,274,544
METHOD OF DISTINGUISHING SEISMIC SIGNALS
Burton McCollum, Houston, Tex.; P. R. Rowe and Bank of the Southwest National Association, Houston, Tex., executors of said Burton McCollum, deceased
Filed Oct. 21, 1963, Ser. No. 317,423
8 Claims. (Cl. 340—15.5)



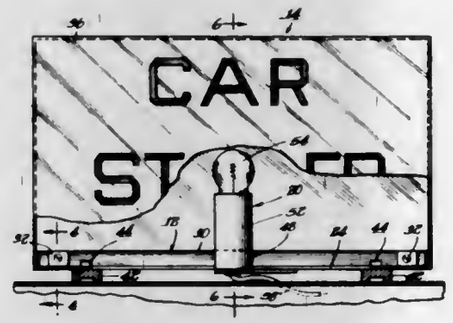
1. The method of seismic exploration comprising radiating in the earth a truncated wave train signal of constant frequency and amplitude and predetermined number of cycles, detecting a subsurface reflection of said signal and accompanying wave energy, repeating the detected signal reflection and associated wave energy a number of times equal to the number of half cycles in said signal, and making an algebraically composited record of the repeated reflection and wave energy progressively shifted in phase a half wave length of the signal and alternately reversed in phase for emphasizing the beginning of the reflected wave energy on the composite record.

3,274,545
ELECTRONIC DISPLAY APPARATUS
Donald Clive Bowles, Purley, and Derek Raymond Burrows, London, England, assignors to Rank-Bush Murphy Limited, London, England, a company of Great Britain
Filed July 15, 1963, Ser. No. 294,920
9 Claims. (Cl. 340—24)



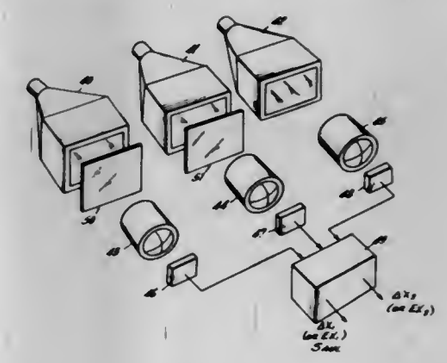
1. Electronic display apparatus comprising in combination: a cathode ray tube having a luminescent screen; means for producing a luminous display upon said screen; a partial reflector mounted for movement about an axis; an optical path whereby an image of said screen may be viewed in said reflector; electrical potential control means operated by movement of said reflector; shift means producing a displacement of said display on said screen; and means for applying said controlled potential to said shift means, thereby producing a displacement of said image when said reflector is moved such as to compensate for said movement of said reflector.

3,274,546
AIRCRAFT GUIDANCE, APPROACH, AND LANDING SYSTEM WITH YAW DETECTION AND METERING
Ross Gunn, 4437 Lowell St. NW., Washington, D.C.
Original application Apr. 29, 1959, Ser. No. 809,861, now Patent No. 3,116,473, dated Dec. 31, 1963. Divided and this application Oct. 30, 1963, Ser. No. 320,113
6 Claims. (Cl. 340—25)



1. A guidance system for vehicles including, in combination, means for generating a pattern of alternating magnetic flux at least within the audio range, induction means on a vehicle for sensing said flux as an A.C. voltage, means on the vehicle to rectify said voltage, means to indicate the phase direction of the flux from said rectified voltage, a conductor positioned above ground and within the influence of said pattern of A.C. magnetic flux, means energizing said conductor with a high A.C. voltage of the same frequency as said pattern, and means on the vehicle to detect the electrostatic flux from said conductor, said means to rectify said voltage sensed from the pattern flux being synchronized by the detected electrostatic flux to insure correct indication of phase.

3,274,547
TRAFFIC SIGNAL CONTROLLER
Norman A. Bolton, Scottsville, N.Y., assignor to The General Signal Corporation, Rochester, N.Y., a corporation of New York
Filed Oct. 29, 1963, Ser. No. 319,761
9 Claims. (Cl. 340—37)



1. A multi-phase controller for traffic signals having a plurality of signal lamps which are illuminated in different combinations on successive intervals of each signal cycle and comprising in combination, a counter having a predetermined number of steps and including means for operating said counter from one step to the next in sequence, selector means operable between first and second conditions, said selector means in the first of its conditions operatively connecting said counter on any one step of a successive plurality of its steps with a respective first plurality of said signal lamps and in a second of its conditions operatively connecting said counter on said one step with a respective second plurality of signal lamps, and means for at times operating said selector means between its said first and second conditions but only when none of said successive plurality of steps of said counter is being operated.

3,274,548
ILLUMINATING AND SIGNAL DEVICE
John W. Brimsek, 630 Long Road, Glenview, Ill.
Filed Apr. 3, 1963, Ser. No. 270,304
3 Claims. (Cl. 340—84)

1. A device of the character described comprising, in combination, an electric light, a light mount supporting said electric light, an electric cord being electrically connected at one end to said electric light, an electric plug connected to the other end of the electric cord and being adapted for mounting in an automobile electric cigar lighter receptacle to energize said electric light, a base being removably attached to said light mount for supporting said light mount and the electric light, said base having an aperture for receiving said light and an elongated slot opening into said aperture, a magnet having a narrow neck being mounted in said slot and having one portion on one side of said base and the remainder on the other side of said base, a translucent message plate fixed to said base, and a second translucent message plate fixed to said base and being substantially opposite to the first-mentioned translucent message plate to have the electric light between said plates to illuminate the plates.

3,274,549
AUTOMATIC PATTERN RECOGNITION SYSTEM
Saul Moskowitz, Brooklyn, N.Y., assignor to Kollsman Instrument Corporation, Elmhurst, N.Y., a corporation of New York
Filed May 4, 1962, Ser. No. 192,456
3 Claims. (Cl. 340—146.3)

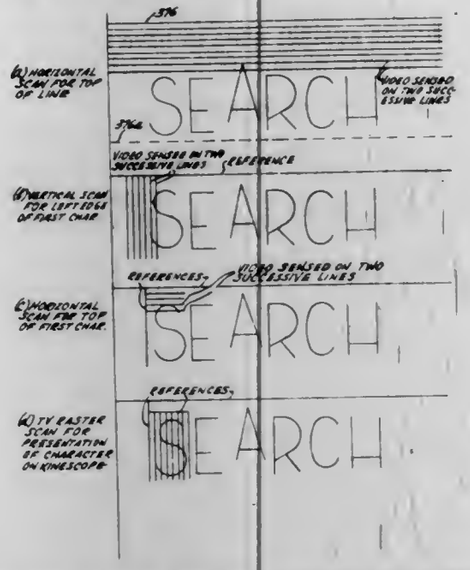
1. A pattern recognition system; said pattern recognition system comprising first and second and third image producing means for producing an image of a common object to be identified, first, second and third transducer means for receiving the radiant energy across the full area of said first, second and third images respectively, filter means for partially absorbing a predetermined portion of the energy of said first and second image interposed between said first and second image and said first and second transducer means, and computation network means for computing pattern information from the outputs of said first, second and third transducers; the output of said first cell being related to

$$\int_A \frac{I(x_1, x_2)}{K_1(x_1, x_2)} dx_1 dx_2$$

wherein $I(x_1, x_2)$ is a variable intensity distribution over the area A and $K_1(x_1, x_2)$ is a function of variables x_1 and x_2 over the area A the output of said second cell being related to

$$\int_A \frac{I(x_1, x_2)}{K_2(x_1, x_2)} dx_1 dx_2$$

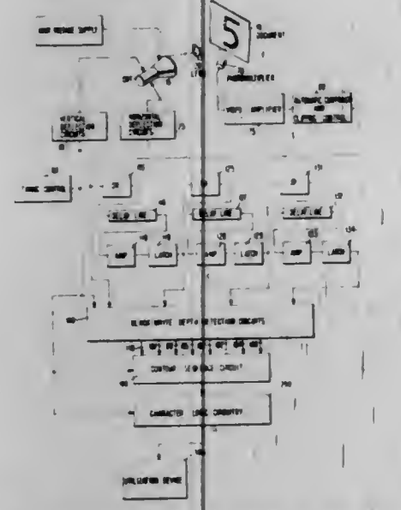
wherein $K_2(x_1 x_2)$ is a second function of variables x_1, x_2 over the area A the output of said third cell being related to



$$\int_A I(x_1, x_2) dx_1 dx_2$$

said computer being operable to compute the implicit displacement information Δx_1, and Δx_2 of said pattern from a predetermined value.

3,274,550
CHARACTER RECOGNITION SYSTEM INCLUDING CIRCUITS FOR LOCATING CHARACTERS AND CIRCUITS FOR DISCRIMINATING AGAINST NOISE
Seymour Klein, Philadelphia, Pa., assignor to Radio Corporation of America, a corporation of Delaware
Filed June 6, 1962, Ser. No. 200,365
9 Claims. (Cl. 340—146.3)



1. In a system for recognizing characters appearing on a page of printed material; means for locating the top

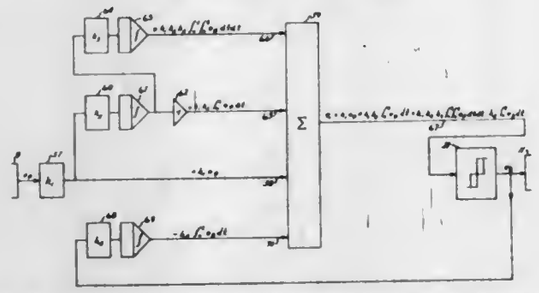
edge of the highest character in the first line of print; means for locating the left edge of the first character in

the first line of print; and means for locating the top edge of the said first character.

3,274,551
PATTERN RECOGNITION BY CONTOUR SEQUENCES
William S. Rohland, Rochester, Minn., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 23, 1963, Ser. No. 332,516
19 Claims. (Cl. 340—146.3)

1. Pattern recognition apparatus in which patterns are scanned in a series of vertical scans horizontally displaced from each other, the pattern recognition apparatus including:

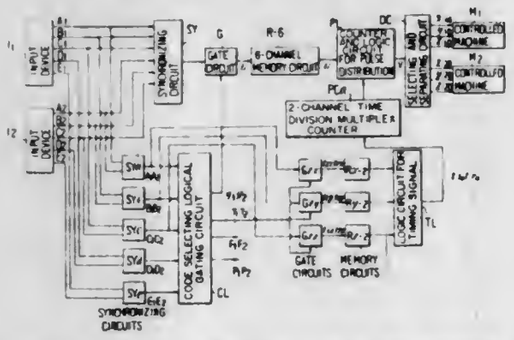
means for simultaneously presenting signals representing a present scan and a predetermined number of previous scans;



means for simultaneously sampling said signals a successive number of times;

depth detection means connected to said signal representing means and to said sampling means for developing weighted notation signals according to the optical condition of each sampling interval of each current scan and modified according to the optical conditions of horizontally adjacent previously scanned areas to indicate the degree of entry into and exit from the pattern for each sampling interval of each current scan;

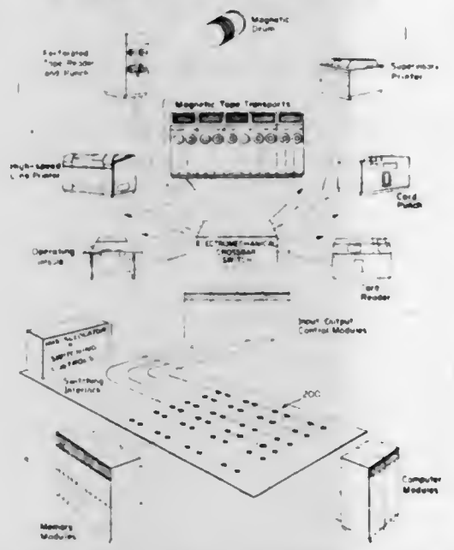
examining means connected to said depth detection means for sequentially examining said notation signals within each vertical scan to develop outputs indicative of segmental shapes indicative of portions of patterns; and



pattern identifying means operatively connected to said examining means to sequentially combine outputs therefrom for identifying the patterns.

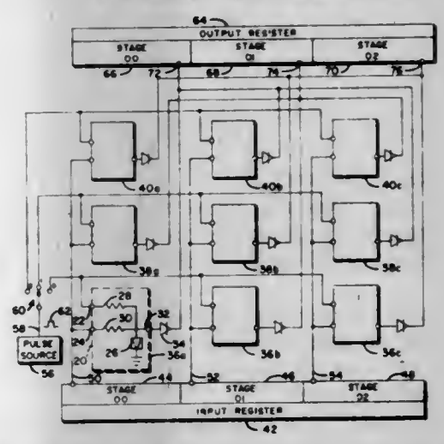
3,274,552
ADAPTIVE MISSILE CONTROL SYSTEM
George Lamar Harmon and William O. Purcell, Orange County, Fla., assignors to Martin-Marietta Corporation, Middle River, Baltimore, Md., a corporation of Maryland
Filed June 25, 1962, Ser. No. 204,875
13 Claims. (Cl. 340—147)

12. In a control system, manually controlled means for producing a first signal, means for deriving first and second integrals of said first signal, means for deriving a degenerative feedback signal, means for adding said first signal, the integrals of said first signal, and said degenerative feedback signal to provide a composite signal, output means connected to be triggered by said composite signal, said output means having a predetermined upper threshold trigger value and a predetermined lower threshold trigger value and being triggered to an operative condition when said composite signal exceeds said upper threshold trigger value, said output means producing an output signal when in its operative condition, and means for producing from the output signal said degenerative feedback signal, said output means becoming inoperative to produce said output signal when said composite signal as a result of said degenerative feedback signal decreases to a valve lower than said predetermined lower thereshold value.



3,274,553
TIME-DIVISION, MULTIPLEX, NUMERICAL-CONTROL SYSTEM
Yuichiro Oya, Kitatama-gun, Tokyo-to, Japan, assignor to Kabushiki Kaisha Hitachi Seisakusho, Tokyo-to, Japan, a joint-stock company of Japan
Filed Jan. 17, 1963, Ser. No. 252,110
1 Claim. (Cl. 340—147)

A time-division, multiplex numerical control system for accomplishing digital information processing, which comprises: m digital input devices, each generating respective command signals of n_1, n_2 . . . n_m channels and



auxiliary signals corresponding to said respective command signals; a first synchronizing circuit which produces a time-division multiplexed signal of said respective command signals by synchronous pulses; a second synchronizing circuit which produces a time-division multiplexed signal of said respective command signals and auxiliary signals by synchronous pulses; a code selecting logical gating circuit which selects codes of the output time-division multiplexed signal of said second synchronizing circuit and produces various gate control signals, in accordance with said selected codes; a first gate circuit which controls an output time-division signal of said first synchronizing circuit to pass through said first gate circuit by one of said various gate control signals and passes a data signal of said output time-division signal through said first gate circuit; a first time-division memory circuit which memorizes said data signal; second gate circuits which control output time-division signals of said second synchronizing circuits to pass through said second gate circuit by another of said various gate control signals and passes time control signals of said output time division signals through said second gate circuits; second time-division memory circuits of m channel which memorize said time control signals from said second time-division memory circuits and produces time command signals in each input device; a counter circuit which introduces clock pulses synchronized with each channel into the input of appropriate bits of said counter circuit for each channel in accordance with said time command signal and counts said clock pulses; a time-division multiplexed pulse distribution circuit which controls the non-carry pulses of each channel of each bit of said counter circuit in accordance with said data signals and produces the time-division controlling command pulses of m channels; a separating circuit which separates said time-division controlling command pulse trains of m channel for m controlled devices.

3,274,554
COMPUTER SYSTEM
Warren W. Hopper, West Chester, Stanley J. Pezely, Norristown, Leonard H. Sichel, Jr., Bryn Mawr, Ronald B. Lounsbury, St. Davids, and Patricia V. Zimmerman, Oreland, Pa., assignors to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Feb. 15, 1961, Ser. No. 89,525
27 Claims. (Cl. 340—172.5)

21. In a system comprising requestor units and a unit to which a request is made, hold matrix means operable upon more than one request for the said requested unit and on busy conditions of said requested unit, said matrix comprising an OR gate for each requestor unit, an AND gate for said requested unit for each of the requestor units, means to provide a first input indicative of requested unit address from each of said requestor units to each of said AND gates, and a second common input to each of said AND gates responsive to busy condition of said addressed unit, each of said requestor unit OR gates being responsive to its respective AND gate, said OR gate having an input responsive to a signal indicating that said requestor unit is to await operation upon its request, each of said OR gates having output means to provide a signal to its corresponding unit to enable said unit to sense said OR gate output and take appropriate holding action.

3,274,555
DIGITAL DATA TRANSFER CIRCUIT UTILIZING TUNNEL DIODES
Louzelle A. Luke, Coon Rapids, Minn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Feb. 26, 1962, Ser. No. 175,529
10 Claims. (Cl. 340—172.5)

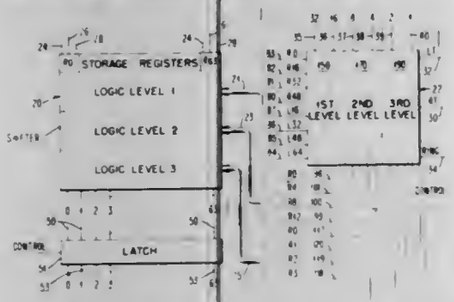
1. A digital signal shifting circuit comprising: a plurality of switching circuits arranged in a matrix array of rows and columns; each of said switching circuits comprising two signal input terminals, an output terminal, a tunnel diode electrically operational in at least two different states, and impedance means electrically interconnecting said input terminals, said output terminal and one electrode of said tunnel diode; an input data storage register; an output data storage register; means connecting electrical signal representations of the data value of each different stage of the input register to a first input terminal of all of the switching circuits in respectively different columns; impedance means connecting the output terminal of different ones of the switching circuits in each column to a respectively different stage of said output data storage register; and means for selectively applying an electrical signal to the second input terminal of all of the switching circuits in any one row.

3,274,556
LARGE SCALE SHIFTER
Gerard T. Paul, Jules F. Dirac, and Gene M. Amdahl, Poughkeepsie, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed July 10, 1962, Ser. No. 208,845
14 Claims. (Cl. 340—172.5)

1. A data transfer device comprising

a plurality of storage registers for storing information in assigned register positions,

a first logic level connected to the storage registers and including a first data collecting means adapted to provide a first output,



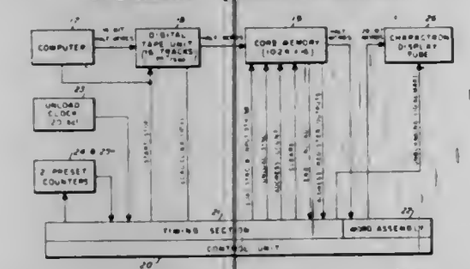
said first logic level responsive to a first control signal to transfer information from the register positions to preselected points in the first data collecting means,

said points being displaced in first or second directions or both directions relative to the register positions according to the first control signal,

a second logic level connected to the first output and including a second data collecting means adapted to provide a second output,

said second logic level responsive to a second control signal to transfer the information from the first output to preselected points in the second data collecting means, said points in the second data collecting means being displaced in the first direction relative to the points in the first data collecting means according to the second control signal,

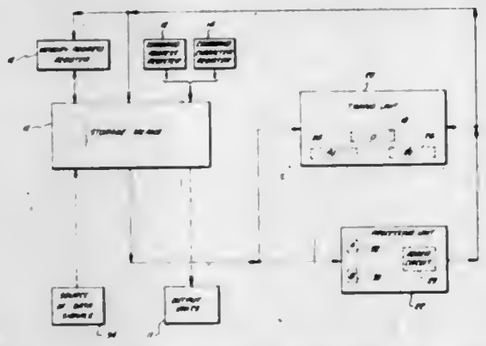
and a third logic level connected to the second output and including a third data collecting means adapted



to provide a third output,

said third logic level responsive to a third control signal to transfer the information from the second output to preselected points in the third data collecting means,

said points in the third data collecting means being displaced in the first direction relative to the points in the second data collecting means according to the third control signal,

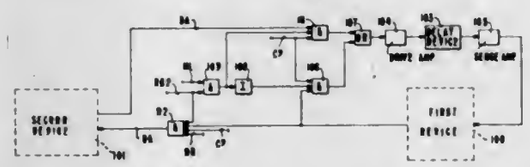


thereby to transfer the information in the storage register positions to the third output whereby the third output is displaced in a direction and a desired number of positions relative to the register positions according to the sum of the first, second and third control signals.

3,274,557
DISPLAY SIMULATOR FOR COMPUTER-AIDED SYSTEMS
Roger H. Prager, San Diego, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Filed July 24, 1962, Ser. No. 212,172
5 Claims. (Cl. 340—172.5)

1. A display simulator for computer-aided systems comprising in combination, tape recorder means adapted for receiving and recording fourteen bit half-words and concomitant regulatory signals and timely producing successive sets of fourteen bit half-words as the output therefrom, memory means coupled to the output of said tape recorder means for storing each of said successive sets of fourteen bit half-words a predetermined time period, means connected to the output of said memory means for assembling successive adjacent pairs of said fourteen bit half-words into twenty-eight bit words, means connected to said assembling means for displaying said twenty-eight bit words, and means interconnecting each of the aforesaid means for timing the respective aforementioned functions thereof to effect the display of said twenty-eight bit words by said display means so that they will be read out as predetermined coherent symbolic characters.

3,274,558
DIGITAL DATA PROCESSOR
Richard Stanton Sharp, Sierra Madre, Calif., Dan Allan Neilson, North Palm Beach, Fla., and James Russell Bennett, Glendora, Calif., assignors to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Continuation of application Ser. No. 80,171, Jan. 3, 1961. This application Oct. 19, 1965, Ser. No. 505,123
33 Claims. (Cl. 340—172.5)



17. In a stored program computer the combination comprising:

(a) memory means for storing and reading out information a character at a time and arranged for storing and reading out commands composed of at least two addresses and at least two field length signals associated with the two addresses, said memory means including means for repeatedly reading out the addresses of a command,

(b) means for individually storing and selectively modifying in a predetermined manner the two field length signals of a command read out of the memory means and thereby form a plurality of different field length signals for each command, and

(c) means for combining the plurality of field length signals with the corresponding addresses repeatedly read out of the memory means and for forming a plurality of different addresses of characters in the memory means.

3,274,559
APPARATUS FOR TRANSFERRING DATA
Paul H. Giroux and Robert J. Urquhart, both of Endicott, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Dec. 4, 1961, Ser. No. 156,825
1 Claim. (Cl. 340—172.5)

In a data processing system, means for transferring serial trains of digital information between first and second devices, each of said first and second devices being operable at different first and second bit rates, each of said trains representing a word length composed of a predetermined plural number of bit intervals, said means comprising:

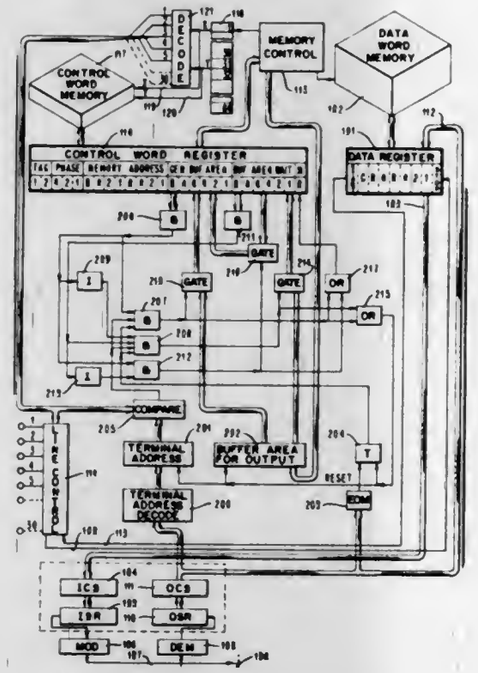
first And gate means coupled between the output of said first device and the input of said second device,

second And gate means coupled to the output of said second device,

delay means operable at a bit rate equal to said first bit rate and having an output coupled to the input of said first device,

third And gate means coupled to the output of said first device,

Or gate means having first and second inputs coupled respectively to the output of said second And gate means and the output of said third And gate means,



first means for periodically actuating said second And gate means at said second bit rate to pass therethrough the data bits of a serial train from the second device to said delay and first devices, one data bit of the serial train from said second device being passed during each actuation of said second And gate means,

second means for periodically actuating said first And gate means at said first bit rate to pass therethrough the data bits of a serial train from said first device for recirculation thereof through said delay and first devices, one data bit of the serial train from said first device being passed during each actuation of said first And gate means, and

third means for periodically actuating said third And gate means at said second bit rate to pass therethrough the data bits of a serial train from said first device to said second device, one data bit of the serial train from said first device being passed during each actuation of said third And gate means,

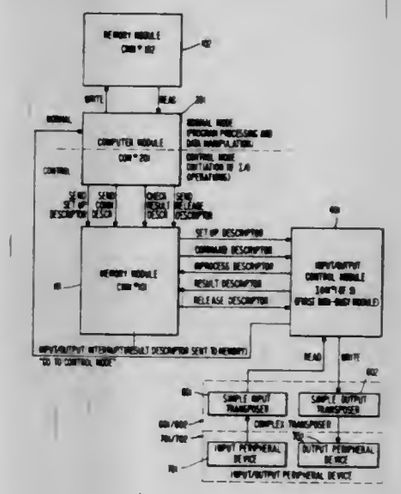
said first, second and third gate means being actuated by their respective said actuating means to allow the data bits to be transferred between the first and second devices simultaneously.

3,274,560
MESSAGE HANDLING SYSTEM
Gerry D. Granito, Poughkeepsie, N.Y., Lucius D. Smith, Atlanta, Ga., and Dana R. Spencer and Thomas S. Stafford, Wappingers Falls, N.Y., assignors to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed Sept. 12, 1962, Ser. No. 223,228
10 Claims. (Cl. 340—172.5)

1. A message handling system comprising:

a plurality of data lines;

a plurality of utilization devices respectively connected to each said data line;



a data memory, said memory having addressable locations for storing data messages;

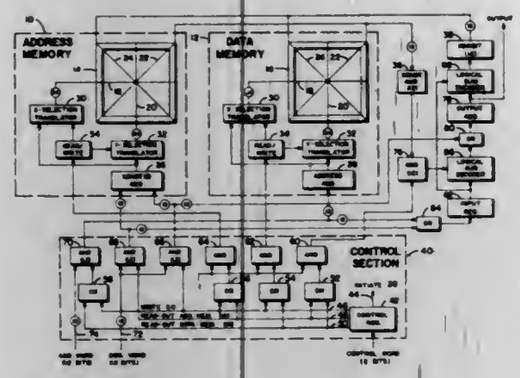
control means for placing each said lines in one or the other of two modes for transfer of data to or from an associated utilization device and one of said memory locations as required;

means for recognizing that a completed message is ready for transfer from one of said memory locations to one of said lines;

means, responsive to said control means and said completed message recognition means, for effecting immediate transfer of said message if said line is not presently in one of said modes.

3,274,561
DATA PROCESSOR INPUT/OUTPUT CONTROL SYSTEM
Henry Raymond Hallman, Norristown, and Leonard H. Sichel, Jr., Bryn Mawr, Pa., Cornelius C. Perkins, Birmingham, Mich., and Stanley J. Pezely, Norristown, Pa., assignors to Burroughs Corporation, Detroit, Mich., a corporation of Michigan
Filed Nov. 30, 1962, Ser. No. 241,421
27 Claims. (Cl. 340—172.5)

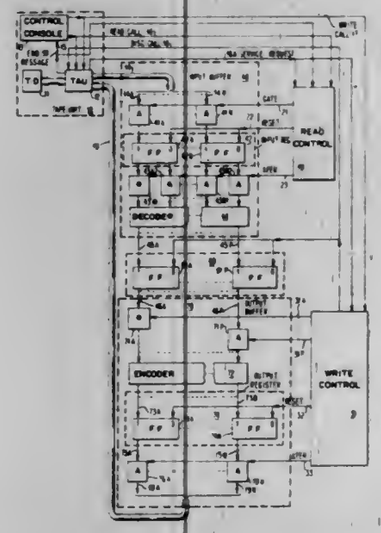
24. An input/output system for a data processor having at least one Input/Output peripheral control device and a plurality of peripheral devices, each of said peripheral devices having means associated with it to control the communication transfer rate between said peripheral device and said at least one *I/O* peripheral control device, and said at least one peripheral control device having means for transferring said control to said associated means.



3,274,562
MEMORY APPARATUS WHEREIN THE LOGICAL SUM OF ADDRESS AND DATA IS STORED AT TWO ADDRESSABLE LOCATIONS
George B. Strawbridge, St. Paul, Minn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Jan. 30, 1963, Ser. No. 254,986
5 Claims. (Cl. 340—172.5)

1. In combination:

memory apparatus comprising a plurality of independently accessible addressable storage registers, said memory apparatus including addressing means for accessing selected ones of said addressable storage locations;



receiving means for receiving manifestations of first and second binary-coded words, each of said words indicative at least in part of an address to be accessed in said memory apparatus, said receiving means coupled to said addressing means;

logical summing means coupled to said receiving means for combining the manifestations of said first and second words to provide manifestations of the logical sum thereof;

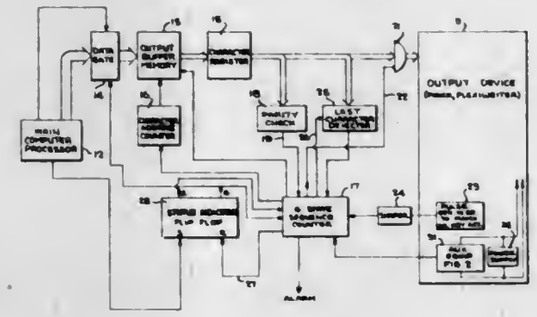
and control means coupled to said logical summing means and said memory apparatus for storing the manifestations of the logical sum in said memory apparatus at a storage register address defined by the manifestations of said first word and at storage register address defined by the manifestations of said second word.

3,274,563
SORTER SYSTEM
Theodore C. Cox, Rhinebeck, N.Y., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed July 2, 1963, Ser. No. 292,241
5 Claims. (Cl. 340—172.5)

3. In a system for sorting into order of value each of a plurality of words which may have any one of a number of values and which are serially produced in random order of value by a word generator,

the combination comprising:

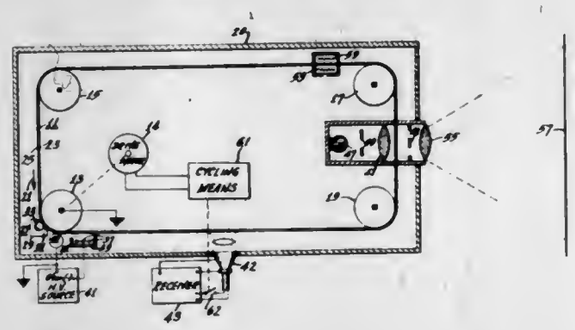
a storage device having a plurality of elements,



said elements corresponding to and representative of the various possible values of said words arrayed in the order of word values represented thereby,

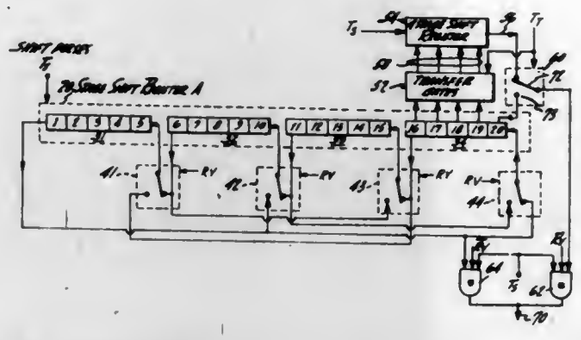
each of said elements being operable for storing a single bit of information, and

decoding means coupled to said generator operative in response to each of the series of words produced by said generator for writing a bit into the one of said memory elements representing the value of the received word,



whereby a number of significant information bits representing each value of a plurality of words are stored in serial order within the appropriate storage elements to represent the identity or relative values of said words.

3,274,564
DATA PROCESSOR
Alfred A. Binder, Cincinnati, Ohio, and Thomas J. Linder, Eau Gallie, Fla., assignors to Avco Corporation, Cincinnati, Ohio, a corporation of Delaware
Filed July 12, 1963, Ser. No. 294,589
11 Claims. (Cl. 340—172.5)



1. In a data processor wherein data are transferred from a main processor through an addressed buffer memory to an outputting device, means for deriving an indication in response to a non-operating condition of said device, means responsive to said indication for resetting said memory back to a predetermined address, and means responsive to said indication for preventing data flow from the main processor to the buffer memory while said device is in the non-operating condition.

3,274,565
OPTICAL-PHOTOCONDUCTIVE REPRODUCER UTILIZING INSULATIVE LIQUIDS
Paul E. Wright, Haddonfield, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed May 1, 1961, Ser. No. 106,698
18 Claims. (Cl. 340—173)

13. Image reproduction apparatus comprising a substantially transparent elongated layer of photoconductive insulating material, means for transporting said layer along a predetermined path, means adjacent said path for applying insulating liquid to said layer as a thin film, corona generating means for producing a substantially uniform electrostatic charge on said layer, means for projecting a light image onto said layer to produce thereon a latent electrostatic image, and schlieren optic means for illuminating said layer to convert the surface modulated image formed by said latent electrostatic image into a projected light image.

3,274,566
STORAGE CIRCUIT
Ellwood P. McGrogan, Jr., Cherry Hill, N.J., assignor to Radio Corporation of America, a corporation of Delaware
Filed Feb. 15, 1966, Ser. No. 527,566
3 Claims. (Cl. 340—173)

1. In combination:

a first one-way shift register having n storage stages and subdivided into $k=n/x$ groups of x stages each, the first stage of each i'^{th} group being connected to the last stage of the

$$i\overset{\ominus}{k}1'^{th}$$

group, said register storing bits in a certain order, where n, k and x are integers, $i=1, 2 \ldots k$, and

$$\overset{\ominus}{k}$$

represents modulo k subtraction;

a second one-way shift register, this one with at least $x-1$ stages;

means for applying shift pulses to both of said registers, in the case of the first register, for shifting the information stored in each j'^{th} stage to the

$$j\overset{\ominus}{n}1'^{th}$$

stage and, in the case of the second register, for shifting the information stored from stage to stage; where $j=1, 2 \ldots n$, and

$$\overset{\ominus}{n}$$

represents modulo n subtraction;

an output terminal at one of said stages of said first register at which the stored bits may be read out in serial fashion in said certain order in response to said shift pulses;

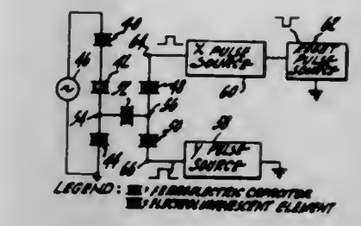
an output terminal at one of the stages of the second register at which the bits stored therein may be read out in serial fashion in response to said shift pulses;

switch means associated with said first register for disconnecting the first stage of each i'^{th} group from the last stage of the

$$i\overset{\ominus}{n}1'^{th}$$

group and for connecting the first stage of each i'^{th} group to the last stage of the

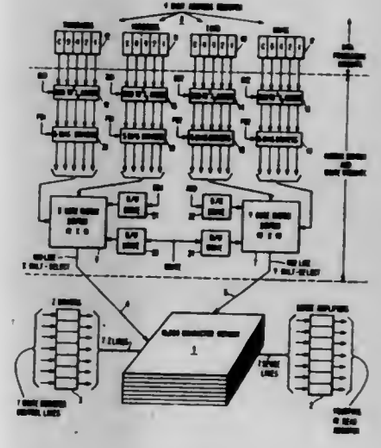
$$i\overset{\oplus}{k}1'^{th}$$



group, where

$$\overset{\oplus}{k}$$

represents modulo k addition; and



means for transferring at least the first $x-1$ bits stored in one of said groups of stages in the first register into the second register, in an order such that they are shifted out of the second register in an order which is the reverse of that in which they are stored in the first register, each x'^{th} shift pulse.

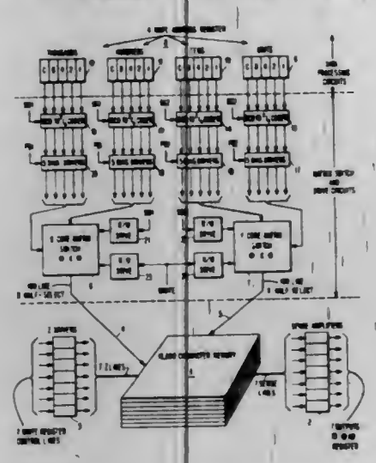
3,274,567
FERROELECTRIC CONTROL CIRCUIT
Ennio Fatuzzo, Zurich, Switzerland, assignor to Radio Corporation of America, a corporation of Delaware
Filed May 17, 1962, Ser. No. 195,453
12 Claims. (Cl. 340—173.2)

2. In combination, an alternating current load, first and second ferroelectric storage elements, and an alternating current source, all connected in series; means for polarizing said elements in opposite directions; and means including third and fourth series connected ferroelectric storage elements coupled to said first and second elements responsive to a single pulse for providing a low impedance path for said pulse, and responsive to two concurrent pulses for reversing the polarization of one of said storage elements.

3,274,568
MAGNETIC CORE MATRIX SWITCH
Warren A. Christopherson, San Jose, Calif., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed June 21, 1961, Ser. No. 118,618
12 Claims. (Cl. 340—174)

1. In a magnetic core matrix having a plurality of bistable cores arranged according to rows and columns, means for changing the magnetic state of a selected core comprising:

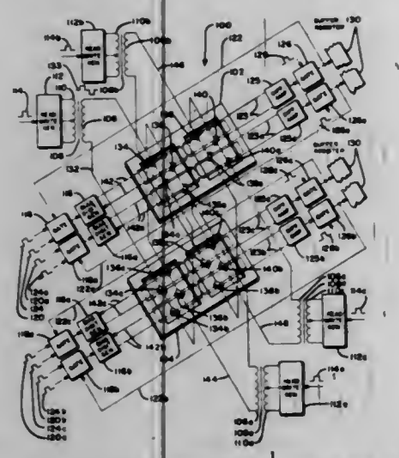
row and column bias windings on each of said cores,



means for energizing all of said bias windings to produce additive M.M.F. in each core tending to drive said cores toward a first saturation state,

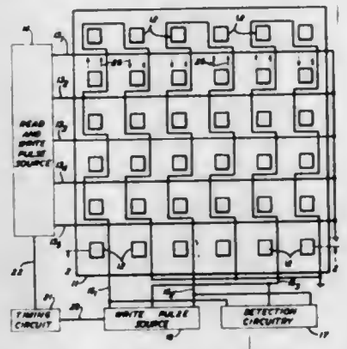
a read winding on each of said cores,

means for energizing said read windings to produce an M.M.F. tending to drive the subsequently unbiased of said cores toward a second saturation state,



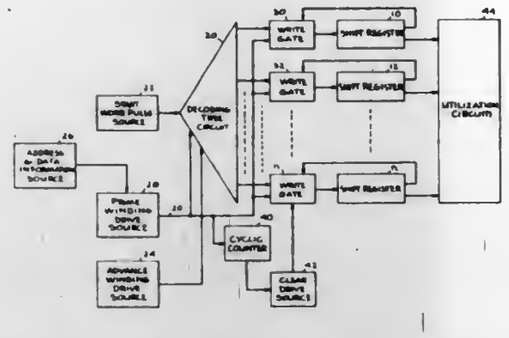
and means for deenergizing those of said bias windings tending to drive the selected core toward the first saturation state whereby the M.M.F. induced in said selected core by said read winding effects a change of flux in the selected core.

3,274,569
DECODING DEVICE
Leonard Roy Harper, San Jose, Calif., assignor to International Business Machines Corporation, New York, N.Y., a corporation of New York
Filed June 21, 1961, Ser. No. 118,623
11 Claims. (Cl. 340—174)



1. In a magnetic core matrix having a plurality of bistable cores arranged according to rows and columns, means for changing the magnetic remanent state of a selected core comprising: bias means for driving all but a selected core to saturation in a first direction, said bias means including row and column bias windings, means for energizing selected of said column bias windings to bias all but one column of said cores to saturation in a first direction, means for energizing selected of said row bias windings to bias all but one row of said cores to saturation in a first direction, a read winding including all of said cores, and means for energizing said read winding to drive an unbiased core to saturation in a second direction whereby the selected core common to said unbiased column and row is changed in state.

3,274,570
TIME-LIMITED SWITCHING FOR WORD-ORGANIZED MEMORY
Sigbjorn A. Brekne, St. Paul, Minn., assignor to Sperry Rand Corporation, New York, N.Y., a corporation of Delaware
Filed Sept. 22, 1961, Ser. No. 139,947
13 Claims. (Cl. 340—174)



1. A magnetic memory system comprising a plurality of substantially similar two-dimensional arrays each of which includes a plurality of magnetic cores each having a substantially rectangular hysteresis characteristic and being capable of being operated in a time-limited, a steady-state, or a saturated condition as a function of a magnetic field of a predetermined amplitude-duration characteristic, with all of said cores arranged in columns and rows and including a first plurality of conductors each of which is inductively coupled to a separate column and a second plurality of conductors each of which is inductively coupled to a separate row for producing a plurality of magnetic fields for placing said cores in at least two magnetic stable states and a third plurality of conductors each of which is inductively coupled to predetermined ones of said cores for sensing the magnetic state of said cores, the improvement comprising: means coupled to each of said first plurality of column conductors for conducting symmetrical first and a second, opposite polarity, time-limited, read and write signals, respectively; means coupled to each of said second plurality of row conductors for conducting a constant bias signal of said first polarity and a time-limited digit signal of said second polarity wherein the field produced by said read and bias signals has a sufficient amplitude-duration characteristic to drive the magnetic state of said cores into a first stable state saturation condition, the field produced by said write and bias signals has an insufficient amplitude-duration characteristic to drive the magnetic state of said cores into a stable state substantially different from said first stable state, and the field produced by said write, bias and digit signals has only a sufficient amplitude-duration characteristic to drive the magnetic state of said cores into a second stable state time-limited condition; and transformer means coupling said read-write signals to said first plurality of column conductors.

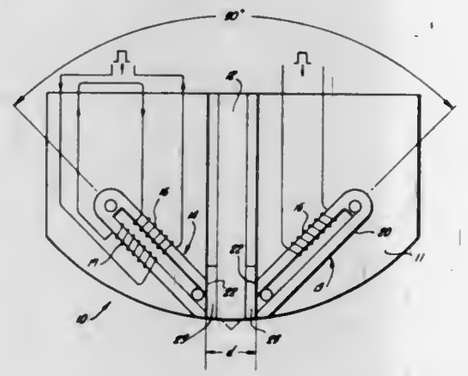
MAGNETIC MEMORY CIRCUITS
Andrew H. Bobeck, Chatham, and James L. Smith, Bedminster, N.J., assignors to Bell Telephone Laboratories, Incorporated, New York, N.Y., a corporation of New York
Filed Aug. 7, 1962, Ser. No. 215,318
20 Claims. (Cl. 340—174)



1. A magnetic memory circuit comprising a high magnetic permeability base plate having a bottom portion and a plurality of posts protruding from said bottom portion, an overlay magnetic sheet having substantially rectangular hysteresis characteristics positioned contiguous to said posts, a first and a second memory cell, each being defined by said bottom portion, said overlay sheet and two of said posts, each of said memory cells including a closed flux path therein, said first and second memory cells together comprising a bit address, means for establishing a first remanent magnetic condition in said first memory cell and a second remanent magnetic condition in said second memory cell indicative of a first binary value stored in said bit address and for establishing said second remanent magnetic condition in said first cell and said first remanent magnetic condition in said second cell indicative of a second binary value stored in said bit address, means for establishing said first remanent magnetic condition in both of said first and second cells, and means for detecting the flux reversals effected in either said first or said second cell when it is switched from said second to said first remanent magnetic condition.
